Re: 113 - 30979 - 00092  
First Notice-Only Change to  
M 113 - 30094 - 00092

Dear Kim Conrad:

Ashley Industrial Molding, Inc was issued a New Source Construction and Minor Source Operating Permit (MSOP) No. M113 - 30094 - 00092 on May 5, 2011 for a stationary automotive, construction, and farm equipment plastic part manufacturing source located at 102 Progress Drive West, Kendallville, Indiana 46755. On September 27, 2011, the Office of Air Quality (OAQ) received an application from the source requesting to add two reaction injection molding presses to the source. The company also indicated that one existing molding press will be removed. On October 17, 2011, the company submitted the additional information to indicate that another reaction injection molding press will be added and request a change of company mailing address. The addition of the three new molding presses to the permit is considered a notice-only change, since the potential emissions of VOC is less than 10 tons per year and all other regulated criteria pollutants and hazardous air pollutants are less than the ranges specified 326 IAC 2-6.1-6(g)(4) and 326 IAC 2-6.1-6(d)(10). (See Appendix A for detailed calculations) The uncontrolled potential to emit of the entire source will continue to be less than the threshold levels specified in 326 IAC 2-7. The addition of these units will not cause the source's potential to emit to be greater than the threshold levels specified in 326 IAC 2-2 or 326 IAC 2-3.

In addition, IDEM has reviewed greenhouse gases (GHGs) emissions for the source, because starting July 1, 2011, greenhouse gases (GHGs) emissions are subject to regulation at a source with a potential to emit 100,000 tons per year or more of CO<sub>2</sub> equivalent emissions (CO<sub>2</sub>e). Therefore, CO<sub>2</sub>e emissions have been calculated for this source. Based on the calculations the unlimited potential to emit greenhouse gases from the entire source is less than 100,000 tons of CO<sub>2</sub>e per year (See also Appendix A for detailed calculations). Therefore, the requirements of greenhouse gases are not applicable to this source.

The following table is used to determine the appropriate permit level under 326 IAC 2-6.1-6. This table reflects the PTE before controls of the additional units.

Process/ Emission Unit	PTE of Proposed Revision (tons/year)									
	PM	PM10	PM2.5	SO <sub>2</sub>	NO <sub>x</sub>	VOC	CO	GHGs as CO <sub>2</sub> e	Total HAPs	Worst Single HAP

The table below summarizes the potential to emit of the entire source, with updated emissions shown as **bold** values and removed emission unit shown as ~~strikethrough~~ values.

*Under the Part 70 Permit program (40 CFR 70), particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers (PM10), not particulate matter (PM), is considered as a "regulated air pollutant". **The 100,000 CO <sub>2</sub> e threshold represents the Title V and PSD subject to regulation thresholds for GHGs in order to determine whether a source's emissions are a regulated NSR pollutant under Title V and PSD.										

Pursuant to the provisions of 326 IAC 2-6.1-6, the permit is hereby revised as follows with the deleted language as ~~strikeouts~~ and new language **bolded**.

PM2.5 emission factor is filterable and condensable PM2.5 combined.

\*\*Emission Factors for NOx: Uncontrolled = 100

**Methodology**

All emission factors are based on normal firing.

MMBtu = 1,000,000 Btu

MMCF = 1,000,000 Cubic Feet of Gas

Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03

Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,000 MMBtu

Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton
