Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), PM10 emissions from the HU (hydrogen unit) B-501 Process Heater shall not exceed 0.0075 lb/MMBTU and 2.729 lb/hr.

D.17.1.2 Lake County PM10 (Filterable) Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), filterable PM10 emissions from the B-501 HU Process Heater shall not exceed 0.009 lb/MMBTU and 3.340 lbs/hour.

These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.1.1.1 as part of the Indiana State Implementation Plan.

D.18.1.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 the Permittee shall not exceed the following PM10 emission limitations for the DDU Process Heaters:

Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the Permittee shall not exceed the following PM10 emission limitations for the DDU Process Heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>WB-301</td>

<td>0.004</td>
<td>0.250</td>
</tr>
<tr>
<td>WB-302</td>
<td>0.004</td>
<td>0.240</td>
</tr>
</tbody>
</table>
These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.18.1.1 as part of the Indiana State Implementation Plan.

D.19.1.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 the PM10 from the CFHU Process Heaters F-801A, F-801B and F-801C shall not exceed 0.0075 lb/MMBTU and 0.943 lb/hr (total). Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the PM10 from each stack serving CFHU (Cat Feed Hydrotreating Unit) Process Heaters F-801A, F-801B and F-801C shall not exceed 0.0075 lb/MMBTU and 0.943 lb/hr.

D.19.1.2 Lake County PM10 (Filterable) Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), PM10 (filterable) emissions from the CFHU Process Heaters F-801A/B shall be limited to 0.004 lbs/MMBtu and 0.246 lbs/hour.

These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.19.1.1 as part of the Indiana State Implementation Plan.

D.20.1.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01, the Permittee must comply with the following PM10 emission limitations for the CRU Process Heaters: Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the Permittee must comply with the following PM10 emission limitations for the No. 1 CRU (also known as unit ID 201) feed preheaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM10 Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-101</td>

<tr>
<td>F-101</td>
<td>0.004</td>
<td>0.267</td>
</tr>
<tr>
<td>F-102A</td>
<td>0.004</td>
<td>0.290</td>
</tr>
</tbody>
</table>

These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.20.1.1 as part of the Indiana State Implementation Plan.
D.23.2.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

Until the shutdown of boilers #5, 6, and 7:

Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the Permittee shall comply with the following PM10 emission limitations for the No. 1 SPS (no. 1 powerstation) boilers:

<table>
<thead>
<tr>
<th>Boiler</th>
<th>PM10 Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack serving Boilers #5, #6, and #7</td>
<td>0.0075</td>
<td>5.924</td>
</tr>
</tbody>
</table>

D.23.2.2 Lake County PM10 (Filterable) Emission Limitations [326 IAC 6.8-2-6]

(a) Until the shutdown of boilers #5, 6, and 7:

Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), the Permittee shall comply with the following filterable PM10 emission limitations for the No. 1 SPS Boilers:

<table>
<thead>
<tr>
<th>Boiler</th>
<th>PM10 Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack serving Boilers #5, #6, and #7</td>
<td>0.016</td>
<td>13.244 (Total)</td>
</tr>
</tbody>
</table>

These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.23.2.1 as part of the Indiana State Implementation Plan.

D.24.1.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), PM10 emissions from each stack serving No. 3 power station boilers #1, #2, #3, #4 and #6 shall not exceed 0.0075 pounds per million Btu heat input and 4.28 pounds per hour for each boiler.

D.24.1.2 Lake County PM10 (Filterable) Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), filterable PM10 emissions from each stack serving Boilers #1, #2, #3, #4 and #6 shall not exceed 0.030 pounds per million Btu heat input and 17.49 pounds per hour for each boiler.

These filterable PM10 emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.24.1.1 as part of the Indiana State Implementation Plan.

D.32.1.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

Pursuant to 326 IAC 6.8-2-6 (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the Permittee must comply with the following PM10 emission limitations for the Asphalt facility process heaters:
<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-1 Asphalt Heater</td>
<td>0.0075</td>
<td>0.089</td>
</tr>
<tr>
<td>F-2 Steiglitz Park Heater</td>
<td>0.0075</td>
<td>0.209</td>
</tr>
</tbody>
</table>

D.32.1.2 Lake County PM$_{10}$ (Filterable) Emission Limitations [326 IAC 6.8-2-6]

Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), the Permittee must comply with the following filterable PM$_{10}$ emission limitations for the Asphalt facility process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-1 Asphalt Heater</td>
<td>0.004</td>
<td>0.048</td>
</tr>
<tr>
<td>F-2 Steiglitz Park Heater</td>
<td>0.008</td>
<td>0.208</td>
</tr>
</tbody>
</table>

These filterable PM$_{10}$ emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.32.1.1 as part of the Indiana State Implementation Plan.

D.34.1.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-3-6]

Pursuant to 326 IAC 6.8-2-6(b) (as published in the Indiana Register, Document Identification Number (DIN): 20080220-IR-32604279FRA, on February 20, 2008), the F-100 marine docks distillate heater shall have the following emission limits:

(a) Only natural gas shall be burned as fuel; and

(b) The PM$_{10}$ emissions shall not exceed 0.0075 pounds per million Btu heat input and 0.052 pounds per hour.

D.34.1.2 Lake County PM$_{10}$ (Filterable) Emission Limitations [326 IAC 6.8-3-6]

Pursuant to 326 IAC 6.8-6-3 (formerly 326 IAC 6-1-10.1(h)) (as published in the Indiana Register, 28 IR 3508, on September 1, 2005), the Permittee shall comply with the following requirements for process heater F-100:

(a) Only natural gas shall be burned as fuel; and

(b) The filterable PM$_{10}$ emissions shall not exceed 0.003 pounds per million Btu heat input and 0.020 pounds per hour.

These filterable PM$_{10}$ emission limitations shall be in effect until U.S. EPA approves the revised version of 326 IAC 6.8 specified in D.1.1.1 as part of the Indiana State Implementation Plan.

EPA Comment No. 3:

The draft permits contain requirements for units that have converted or will convert from the use of fuel oil to cleaner fuel such as natural or refinery gas (for example, the #11A and 11C Pipe Still process heaters). The particulate matter emission limits listed for these sources should reflect the conversion to the cleaner fuel. The permit should incorporate a ban on burning fuel oil and/or specify that the lower emission limit applies, and this should be made effective upon the conversion, rather than the end of the OCC project.
Response:

Upon further review, IDEM has added the following requirements to the permit:

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

... 
(d) The following heaters shall not combust any fuel oil: H-1X, H-2, H-3, H-200, H-300.

D.3.5 Emission Offset [326 IAC 2-3], Prevention of Significant Deterioration [326 IAC 2-2] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

(a) Pursuant to CP 089-2055-00453 issued on March 12, 1992, until heater H-1CX is shutdown, nitrogen oxide emissions from the 12 Pipe Still H-1CX furnace shall not exceed 0.10 lb/MMBtu. Compliance with this limit renders 326 IAC 2-3 not applicable. The H-1CX furnace shall also be equipped with low NOx burners.

In order to render 326 IAC 2-2-8, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable:

... 
(e) The following heaters and preheaters shall not combust any fuel oil: H-1AN, H-1AS, H-1B preheaters, H-2 vacuum heaters.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable:

(a) The boilers #5, 6, and 7 shall not combust fuel oil; and

(b) The boilers #5, 6, and 7 shall be permanently shutdown prior to the completion of the CXHO project. start-up of the new Coker (#2 Coker).

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall not combust fuel oil at boilers # 1,2,3,4 and 5 and shall comply with the following for No. 3 Stanolind Power Station:

EPA Comment No. 4:

IDEM has incorporated into the draft operating permit entire New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAPs) subparts that may contain requirements applicable to various units within the facility. This approach does not make clear what requirements apply to individual emission units at the source. IDEM should provide tables in the permit that specify the applicable sections and subsections of the NSPS and NESHAPs for each affected emission unit at the facility.
Response:

In response to this comment, we have included a summary table as Appendix A of this Addendum to the Technical Support Document which outlines the regulatory applicability for the OCC project. In addition, IDEM has determined that the following portions of the federal rules contained in the draft E sections of draft permit nos. 089-25484-00453 and 089-25488-00453 are not currently applicable to BP Whiting:

Section E.18: The entire section is no longer applicable due to the shutdown of the Fluidized Bed Incinerator.

Section E.21:
40 CFR 63.7881(a)(3)(i) through (a)(3)(ii) {Note that the main paragraph (a)(3) should be kept in the permit}
40 CFR 63.7881(b)(4) and (b)(5)
40 CFR 63.7883(d)

Section E.22:
40 CFR 60.40b(b),(d),(h)(i) and (k)
40 CFR 60.42b
40 CFR 60.43b
40 CFR 60.44b(a),(b),(c),(d),(g),(j) and (k)
40 CFR 60.45b
40 CFR 60.46b(b),(d),(e)(2), (e)(4),(e)(5),(f),(g),(i) and (j)
40 CFR 60.47b
40 CFR 60.48b(a),(e)(1),(g),(h),(i),(j) and (k)
40 CFR 60.49b(a)(4),(e),(f),(j),(k),(l),(m),(n),(p),(q),(r),(s),(t),(u),(x) and (y)

Section E.23:
40 CFR 60.4207(d) and (e)
Table 6
Table 7

Section E.24:
40 CFR 63.2334(c)
40 CFR 63.2342(a)(1)(i),(a)(1)(ii), and (c)

Section E.26:
40 CFR 63.480a(d)(4)

The non-applicable portions of federal rules that were included in the E sections of the draft permit have been deleted as follows:

1. **Section E.18** - 40 CFR Part 61, Subpart E – National Emission Standards for Mercury, has been deleted in its entirety, since the Fluidized Bed Incinerator is no longer in operation.

2. **Section E.21**

§ 63.7881  Am I subject to this subpart?

(a) This subpart applies to you if you own or operate a facility at which you conduct a site remediation, as defined in §63.7957; and this site remediation, unless exempted under paragraph (b) or (c) of this section, meets all three of the following conditions specified in paragraphs (a)(1) through (3) of this section.
(1) Your site remediation cleans up a remediation material, as defined in §63.7957.

(2) Your site remediation is co-located at your facility with one or more other stationary sources that emit HAP and meet an affected source definition specified for a source category that is regulated by another subpart under 40 CFR part 63. This condition applies regardless whether or not the affected stationary source(s) at your facility is subject to the standards under the applicable subpart(s).

(3) Your facility is a major source of HAP as defined in §63.2, except as specified in paragraph (a)(3)(i) or (ii) of this section. A major source emits or has the potential to emit any single HAP at the rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year.

(i) For production field facilities, as defined in §63.761, only the HAP emissions from the glycol dehydration units and storage vessels with the potential for flash emissions (both as defined in §63.761) shall be aggregated with the HAP emissions from the site remediation activities at the facility for a major source determination.

(ii) For natural gas transmission and storage facilities, HAP emissions shall be aggregated in accordance with the definition of major source in §63.1271 for a major source determination.

(b) You are not subject to this subpart if your site remediation qualifies for any of one of the exemptions listed in paragraphs (b)(1) through (6) of this section.

(1) Your site remediation is not subject to this subpart if the site remediation only cleans up material that does not contain any of the HAP listed in Table 1 of this subpart.

(2) Your site remediation is not subject to this subpart if the site remediation will be performed under the authority of the Comprehensive Environmental Response and Compensation Liability Act (CERCLA) as a remedial action or a non time-critical removal action.

(3) Your site remediation is not subject to this subpart if the site remediation will be performed under a Resource Conservation and Recovery Act (RCRA) corrective action conducted at a treatment, storage and disposal facility (TSDF) that is either required by your permit issued by either the U.S. Environmental Protection Agency (EPA) or a State program authorized by the EPA under RCRA section 3006; required by orders authorized under RCRA; or required by orders authorized under RCRA section 7003.

(4) Your site remediation is not subject to this subpart if the site remediation is conducted at a gasoline service station to clean up remediation material from a leaking underground storage tank.

(5) Your site remediation is not subject to this subpart if the site remediation is conducted at a farm or residential site.

(6) Your site remediation is not subject to this subpart if the site remediation is conducted at a research and development facility that meets the requirements under Clean Air Act (CAA) section 112(c)(7).

(c) Your site remediation activities are not subject to the requirements of this subpart, except for the recordkeeping requirements in this paragraph, provided that you meet the requirements specified in paragraphs (c)(1) through (c)(3) of this section.
(1) You determine that the total quantity of the HAP listed in Table 1 to this subpart that is contained in the remediation material excavated, extracted, pumped, or otherwise removed during all of the site remediations conducted at your facility is less than 1 megagram (Mg) annually. This exemption applies the 1 Mg limit on a facility-wide, annual basis, and there is no restriction to the number of site remediations that can be conducted during this period.

(2) You must prepare and maintain at your facility written documentation to support your determination that the total HAP quantity in your remediation materials for the year is less than 1 Mg. The documentation must include a description of your methodology and data used for determining the total HAP content of the remediation material.

(3) Your Title V permit does not have to be reopened or revised solely to include the recordkeeping requirement specified in paragraph (c)(2) of this section. However, the requirement must be included in your permit the next time the permit is renewed, reopened, or revised for another reason.

(d) Your site remediation is not subject to the requirements of this subpart if all remediation activities at your facility subject to this subpart are completed and you have notified the Administrator in writing that all remediation activities subject to this subpart are completed. You must maintain records of compliance, in accordance with §63.7953, for each remediation activity that was subject to this subpart. All future remediation activity meeting the applicability criteria in this section must comply with the requirements of this subpart.

§ 63.7883 When do I have to comply with this subpart?

(a) If you have an existing affected source, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than October 9, 2006.

(b) If you have a new affected source that manages remediation material other than a radioactive mixed waste as defined in §63.7957, then you must meet the compliance date specified in paragraph (b)(1) or (2) of this section, as applicable to your affected source.

(1) If the affected source's initial startup date is on or before October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you by October 8, 2003.

(2) If the affected source’s initial startup date is after October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.

(c) If you have a new affected source that manages remediation material that is a radioactive mixed waste as defined in §63.7957, then you must meet the compliance date specified in paragraph (c)(1) or (2) of this section, as applicable to your affected source.

(1) If the affected source’s initial startup date is on or before October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than October 9, 2006.

(2) If the affected source’s initial startup date is after October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.
(d) If your facility is an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP as defined in §63.2, then you must meet the compliance dates specified in paragraphs (d)(1) and (2) of this section.

(1) For each source at your facility that is a new affected source subject to this subpart, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.

(2) For all other affected sources subject to this subpart, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than 3 years after your facility becomes a major source.

(e) You must meet the notification requirements, according to the schedule applicable to your facility, as specified in §63.7950 and in 40 CFR part 63, subpart A. Some of the notifications must be submitted before you are required to comply with the emissions limitations and work practice standards in this subpart.

Section E.22

§ 60.40b Applicability and delegation of authority.

(a) The affected facility to which this subpart applies is each steam generating unit that commences construction, modification, or reconstruction after June 19, 1984, and that has a heat input capacity from fuels combusted in the steam generating unit of greater than 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/hr)).

(b) Any affected facility meeting the applicability requirements under paragraph (a) of this section and commencing construction, modification, or reconstruction after June 19, 1984, but on or before June 19, 1986, is subject to the following standards:

(1) Coal-fired affected facilities having a heat input capacity between 29 and 73 MW (100 and 250 MMBtu/hr), inclusive, are subject to the particulate matter (PM) and nitrogen oxides (NOX) standards under this subpart.

(2) Coal-fired affected facilities having a heat input capacity greater than 73 MW (250 MMBtu/hr) and meeting the applicability requirements under subpart D (Standards of performance for fossil-fuel-fired steam generators; §60.40) are subject to the PM and NOx standards under this subpart and to the sulfur dioxide (SO2) standards under subpart D (§60.43).

(3) Oil-fired affected facilities having a heat input capacity between 29 and 73 MW (100 and 250 MMBtu/hr), inclusive, are subject to the NOX standards under this subpart.

(4) Oil-fired affected facilities having a heat input capacity greater than 73 MW (250 MMBtu/hr) and meeting the applicability requirements under subpart D (Standards of performance for fossil-fuel-fired steam generators; §60.40) are also subject to the NOX standards under this subpart and the PM and SO2 standards under subpart D (§60.42 and §60.43).

(c) Affected facilities that also meet the applicability requirements under subpart J (Standards of performance for petroleum refineries; §60.104) are subject to the PM and NOX standards under this subpart and the SO2 standards under subpart J (§60.104).

(d) Affected facilities that also meet the applicability requirements under subpart E (Standards of performance for incinerators; §60.50) are subject to the NOX and PM standards under this subpart.
(e) Steam generating units meeting the applicability requirements under subpart Da (Standards of performance for electric utility steam generating units; §60.40Da) are not subject to this subpart.

(f) Any change to an existing steam generating unit for the sole purpose of combusting gases containing total reduced sulfur (TRS) as defined under §60.281 is not considered a modification under §60.14 and the steam generating unit is not subject to this subpart.

(g) In delegating implementation and enforcement authority to a State under section 111(c) of the Clean Air Act, the following authorities shall be retained by the Administrator and not transferred to a State.

1. Section 60.44b(f).
2. Section 60.44b(g).
3. Section 60.49b(a)(4).

(h) Any affected facility that meets the applicability requirements and is subject to subpart Ea, subpart Eb, or subpart AAAA of this part is not covered by this subpart.

(i) Heat recovery steam generators that are associated with combined cycle gas turbines and that meet the applicability requirements of subpart GG or KKKK of this part are not subject to this subpart. This subpart will continue to apply to all other heat recovery steam generators that are capable of combusting more than 29 MW (100 MMBtu/hr) heat input of fossil fuel. If the heat recovery steam generator is subject to this subpart, only emissions resulting from combustion of fuels in the steam generating unit are subject to this subpart. (The gas turbine emissions are subject to subpart GG or KKKK, as applicable, of this part.)

(j) Any affected facility meeting the applicability requirements under paragraph (a) of this section and commencing construction, modification, or reconstruction after June 19, 1986 is not subject to subpart D (Standards of Performance for Fossil-Fuel-Fired Steam Generators, §60.40).

(k) Any affected facility that meets the applicability requirements and is subject to an EPA approved State or Federal section 111(d)/129 plan implementing subpart Cb or subpart BBBB of this part is not covered by this subpart.

§ 60.41b Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act and in subpart A of this part.

Annual capacity factor means the ratio between the actual heat input to a steam generating unit from the fuels listed in §60.42b(a), §60.43b(a), or §60.44b(a), as applicable, during a calendar year and the potential heat input to the steam generating unit had it been operated for 8,760 hours during a calendar year at the maximum steady state design heat input capacity. In the case of steam generating units that are rented or leased, the actual heat input shall be determined based on the combined heat input from all operations of the affected facility in a calendar year.

Byproduct/waste means any liquid or gaseous substance produced at chemical manufacturing plants, petroleum refineries, or pulp and paper mills (except natural gas, distillate oil, or residual oil) and combusted in a steam generating unit for heat recovery or for disposal. Gaseous substances with carbon dioxide (CO2) levels greater than 50 percent or carbon monoxide levels greater than 10 percent are not byproduct/waste for the purpose of this subpart.

Chemical manufacturing plants mean industrial plants that are classified by the Department of Commerce under Standard Industrial Classification (SIC) Code 28.
Coal means all solid fuels classified as anthracite, bituminous, subbituminous, or lignite by the American Society of Testing and Materials in ASTM D388 (incorporated by reference, see §60.17), coal refuse, and petroleum coke. Coal-derived synthetic fuels, including but not limited to solvent refined coal, gasified coal, coal-oil mixtures, coke oven gas, and coal-water mixtures, are also included in this definition for the purposes of this subpart.

Coal refuse means any byproduct of coal mining or coal cleaning operations with an ash content greater than 50 percent, by weight, and a heating value less than 13,900 kJ/kg (6,000 Btu/lb) on a dry basis.

Cogeneration, also known as combined heat and power, means a facility that simultaneously produces both electric (or mechanical) and useful thermal energy from the same primary energy source.

Coke oven gas means the volatile constituents generated in the gaseous exhaust during the carbonization of bituminous coal to form coke.

Combined cycle system means a system in which a separate source, such as a gas turbine, internal combustion engine, kiln, etc., provides exhaust gas to a steam generating unit.

Conventional technology means wet flue gas desulfurization (FGD) technology, dry FGD technology, atmospheric fluidized bed combustion technology, and oil hydrodesulfurization technology.

Distillate oil means fuel oils that contain 0.05 weight percent nitrogen or less and comply with the specifications for fuel oil numbers 1 and 2, as defined by the American Society of Testing and Materials in ASTM D396 (incorporated by reference, see §60.17).

Dry flue gas desulfurization technology means a SO2control system that is located downstream of the steam generating unit and removes sulfur oxides from the combustion gases of the steam generating unit by contacting the combustion gases with an alkaline reagent and water, whether introduced separately or as a premixed slurry or solution and forming a dry powder material. This definition includes devices where the dry powder material is subsequently converted to another form. Alkaline slurries or solutions used in dry flue gas desulfurization technology include but are not limited to lime and sodium.

Duct burner means a device that combusts fuel and that is placed in the exhaust duct from another source, such as a stationary gas turbine, internal combustion engine, kiln, etc., to allow the firing of additional fuel to heat the exhaust gases before the exhaust gases enter a steam generating unit.

Emerging technology means any SO2control system that is not defined as a conventional technology under this section, and for which the owner or operator of the facility has applied to the Administrator and received approval to operate as an emerging technology under §60.49b(a)(4).

Federally enforceable means all limitations and conditions that are enforceable by the Administrator, including the requirements of 40 CFR parts 60 and 61, requirements within any applicable State Implementation Plan, and any permit requirements established under 40 CFR 52.21 or under 40 CFR 51.18 and 51.24.

Fluidized bed combustion technology means combustion of fuel in a bed or series of beds (including but not limited to bubbling bed units and circulating bed units) of limestone aggregate (or other sorbent materials) in which these materials are forced upward by the flow of combustion air and the gaseous products of combustion.
Fuel pretreatment means a process that removes a portion of the sulfur in a fuel before combustion of the fuel in a steam generating unit.

Full capacity means operation of the steam generating unit at 90 percent or more of the maximum steady-state design heat input capacity.

Gaseous fuel means any fuel that is present as a gas at ISO conditions.

Gross output means the gross useful work performed by the steam generated. For units generating only electricity, the gross useful work performed is the gross electrical output from the turbine/generator set. For cogeneration units, the gross useful work performed is the gross electrical or mechanical output plus 75 percent of the useful thermal output measured relative to ISO conditions that is not used to generate additional electrical or mechanical output (i.e., steam delivered to an industrial process).

Heat input means heat derived from combustion of fuel in a steam generating unit and does not include the heat derived from preheated combustion air, recirculated flue gases, or exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.

Heat release rate means the steam generating unit design heat input capacity (in MW or Btu/hr) divided by the furnace volume (in cubic meters or cubic feet); the furnace volume is that volume bounded by the front furnace wall where the burner is located, the furnace side waterwall, and extending to the level just below or in front of the first row of convection pass tubes.

Heat transfer medium means any material that is used to transfer heat from one point to another point.

High heat release rate means a heat release rate greater than 730,000 J/sec-m3 (70,000 Btu/hr-ft3 ).
ISO Conditions means a temperature of 288 Kelvin, a relative humidity of 60 percent, and a pressure of 101.3 kilopascals.

Lignite means a type of coal classified as lignite A or lignite B by the American Society of Testing and Materials in ASTM D388 (incorporated by reference, see §60.17).

Low heat release rate means a heat release rate of 730,000 J/sec-m3 (70,000 Btu/hr-ft3 ) or less.

Mass-feed stoker steam generating unit means a steam generating unit where solid fuel is introduced directly into a retort or is fed directly onto a grate where it is combusted.

Maximum heat input capacity means the ability of a steam generating unit to combust a stated maximum amount of fuel on a steady state basis, as determined by the physical design and characteristics of the steam generating unit.

Municipal-type solid waste means refuse, more than 50 percent of which is waste consisting of a mixture of paper, wood, yard wastes, food wastes, plastics, leather, rubber, and other combustible materials, and noncombustible materials such as glass and rock.

Natural gas means: (1) A naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in geologic formations beneath the earth’s surface, of which the principal constituent is methane; or (2) liquefied petroleum gas, as defined by the American Society for Testing and Materials in ASTM D1835 (incorporated by reference, see §60.17).
Noncontinental area means the State of Hawaii, the Virgin Islands, Guam, American Samoa, the Commonwealth of Puerto Rico, or the Northern Mariana Islands.

Oil means crude oil or petroleum or a liquid fuel derived from crude oil or petroleum, including distillate and residual oil.

Petroleum refinery means industrial plants as classified by the Department of Commerce under Standard Industrial Classification (SIC) Code 29.

Potential sulfur dioxide emission rate means the theoretical SO2 emissions (nanograms per joule (ng/J) or lb/MBtu heat input) that would result from combusting fuel in an uncleaned state and without using emission control systems.

Process heater means a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst.

Pulp and paper mills means industrial plants that are classified by the Department of Commerce under North American Industry Classification System (NAICS) Code 322 or Standard Industrial Classification (SIC) Code 26.

Pulverized coal-fired steam generating unit means a steam generating unit in which pulverized coal is introduced into an air stream that carries the coal to the combustion chamber of the steam generating unit where it is fired in suspension. This includes both conventional pulverized coal-fired and micropulverized coal-fired steam generating units. Residual oil means crude oil, fuel oil numbers 1 and 2 that have a nitrogen content greater than 0.05 weight percent, and all fuel oil numbers 4, 5 and 6, as defined by the American Society of Testing and Materials in ASTM D396 (incorporated by reference, see §60.17).

Spreader stoker steam generating unit means a steam generating unit in which solid fuel is introduced to the combustion zone by a mechanism that throws the fuel onto a grate from above. Combustion takes place both in suspension and on the grate.

Steam generating unit means a device that combusts any fuel or byproduct/waste and produces steam or heats water or any other heat transfer medium. This term includes any municipal-type solid waste incinerator with a heat recovery steam generating unit or any steam generating unit that combusts fuel and is part of a cogeneration system or a combined cycle system. This term does not include process heaters as they are defined in this subpart.

Steam generating unit operating day means a 24-hour period between 12:00 midnight and the following midnight during which any fuel is combusted at any time in the steam generating unit. It is not necessary for fuel to be combusted continuously for the entire 24-hour period.

Very low sulfur oil means for units constructed, reconstructed, or modified on or before February 28, 2005, an oil that contains no more than 0.5 weight percent sulfur or that, when combusted without SO2 emission control, has a SO2 emission rate equal to or less than 215 ng/J (0.5 lb/MBtu) heat input. For units constructed, reconstructed, or modified after February 28, 2005, very low sulfur oil means an oil that contains no more than 0.3 weight percent sulfur or that, when combusted without SO2 emission control, has a SO2 emission rate equal to or less than 140 ng/J (0.32 lb/MBtu) heat input.

Wet flue gas desulfurization technology means a SO2 control system that is located downstream of the steam generating unit and removes sulfur oxides from the combustion gases of the steam generating unit by contacting the combustion gas with an alkaline slurry or solution and forming a liquid material. This definition applies to devices where the aqueous liquid material product of this...
contact is subsequently converted to other forms. Alkaline reagents used in wet flue gas desulfurization technology include, but are not limited to, lime, limestone, and sodium.

Wet scrubber system means any emission control device that mixes an aqueous stream or slurry with the exhaust gases from a steam generating unit to control emissions of PM or SO2.

Wood means wood, wood residue, bark, or any derivative fuel or residue thereof, in any form, including, but not limited to, sawdust, sander dust, wood chips, scraps, slabs, millings, shavings, and processed pellets made from wood or other forest residues.

§ 60.42b   Standard for sulfur dioxide (SO2).

(a) Except as provided in paragraphs (b), (c), (d), or (k) of this section, on and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, that combusts coal or oil shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) or 10 percent (0.10) of the potential SO2 emission rate (90 percent reduction) and the emission limit determined according to the following formula:

\[
E_s = \frac{(K_aH_a + K_bH_b)}{(H_a + H_b)}
\]

Where:
- \(E_s\) = SO2 emission limit, in ng/J or lb/MMBtu heat input;
- \(K_a\) = 520 ng/J (or 1.2 lb/MMBtu);
- \(K_b\) = 340 ng/J (or 0.80 lb/MMBtu);
- \(H_a\) = Heat input from the combustion of coal, in J (MMBtu); and
- \(H_b\) = Heat input from the combustion of oil, in J (MMBtu).

Only the heat input supplied to the affected facility from the combustion of coal and oil is counted under this section. No credit is provided for the heat input to the affected facility from the combustion of natural gas, wood, municipal-type solid waste, or other fuels or heat derived from exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.

(b) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts coal refuse alone in a fluidized bed combustion steam generating unit shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) or 20 percent (0.20) of the potential SO2 emission rate (80 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input. If coal or oil is fired with coal refuse, the affected facility is subject to paragraph (a) or (d) of this section, as applicable.

(c) On and after the date on which the performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that combusts coal or oil, either alone or in combination with any other fuel, and that uses an emerging technology for the control of SO2 emissions, shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 50 percent of the potential SO2 emission rate (50 percent reduction) and that contain SO2 in excess of the emission limit determined according to the following formula:

\[
E_s = \frac{(K_aH_a + K_bH_b)}{(H_a + H_b)}
\]

Where:
- \(E_s\) = SO2 emission limit, in ng/J or lb/MMBtu heat input;
Kc = 260 ng/J (or 0.60 lb/MMBtu); 
Kd = 170 ng/J (or 0.40 lb/MMBtu); 
Hc = Heat input from the combustion of coal, in J (MMBtu); and 
Hd = Heat input from the combustion of oil, in J (MMBtu).

Only the heat input supplied to the affected facility from the combustion of coal and oil is counted under this section. No credit is provided for the heat input to the affected facility from the combustion of natural gas, wood, municipal-type solid waste, or other fuels, or from the heat input derived from exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.

(d) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005 and listed in paragraphs (d)(1), (2), (3), or (4) of this section shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 520 ng/J (1.2 lb/MMBtu) heat input if the affected facility combusts coal, or 215 ng/J (0.5 lb/MMBtu) heat input if the affected facility combusts oil other than very low sulfur oil. Percent reduction requirements are not applicable to affected facilities under paragraphs (d)(1), (2), (3) or (4) of this section.

(1) Affected facilities that have an annual capacity factor for coal and oil of 30 percent (0.30) or less and are subject to a federally enforceable permit limiting the operation of the affected facility to an annual capacity factor for coal and oil of 30 percent (0.30) or less;

(2) Affected facilities located in a noncontinental area; or

(3) Affected facilities combusting coal or oil, alone or in combination with any fuel, in a duct burner as part of a combined cycle system where 30 percent (0.30) or less of the heat entering the steam generating unit is from combustion of coal and oil in the duct burner and 70 percent (0.70) or more of the heat entering the steam generating unit is from the exhaust gases entering the duct burner; or

(4) The affected facility burns coke oven gas alone or in combination with natural gas or very low sulfur distillate oil.

(e) Except as provided in paragraph (f) of this section, compliance with the emission limits, fuel oil sulfur limits, and/or percent reduction requirements under this section are determined on a 30-day rolling average basis.

(f) Except as provided in paragraph (j)(2) of this section, compliance with the emission limits or fuel oil sulfur limits under this section is determined on a 24-hour average basis for affected facilities that (1) have a federally enforceable permit limiting the annual capacity factor for oil to 10 percent or less, (2) combust only very low sulfur oil, and (3) do not combust any other fuel.

(g) Except as provided in paragraph (i) of this section and §60.45b(a), the SO2 emission limits and percent reduction requirements under this section apply at all times, including periods of startup, shutdown, and malfunction.

(h) Reductions in the potential SO2 emission rate through fuel pretreatment are not credited toward the percent reduction requirement under paragraph (c) of this section unless:

(1) Fuel pretreatment results in a 50 percent or greater reduction in potential SO2 emissions and

(2) Emissions from the pretreated fuel (without combustion or post-combustion SO2 control) are equal to or less than the emission limits specified in paragraph (c) of this section.

(i) An affected facility subject to paragraph (a), (b), or (c) of this section may combust very low sulfur oil or natural gas when the SO2 control system is not being operated because of malfunction or maintenance of the SO2 control system.
Percent reduction requirements are not applicable to affected facilities combusting only very low sulfur oil. The owner or operator of an affected facility combusting very low sulfur oil shall demonstrate that the oil meets the definition of very low sulfur oil by: (1) Following the performance testing procedures as described in §60.45b(c) or §60.45b(d), and following the monitoring procedures as described in §60.47b(a) or §60.47b(b) to determine SO2 emission rate or fuel oil sulfur content; or (2) maintaining fuel records as described in §60.49b(r).

(k)(1) Except as provided in paragraphs (k)(2), (k)(3), and (k)(4) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences construction, reconstruction, or modification after February 28, 2005, and that combusts coal, oil, natural gas, a mixture of these fuels, or a mixture of these fuels with any other fuels shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) heat input or 8 percent (0.08) of the potential SO2 emission rate (92 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input.

(2) Units firing only very low sulfur oil and/or a mixture of gaseous fuels with a potential SO2 emission rate of 140 ng/J (0.32 lb/MMBtu) heat input or less are exempt from the SO2 emission limit in paragraph 60.42b(k)(1).

(3) Units that are located in a noncontinental area and that combust coal or oil shall not discharge any gases that contain SO2 in excess of 520 ng/J (1.2 lb/MMBtu) heat input if the affected facility combusts coal, or 215 ng/J (0.50 lb/MMBtu) heat input if the affected facility combusts oil.

(4) As an alternative to meeting the requirements under paragraph (k)(1) of this section, modified facilities that combust coal or a mixture of coal with other fuels shall not cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) heat input or 10 percent (0.10) of the potential SO2 emission rate (90 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input.

§ 60.43b Standard for particulate matter (PM).

(a) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005 that combusts coal or combusts mixtures of coal with other fuels, shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 22 ng/J (0.051 lb/MMBtu) heat input, (i) If the affected facility combusts only coal, or (ii) If the affected facility combusts coal and other fuels and has an annual capacity factor for the other fuels of 10 percent (0.10) or less.

(2) 43 ng/J (0.10 lb/MMBtu) heat input if the affected facility combusts coal and other fuels and has an annual capacity factor for the other fuels greater than 10 percent (0.10) and is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor greater than 10 percent (0.10) for fuels other than coal.

(3) 86 ng/J (0.20 lb/MMBtu) heat input if the affected facility combusts coal or coal and other fuels and

(i) Has an annual capacity factor for coal or coal and other fuels of 30 percent (0.30) or less, (ii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less,
(iii) Has a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for coal or coal and other solid fuels, and
(4) An affected facility burning coke oven gas alone or in combination with other fuels not subject to a PM standard under §60.43b and not using a post-combustion technology (except a wet scrubber) for reducing PM or SO2 emissions is not subject to the PM limits under §60.43b(a).

(b) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, and that combusts oil (or mixtures of oil with other fuels) and uses a conventional or emerging technology to reduce SO2 emissions shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 43 ng/J (0.10 lb/MMBtu) heat input.

(c) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, and that combusts wood, or wood with other fuels, except coal, shall cause to be discharged from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 43 ng/J (0.10 lb/MMBtu) heat input if the affected facility has an annual capacity factor greater than 30 percent (0.30) for wood;

(2) 86 ng/J (0.20 lb/MMBtu) heat input if (i) The affected facility has an annual capacity factor of 30 percent (0.30) or less for wood;

(ii) Is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for wood; and

(iii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less.

(d) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts municipal-type solid waste or mixtures of municipal-type solid waste with other fuels, shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 43 ng/J (0.10 lb/MMBtu) heat input; if the affected facility combusts only municipal-type solid waste; or

(i) Has an annual capacity factor for municipal-type solid waste of 10 percent (0.10) or less.

(ii) Has an annual capacity factor for the other fuels of 10 percent (0.10) or less.

(2) 86 ng/J (0.20 lb/MMBtu) heat input if the affected facility combusts municipal-type solid waste or municipal-type solid waste and other fuels; and

(i) Has an annual capacity factor for municipal-type solid waste and other fuels of 30 percent (0.30) or less;

(ii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less;
(iii) Has a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for municipal-type solid waste, or municipal-type solid waste and other fuels; and

(iv) Construction of the affected facility commenced after June 19, 1984, but on or before November 25, 1986.

(e) For the purposes of this section, the annual capacity factor is determined by dividing the actual heat input to the steam generating unit during the calendar year from the combustion of coal, wood, or municipal-type solid waste, and other fuels, as applicable, by the potential heat input to the steam generating unit if the steam generating unit had been operated for 8,760 hours at the maximum heat input capacity.

(f) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts coal, oil, wood, or mixtures of these fuels with any other fuels shall cause to be discharged into the atmosphere any gases that exhibit greater than 20 percent opacity (6-minute average), except for one 6-minute period per hour of not more than 27 percent opacity.

(g) The PM and opacity standards apply at all times, except during periods of startup, shutdown or malfunction.

(h)(1) Except as provided in paragraphs (h)(2), (h)(3), (h)(4), and (h)(5) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification after February 28, 2005, and that combusts coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels shall cause to be discharged into the atmosphere any gases that contain PM in excess of 13 ng/J (0.030 lb/MMBtu) heat input,

(2) As an alternative to meeting the requirements of paragraph (h)(1) of this section, the owner or operator of an affected facility for which modification commenced after February 28, 2005, may elect to meet the requirements of this paragraph. On and after the date on which the initial performance test is completed or required to be completed under §60.8, no owner or operator of an affected facility that commences modification after February 28, 2005 shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of both:

(i) 22 ng/J (0.051 lb/MMBtu) heat input derived from the combustion of coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels; and
(ii) 0.2 percent of the combustion concentration (99.8 percent reduction) when combusting coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels.

(3) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences modification after February 28, 2005, and that combusts over 30 percent wood (by heat input) on an annual basis and has a maximum heat input capacity of 73 MW (250 MMBtu/h) or less shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 43 ng/J (0.10 lb/MMBtu) heat input.

(4) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences modification after February 28, 2005, and that combusts over 30 percent wood (by heat input) on an annual basis and has a maximum heat input capacity greater than 73 MW
(250 MMBtu/h) shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 37 ng/J (0.085 lb/MMBtu) heat input.

(5) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, an owner or operator of an affected facility that commences construction, reconstruction, or modification after February 28, 2005, and that combusts only oil that contains no more than 0.3 weight percent sulfur, coke oven gas, a mixture of these fuels, or either fuel (or a mixture of these fuels) in combination with other fuels not subject to a PM standard under §60.43b and not using a post-combustion technology (except a wet scrubber) to reduce SO2 or PM emissions is not subject to the PM limits under §60.43b(h)(1).

§ 60.44b Standard for nitrogen oxides (NOX).

(a) Except as provided under paragraphs (k) and (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that is subject to the provisions of this section and that combusts only coal, oil, or natural gas shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX (expressed as NO2) in excess of the following emission limits:

(b) Except as provided under paragraphs (k) and (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever
date comes first, no owner or operator of an affected facility that simultaneously combusts mixtures of coal, oil, or natural gas shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX in excess of a limit determined by the use of the following formula:

\[
E_n = \frac{(EL_{go}H_{go}) + (EL_{ro}H_{ro}) + (EL_{co}H_{co})}{(H_{go} + H_{ro} + H_{co})}
\]

Where:

- \(E_n\) = NOX emission limit (expressed as NO2), ng/J (lb/MMBtu);
- \(EL_{go}\) = Appropriate emission limit from paragraph (a)(1) for combustion of natural gas or distillate oil, ng/J (lb/MMBtu);
- \(H_{go}\) = Heat input from combustion of natural gas or distillate oil, J (MMBtu);
- \(EL_{ro}\) = Appropriate emission limit from paragraph (a)(2) for combustion of residual oil, ng/J (lb/MMBtu);
- \(H_{ro}\) = Heat input from combustion of residual oil, J (MMBtu);
- \(EL_{co}\) = Appropriate emission limit from paragraph (a)(3) for combustion of coal, ng/J (lb/MMBtu); and
- \(H_{co}\) = Heat input from combustion of coal, J (MMBtu).

(c) Except as provided under paragraph (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed, no owner or operator of an affected facility that simultaneously combusts coal or oil, or a mixture of these fuels with natural gas, and wood, municipal-type solid waste, or any other fuel shall cause to be discharged into the atmosphere any gases that contain NOX in excess of the emission limit for the coal or oil, or mixtures of these fuels with natural gas combusted in the affected facility, as determined pursuant to paragraph (a) or (b) of this section, unless the affected facility has an annual capacity factor for coal or oil, or mixture of these fuels with natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less for coal, oil, or a mixture of these fuels with natural gas.

(d) On and after the date on which the initial performance test is completed or is required to be completed, no owner or operator of an affected facility that simultaneously combusts natural gas with wood, municipal-type solid waste, or other solid fuel, except coal, shall cause to be discharged into the atmosphere any gases that contain NOX in excess of 130 ng/J (0.30 lb/MMBtu) heat input unless the affected facility has an annual capacity factor for natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less for natural gas.

(e) Except as provided under paragraph (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed, no owner or operator of an affected facility that simultaneously combusts coal, oil, or natural gas with byproduct/waste shall cause to be discharged into the atmosphere any gases that contain NOX in excess of the emission limit determined by the following formula unless the affected facility has an annual capacity factor for coal, oil, and natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less:

\[
E_n = \frac{(EL_{go}H_{go}) + (EL_{ro}H_{ro}) + (EL_{co}H_{co})}{(H_{go} + H_{ro} + H_{co})}
\]

Where:

- \(E_n\) = NOX emission limit (expressed as NO2), ng/J (lb/MMBtu);
E_{\text{Lgo}}= \text{Appropriate emission limit from paragraph (a)(1) for combustion of natural gas or distillate oil, ng/J (lb/MMBtu)};
H_{\text{go}}= \text{Heat input from combustion of natural gas, distillate oil and gaseous byproduct/waste, J (MMBtu)};
E_{\text{Lro}}= \text{Appropriate emission limit from paragraph (a)(2) for combustion of residual oil and/or byproduct/waste, ng/J (lb/MMBtu)};
H_{\text{ro}}= \text{Heat input from combustion of residual oil, J (MMBtu)};
E_{\text{Lc}}= \text{Appropriate emission limit from paragraph (a)(3) for combustion of coal, ng/J (lb/MMBtu)};
\text{and}
H_{\text{c}}= \text{Heat input from combustion of coal, J (MMBtu)}.

(f) Any owner or operator of an affected facility that combusts byproduct/waste with either natural gas or oil may petition the Administrator within 180 days of the initial startup of the affected facility to establish a NOX emission limit that shall apply specifically to that affected facility when the byproduct/waste is combusted. The petition shall include sufficient and appropriate data, as determined by the Administrator, such as NOX emissions from the affected facility, waste composition (including nitrogen content), and combustion conditions to allow the Administrator to confirm that the affected facility is unable to comply with the emission limits in paragraph (e) of this section and to determine the appropriate emission limit for the affected facility.

(1) Any owner or operator of an affected facility petitioning for a facility-specific NOX emission limit under this section shall:

(i) Demonstrate compliance with the emission limits for natural gas and distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, by conducting a 30-day performance test as provided in §60.46b(e). During the performance test only natural gas, distillate oil, or residual oil shall be combusted in the affected facility; and

(ii) Demonstrate that the affected facility is unable to comply with the emission limits for natural gas and distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, when gaseous or liquid byproduct/waste is combusted in the affected facility under the same conditions and using the same technological system of emission reduction applied when demonstrating compliance under paragraph (f)(1)(i) of this section.

(2) The NOX emission limits for natural gas or distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, shall be applicable to the affected facility until and unless the petition is approved by the Administrator. If the petition is approved by the Administrator, a facility-specific NOX emission limit will be established at the NOX emission level achievable when the affected facility is combusting oil or natural gas and byproduct/waste in a manner that the Administrator determines to be consistent with minimizing NOX emissions. In lieu of amending this subpart, a letter will be sent to the facility describing the facility-specific NOX limit. The facility shall use the compliance procedures detailed in the letter and make the letter available to the public. If the Administrator determines it is appropriate, the conditions and requirements of the letter can be reviewed and changed at any point.

(g) Any owner or operator of an affected facility that combusts hazardous waste (as defined by 40 CFR part 261 or 40 CFR part 761) with natural gas or oil may petition the Administrator within 180 days of the initial startup of the affected facility for a waiver from compliance with the NOX emission limit that applies specifically to that affected facility. The petition must include sufficient and appropriate data, as determined by the Administrator, on NOX emissions from the affected facility, waste destruction efficiencies, waste composition (including nitrogen content), the quantity of specific wastes to be combusted and combustion conditions to allow the Administrator to determine if the affected facility is able to comply with the NOX emission limits required by this section. The owner or operator of the affected facility shall demonstrate that when hazardous waste is combusted in the affected facility, thermal destruction efficiency requirements for...
hazardous waste specified in an applicable federally enforceable requirement preclude compliance with the NOX emission limits of this section. The NOX emission limits for natural gas or distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, are applicable to the affected facility until and unless the petition is approved by the Administrator. (See 40 CFR 761.70 for regulations applicable to the incineration of materials containing polychlorinated biphenyls (PCB’s).) In lieu of amending this subpart, a letter will be sent to the facility describing the facility-specific NOX limit. The facility shall use the compliance procedures detailed in the letter and make the letter available to the public. If the Administrator determines it is appropriate, the conditions and requirements of the letter can be reviewed and changed at any point.

(h) For purposes of paragraph (i) of this section, the NOX standards under this section apply at all times including periods of startup, shutdown, or malfunction.

(i) Except as provided under paragraph (j) of this section, compliance with the emission limits under this section is determined on a 30-day rolling average basis.

(j) Compliance with the emission limits under this section is determined on a 24-hour average basis for the initial performance test and on a 3-hour average basis for subsequent performance tests for any affected facilities that:

1. Combust, alone or in combination, only natural gas, distillate oil, or residual oil with a nitrogen content of 0.30 weight percent or less;

2. Have a combined annual capacity factor of 10 percent or less for natural gas, distillate oil, and residual oil with a nitrogen content of 0.30 weight percent or less;

3. Are subject to a federally enforceable requirement limiting operation of the affected facility to the firing of natural gas, distillate oil, and/or residual oil with a nitrogen content of 0.30 weight percent or less and limiting operation of the affected facility to a combined annual capacity factor of 10 percent or less for natural gas, distillate oil, and residual oil with a nitrogen content of 0.30 weight percent or less.

(k) Affected facilities that meet the criteria described in paragraphs (j)(1), (2), and (3) of this section, and that have a heat input capacity of 73 MW (250 MMBtu/hr) or less, are not subject to the NOX emission limits under this section.

(l) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commenced construction or reconstruction after July 9, 1997 shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX (expressed as NO2) in excess of the following limits:

1. If the affected facility combusts coal, oil, or natural gas, or a mixture of these fuels, or with any other fuels: A limit of 86 ng/J (0.20 lb/MMBtu) heat input unless the affected facility has an annual capacity factor for coal, oil, and natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the facility to an annual capacity factor of 10 percent (0.10) or less for coal, oil, and natural gas; or

2. If the affected facility has a low heat release rate and combusts natural gas or distillate oil in excess of 30 percent of the heat input on a 30-day rolling average from the combustion of all fuels, a limit determined by use of the following formula:

\[
E_n = \frac{(0.10 \times H_p) + (0.20 \times H_d)}{H_p + H_d}
\]

Where:
En= NOX emission limit, (lb/MMBtu);
Hgo= 30-day heat input from combustion of natural gas or distillate oil; and
Hr= 30-day heat input from combustion of any other fuel.

(3) After February 27, 2006, units where more than 10 percent of total annual output is electrical or mechanical may comply with an optional limit of 270 ng/J (2.1 lb/MWh) gross energy output, based on a 30-day rolling average. Units complying with this output-based limit must demonstrate compliance according to the procedures of §60.48Da(i) of subpart Da of this part, and must monitor emissions according to §60.49Da(c), (k), through (n) of subpart Da of this part.

§ 60.45b Compliance and performance test methods and procedures for sulfur dioxide.

(a) The SO2 emission standards under §60.42b apply at all times. Facilities burning coke oven gas alone or in combination with any other gaseous fuels or distillate oil and complying with the fuel based limit under §60.42b(d) or §60.42b(k)(2) are allowed to exceed the limit 30 operating days per calendar year for by-product plant maintenance.

(b) In conducting the performance tests required under §60.8, the owner or operator shall use the methods and procedures in appendix A (including fuel certification and sampling) of this part or the methods and procedures as specified in this section, except as provided in §60.8(b). Section 60.8(f) does not apply to this section. The 30-day notice required in §60.8(d) applies only to the initial performance test unless otherwise specified by the Administrator.

(c) The owner or operator of an affected facility shall conduct performance tests to determine compliance with the percent of potential SO2 emission rate (%Ps) and the SO2 emission rate (Es) pursuant to §60.42b following the procedures listed below, except as provided under paragraph (d) and (k) of this section.

(1) The initial performance test shall be conducted over 30 consecutive operating days of the steam generating unit. Compliance with the SO2 standards shall be determined using a 30-day average. The first operating day included in the initial performance test shall be scheduled within 30 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of the facility.

(2) If only coal, only oil, or a mixture of coal and oil is combusted, the following procedures are used:

(i) The procedures in Method 19 of appendix A of this part are used to determine the hourly SO2 emission rate (Eho) and the 30-day average emission rate (Eao). The hourly averages used to compute the 30-day averages are obtained from the continuous emission monitoring system (CEMS) of §60.47b(a) or (b).

(ii) The percent of potential SO2 emission rate (%Ps) emitted to the atmosphere is computed using the following formula:

\[
\%Ps = \frac{100}{100} \left(1 - \frac{\%R_g}{100}\right) \left(1 - \frac{\%R_f}{100}\right)
\]

Where:

- %Ps = Potential SO2 emission rate, percent;
- %Rg = SO2 removal efficiency of the control device as determined by Method 19 of appendix A of this part, in percent; and
- %Rf = SO2 removal efficiency of fuel pretreatment as determined by Method 19 of appendix A of this part, in percent.

(3) If coal or oil is combusted with other fuels, the same procedures required in paragraph (c)(2) of this section are used, except as provided in the following:
(i) An adjusted hourly SO2 emission rate ($E_{hoo}$) is used in Equation 19–19 of Method 19 of appendix A of this part to compute an adjusted 30-day average emission rate ($E_{aoo}$). The $E_{hoo}$ is computed using the following formula:

$$E_{hoo} = E_{h} - E_{w}(1 - X_k)$$

Where:

- $E_{hoo}$ = Adjusted hourly SO2 emission rate, ng/J (lb/MMBtu);
- $E_{h}$ = Hourly SO2 emission rate, ng/J (lb/MMBtu);
- $E_{w}$ = SO2 concentration in fuels other than coal and oil combusted in the affected facility, as determined by the fuel sampling and analysis procedures in Method 19 of appendix A of this part, ng/J (lb/MMBtu). The value $E_{w}$ for each fuel lot is used for each hourly average during the time that the lot is being combusted; and
- $X_k$ = Fraction of total heat input from fuel combustion derived from coal, oil, or coal and oil, as determined by applicable procedures in Method 19 of appendix A of this part.

(ii) To compute the percent of potential SO2 emission rate (%Ps), an adjusted %Rg (%Rgo) is computed from the adjusted $E_{aoo}$ from paragraph (b)(3)(i) of this section and an adjusted average SO2 inlet rate ($E_{aio}$) using the following formula:

$$%R_g = \frac{E_{aio} - E_{a}}{E_{a} - E_{w}(1 - X_k)}$$

To compute $E_{aio}$, an adjusted hourly SO2 inlet rate ($E_{hio}$) is used. The $E_{hio}$ is computed using the following formula:

$$E_{hio} = \frac{E_{h} - E_{w}(1 - X_k)}{X_k}$$

Where:

- $E_{aio}$ = Adjusted hourly SO2 inlet rate, ng/J (lb/MMBtu); and
- $E_{hio}$ = Hourly SO2 inlet rate, ng/J (lb/MMBtu).

(4) The owner or operator of an affected facility subject to paragraph (b)(3) of this section does not have to measure parameters $E_w$ or $X_k$ if the owner or operator elects to assume that $X_k = 1.0$. Owners or operators of affected facilities who assume $X_k = 1.0$ shall:

(i) Determine %Ps following the procedures in paragraph (c)(2) of this section; and

(ii) Sulfur dioxide emissions ($E_s$) are considered to be in compliance with SO2 emission limits under §60.42b.

(5) The owner or operator of an affected facility that qualifies under the provisions of §60.42b(d) does not have to measure parameters $E_w$ or $X_k$ under paragraph (b)(3) of this section if the owner or operator of the affected facility elects to measure SO2 emission rates of the coal or oil following the fuel sampling and analysis procedures under Method 19 of appendix A of this part.

(d) Except as provided in paragraph (i) of this section, the owner or operator of an affected facility that combusts only very low sulfur oil, has an annual capacity factor for oil of 10 percent (0.10) or less, and is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor for oil of 10 percent (0.10) or less shall:

(1) Conduct the initial performance test over 24 consecutive steam generating unit operating hours at full load;
(2) Determine compliance with the standards after the initial performance test based on the arithmetic average of the hourly emissions data during each steam generating unit operating day if a CEMS is used, or based on a daily average if Method 6B of appendix A of this part or fuel sampling and analysis procedures under Method 19 of appendix A of this part are used.

(e) The owner or operator of an affected facility subject to §60.42b(d)(1) shall demonstrate the maximum design capacity of the steam generating unit by operating the facility at maximum capacity for 24 hours. This demonstration will be made during the initial performance test and a subsequent demonstration may be requested at any other time. If the 24-hour average firing rate for the affected facility is less than the maximum design capacity provided by the manufacturer of the affected facility, the 24-hour average firing rate shall be used to determine the capacity utilization rate for the affected facility, otherwise the maximum design capacity provided by the manufacturer is used.

(f) For the initial performance test required under §60.8, compliance with the SO2 emission limits and percent reduction requirements under §60.42b is based on the average emission rates and the average percent reduction for SO2 for the first 30 consecutive steam generating unit operating days, except as provided under paragraph (d) of this section. The initial performance test is the only test for which at least 30 days prior notice is required unless otherwise specified by the Administrator. The initial performance test is to be scheduled so that the first steam generating unit operating day of the 30 successive steam generating unit operating days is completed within 30 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of the facility. The boiler load during the 30-day period does not have to be the maximum design load, but must be representative of future operating conditions and include at least one 24-hour period at full load.

(g) After the initial performance test required under §60.8, compliance with the SO2 emission limits and percent reduction requirements under §60.42b is based on the average emission rates and the average percent reduction for SO2 for 30 successive steam generating unit operating days, except as provided under paragraph (d). A separate performance test is completed at the end of each steam generating unit operating day after the initial performance test, and a new 30-day average emission rate and percent reduction for SO2 are calculated to show compliance with the standard.

(h) Except as provided under paragraph (i) of this section, the owner or operator of an affected facility shall use all valid SO2 emissions data in calculating %Ps and Eho under paragraph (c) of this section whether or not the minimum emissions data requirements under §60.46b are achieved. All valid emissions data, including valid SO2 emission data collected during periods of startup, shutdown and malfunction, shall be used in calculating %Ps and Eho pursuant to paragraph (c) of this section.

(i) During periods of malfunction or maintenance of the SO2 control systems when oil is combusted as provided under §60.42b(i), emission data are not used to calculate %Ps or Es under §60.42b(a), (b) or (c), however, the emissions data are used to determine compliance with the emission limit under §60.42b(ii).

(j) The owner or operator of an affected facility that combusts very low sulfur oil is not subject to the compliance and performance testing requirements of this section if the owner or operator obtains fuel receipts as described in §60.49b(r).

(k) The owner or operator of an affected facility seeking to demonstrate compliance under §§60.42b(d)(4), 60.42b(j), and 60.42b(k)(2) shall follow the applicable procedures under §60.49b(r).
§ 60.46b Compliance and performance test methods and procedures for particulate matter and nitrogen oxides.

(a) The PM emission standards and opacity limits under §60.43b apply at all times except during periods of startup, shutdown, or malfunction. The NOX emission standards under §60.44b apply at all times.

(b) Complian

(c) Compliance with the NOX emission standards under §60.44b shall be determined through performance testing under paragraph (e) or (f), or under paragraphs (g) and (h) of this section, as applicable.

(d) To determine compliance with the PM emission limits and opacity limits under §60.43b, the owner or operator of an affected facility shall conduct an initial performance test as required under §60.8, and shall conduct subsequent performance tests as requested by the Administrator, using the following procedures and reference methods:

1. Method 3B of appendix A of this part is used for gas analysis when applying Method 5 or 17 of appendix A of this part.

2. Method 5, 5B, or 17 of appendix A of this part shall be used to measure the concentration of PM as follows:

(i) Method 5 of appendix A of this part shall be used at affected facilities without wet flue gas desulfurization (FGD) systems; and

(ii) Method 17 of appendix A of this part may be used at facilities with or without wet scrubber systems provided the stack gas temperature does not exceed a temperature of 160 °C (32 °F). The procedures of sections 2.1 and 2.3 of Method 5B of appendix A of this part may be used in Method 17 of appendix A of this part only if it is used after a wet FGD system. Do not use Method 17 of appendix A of this part after wet FGD systems if the effluent is saturated or laden with water droplets.

(iii) Method 5B of appendix A of this part is to be used only after wet FGD systems.

3. Method 1 of appendix A of this part is used to select the sampling site and the number of traverse sampling points. The sampling time for each run is at least 120 minutes and the minimum sampling volume is 1.7 dscm (60 dscf) except that smaller sampling times or volumes may be approved by the Administrator when necessitated by process variables or other factors.

4. For Method 5 of appendix A of this part, the temperature of the sample gas in the probe and filter holder is monitored and is maintained at 160±14 °C (320±25 °F).

5. For determination of PM emissions, the oxygen (O2) or CO2 sample is obtained simultaneously with each run of Method 5, 5B, or 17 of appendix A of this part by traversing the duct at the same sampling location.

6. For each run using Method 5, 5B, or 17 of appendix A of this part, the emission rate expressed in ng/J heat input is determined using:

(i) The O2 or CO2 measurements and PM measurements obtained under this section;
(ii) The dry basis F factor; and

(iii) The dry basis emission rate calculation procedure contained in Method 19 of appendix A of this part.

(7) Method 9 of appendix A of this part is used for determining the opacity of stack emissions.

(e) To determine compliance with the emission limits for NOX required under §60.44b, the owner or operator of an affected facility shall conduct the performance test as required under §60.8 using the continuous system for NOX under §60.48(b).

(1) For the initial compliance test, NOX from the steam generating unit are monitored for 30 successive steam generating unit operating days and the 30-day average emission rate is used to determine compliance with the NOX emission standards under §60.44b. The 30-day average emission rate is calculated as the average of all hourly emissions data recorded by the monitoring system during the 30-day test period.

(2) Following the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility which combusts coal or which combusts residual oil having a nitrogen content greater than 0.30 weight percent shall determine compliance with the NOX emission standards under §60.44b on a continuous basis through the use of a 30-day rolling average emission rate. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOX emission data for the preceding 30 steam generating unit operating days.

(3) Following the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility that has a heat input capacity greater than 73 MW (250 MMBtu/hr) and that combusts natural gas, distillate oil, or residual oil having a nitrogen content of 0.30 weight percent or less shall determine compliance with the NOX standards under §60.44b on a continuous basis through the use of a 30-day rolling average emission rate. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOX emission data for the preceding 30 steam generating unit operating days.

(4) Following the date on which the initial performance test is completed or required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility that has a heat input capacity of 73 MW (250 MMBtu/hr) or less and that combusts natural gas, distillate oil, or residual oil having a nitrogen content of 0.30 weight percent or less shall upon request determine compliance with the NOX emission standards under §60.44b through the use of a 30-day performance test. During periods when performance tests are not requested, NOX emissions data collected pursuant to §60.48b(g)(1) or §60.48b(g)(2) are used to calculate a 30-day rolling average emission rate on a daily basis and used to prepare excess emission reports, but will not be used to determine compliance with the NOX emission standards. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOX emission data for the preceding 30 steam generating unit operating days.

(5) If the owner or operator of an affected facility that combusts residual oil does not sample and analyze the residual oil for nitrogen content, as specified in §60.49b(e), the requirements of §60.48b(g)(1) apply and the provisions of §60.48b(g)(2) are inapplicable.

(f) To determine compliance with the emissions limits for NOX required by §60.44b(a)(4) or §60.44b(l) for duct burners used in combined cycle systems, either of the procedures described in paragraph (f)(1) or (2) of this section may be used:
(1) The owner or operator of an affected facility shall conduct the performance test required under §60.8 as follows:

(i) The emissions rate \( E \) of NO\(_X\) shall be computed using Equation 1 in this section:

\[
E = E_{r} - \left( \frac{H_{r}}{H_{g}} \right) \left( E_{r} - E_{g} \right) \quad \text{(Eq. 1)}
\]

Where:
- \( E \) = Emissions rate of NO\(_X\) from the duct burner, ng/J (lb/MMBtu) heat input;
- \( E_{r} \) = Combined effluent emissions rate, in ng/J (lb/MMBtu) heat input using appropriate F factor as described in Method 19 of appendix A of this part;
- \( H_{r} \) = Heat input rate to the combustion turbine, in J/hr (MMBtu/hr); and
- \( H_{g} \) = Heat input rate to the duct burner, in J/hr (MMBtu/hr); and
- \( E_{g} \) = Emissions rate from the combustion turbine, in ng/J (lb/MMBtu) heat input calculated using appropriate F factor as described in Method 19 of appendix A of this part.

(ii) Method 7E of appendix A of this part shall be used to determine the NO\(_X\) concentrations. Method 3A or 3B of appendix A of this part shall be used to determine O\(_2\) concentration.

(iii) The owner or operator shall identify and demonstrate to the Administrator's satisfaction suitable methods to determine the average hourly heat input rate to the combustion turbine and the average hourly heat input rate to the affected duct burner.

(iv) Compliance with the emissions limits under §60.44b(a)(4) or §60.44b(l) is determined by the three-run average (nominal 1-hour run) for the initial and subsequent performance tests; or

(2) The owner or operator of an affected facility may elect to determine compliance on a 30-day rolling average basis by using the CEMS specified under §60.48b for measuring NO\(_X\) and O\(_2\) and meet the requirements of §60.48b. The sampling site shall be located at the outlet from the steam generating unit. The NO\(_X\) emissions rate at the outlet from the steam generating unit shall constitute the NO\(_X\) emissions rate from the duct burner of the combined cycle system.

(g) The owner or operator of an affected facility described in §60.44b(j) or §60.44b(k) shall demonstrate the maximum heat input capacity of the steam generating unit by operating the facility at maximum capacity for 24 hours. The owner or operator of an affected facility shall determine the maximum heat input capacity using the heat loss method described in sections 5 and 7.3 of the ASME Power Test Codes 4.1 (incorporated by reference, see §60.17). This demonstration of maximum heat input capacity shall be made during the initial performance test for affected facilities that meet the criteria of §60.44b(j). It shall be made within 60 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of each facility, for affected facilities meeting the criteria of §60.44b(k). Subsequent demonstrations may be required by the Administrator at any other time. If this demonstration indicates that the maximum heat input capacity of the affected facility is less than that stated by the manufacturer of the affected facility, the maximum heat input capacity determined during this demonstration shall be used to determine the capacity utilization rate for the affected facility. Otherwise, the maximum heat input capacity provided by the manufacturer is used.

(h) The owner or operator of an affected facility described in §60.44b(j) that has a heat input capacity greater than 73 MW (250 MMBtu/hr) shall:

(1) Conduct an initial performance test as required under §60.8 over a minimum of 24 consecutive steam generating unit operating hours at maximum heat input capacity to demonstrate compliance with the NO\(_X\) emission standards under §60.44b using Method 7, 7A, 7E of appendix A of this part, or other approved reference methods; and
(2) Conduct subsequent performance tests once per calendar year or every 400 hours of operation (whichever comes first) to demonstrate compliance with the NOX emission standards under §60.44b over a minimum of 3 consecutive steam generating unit operating hours at maximum heat input capacity using Method 7, 7A, 7E of appendix A of this part, or other approved reference methods.

(i) The owner or operator of an affected facility seeking to demonstrate compliance under paragraph §60.43b(h)(5) shall follow the applicable procedures under §60.49b(r).

(j) In place of PM testing with EPA Reference Method 5, 5B, or 17 of appendix A of this part, an owner or operator may elect to install, calibrate, maintain, and operate a CEMS for monitoring PM emissions discharged to the atmosphere and record the output of the system. The owner or operator of an affected facility who elects to continuously monitor PM emissions instead of conducting performance testing using EPA Method 5, 5B, or 17 of appendix A of this part shall comply with the requirements specified in paragraphs (j)(1) through (j)(13) of this section.

(1) Notify the Administrator one month before starting use of the system.

(2) Notify the Administrator one month before stopping use of the system.

(3) The monitor shall be installed, evaluated, and operated in accordance with §60.13 of subpart A of this part.

(4) The initial performance evaluation shall be completed no later than 180 days after the date of initial startup of the affected facility, as specified under §60.8 of subpart A of this part or within 180 days of notification to the Administrator of use of the CEMS if the owner or operator was previously determining compliance by Method 5, 5B, or 17 of appendix A of this part performance tests, whichever is later.

(5) The owner or operator of an affected facility shall conduct an initial performance test for PM emissions as required under §60.8 of subpart A of this part. Compliance with the PM emission limit shall be determined by using the CEMS specified in paragraph (j) of this section to measure PM and calculating a 24-hour block arithmetic average emission concentration using EPA Reference Method 19 of appendix A of this part, section 4.1.

(6) Compliance with the PM emission limit shall be determined based on the 24-hour daily (block) average of the hourly arithmetic average emission concentrations using CEMS outlet data.

(7) At a minimum, valid CEMS hourly averages shall be obtained as specified in paragraphs (j)(7)(i) through (j)(7)(ii) of this section for 75 percent of the total operating hours per 30-day rolling average.

(i) At least two data points per hour shall be used to calculate each 1-hour arithmetic average.

(ii) [Reserved]

(8) The 1-hour arithmetic averages required under paragraph (j)(7) of this section shall be expressed in ng/J or lb/MMBtu heat input and shall be used to calculate the boiler operating day daily arithmetic average emission concentrations. The 1-hour arithmetic averages shall be calculated using the data points required under §60.13(e)(2) of subpart A of this part.

(9) All valid CEMS data shall be used in calculating average emission concentrations even if the minimum CEMS data requirements of paragraph (j)(7) of this section are not met.

(10) The CEMS shall be operated according to Performance Specification 11 in appendix B of this part.
(11) During the correlation testing runs of the CEMS required by Performance Specification 11 in appendix B of this part, PM and O2(or CO2) data shall be collected concurrently (or within a 30- to 60-minute period) by both the continuous emission monitors and the test methods specified in paragraphs (j)(7)(i) of this section.

(i) For PM, EPA Reference Method 5, 5B, or 17 of appendix A of this part shall be used.

(ii) For O2(or CO2), EPA reference Method 3, 3A, or 3B of appendix A of this part, as applicable shall be used.

(12) Quarterly accuracy determinations and daily calibration drift tests shall be performed in accordance with procedure 2 in appendix F of this part. Relative Response Audit's must be performed annually and Response Correlation Audits must be performed every 3 years.

(13) When PM emissions data are not obtained because of CEMS breakdowns, repairs, calibration checks, and zero and span adjustments, emissions data shall be obtained by using other monitoring systems as approved by the Administrator or EPA Reference Method 19 of appendix A of this part to provide, as necessary, valid emissions data for a minimum of 75 percent of total operating hours per 30-day rolling average.

§ 60.47b Emission monitoring for sulfur dioxide.

(a) Except as provided in paragraphs (b), (f), and (h) of this section, the owner or operator of an affected facility subject to the SO2 standards under §60.42b shall install, calibrate, maintain, and operate CEMS for measuring SO2 concentrations and either O2 or CO2 concentrations and shall record the output of the systems. For units complying with the percent reduction standard, the SO2 and either O2 or CO2 concentrations shall both be monitored at the inlet and outlet of the SO2 control device. If the owner or operator has installed and certified SO2 and O2 or CO2 CEMS according to the requirements of §75.20(c)(1) of this chapter and appendix A to part 75 of this chapter, and is continuing to meet the ongoing quality assurance requirements of §75.21 of this chapter and appendix B to part 75 of this chapter, those CEMS may be used to meet the requirements of this section, provided that:

(1) When relative accuracy testing is conducted, SO2 concentration data and CO2(or O2) data are collected simultaneously; and

(2) In addition to meeting the applicable SO2 and CO2(or O2) relative accuracy specifications in Figure 2 of appendix B to part 75 of this chapter, the relative accuracy (RA) standard in section 13.2 of Performance Specification 2 in appendix B to this part is met when the RA is calculated on a lb/MMBtu basis; and

(3) The reporting requirements of §60.49b are met. SO2 and CO2(or O2) data used to meet the requirements of §60.49b shall not include substitute data values derived from the missing data procedures in subpart D of part 75 of this chapter, nor shall the SO2 data have been bias adjusted according to the procedures of part 75 of this chapter.

(b) As an alternative to operating CEMS as required under paragraph (a) of this section, an owner or operator may elect to determine the average SO2 emissions and percent reduction by:

(1) Collecting coal or oil samples in an as-fired condition at the inlet to the steam generating unit and analyzing them for sulfur and heat content according to Method 19 of appendix A of this part. Method 19 of appendix A of this part provides procedures for converting these measurements into the format to be used in calculating the average SO2 input rate, or
(2) Measuring SO\(_2\) according to Method 6B of appendix A of this part at the inlet or outlet to the SO\(_2\) control system. An initial stratification test is required to verify the adequacy of the Method 6B of appendix A of this part sampling location. The stratification test shall consist of three paired runs of a suitable SO\(_2\) and CO\(_2\) measurement train operated at the candidate location and a second similar train operated according to the procedures in section 3.2 and the applicable procedures in section 7 of Performance Specification 2. Method 6B of appendix A of this part, Method 6A of appendix A of this part, or a combination of Methods 6 and 3 or 3B of appendix A of this part or Methods 6C and 3A of appendix A of this part are suitable measurement techniques. If Method 6B of appendix A of this part is used for the second train, sampling time and timer operation may be adjusted for the stratification test as long as an adequate sample volume is collected; however, both sampling trains are to be operated similarly. For the location to be adequate for Method 6B of appendix A of this part 24-hour tests, the mean of the absolute difference between the three paired runs must be less than 10 percent.

(3) A daily SO\(_2\) emission rate, \(E_D\), shall be determined using the procedure described in Method 6A of appendix A of this part, section 7.6.2 (Equation 6A–8) and stated in ng/J (lb/MMBtu) heat input.

(4) The mean 30-day emission rate is calculated using the daily measured values in ng/J (lb/MMBtu) for 30 successive steam generating unit operating days using equation 19–20 of Method 19 of appendix A of this part.

(c) The owner or operator of an affected facility shall obtain emission data for at least 75 percent of the operating hours in at least 22 out of 30 successive boiler operating days. If this minimum data requirement is not met with a single monitoring system, the owner or operator of the affected facility shall supplement the emission data with data collected with other monitoring systems as approved by the Administrator or the reference methods and procedures as described in paragraph (b) of this section.

(d) The 1-hour average SO\(_2\) emission rates measured by the CEMS required by paragraph (a) of this section and required under §60.13(h) is expressed in ng/J or lb/MMBtu heat input and is used to calculate the average emission rates under §60.42(b). Each 1-hour average SO\(_2\) emission rate must be based on 30 or more minutes of steam generating unit operation. The hourly averages shall be calculated according to §60.13(h)(2). Hourly SO\(_2\) emission rates are not calculated if the affected facility is operated less than 30 minutes in a given clock hour and are not counted toward determination of a steam generating unit operating day.

(e) The procedures under §60.13 shall be followed for installation, evaluation, and operation of the CEMS.

(1) Except as provided for in paragraph (e)(4) of this section, all CEMS shall be operated in accordance with the applicable procedures under Performance Specifications 1, 2, and 3 of appendix B of this part.

(2) Except as provided for in paragraph (e)(4) of this section, quarterly accuracy determinations and daily calibration drift tests shall be performed in accordance with Procedure 1 of appendix F of this part.

(3) For affected facilities combusting coal or oil, alone or in combination with other fuels, the span value of the SO\(_2\)CEMS at the inlet to the SO\(_2\) control device is 125 percent of the maximum estimated hourly potential SO\(_2\) emissions of the fuel combusted, and the span value of the CEMS at the outlet to the SO\(_2\) control device is 50 percent of the maximum estimated hourly potential SO\(_2\) emissions of the fuel combusted. Alternatively, SO\(_2\) span values determined according to section 2.1.1 in appendix A to part 75 of this chapter may be used.
(4) As an alternative to meeting the requirements of requirements of paragraphs (e)(1) and (e)(2) of this section, the owner or operator may elect to implement the following alternative data accuracy assessment procedures:

(i) For all required CO₂ and O₂ monitors and for SO₂ and NOₓ monitors with span values less than 100 ppm, the daily calibration error test and calibration adjustment procedures described in sections 2.1.1 and 2.1.3 of appendix B to part 75 of this chapter may be followed instead of the CD assessment procedures in Procedure 1, section 4.1 of appendix F to this part. If this option is selected, the data validation and out-of-control provisions in sections 2.1.4 and 2.1.5 of appendix B to part 75 of this chapter shall be followed instead of the excessive CD and out-of-control criteria in Procedure 1, section 4.3 of appendix F to this part. For the purposes of data validation under this subpart, the excessive CD and out-of-control criteria in Procedure 1, section 4.3 of appendix F to this part shall apply to SO₂ and NOₓ span values less than 100 ppm;

(ii) For all required CO₂ and O₂ monitors and for SO₂ and NOₓ monitors with span values greater than 30 ppm, quarterly linearity checks may be performed in accordance with section 2.2.1 of appendix B to part 75 of this chapter, instead of performing the cylinder gas audits (CGAs) described in Procedure 1, section 5.1.2 of appendix F to this part. If this option is selected: The frequency of the linearity checks shall be as specified in section 2.2.1 of appendix B to part 75 of this chapter; the applicable linearity specifications in section 3.2 of appendix A to part 75 of this chapter shall be met; the data validation and out-of-control criteria in section 2.2.3 of appendix B to part 75 of this chapter shall be followed instead of the excessive audit inaccuracy and out-of-control criteria in Procedure 1, section 5.2 of appendix F to this part; and the grace period provisions in section 2.2.4 of appendix B to part 75 of this chapter shall apply. For the purposes of data validation under this subpart, the cylinder gas audits described in Procedure 1, section 5.1.2 of appendix F to this part shall be performed for SO₂ and NOₓ span values less than or equal to 30 ppm; and

(iii) For SO₂, CO₂, and O₂ monitoring systems and for NOₓ emission rate monitoring systems, RATAs may be performed in accordance with section 2.3 of appendix B to part 75 of this chapter instead of following the procedures described in Procedure 1, section 5.1.1 of appendix F to this part. If this option is selected: The frequency of each RATA shall be as specified in section 2.3.1 of appendix B to part 75 of this chapter; the applicable relative accuracy specifications shown in Figure 2 in appendix B to part 75 of this chapter shall be met; the data validation and out-of-control criteria in section 2.3.2 of appendix B to part 75 of this chapter shall be followed instead of the excessive audit inaccuracy and out-of-control criteria in Procedure 1, section 5.2 of appendix F to this part; and the grace period provisions in section 2.3.3 of appendix B to part 75 of this chapter shall apply. For the purposes of data validation under this subpart, the relative accuracy specification in section 13.2 of Performance Specification 2 in appendix B to this part shall be met on a lb/MMBtu basis for SO₂ (regardless of the SO₂ emission level during the RATA), and for NOₓ when the average NOₓ emission rate measured by the reference method during the RATA is less than 0.100 lb/MMBtu.

(f) The owner or operator of an affected facility that combusts very low sulfur oil or is demonstrating compliance under §60.45b(k) is not subject to the emission monitoring requirements under paragraph (a) of this section if the owner or operator maintains fuel records as described in §60.49b(r).

§ 60.48b Emission monitoring for particulate matter and nitrogen oxides.

(a) Except as provided in paragraph (j) of this section, the owner or operator of an affected facility subject to the opacity standard under §60.43b shall install, calibrate, maintain, and operate a CEMS for measuring the opacity of emissions discharged to the atmosphere and record the output of the system.
(b) Except as provided under paragraphs (g), (h), and (i) of this section, the owner or operator of an affected facility subject to a NOX standard under §60.44b shall comply with either paragraphs (b)(1) or (b)(2) of this section.

(1) Install, calibrate, maintain, and operate CEMS for measuring NOX and O2(or CO2) emissions discharged to the atmosphere, and shall record the output of the system; or

(2) If the owner or operator has installed a NOX emission rate CEMS to meet the requirements of part 75 of this chapter and is continuing to meet the ongoing requirements of part 75 of this chapter, that CEMS may be used to meet the requirements of this section, except that the owner or operator shall also meet the requirements of §60.49b. Data reported to meet the requirements of §60.49b shall not include data substituted using the missing data procedures in subpart D of part 75 of this chapter, nor shall the data have been bias adjusted according to the procedures of part 75 of this chapter.

(c) The CEMS required under paragraph (b) of this section shall be operated and data recorded during all periods of operation of the affected facility except for CEMS breakdowns and repairs. Data is recorded during calibration checks, and zero and span adjustments.

(d) The 1-hour average NOX emission rates measured by the continuous NOX monitor required by paragraph (b) of this section and required under §60.13(h) shall be expressed in ng/J or lb/MBtu heat input and shall be used to calculate the average emission rates under §60.44b. The 1-hour averages shall be calculated using the data points required under §60.13(h)(2).

(e) The procedures under §60.13 shall be followed for installation, evaluation, and operation of the continuous monitoring systems.

(1) For affected facilities combusting coal, wood or municipal-type solid waste, the span value for a continuous monitoring system for measuring opacity shall be between 60 and 80 percent.

(2) For affected facilities combusting coal, oil, or natural gas, the span value for NOX is determined using one of the following procedures:

(i) Except as provided under paragraph (e)(2)(i) of this section, NOX span values shall be determined as follows:

<table>
<thead>
<tr>
<th>Fuel</th>
<th>Span values for NOX (ppm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural gas</td>
<td>500.</td>
</tr>
<tr>
<td>Oil</td>
<td>500.</td>
</tr>
<tr>
<td>Coal</td>
<td>1,000.</td>
</tr>
<tr>
<td>Mixtures</td>
<td>500 (x + y) + 1,000z.</td>
</tr>
</tbody>
</table>

Where:
- \( x \) = Fraction of total heat input derived from natural gas;
- \( y \) = Fraction of total heat input derived from oil; and
- \( z \) = Fraction of total heat input derived from coal.

(ii) As an alternative to meeting the requirements of paragraph (e)(2)(i) of this section, the owner or operator of an affected facility may elect to use the NOX span values determined according to section 2.1.2 in appendix A to part 75 of this chapter.

(3) All span values computed under paragraph (e)(2)(i) of this section for combusting mixtures of regulated fuels are rounded to the nearest 500 ppm. Span values computed under paragraph
(e)(2)(ii) of this section shall be rounded off according to section 2.1.2 in appendix A to part 75 of this chapter.

(f) When NOX emission data are not obtained because of CEMS breakdowns, repairs, calibration checks and zero and span adjustments, emission data will be obtained by using standby monitoring systems, Method 7 of appendix A of this part, Method 7A of appendix A of this part, or other approved reference methods to provide emission data for a minimum of 75 percent of the operating hours in each steam generating unit operating day, in at least 22 out of 30 successive steam generating unit operating days.

(g) The owner or operator of an affected facility that has a heat input capacity of 73 MW (250 MMBtu/hr) or less, and that has an annual capacity factor for residual oil having a nitrogen content of 0.30 weight percent or less, natural gas, distillate oil, or any mixture of these fuels, greater than 10 percent (0.10) shall:

1. Comply with the provisions of paragraphs (b), (c), (d), (e)(2), (e)(3), and (f) of this section; or

2. Monitor steam generating unit operating conditions and predict NOX emission rates as specified in a plan submitted pursuant to §60.49b(c).

(h) The owner or operator of a duct burner, as described in §60.41b, that is subject to the NOX standards of §60.44b(a)(4) or §60.44b(i) is not required to install or operate a continuous emissions monitoring system to measure NOX emissions.

(i) The owner or operator of an affected facility described in §60.44b(i) or §60.44b(k) is not required to install or operate a CEMS for measuring NOX emissions.

(j) The owner or operator of an affected facility that meets the conditions in either paragraph (j)(1), (2), (3), (4), or (5) of this section is not required to install or operate a COMS for measuring opacity if:

1. The affected facility uses a PM CEMS to monitor PM emissions; or

2. The affected facility burns only liquid (excluding residual oil) or gaseous fuels with potential SO2emissions rates of 26 ng/J (0.060 lb/MMBtu) or less and does not use a post-combustion technology to reduce SO2or PM emissions. The owner or operator must maintain fuel records of the sulfur content of the fuels burned, as described under §60.49b(r); or

3. The affected facility burns coke oven gas alone or in combination with fuels meeting the criteria in paragraph (j)(2) of this section and does not use a post-combustion technology to reduce SO2or PM emissions; or

4. The affected facility does not use post-combustion technology (except a wet scrubber) for reducing PM, SO2, or carbon monoxide (CO) emissions, burns only gaseous fuels or fuel oils that contain less than or equal to 0.30 weight percent sulfur, and is operated such that emissions of CO to the atmosphere from the affected facility are maintained at levels less than or equal to 0.15 lb/MMBtu on a steam generating unit operating day average basis. Owners and operators of affected facilities electing to comply with this paragraph must demonstrate compliance according to the procedures specified in paragraphs (j)(4)(i) through (iv) of this section.

(i) You must monitor CO emissions using a CEMS according to the procedures specified in paragraphs (j)(4)(i)(A) through (D) of this section.

(A) The CO CEMS must be installed, certified, maintained, and operated according to the provisions in
§60.58b(i)(3) of subpart Eb of this part.

(B) Each 1-hour CO emissions average is calculated using the data points generated by the CO CEMS expressed in parts per million by volume corrected to 3 percent oxygen (dry basis).

(C) At a minimum, valid 1-hour CO emissions averages must be obtained for at least 90 percent of the operating hours on a 30-day rolling average basis. At least two data points per hour must be used to calculate each 1-hour average.

(D) Quarterly accuracy determinations and daily calibration drift tests for the CO CEMS must be performed in accordance with procedure 1 in appendix F of this part.

(ii) You must calculate the 1-hour average CO emissions levels for each steam generating unit operating day by multiplying the average hourly CO output concentration measured by the CO CEMS times the corresponding average hourly flue gas flow rate and divided by the corresponding average hourly heat input to the affected source. The 24-hour average CO emission level is determined by calculating the arithmetic average of the hourly CO emission levels computed for each steam generating unit operating day.

(iii) You must evaluate the preceding 24-hour average CO emission level each steam generating unit operating day excluding periods of affected source startup, shutdown, or malfunction. If the 24-hour average CO emission level is greater than 0.15 lb/MMBtu, you must initiate investigation of the relevant equipment and control systems within 24 hours of the first discovery of the high emission incident and, take the appropriate corrective action as soon as practicable to adjust control settings or repair equipment to reduce the 24-hour average CO emission level to 0.15 lb/MMBtu or less.

(iv) You must record the CO measurements and calculations performed according to paragraph (j)(4) of this section and any corrective actions taken. The record of corrective action taken must include the date and time during which the 24-hour average CO emission level was greater than 0.15 lb/MMBtu, and the date, time, and description of the corrective action.

(5) The affected facility burns only gaseous fuels or fuel oils that contain less than or equal to 0.30 weight percent sulfur and operates according to a written site-specific monitoring plan approved by the appropriate delegated permitting authority. This monitoring plan must include procedures and criteria for establishing and monitoring specific parameters for the affected facility indicative of compliance with the opacity standard.

(k) Owners or operators complying with the PM emission limit by using a PM CEMS monitor instead of monitoring opacity must calibrate, maintain, and operate a CEMS, and record the output of the system, for PM emissions discharged to the atmosphere as specified in §60.46b(j). The CEMS specified in paragraph §60.46b(j) shall be operated and data recorded during all periods of operation of the affected facility except for CEMS breakdowns and repairs. Data is recorded during calibration checks, and zero and span adjustments.

§ 60.49b Reporting and recordkeeping requirements.

(a) The owner or operator of each affected facility shall submit notification of the date of initial startup, as provided by §60.7. This notification shall include:

(1) The design heat input capacity of the affected facility and identification of the fuels to be combusted in the affected facility;

(2) If applicable, a copy of any federally enforceable requirement that limits the annual capacity factor for any fuel or mixture of fuels under §§60.42b(d)(1), 60.43b(a)(2), (a)(3)(iii), (c)(2)(ii), (d)(2)(iii), 60.44b(c), (d), (e), (i), (j), (k), 60.45b(d), (g), 60.46b(h), or 60.48b(i);
(3) The annual capacity factor at which the owner or operator anticipates operating the facility based on all fuels fired and based on each individual fuel fired; and

(4) Notification that an emerging technology will be used for controlling emissions of SO2. The Administrator will examine the description of the emerging technology and will determine whether the technology qualifies as an emerging technology. In making this determination, the Administrator may require the owner or operator of the affected facility to submit additional information concerning the control device. The affected facility is subject to the provisions of §60.42b(a) unless and until this determination is made by the Administrator.

(b) The owner or operator of each affected facility subject to the SO2, PM, and/or NOX emission limits under §§60.42b, 60.43b, and 60.44b shall submit to the Administrator the performance test data from the initial performance test and the performance evaluation of the CEMS using the applicable performance specifications in appendix B of this part. The owner or operator of each affected facility described in §60.44b(j) or §60.44b(k) shall submit to the Administrator the maximum heat input capacity data from the demonstration of the maximum heat input capacity of the affected facility.

(c) The owner or operator of each affected facility subject to the NOX standard of §60.44b who seeks to demonstrate compliance with those standards through the monitoring of steam generating unit operating conditions under the provisions of §60.48b(g)(2) shall submit to the Administrator for approval a plan that identifies the operating conditions to be monitored under §60.48b(g)(2) and the records to be maintained under §60.49b(j). This plan shall be submitted to the Administrator for approval within 360 days of the initial startup of the affected facility. If the plan is approved, the owner or operator shall maintain records of predicted nitrogen oxide emission rates and the monitored operating conditions, including steam generating unit load, identified in the plan. The plan shall:

(1) Identify the specific operating conditions to be monitored and the relationship between these operating conditions and NOX emission rates (i.e., ng/J or lbs/MMBtu heat input). Steam generating unit operating conditions include, but are not limited to, the degree of staged combustion (i.e., the ratio of primary air to secondary and/or tertiary air) and the level of excess air (i.e., flue gas O2 level);

(2) Include the data and information that the owner or operator used to identify the relationship between NOX emission rates and these operating conditions; and

(3) Identify how these operating conditions, including steam generating unit load, will be monitored under §60.48b(g) on an hourly basis by the owner or operator during the period of operation of the affected facility; the quality assurance procedures or practices that will be employed to ensure that the data generated by monitoring these operating conditions will be representative and accurate; and the type and format of the records of these operating conditions, including steam generating unit load, that will be maintained by the owner or operator under §60.49b(j).

(d) The owner or operator of an affected facility shall record and maintain records of the amounts of each fuel combusted during each day and calculate the annual capacity factor individually for coal, distillate oil, residual oil, natural gas, wood, and municipal-type solid waste for the reporting period. The annual capacity factor is determined on a 12-month rolling average basis with a new annual capacity factor calculated at the end of each calendar month.

(e) For an affected facility that combusts residual oil and meets the criteria under §§60.46b(e)(4), 60.44b(j), or (k), the owner or operator shall maintain records of the nitrogen content of the residual oil combusted in the affected facility and calculate the average fuel nitrogen content for the reporting period. The nitrogen content shall be determined using ASTM Method D4629 (incorporated by reference, see §60.17), or fuel suppliers. If residual oil blends are being
combusted, fuel nitrogen specifications may be prorated based on the ratio of residual oils of different nitrogen content in the fuel blend.

(f) For facilities subject to the opacity standard under §60.43b, the owner or operator shall maintain records of opacity.

(g) Except as provided under paragraph (p) of this section, the owner or operator of an affected facility subject to the NOX standards under §60.44b shall maintain records of the following information for each steam generating unit operating day:

(1) Calendar date;

(2) The average hourly NOX emission rates (expressed as NO2) (ng/J or lb/MMBtu heat input) measured or predicted;

(3) The 30-day average NOX emission rates (ng/J or lb/MMBtu heat input) calculated at the end of each steam generating unit operating day from the measured or predicted hourly nitrogen oxide emission rates for the preceding 30 steam generating unit operating days;

(4) Identification of the steam generating unit operating days when the calculated 30-day average NOX emission rates are in excess of the NOX emissions standards under §60.44b, with the reasons for such excess emissions as well as a description of corrective actions taken;

(5) Identification of the steam generating unit operating days for which pollutant data have not been obtained, including reasons for not obtaining sufficient data and a description of corrective actions taken;

(6) Identification of the times when emission data have been excluded from the calculation of average emission rates and the reasons for excluding data;

(7) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(8) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(9) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3; and

(10) Results of daily CEMS drift tests and quarterly accuracy assessments as required under appendix F, Procedure 1 of this part.

(h) The owner or operator of any affected facility in any category listed in paragraphs (h)(1) or (2) of this section is required to submit excess emission reports for any excess emissions that occurred during the reporting period.

(1) Any affected facility subject to the opacity standards under §60.43b(e) or to the operating parameter monitoring requirements under §60.13(i)(1).

(2) Any affected facility that is subject to the NOX standard of §60.44b, and that:

(i) Combusts natural gas, distillate oil, or residual oil with a nitrogen content of 0.3 weight percent or less; or
(ii) Has a heat input capacity of 73 MW (250 MMBtu/hr) or less and is required to monitor NOX emissions on a continuous basis under §60.48b(g)(1) or steam generating unit operating conditions under §60.48b(g)(2).

(3) For the purpose of §60.43b, excess emissions are defined as all 6-minute periods during which the average opacity exceeds the opacity standards under §60.43b(f).

(4) For purposes of §60.48b(g)(1), excess emissions are defined as any calculated 30-day rolling average NOx emission rate, as determined under §60.46b(e), that exceeds the applicable emission limits in §60.44b.

(i) The owner or operator of any affected facility subject to the continuous monitoring requirements for NOX under §60.48(b) shall submit reports containing the information recorded under paragraph (g) of this section.

(j) The owner or operator of any affected facility subject to the SO2 standards under §60.42b shall submit reports.

(k) For each affected facility subject to the compliance and performance testing requirements of §60.45b and the reporting requirement in paragraph (j) of this section, the following information shall be reported to the Administrator:

(1) Calendar dates covered in the reporting period;

(2) Each 30-day average SO2 emission rate (ng/J or lb/MMBtu heat input) measured during the reporting period, ending with the last 30-day period; reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(3) Each 30-day average percent reduction in SO2 emissions calculated during the reporting period, ending with the last 30-day period; reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(4) Identification of the steam generating unit operating days that coal or oil was combusted and for which SO2 or diluent (O2 or CO2) data have not been obtained by an approved method for at least 75 percent of the operating hours in the steam generating unit operating day; justification for not obtaining sufficient data; and description of corrective action taken;

(5) Identification of the times when emissions data have been excluded from the calculation of average emission rates; justification for excluding data; and description of corrective action taken if data have been excluded for periods other than those during which coal or oil were not combusted in the steam generating unit;

(6) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(7) Identification of times when hourly averages have been obtained based on manual sampling methods;

(8) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(9) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3;

(10) Results of daily CEMS drift tests and quarterly accuracy assessments as required under appendix F, Procedure 1 of this part; and
(11) The annual capacity factor of each fired as provided under paragraph (d) of this section.

(1) For each affected facility subject to the compliance and performance testing requirements of §60.45b(d) and the reporting requirements of paragraph (j) of this section, the following information shall be reported to the Administrator:

(1) Calendar dates when the facility was in operation during the reporting period;

(2) The 24-hour average SO2 emission rate measured for each steam generating unit operating day during the reporting period that coal or oil was combusted, ending in the last 24-hour period in the quarter, reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(3) Identification of the steam generating unit operating days that coal or oil was combusted for which SO2 or diluent (O2 or CO2) data have not been obtained by an approved method for at least 75 percent of the operating hours; justification for not obtaining sufficient data; and description of corrective action taken;

(4) Identification of the times when emissions data have been excluded from the calculation of average emission rates; justification for excluding data; and description of corrective action taken if data have been excluded for periods other than those during which coal or oil were not combusted in the steam generating unit;

(5) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(6) Identification of times when hourly averages have been obtained based on manual sampling methods;

(7) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(8) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3; and

(9) Results of daily CEMS drift tests and quarterly accuracy assessments as required under Procedure 1 of appendix F.1 of this part. If the owner or operator elects to implement the alternative data assessment procedures described in §§60.47b(e)(4)(i) through (e)(4)(iii), each data assessment report shall include a summary of the results of all of the RATAs, linearity checks, CGAs, and calibration error or drift assessments required by §§60.47b(e)(4)(i) through (e)(4)(iii).

(m) For each affected facility subject to the SO2 standards under §60.42(b) for which the minimum amount of data required under §60.47b(f) were not obtained during the reporting period, the following information is reported to the Administrator in addition to that required under paragraph (k) of this section:

(1) The number of hourly averages available for outlet emission rates and inlet emission rates;

(2) The standard deviation of hourly averages for outlet emission rates and inlet emission rates, as determined in Method 19 of appendix A of this part, section 7;

(3) The lower confidence limit for the mean outlet emission rate and the upper confidence limit for the mean inlet emission rate, as calculated in Method 19 of appendix A of this part, section 7; and
(4) The ratio of the lower confidence limit for the mean outlet emission rate and the allowable emission rate, as determined in Method 19 of appendix A of this part, section 7.

(n) If a percent removal efficiency by fuel pretreatment (i.e., \(\%R_f\)) is used to determine the overall percent reduction (i.e., \(\%R_o\)) under §60.45b, the owner or operator of the affected facility shall submit a signed statement with the report:

(1) Indicating what removal efficiency by fuel pretreatment (i.e., \(\%R_f\)) was credited during the reporting period;

(2) Listing the quantity, heat content, and date each pretreated fuel shipment was received during the reporting period, the name and location of the fuel pretreatment facility, and the total quantity and total heat content of all fuels received at the affected facility during the reporting period;

(3) Documenting the transport of the fuel from the fuel pretreatment facility to the steam generating unit; and

(4) Including a signed statement from the owner or operator of the fuel pretreatment facility certifying that the percent removal efficiency achieved by fuel pretreatment was determined in accordance with the provisions of Method 19 of appendix A of this part and listing the heat content and sulfur content of each fuel before and after fuel pretreatment.

(o) All records required under this section shall be maintained by the owner or operator of the affected facility for a period of 2 years following the date of such record.

(p) The owner or operator of an affected facility described in §60.44b(j) or (k) shall maintain records of the following information for each steam generating unit operating day:

(1) Calendar date;

(2) The number of hours of operation; and

(3) A record of the hourly steam load.

(q) The owner or operator of an affected facility described in §60.44b(j) or §60.44b(k) shall submit to the Administrator a report containing:

(1) The annual capacity factor over the previous 12 months;

(2) The average fuel nitrogen content during the reporting period, if residual oil was fired; and

(3) If the affected facility meets the criteria described in §60.44b(j), the results of any NOX emission tests required during the reporting period, the hours of operation during the reporting period, and the hours of operation since the last NOX emission test.

(r) The owner or operator of an affected facility who elects to use the fuel based compliance alternatives in §60.42b or §60.43b shall either:

(1) The owner or operator of an affected facility who elects to demonstrate that the affected facility combusts only very low sulfur oil under §60.42b(j)(2) or §60.42b(k)(2) shall obtain and maintain at the affected facility fuel receipts from the fuel supplier that certify that the oil meets the definition of distillate oil as defined in §60.41b and the applicable sulfur limit. For the purposes of this section, the distillate oil need not meet the fuel nitrogen content specification in the definition of distillate oil. Reports shall be submitted to the Administrator certifying that only very low sulfur
oil meeting this definition and/or pipeline quality natural gas was combusted in the affected facility during the reporting period; or

(2) The owner or operator of an affected facility who elects to demonstrate compliance based on fuel analysis in §60.42b or §60.43b shall develop and submit a site-specific fuel analysis plan to the Administrator for review and approval no later than 60 days before the date you intend to demonstrate compliance. Each fuel analysis plan shall include a minimum initial requirement of weekly testing and each analysis report shall contain, at a minimum, the following information:

(i) The potential sulfur emissions rate of the representative fuel mixture in ng/J heat input;

(ii) The method used to determine the potential sulfur emissions rate of each constituent of the mixture. For distillate oil and natural gas a fuel receipt or tariff sheet is acceptable;

(iii) The ratio of different fuels in the mixture; and

(iv) The owner or operator can petition the Administrator to approve monthly or quarterly sampling in place of weekly sampling.

(s) Facility specific NOX standard for Cytec Industries Fortier Plant’s C.AOG incinerator located in Westwego, Louisiana:

(1) Definitions.

Oxidation zone is defined as the portion of the C.AOG incinerator that extends from the inlet of the oxidizing zone combustion air to the outlet gas stack.

Reducing zone is defined as the portion of the C.AOG incinerator that extends from the burner section to the inlet of the oxidizing zone combustion air.

Total inlet air is defined as the total amount of air introduced into the C.AOG incinerator for combustion of natural gas and chemical by-product waste and is equal to the sum of the air flow into the reducing zone and the air flow into the oxidation zone.

(2) Standard for nitrogen oxides. (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When natural gas and chemical by-product waste are simultaneously combusted, the NOX emission limit is 289 ng/J (0.67 lb/MMBtu) and a maximum of 81 percent of the total inlet air provided for combustion shall be provided to the reducing zone of the C.AOG incinerator.

(3) Emission monitoring. (i) The percent of total inlet air provided to the reducing zone shall be determined at least every 15 minutes by measuring the air flow of all the air entering the reducing zone and the air flow of all the air entering the oxidation zone, and compliance with the percentage of total inlet air that is provided to the reducing zone shall be determined on a 3-hour average basis.

(ii) The NOX emission limit shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b(i).

(iii) The monitoring of the NOX emission limit shall be performed in accordance with §60.48b.

(4) Reporting and recordkeeping requirements. (i) The owner or operator of the C.AOG incinerator shall submit a report on any excursions from the limits required by paragraph (a)(2) of this section to the Administrator with the quarterly report required by paragraph (i) of this section.

(ii) The owner or operator of the C.AOG incinerator shall keep records of the monitoring required by paragraph (a)(3) of this section for a period of 2 years following the date of such record.
(iii) The owner of operator of the C.AOG incinerator shall perform all the applicable reporting and recordkeeping requirements of this section.

(1) Facility-specific NOx standard for Rohm and Haas Kentucky Incorporated’s Boiler No. 100 located in Louisville, Kentucky:

(1) Definitions—
Air ratio control damper is defined as the part of the low NOX burner that is adjusted to control the split of total combustion air delivered to the reducing and oxidation portions of the combustion flame.
Flue gas recirculation line is defined as the part of Boiler No. 100 that recirculates a portion of the boiler flue gas back into the combustion air.

(2) Standard for nitrogen oxides—(i) When fossil fuel alone is combusted, the NOx emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical by-product waste are simultaneously combusted, the NOx emission limit is 473 ng/J (1.1 lb/MMBtu), and the air ratio control damper tee handle shall be at a minimum of 5 inches (12.7 centimeters) out of the boiler, and the flue gas recirculation line shall be operated at a minimum of 10 percent open as indicated by its valve opening position indicator.

(3) Emission monitoring for nitrogen oxides—(i) The air ratio control damper tee handle setting and the flue gas recirculation line valve opening position indicator setting shall be recorded during each 8-hour operating shift.

(ii) The NOx emission limit shall be determined by the compliance and performance test methods and procedures for NOx in §60.46b.

(iii) The monitoring of the NOx emission limit shall be performed in accordance with §60.48b.

(4) Reporting and recordkeeping requirements—(i) The owner or operator of Boiler No. 100 shall submit a report on any excursions from the limits required by paragraph (b)(2) of this section to the Administrator with the quarterly report required by §60.49b(i).

(ii) The owner or operator of Boiler No. 100 shall keep records of the monitoring required by paragraph (b)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner of operator of Boiler No. 100 shall perform all the applicable reporting and recordkeeping requirements of §60.49b.

(u) Site-specific standard for Merck & Co., Inc.’s Stonewall Plant in Elkton, Virginia—(1) This paragraph (u) applies only to the pharmaceutical manufacturing facility, commonly referred to as the Stonewall Plant, located at Route 340 South, in Elkton, Virginia (“site”) and only to the natural gas-fired boilers installed as part of the powerhouse conversion required pursuant to 40 CFR 52.2454(g). The requirements of this paragraph shall apply, and the requirements of §§60.40b through 60.49b(f) shall not apply, to the natural gas-fired boilers installed pursuant to 40 CFR 52.2454(g).

(i) The site shall equip the natural gas-fired boilers with low NOx technology.

(ii) The site shall install, calibrate, maintain, and operate a continuous monitoring and recording system for measuring NOx emissions discharged to the atmosphere and opacity using a continuous emissions monitoring system or a predictive emissions monitoring system.
(iii) Within 180 days of the completion of the powerhouse conversion, as required by 40 CFR §22454, the site shall perform a performance test to quantify criteria pollutant emissions.

(2) [Reserved]

(v) The owner or operator of an affected facility may submit electronic quarterly reports for SO2 and/or NOX and/or opacity in lieu of submitting the written reports required under paragraphs (h), (i), (j), (k) or (l) of this section. The format of each quarterly electronic report shall be coordinated with the permitting authority. The electronic report(s) shall be submitted no later than 30 days after the end of the calendar quarter and shall be accompanied by a certification statement from the owner or operator, indicating whether compliance with the applicable emission standards and minimum data requirements of this subpart was achieved during the reporting period. Before submitting reports in the electronic format, the owner or operator shall coordinate with the permitting authority to obtain their agreement to submit reports in this alternative format.

(w) The reporting period for the reports required under this subpart is each 6 month period. All reports shall be submitted to the Administrator and shall be postmarked by the 30th day following the end of the reporting period.

(x) Facility-specific NOX standard for Weyerhaeuser Company’s No. 2 Power Boiler located in New Bern, North Carolina:

(1) Standard for nitrogen oxides - (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical by-product waste are simultaneously combusted, the NOX emission limit is 215 ng/J (0.5 lb/MMBtu).

(2) Emission monitoring for nitrogen oxides - (i) The NOX emissions shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b.

(ii) The monitoring of the NOX emissions shall be performed in accordance with §60.48b.

(3) Reporting and recordkeeping requirements - (i) The owner or operator of the No. 2 Power Boiler shall submit a report on any excursions from the limits required by paragraph (x)(2) of this section to the Administrator with the quarterly report required by §60.49b(i).

(ii) The owner or operator of the No. 2 Power Boiler shall keep records of the monitoring required by paragraph (x)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner or operator of the No. 2 Power Boiler shall perform all the applicable reporting and recordkeeping requirements of §60.49b.

(y) Facility-specific NOX standard for INEOS USA’s AOGI located in Lima, Ohio:

(1) Standard for NOX - (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical byproduct/waste are simultaneously combusted, the NOX emission limit is 645 ng/J (1.5 lb/MMBtu).

(2) Emission monitoring for NOX - (i) The NOX emissions shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b.

(ii) The monitoring of the NOX emissions shall be performed in accordance with §60.48b.
(3) Reporting and recordkeeping requirements. (i) The owner or operator of the AOGI shall submit a report on any excursions from the limits required by paragraph (y)(2) of this section to the Administrator with the quarterly report required by paragraph (i) of this section.

(ii) The owner or operator of the AOGI shall keep records of the monitoring required by paragraph (y)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner or operator of the AOGI shall perform all the applicable reporting and recordkeeping requirements of this section.

Section E.23

§ 60.4207 What fuel requirements must I meet if I am an owner or operator of a stationary CI internal combustion engine subject to this subpart?

(a) Beginning October 1, 2007, owners and operators of stationary CI ICE subject to this subpart that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(a).

(b) Beginning October 1, 2010, owners and operators of stationary CI ICE subject to this subpart with a displacement of less than 30 liters per cylinder that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(b) for nonroad diesel fuel.

(c) Owners and operators of pre-2011 model year stationary CI ICE subject to this subpart may petition the Administrator for approval to use remaining non-compliant fuel that does not meet the fuel requirements of paragraphs (a) and (b) of this section beyond the dates required for the purpose of using up existing fuel inventories. If approved, the petition will be valid for a period of up to 6 months. If additional time is needed, the owner or operator is required to submit a new petition to the Administrator.

(d) Owners and operators of pre-2011 model year stationary CI ICE subject to this subpart that are located in areas of Alaska not accessible by the Federal Aid Highway System may petition the Administrator for approval to use any fuels mixed with used lubricating oil that do not meet the fuel requirements of paragraphs (a) and (b) of this section. Owners and operators must demonstrate in their petition to the Administrator that there is no other place to use the lubricating oil. If approved, the petition will be valid for a period of up to 6 months. If additional time is needed, the owner or operator is required to submit a new petition to the Administrator.

(e) Stationary CI ICE that have a national security exemption under §60.4200(d) are also exempt from the fuel requirements in this section.

Section E.24:

§ 63.2334  Am I subject to this subpart?
(a) Except as provided for in paragraphs (b) and (c) of this section, you are subject to this subpart if you own or operate an OLD operation that is located at, or is part of, a major source of HAP emissions. An OLD operation may occupy an entire plant site or be collocated with other industrial (e.g., manufacturing) operations at the same plant site.
(b) Organic liquid distribution operations located at research and development facilities, consistent with section 112(c)(7) of the Clean Air Act (CAA), are not subject to this subpart.
(c) Organic liquid distribution operations do not include the activities and equipment, including product loading racks, used to process, store, or transfer organic liquids at facilities listed in paragraph (c) (1) and (2) of this section.

(1) Oil and natural gas production field facilities, as the term “facility” is defined in §63.761 of subpart HH.

(2) Natural gas transmission and storage facilities, as the term “facility” is defined in §63.1271 of subpart HHH.

§ 63.2342 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source, you must comply with this subpart according to the schedule identified in paragraph (a)(1), (a)(2), or (a)(3) of this section, as applicable.

(1)(i) Except as provided in paragraph (a)(1)(ii) of this section, if you startup your new affected source on or before February 3, 2004 or if you reconstruct your affected source on or before February 3, 2004, you must comply with the emission limitations, operating limits, and work practice standards for new and reconstructed sources in this subpart no later than February 3, 2004.

(ii) For any emission source listed in paragraph §63.2338(b) at an affected source that commenced construction or reconstruction after April 2, 2002, but before February 3, 2004, that is required to be controlled based on the applicability criteria in this subpart, but:

(A) Would not have been required to be controlled based on the applicability criteria as proposed for this subpart, you must comply with the emission limitations, operating limits, and work practice standards for each such emission source based on the schedule found in paragraph (b) of this section or at startup, whichever is later; or

(B) Would have been subject to a less stringent degree of control requirement as proposed for this subpart, you must comply with the emission limitations, operating limits, and work practice standards in this subpart for each such emission source based on the schedule found in paragraph (b) of this section or at startup, whichever is later, and if you start up your affected new or reconstructed source before February 5, 2007, you must comply with the emission limitations, operating limits, and work practice standards in this subpart for each such emission source as proposed for this subpart, until you are required to comply with the emission limitations, operating limits, and work practice standards in this subpart for each such emission source based on the schedule found in paragraph (b) of this section.

(c) If you have an area source that does not commence reconstruction but increases its emissions or its potential to emit such that it becomes a major source of HAP emissions and an existing affected source subject to this subpart, you must be in compliance by 3 years after the area source becomes a major source.

(d) You must meet the notification requirements in §§63.2343 and 63.2382(a), as applicable, according to the schedules in §63.2382(a) and (b)(1) through (3) and in subpart A of this part. Some of these notifications must be submitted before the compliance dates for the emission limitations, operating limits, and work practice standards in this subpart.

Section E.26:
§ 60.480a   Applicability and designation of affected facility.

(a)(1) The provisions of this subpart apply to affected facilities in the synthetic organic chemicals manufacturing industry.

(2) The group of all equipment (defined in §60.481a) within a process unit is an affected facility.

(b) Any affected facility under paragraph (a) of this section that commences construction, reconstruction, or modification after November 7, 2006, shall be subject to the requirements of this subpart.

(c) Addition or replacement of equipment for the purpose of process improvement which is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(d)(1) If an owner or operator applies for one or more of the exemptions in this paragraph, then the owner or operator shall maintain records as required in §60.486a(i).

(2) Any affected facility that has the design capacity to produce less than 1,000 Mg/yr (1,102 ton/yr) of a chemical listed in §60.489 is exempt from §§60.482–1a through 60.482–11a.

(3) If an affected facility produces heavy liquid chemicals only from heavy liquid feed or raw materials, then it is exempt from §§60.482–1a through 60.482–11a.

(4) Any affected facility that produces beverage alcohol is exempt from §§60.482–1a through 60.482–11a.

(5) Any affected facility that has no equipment in volatile organic compounds (VOC) service is exempt from §§60.482–1a through 60.482–11a.

EPA Comment No. 5:

Some of the specific unit name descriptions provided in the draft permits vary from the unit names used in regulations included in the current SIP as well as the recently submitted SIP revision. For clarity, IDEM should cross-reference the SIP and permit unit descriptions where the two differ.

Response:

IDEM has cross-referenced the SIP and the permit unit descriptions and added clarifications to the descriptions of emissions units subject to the SIP as appropriate (for example, in Condition D.1.1.1, the No. 11 pipe still which includes both 11A and 11C pipe stills have been identified as "No. 11 pipe still (including nos. 11A and 11C pipe still)" for clarification purposes.

EPA Comment No. 6:

On January 25, 2007, and November 29, 2007, EPA issued separate Notices of Violation (NOVs) to BP. In some instances, the violations alleged in EPA's NOVs also constitute alleged violations of the Consent Decree between the United States, et al., and BP entered on August 29, 2001. Because BP is allegedly not in compliance with all applicable Clean Air Act requirements, IDEM cannot issue a Title V permit to BP that serves as a shield to alleged violations. IDEM must include language appropriately limiting the application of the permit shield set out in 42 U.S.C. Section 7661(c)(f) and 40 CFR Part
70.6. EPA will continue to seek resolution of all violations. Our review of BP’s draft permit and any enforcement actions are necessarily separate matters, and EPA may take actions as appropriate.

Response:

IDEM received the BP OCC project application on November 1, 2007 and a completeness determination regarding the application was made by IDEM on November 19, 2007, ten days prior to the violations identified in the November 29, 2007 Notice of Violation issued by the U.S. EPA to BP.

The alleged violations of the sulfur dioxide and reduced sulfur compound emission limits at the sulfur recovery plant were intermittent and BP contends were the result of malfunctions and occurred prior to the effective date of BP’s initial Title V permit which was January 1, 2007. The OCC project includes the installation of redundant equipment which will automatically address the prior malfunction problems that led to the alleged violations at the sulfur recovery plant. This redundant equipment should also address any potential exceedance of the hydrogen sulfide limit due to flaring. Because the past alleged violations were intermittent and because the cause of these emission limit exceedances will be addressed by the OCC project, IDEM contends that a schedule of compliance is not necessary for the past alleged violations of sulfur dioxide and reduced sulfur compounds limit. Further, the U.S. EPA is not prohibited from pursuing civil enforcement concerning these alleged past violations because they are not included within the permit shield provisions of the Title V permit.

The alleged violations for failure to conduct performance testing and submit results pursuant to the Refinery MACT II concern timing issues. BP has completed performance testing and submitted results of its HCl emissions from Ultraformers 3 and 4 as required by the Refinery MACT II therefore a compliance schedule is not indicated. Also, the U.S. EPA is not prohibited from pursuing civil enforcement concerning the alleged past violation of the Refinery MACT II because it is not included within the permit shield provision of the Title V permit.

IDEM has developed and U.S. EPA Region V has approved placeholder language that effectively serves the purpose of a compliance schedule as contemplated by Title V of the Clean Air Act. This language has been used in Title V permits previously when major New Source Review violation allegations have not been resolved to the point where a meaningful compliance schedule can be established and inserted into the Title V permit. For the record, IDEM would point out that it disagrees with and is not bound by the position taken by the United States Second Circuit Court of Appeals in *NYPIRG v. Johnson* that it is reasonable to require that a traditional compliance schedule be placed in a Title V permit prior to an adjudication or settlement in cases involving major New Source Review allegations because of the myriad economic and technical decisions involved in establishing a remedy if one is indicated. The placeholder language will address the concerns that were actually contemplated by the Title V compliance schedule requirement, that is, to fulfill the reason that Congress created the Title V program: "To allow the public and government officials to know whether facilities covered by the program are complying with Clean Air Act-based air pollution limitations and standards." See January 18, 2000 letter to Carol Browner, U.S. EPA Administrator from various national and regional organizations, [http://www.titlev.org/News%20Release/SignOn70.pdf](http://www.titlev.org/News%20Release/SignOn70.pdf)

If it is determined that major New Source Review violations have occurred then IDEM will reopen and revise the permit to include BACT, LAER, NSPS or NESHAP emission limits and milestones for achieving compliance. In the mean time the BP permit language will make clear that no permit shield will attach to the units with alleged NSPS or major New Source Review violations. As a result of this comment and in keeping with IDEM the following condition has been modified as follows:
B.12 Permit Shield [326 IAC 2-7-15] [326 IAC 2-7-20] [326 IAC 2-7-12]

(a) Pursuant to 326 IAC 2-7-15, the Permittee has been granted a permit shield. The permit shield provides, except as otherwise specified in this Section (B.12 - Permit Shield), that compliance with the conditions of this permit shall be deemed compliance with any applicable requirements as of the effective date of the permit, provided that either the applicable requirements are included and specifically identified in this permit or the permit contains an explicit determination or concise summary of a determination that other specifically identified requirements are not applicable. The Indiana statutes from IC 13 and rules from 326 IAC, referenced in conditions in this permit, are those applicable at the time the permit was issued. The issuance or possession of this permit shall not alone constitute a defense against an alleged violation of any law, regulation or standard, except for the requirement to obtain a Part 70 permit under 326 IAC 2-7 or for applicable requirements for which a permit shield has been granted.

This permit shield does not extend to applicable requirements which are promulgated after the date of issuance of this permit unless this permit has been modified to reflect such new requirements.

(h) On January 25, 2007 and November 29, 2007 the U.S. EPA issued Notices of Violation (NOV) to the Permittee for allegedly failing to comply with the provisions set out in 326 IAC 2 and the Clean Air Act, including the Prevention of Significant Deterioration and the nonattainment New Source Review programs, the federal New Source Performance Standards (NSPS), and the National Emission Standards for Hazardous Air Pollutants. In addition, the Notices of Violation issued by U.S. EPA allege violations of the Consent Decree between the United States, et al., and BP entered on August 29, 2001, and amendments thereto. Therefore the Permit Shield in Section B - Permit Shield does not shield the Permittee from possible enforcement actions initiated by U.S. EPA, IDEM or citizens. Compliance with the terms of this permit does not serve as proof of compliance for the emission units or the matters addressed in the NOVs. Following resolution of this enforcement action, IDEM will reopen this permit, if necessary, to incorporate a compliance schedule or any new applicable requirements. The standard language of Section B - Permit Shield does not shield any activity on which the permit is silent.

---

IDEM, OAQ Changes

IDEM Change No. 1:

Upon further review, IDEM, OAQ has determined that the NOx emissions from FCU 500 and FCU 600 should be calculated based on NO2 instead of NOx in the following equation used in Appendix C of the Technical Support Document:

\[
\text{NOx emissions [tpy]} = \text{coke burn rate [1000 lb coke/yr]} \times \frac{\text{NOx concentration [ppm @ 0% O2]} \times 11.6 \text{ [lb flue gas per lb coke burned]} \times \text{Molecular Weight of NOx [lb/lb-mole]} / 31 \times \text{Molecular Weight of flue gas in lb/lb-mole}} {2000 \text{ [lb/ton]}}
\]
Using the molecular weight of NO₂ (i.e., 46 lb/lb-mole) in this equation, changes to the estimate of baseline and future project emissions would occur for NOx emissions for FCU 500 and FCU 600. BP has proposed a NOx future allowable emissions limitation for FCU 500 of 228.6 tpy NOx using a lower NOx concentration of 39.7 ppm instead of 40 ppm included in the original calculations. The NOx future allowable emissions limitation for FCU 600 has also been updated to 73.8 based on the updated methodology. The updated tables are included as Appendix C and E of this Addendum to the Technical Support Document.

Conditions D.21.3 and D.22.3 have been updated as follows:

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for FCU 500 after the start-up of the new Coker (#2 Coker):

(a) The emissions of NOx shall not exceed 228.6 tons per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of VOC shall not exceed 3.3 pounds per 1000 barrels of fresh feed used per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of SO₂ shall not exceed 200.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of PM and PM-10 shall not exceed 0.465 pounds per 1000 pounds of coke burned at FCU 500 per 12 consecutive month period, with compliance determined at the end of each month.

(e) The emissions of CO shall not exceed 147.2 tons per 12 consecutive month period, with compliance determined at the end of each month.

(f) The fresh feed used at FCU 500 shall not exceed 37.6 million barrels per 12 consecutive month period, with compliance determined at the end of each month.

(g) The coke burned at FCU 500 shall not exceed 669,191,000 pounds per 12 consecutive month period, with compliance determined at the end of each month.

(h) The FCU 500 blowdown stack shall be permanently shutdown and the pressure relief discharges that were routed to the blowdown stack will be routed to the VRU flare.

Compliance with the FCU 500 throughput limits and the NOx, VOC, SO₂, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, CO, SO₂, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for FCU 600:
After the startup of the New Coker (#2 Coker), the Permittee shall comply with the following:

(a) The emissions of NOx shall not exceed 73.8 tons per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of VOC shall not exceed 3.3 pounds per 1000 barrels of fresh feed used per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of SO2 shall not exceed 190.0 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of PM and PM-10 shall not exceed 0.35 pounds per 1000 pounds of coke burned at FCU 600 per 12 consecutive month period, with compliance determined at the end of each month.

(e) The emissions of CO shall not exceed 92.1 tons per 12 consecutive month period, with compliance determined at the end of each month.

(f) The fresh feed used at FCU 600 shall not exceed 24.09 million barrels per 12 consecutive month period, with compliance determined at the end of each month.

(g) The coke burned at FCU 600 shall not exceed 428,802,000 pounds per 12 consecutive month period, with compliance determined at the end of each month.

(h) The FCU 600 blowdown stack shall be permanently shutdown and with the exhaust routed to the FCU stack.

Compliance with the FCU 600 throughput limits and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

IDEM Change No. 2:

Throughout the permit there are units affected by the CXHO project that will be subject to new emission limitations. These limits are necessary to ensure that the net emission increases or decreases remain below the significant levels under PSD, EO, and nonattainment NSR. For these affected units, which are not new or modified, the limits will be effective upon issuance of the Significant Permit Modification (SM No. 089-25488-00453). To ensure that this is clear to BP and the public, IDEM has amended conditions D.9.3, D.10.3, D.11.3, D.16.3, D.17.3, D.18.3, D.19.3, and D.20.3 to reflect the effective date of these limits.

IDEM Change No. 3:

Throughout the permit there are references to the phased netting approach originally proposed for this project. With the inclusion of section D.0, which requires monitoring and recordkeeping to ensure that the project remains below the significant levels for PSD, EO, and nonattainment NSR, these references are no longer necessary for each D section. Therefore, the phrase “at each stage of the phased construction of the CXHO project” has been removed from these D sections.
BP Products North America, Inc. - Whiting Business Unit

Whiting, Indiana  TSD Addendum  Permit Reviewer: Madhurima D. Moulik, Ph.D.

SSM No. 089-25484-00453  SPM No. 089-25488-00453

Comments from BP Products North America, Inc. - Whiting Business Unit

OAQ received comments from BP Products North America, Inc. - Whiting Business Unit, Whiting, Indiana. The summary of the comments and IDEM, OAQ responses, including changes to the permit (language deleted is shown in strikeout and language added is shown in bold) are as follows:

BP comment 1:

Some of the emission unit descriptions in the D sections do not match the descriptions in Section A.2 of the permit.

Response:

Section A.3 has been modified to update the unit descriptions as follows:

A.3 Emission Units and Pollution Control Equipment Summary [326 IAC 2-7-4(c)(3)] [326 IAC 2-7-5(15)]

This stationary source consists of the following emission units and pollution control devices:

(a) Nos. 11A and 11C Pipe Stills built in 1956, with a rated capacity of 220,800 barrels per day, and identified as Unit ID 120 process crude into various hydrocarbon fractions based on boiling points. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) ... (7)

(8) No. 11A PS and No. 11C PS WARP, permitted in 2008, to replace the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C, with the exhaust being re-routed to the DDU flare. As part of the No. 11A PS and No. 11C PS WARP, per SPM 089-25488-00453, the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C will be shutdown, with the emergency pressure relief discharge that was previously routed to the blowdown stacks being re-routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COVs.

(b) No. 11B Coker, which processes heavy crude fractions into coke, and Coke Pile. These facilities are identified as Unit 120 and are rated at 2,000 tons of coke per day. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Four (4) process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-101</td>
<td>200 (total)</td>
<td>120-04</td>
<td>None</td>
</tr>
<tr>
<td>H-102</td>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>H-104</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
(2) Storage and handling of the bulk material. Fugitive emissions are controlled by keeping the coke wetted and having a 15’ sheet piling wall surrounding the coke pile. The coke pile height will not exceed 15’.

(3) The No. 11B Coker is connected to the DDU flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) Leaks from process equipment, including pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges and other connectors.

(Note: The No. 11B Coker and Coke Handling System Pile, heaters H-101, H-102, H-103, and H-104 will be replaced by the New Coker (#2 Coker) and Coke Pile and heaters H-201, H-202, and H-203 as part of the CXHO project, identified later in this section).

New Coker (#2 Coker), constructed as part of CXHO project, which processes heavy crude fractions into coke, and new Coke Handling System. These facilities are identified as Unit 800 and are rated at 6,000 tons of coke per day. The New Coker (#2 Coker) heaters H-201, H-202, and H-203 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New Coker (#2 Coker) heater stacks have continuous emissions monitors (CEMS) for NOx and CO. The existing Coker and Coke Pile will be replaced as part of the CXHO Project. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted to</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>

<td>800-03</td>
<td>Low-NOx burners and selective catalytic reduction</td>
</tr>
</tbody>
</table>

(2) Storage and handling (including transfer points 1 through 10) of the bulk material comprised of a partially enclosed crusher, enclosed conveyors, enclosed storage, day bins, and rail car load out. In order to minimize fugitive emissions from the coke handling process, transfer points 1 and 10 will include enclosed conveyors and transfer points 2 through 9 will use enclosed buildings, and all transfer points are controlled by water sprays. Storage and handling (including up to 10 transfer points) of the bulk material comprised of a partially enclosed crusher, enclosed conveyors, enclosed storage, day bins, and rail car load out under the main operating scenario. In order to minimize fugitive emissions from the coke handling process, transfer points 1 and 10 will include enclosed conveyors and transfer points 2 through 9 will use enclosed buildings, and water sprays. Coke handling operations will be expected to operate under this main operating scenario for at least 95% of operating hours annually. There will also be an alternative operating scenario which will consist of three enclosed conveyors with unenclosed transfer points. Coke
handling operations are expected to operate under this alternate operating scenario for no more than 5% of operating hours annually.

(3) The Coker is connected to the South flare system (included in Section D.35). The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) One (1) storage tank, identified as TK-6255, with a maximum storage capacity of 14,028,000 gallons storing coker resid at a vapor pressure less than 0.5 psia. Tank TK-6255 is equipped with a fixed roof.

(5) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

c) No. 12 Pipe Still, constructed in 1959 and to be modified as part of the CXHO Project, which processes crude into various hydrocarbon fractions based on boiling points, identified as Unit ID 130, and is rated at 336,000 barrels per day. Heaters identified as H-1AN, H-1AS, H-1B, H-2, H-1CN, H-1CS, and H-1CX will be shutdown and replaced by heaters H-101A, H-101B, and H-102 as part of the CXHO project. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following process heaters, all of which are fired by natural gas, refinery gas, or liquified petroleum gas:

a No longer in service -- was rated at 120 MMBtu/hour.

b No longer in service -- was exhausted to stack 130-03.
The Sulfur Recovery Unit (SRU) Facility, identified as Unit ID 162, originally constructed in 1971 and expanded in 1981 and 1995, and rated at 600 long tons per day, to be modified as part of the CXHO Project, increasing the capacity to 1,300 long tons per day of sulfur. The facility includes the following and may also include insignificant activities listed in Section A.4 of this permit:

(1) ... (11)

(12) One (1) modular degassing unit, which removes gases that are emitted during the cooling of molten sulfur. Removed gases are vented to the SBS TGU. Removed gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

(13) Two (2) modular degassing units, to be installed as part of the CXHO project, which remove gases that are emitted during the cooling of molten sulfur. The gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

(14) Three (3) sulfur pits, (Sulfur Pits A, B, and C) used to store molten sulfur with their vent stacks routed to the B/S TGU and/or the SBS. As part of the CXHO project, the vents from the sulfur pits A, B and C will be routed to either COT1 and/or COT2.

(15) Two (2) sulfur pits (Sulfur Pits D and E), to be installed as part of the CXHO project, used to store molten sulfur and the vents routed to either COT1 and/or COT2.

(16) One (1) sour water storage tank, identified as TK-431, having a maximum storage capacity of 845,600 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

(17) One (1) sour water storage tank, identified as TK-410, permitted in 2006, having a maximum storage capacity of 4,351,200 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

(18) Two (2) Claus Offgas Treaters (COT), identified as COT1 and COT2, to be installed as part of the CXHO project, thermal oxidation systems which combust natural gas, each rated at 72 mmBTU/hr, exhausting at stacks S/V 162-06 and 162-07.

(19) Two (2) sulfur storage tanks, identified as SH-1 and SH-2, each with a maximum storage capacity of 1,008,000 gallons and used to store molten sulfur exhausting to stacks S/V 163-09 and 162-10. These tanks will be constructed as part of the CXHO Project and are both fixed roof tanks controlled by a caustic scrubber.

(1) Vapor Recovery Unit 100 (VRU-100) identified as Unit ID 241, and Vapor Recovery Unit 200 (VRU-200) identified as Unit ID 231, permitted for turnaround (SPM 089-25488-00453), to repair or replace tower trays and increase existing pumping and cooling capacities. Gasoline and lighter products from the FCUs are separated in the VRUs using a series of distillation towers. The VRUs are connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions
during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes leaks from process equipment including one (1) compressor (identified as J-3E located at VRU-100), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system. The facility may also include insignificant activities listed in Section A.4 of this permit.

(2) As part of the VRU 100/200 Whiting Atmospheric Relief Project (WARP), per SPM 089-25488-00453, the pressure relief discharges that vented to the existing VRU 100/200 vent stack are being re-routed to the VRU flare.

(f) (A) The Vapor Recovery Unit 300 (VRU 300), identified as Unit ID 150. Light ends and naphtha are separated in the VRU using a series of distillation towers. This unit is connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

(1) One (1) off-gas knock out drum (D-400) which exhausts to flare stack S/V 241-01.

(2) Leaks from process equipment, including two (2) compressors (identified as K-340 and K-351), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation system.

(B) Vapor Recovery Unit VRU 400 for the New Coker (#2 Coker), to be installed as part of the CXHO Project.

(o) The No.3 Ultraformer Unit (No. 3 UF), identified as Unit ID 220, commissioned in 1958. The majority of the unit was shutdown in March 2007, including the H-1, H-2 and F-7 heaters, catalyst filled reactors and the internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process. The unit consists of the C-2 Splitter Tower, the D-18 flare gas separator, D-24 knock-out drum and associated piping, used to upgrade low octane naphtha to gasoline blending material and chemical feedstocks. The reforming section consists of a series of process furnaces and catalyst filled reactors in which the naphtha is heated and converted from straight chain to aromatic compounds. The reactor products are separated by distillation for further processing or blending into gasoline. The No. 3 Ultraformer is connected to flare stack S/V 220-04, the UIU flare, to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance and reactor regenerations. The No. 3 Ultraformer includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit.

(1) Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

</table>

- Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:
The No. 3 Ultraformer, consisting of emission units listed in (1) through (5) will be shut down as part of the CXHO project.

(p) The No.4 Ultraformer Unit (no. 4 UF), identified as Unit ID 224, built in 1972, upgrades low-octane naphtha to gasoline blending material and chemical feedstocks. The front-end of the unit is a desulfurization section. The reforming section consists of a series of process furnaces and catalyst-filled reactors in which the naphtha is heated and converted from straight chain to aromatic compounds. The reactor products are separated by distillation for further processing or blending into gasoline. A new reactor will be installed as part of the CXHO project. The No. 4 Ultraformer includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:

(u) The Fluidized Catalytic Cracking Unit (FCU) 500, constructed in 1945, identified as Unit ID 230 and rated at 115,000 barrels per day. This facility converts hydrocarbons that boil above 500 °F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 500 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:
(5) The FCU 500 WARP, permitted in 2008, to replace the existing FCU 500 blowdown stack, with the exhaust re-routed to the VRU flare. As part of the FCU 500 WARP, per SPM 089-25488-00453, the FCU 500 blowdown stack will be shutdown and the pressure relief discharges that vent to the blowdown stack will be re-routed to the VRU flare.

(6) The FCU 500 turnaround (TAR) project, per SPM 089-25488-00453 permitted in 2008, for the repair or replacement of the power recovery turbine, and the air ring for the catalyst regenerator. The increases in emissions from FCU 500 TAR are already accounted for as CXHO project related emissions increases.

(v) The Fluidized Catalytic Cracking Unit (FCU) 600, constructed in 1946, identified as Unit ID 240 and rated at 80,000 barrels per day. This facility converts hydrocarbons that boil above 500 °F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 600 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) catalyst regenerator. Flue gas from the regenerator passes through a waste heat recovery unit, which generates steam and an Electrostatic Precipitator for particulate matter control. The flue gas is then directed to a selective catalytic reduction (SCR) system, which chemically reduces nitrogen oxide emissions by reaction with injected ammonia, and is exhausted through stack S/V 240-01.

(2) Two catalyst storage bins, one each for equilibrium and fresh catalyst. (Spent catalyst is stored in Bin F-52, which is associated with FCU 500.)

(3) One (1) flare exhausting at stack ID S/V 230-02 (FCU Flare). The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) Leaks from process equipment, including two (2) wet gas compressors (identified as J-3D and J-3E), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system.

(5) The FCU 600 WARP, permitted in 2008, to replace the existing FCU 600 blowdown stack, with the exhaust re-routed to the FCU flare. As part of the FCU 600 WARP, per SPM 089-25488-00453, to shutdown the existing FCU 600 blowdown stack and the pressure relief discharges that were vented to the blowdown stack will be re-routed to the FCU flare.

(6) The FCU 600 turnaround (TAR) project, permitted in 2008 per SPM 089-25488-00453, for the repair or replacement of the main fractionator overhead condensers, the slurry and pump around system, unit pump replacement, FCU flare tip replacement, and additional controls to reduce plugging on the SCR, and addition of a soot blower. The increases in emissions from FCU 600 TAR are already accounted for as CXHO project related emissions increases.
(w) A portion of No. 1 Stanolind Power Station (SPS) constructed in 1928 and identified as Unit ID 501. The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas, are NOx budget units:

</table>

(2) Five (5) direct-fired duct burners, per SPM 089-25488-00453 permitted in 2008, rated at 41 mmBTU/hr each, equipped with low NOx burners and controlled by a Selective Catalytic Reduction (SCR) system. The
burners are also equipped with CO analyzers for measuring emissions of CO.

(3) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(y) Hazardous Waste Treatment System:

Dewatering and thermal desorption system for processing sludge, to be installed as part of CXHO project, including dissolved air flotation skimmings (DAF) and API oil/water separator sludge, equipped with a wet scrubber and carbon canister system to optimize absorption of hydrocarbons. The feed rate capacities at the dewatering system and thermal desorption systems are 90,000 and 22,500 tons per year, respectively. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of the permit:

Dewatering and thermal desorption system for processing sludge, per SPM 089-25488-00453, including dissolved air flotation skimmings (DAF) and API oil/water separator sludge. The dewatering system will be equipped with a wet scrubber and carbon canister system and the thermal desorption unit will be equipped with a vapor recovery system to optimize absorption of hydrocarbons. The feed rate capacities at the dewatering system and thermal desorption systems are 22,500 tons of feed per year and 9,000 dry tons of solids per year, respectively. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of the permit:

(1) Two (2) centrifuges;
(2) Two (2) sludge surge tanks;
(3) One (1) oil/water mixture surge tank;
(4) One (1) enclosed auger transfer system;
(5) One (1) vapor recovery system on the thermal desorption unit including: an oil condensing/scrubbing system, a water condensing/scrubbing system, and an oil water separator. Uncondensed vapors from this system are routed to the two (2) diesel fired burners for destruction of VOCs.

Insignificant Activity:

(6) Two (2) diesel fired burners rated at 4 mmBTU/hr each, for the thermal desorption system.

(aa) Oil Movements, identified as Unit 640. This facility is used to store, blend, and ship products. Gasoline blending components are custom blended into various grades of gasoline. Additive and other compounds are blended into the products to give them their unique characteristics. Furnace oil and other distillates are also blended using components from process units or storage. Crude oil and feedstocks for process units and products are also stored at this location. Product loading operations include the pipeline and railcar racks. This facility
includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) internal floating roof storage tank identified as 3730, storing ethanol, constructed in 1955, with a maximum storage capacity of 1,050,721 gallons.

(2) Ten (10) external floating roof storage tanks storing petroleum hydrocarbon with vapor pressure less than 15 psia, comprising the following tanks:

* - During emergencies or flare outages, some emission units or streams may be controlled by an alternate flare system that complies with the same applicable requirements as the flare normally used to control the emissions for those units.

** - Owned and operated by INEOS USA, LLC. (Plant I.D. 089-00076).

*** - Flares are equipped with a flare gas recovery system. Under normal operation the recovered gas streams will be sent to vapor recovery/treating area for removal of H2S and heavy components before being utilized in the refinery fuel gas system.

(oo) Two (2) new boilers, identified as New Boiler 1 and New Boiler 2, per SPM 089-25488-00453, permitted in 2008, each rated at 580 million BTU per hour, equipped with low-NOx burners and/or Selective Catalytic Reduction (SCR) for control of NOx, using either blended natural gas and refinery gas or only refinery fuel gas. A separate TRS CEMS shall be installed to measure the sulfur content of the fuel gas or fuel gas-natural gas blend fed to New Boiler 1 and New Boiler 2.

A.4 Insignificant Activities [326 IAC 2-7-1(21)] [326 IAC 2-7-4(c)] [326 IAC 2-7-5(15)]

This stationary source also includes the following insignificant activities, as defined in 326 IAC 2-7-1(21):

(a) ... (ee)

(ff) Three (3) emergency firepump engines, identified as Firepump 1, 2 and 3, per SPM 089-25488-00453, permitted in 2008, each rated at 390 HP.

(gg) One (1) concrete crushing process, per SPM 089-25488-00453, permitted in 2008, with a maximum processing capacity of 120 tons per hour, having two (2) transfer points.

BP Comment 2:
Condition D.0.1(b)(2) has two compliance equation listed. The first equation should be deleted.

Response:
The first equation under Condition D.0.1(b) has been deleted:

(b) Emissions from Boilers and Process Heaters shall be calculated as follows:

(1) For new heaters to be installed as part of the CXHO project, including replacement heaters, for pollutants that do not have a CEMS, the monthly emissions shall be calculated as follows:
Emissions \( \left( \frac{\text{ton}}{\text{mo}} \right) = (EF) \times \frac{H I}{2,000\, \text{lb}} \)

Where:

5. \( \text{HI} \) = Total actual heat input into unit i, in mmBtu, for the month

6. \( EF \) = Emission factor (lb/mmBTU) for heater as represented in Table D.0.1 or a more representative emission factors as verified through source testing per Condition D.0.3.

Emissions increases each month from the existing modified and affected process heaters and boilers not equipped with a CEMS shall be calculated as follows based on the emission factors in Table D.0.1 or a more representative emission factors as verified through source testing per Condition D.0.3:

\[ E = (\text{Actual Heat Input} - \text{Baseline Heat Input}) \times \text{Emission Factor} \] (lb/mmBTU)

\[ Emissions \left( \frac{\text{ton}}{\text{mo}} \right) = \left( \frac{HI_A \times EF_A}{2,000\, \text{lb}} \right) - \left( \frac{HI_B \times EF_B}{2,000\, \text{lb}} \right) \]

Where,

\( HI_A \) = Actual Heat Input (mmBtu/mo)
\( HI_B \) = Baseline heat input (mmBtu/mo)
\( EF_A \) = Actual emission factor (lb/mmBTU)
\( EF_B \) = Baseline emission factor (lb/mmBTU).

BP Comment No. 3:

Coke Pile should be corrected to Coke Handling System in D.2.11(b) in permit and Technical Support Document.

Response:

Condition D.2.11(b) has been modified as follows:

D.2.11 Fugitive Dust Control Plan [326 IAC 6.8-10]

(a) Until the shutdown of the No. 11B Coker and the associated emissions units:

Pursuant to 326 IAC 6.8-10-4 (formerly 326 IAC 6-1-11.1) the Permittee shall control fugitive particulate matter emissions from No. 11B Coker and **Coke-Pile Coke Handling System** according to the Fugitive Dust Control Plan (FDCP), included as Appendix C. If it is determined that the control procedures specified in the FDCP do not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require that the FDCP be revised and submitted for approval.
(b) Pursuant to 326 IAC 6.8-10-4 (formerly 326 IAC 6-1-11.1), the Permittee shall control fugitive particulate matter emissions from the New Coker (#2 Coker) and Coke Pile Coke Handling System according to the updated Fugitive Dust Control Plan (FDCP) submitted on January 30, 2008, included as Appendix C. If it is determined that the control procedures specified in the FDCP do not demonstrate compliance with the fugitive emissions limitations, IDEM, OAQ may require that the FDCP be revised and submitted for approval.

BP Comment No. 4:

Conditions D.3.4 and D.3.5(a) are missing statements "until shutdown". In addition, heaters H-101A, H-101B, and H-102 need to be added to this condition since 40 CFR 60, Subpart J is applicable to these heaters.

Response:

D.3.4 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]

(a) Pursuant to SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), until these heaters are shutdown, the Permittee shall comply with the requirements specified in Section E.2 for following process heaters: H-1AS and H-1AN Preheaters, H-1B Preheater, H-2 Vacuum Heater, H-1CN Crude Preheater, H-1CS Crude Preheater, and H-1CX Crude Preheater.

(b) The Permittee shall comply with the requirements specified in Section E.2 for the following process heaters: H-101A, H-101B, and H-102.

D.3.5 Emission Offset [326 IAC 2-3], Prevention of Significant Deterioration [326 IAC 2-2] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

(a) Pursuant to CP 089-2055-00453 issued on March 12, 1992, until heater H-1CX is shutdown, nitrogen oxide emissions from the 12 Pipe Still H-1CX furnace shall not exceed 0.10 lb/MMBtu. Compliance with this limit renders 326 IAC 2-3 not applicable. The H-1CX furnace shall also be equipped with low NOₓ burners.

BP Comment No. 5:

Conditions are not numbered sequentially in the permit.

Response:

All conditions in the permit have been renumbered sequentially.

BP Comment No. 6:

D.4 facility description box is missing the alternative operating scenario post-OCC.

Response:

The D.4 facility description box has been modified as follows:

Main Operating Scenario Pre-CXHO:

Approximately 80% of tail gases from the three trains are sent to the B/S TGU, with the remainder sent to the SBS TGU.

Alternate Operating Scenario #1 Pre CXHO:
One train and the B/S TGU are not operate. Tail gases from the other two trains are sent to the SBS TGU.

Alternate Operating Scenario #2 Pre CXHO:
The B/S TGU is not operated. Tail gases from the three trains are sent to the SBS TGU.

Alternate Operating Scenario #3 Pre CXHO:
The SBS TGU is not operated. Tail gases from the three trains are sent to the B/S TGU.

Main Operating Scenario Post CXHO:
The tail gases from the five trains are sent to both of the COTs.

Alternate Operating Scenario #1 Post-CXHO:
One of the COTs is not operated and the tail gases from the five trains are sent to the other COT.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

BP Comment No. 7:
The statement "following the completion of the CXHO project" needs to be changed to "after startup of New Coker (#2 Coker)" in the following Conditions: D.9.3(f), D.10.3(e), D.11.3(e), D.16.3(b), D.20.3(b).

Response:
The "completion of the CXHO project" is now defined in D.0.1 (See the Response to EPA Comment #1), therefore it is not necessary to make this change.

BP Comment No. 8:
D.15 facility description box is missing the statement "(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)"

Response:
The facility description box has been changed as follows:
Facility Description [326 IAC 2-7-5(15)]:

(o) The No.3 Ultraformer Unit (No. 3 UF), identified as Unit ID 220, commissioned in 1958. The majority of the unit was shutdown in March 2007, including the H-1, H-2 and F-7 heaters, catalyst filled reactors and the internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process. The unit consists of the C-2 Splitter Tower, the D-18 flare gas separator, D-24 knock-out drum and associated piping.

The No. 3 Ultraformer is connected to flare stack S/V 220-04, the UIU flare, to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance and reactor regenerations. The No.3 Ultraformer includes the following sources of emissions and may include insignificant activities listed in Section A.4 of this permit.

(1) One (1) flare gas separator (D 18) with emissions vented to vessel D 24, which exhausts to flare stack S/V 220 04.

(2) Leaks from process equipment, including one (1) compressor (identified as K 1), pumps, pressure relief devices, sampling connection systems, open ended valves or lines, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

BP Comment No. 9:

Condition D.24.13(d) should be corrected to refer to "Condition" instead of "Conditions".

Response:

Condition D.24.13(d) has been modified as follows:

D.24.13(d) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.24.4, the Permittee shall submit reports of excess CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,
(2) Date of excess emissions,
(3) Time of commencement and completion for each excess emission,

BP Comment No. 10:

In the TSD, in the Table titled "Permit Level Determination - PSD or Emission Offset", the footnote "Net emissions decreases are shown within brackets ()" should be deleted. In addition, footnote 6 provides a table for the de minimis netting analysis which needs to be updated to include correct emissions numbers.

Response:

IDEM prefers that the Technical Support Document reflect the draft permit that was on public notice. Therefore, changes have not been made to the Technical Support Document. In order to maintain a record of the comments submitted by the Permittee, the following corrections are included in this addendum to the Technical Support Document:
### Potential to Emit (tons/year)

</table>

¹ The details of the phased construction of new emissions units, installation of control devices on existing emissions units, and scheduled shutdown of existing emissions units are included in Appendix A of this Technical Support Document. Net emissions decreases are shown within brackets ( ).

⁶VOC netting analysis performed per 326 IAC 2-3 for VOC emissions evaluation based on the NSR program effective under the 8-hour ozone standard. Pursuant to South Coast Air Quality Mgmt. Dist. v. EPA, 472 F.3d 882 (D.C. Cir., December 22, 2006), the VOC de minimis threshold of 25 tons per year has been used for applicability determination of emission offset rules as follows:

BP Comment No. 11:

The draft permit has the following typographical errors:

Condition D.3.6 header and (b) - GGG should be GGGa, and E25 and E26

Condition D.2.17(d) - should reference Subpart GGGa instead of GGG

Condition D.19.13 - numbering sequence should be (d), (e), (f), (g)

Condition D.44.13 - numbering sequence should be (g), (f)

Response:

The numbering errors in Conditions D.19.13 and D.44.13 have been corrected. The following changes have been made:

D.2.17 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.2.3 and D.2.10, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the No. 11B Coker process heaters. The Permittee shall comply with this requirement until the shutdown of the No. 11B Coker and the associated emissions units.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.2.5, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.2.6(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC and to document compliance with Condition D.2.6(a), the Permittee shall submit reports as specified in Sections E.1, E.25 and E.26 E.4, and E.13.

D.3.6 Equipment Leaks of VOC and Hazardous Air Pollutants (HAPs)[326 IAC 12] [326 IAC 8-4-8] [40 CFR 60, Subpart GGGa] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of

the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25 and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

BP Comment No. 12:

Due to the scope of this project and the longer time period over which the modifications will be made, BP will need additional time to develop Preventive Maintenance Plans (PMPs) for the new and modified equipment.

Response:

Condition B.10 - Preventive Maintenance Plan has been modified as follows:

B.10 Preventive Maintenance Plan [326 IAC 2-7-5(1),(3) and (13)] [326 IAC 2-7-6(1) and (6)] [326 IAC 1-6-3]

(a) The Permittee shall prepare and maintain Preventive Maintenance Plans (PMPs) within ninety (90) days after the effective date of this permit or prior to startup of each respective modification or new unit, whichever is later, for the source as described in 326 IAC 1-6-3. At a minimum, the PMPs shall include:

(1) Identification of the individual(s) responsible for inspecting, maintaining, and repairing emission control devices;

(2) A description of the items or conditions that will be inspected and the inspection schedule for said items or conditions; and

(3) Identification and quantification of the replacement parts that will be maintained in inventory for quick replacement.

BP Comment No. 13:

The operating requirement under Condition D.0.2(b) should also apply for period of time when the BTU analyzers are down.

Response:

The following change has been made:

D.0.2 Operating Requirements

(a) After the installation of the continuous BTU analyzers at fuel mixing drums, in order to demonstrate compliance with emissions limitations, the continuous BTU analyzer shall be calibrated, maintained, and operated for determining compliance with the firing rate limits for heaters and boilers that are new, modified or affected units related to the CXHO project.
(b) Prior to the installation of the continuous BTU analyzers and during periods of time when the BTU analyzers are down, in order to demonstrate compliance with the firing rate limits on heaters and boilers involved in the CXHO project, the Permittee shall:

1. Continuously monitor the fuel flow rates at the heaters and boilers;
2. Conduct a monthly analysis of fuel gas samples taken once per week in order to determine monthly averaged BTU content of the fuel gas in each mixing drum; and
3. Determine the monthly firing rates for heaters and boilers based on the fuel flow rates at each heater and boiler and the monthly averaged BTU content of the fuel gas in the mixing drums.

BP Comment No. 14:

There is a potential that Tank 8a could trigger NSPS Subpart GGGa. This cannot be determined until the engineering of this project is further along. BP suggests that the following language be added to Condition D.1.6 to address Subpart GGGa for No. 11 PS:

Prior to startup of Tank 8a, BP shall make a determination as to whether 40 CFR 60 Subpart GGGa has been triggered by the changes made as a part of the projects authorized by SSM 089-25484-00453. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

Response:

The following change has been made:

D.1.6 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at No. 11A Pipe Still.

(c) Prior to startup of Tank 8a, BP shall make a determination as to whether 40 CFR 60, Subpart GGGa has been triggered by the changes made as a part of the projects authorized by SSM 089-25484-00453. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.
BP Comment No. 15:

In Section D.3, all references to crude preheater H-1CS should be deleted as this unit is no longer in operation.

Response:

All references to H-1CS have been deleted throughout Section A.2 and Section D.3.

BP Comment No. 16:

Condition D.3.14 has duplicate requirements under (a) and (b).

Response:

Condition D.3.14(b) has been deleted as follows:

D.3.14 Continuous Emissions Monitoring

  (a) In order to demonstrate compliance with Conditions D.3.5 and D.3.12, the Total Reduced Sulfur, NOx, and CO continuous emission monitoring systems (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2, NOx, and CO emissions limits for H-101A, H-101B, and H-102 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

  (b) In order to demonstrate compliance with Condition D.3.12, the CO continuous emission monitoring systems (CEMS) shall be calibrated, maintained, and operated for demonstrating compliance with the CO emissions limits for H-101A, H-101B, and H-102 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.

BP Comment No. 17:

Conditions D.4.11 and D.4.14(a) through (f) are only applicable until the referenced emissions units are shutdown.

Response:

The following changes have been made:

D.4.11 Operating Requirement

Until the SRU incinerator is shutdown:

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitation for the SRU incinerator in Condition D.4.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.
D.4.14 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the SRU incinerator (until shutdown) for each day that the unit is operated:

1. fuel type,
2. average daily sulfur content for each fuel type,
3. average daily fuel gravity for each fuel type,
4. total daily fuel usage for each type, and
5. heat content of each fuel.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.4.2, the Permittee shall maintain records for the SRU (until shutdown) as specified in the Continuous Compliance Plan.

(c) Pursuant to 326 IAC 7-4.1-3(b)(1)(C) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the B/S TGU (until shutdown):

1. total reduced sulfur concentration,
2. hydrogen sulfide concentration, and
3. calculated stack gas flow rates.

(d) Pursuant to 326 IAC 7-4.1-3(b)(1)(D) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the SBS TGU (until shutdown):

1. sulfur dioxide concentration, and
2. stack gas flow rate.

(e) To document compliance with Condition D.4.4(a), the Permittee shall keep the following records for the B/S TGU (until shutdown):

1. one-minute block averages from the TRS CEM, and
2. average TRS emission rates, calculated as SO₂, per twelve (12) consecutive month period.

(f) To document compliance with Conditions D.4.4(b), the Permittee shall keep the following records for the SBS TGU (until shutdown):

1. one-minute block averages from the SO₂ CEM, and
2. average SO₂ emission rate per twelve (12) consecutive month period.

BP Comment No. 18:
Condition D.4.15(h) should include CO, since the unit is equipped with a CO CEMS.

**Response:**

Condition D.14(h) has been modified as follows:

(h) In order to demonstrate compliance with Condition D.4.4, upon start-up of COT 1 and/or COT 2, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 and CO emissions at COT1 and COT2 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

**BP Comment No. 19:**

In Section D.4 - Facility Description, Tank TK-410 is described incorrectly as permitted in 2008. This tank was permitted in 2006 in MSM No. 089-23341-00453.

**Response:**

The facility description of Tank No. TK-410 has been modified as follows:

A.2. ........

(d)(17) One (1) sour water storage tank, identified as TK-410, permitted in 2006 per MSM 089-23341-00453, having a maximum storage capacity of 4,351,200 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

**BP Comment No. 20:**

Condition D.18.5 has references to construction permits that need to be modified for clarification purposes.

**Response:**

Condition D.18.5 has been modified as follows for clarification purposes:

D.18.5 Emission Offset and Prevention of Significant Deterioration (PSD) [326 IAC 2-2] [326 IAC 2-3]

Pursuant to Permit CP 089-2055-00003 issued on March 12, 1992, and amended on February 19, 1999, the Permittee shall comply with the following emission limitations and operating conditions:
(a) Prior to start-up of the new coker (#2 Coker), nitrogen Oxide (NO\textsubscript{x}) emissions from the WB-301 and WB-302 Process Heaters shall not exceed 0.065 lb/MMBTU. This is equivalent to total NO\textsubscript{x} emissions of 36.6 tons per year from the WB-301 and WB-302 Process Heaters.

(b) Pursuant to permit CP 089-2055-0003 issued on March 12, 1992, and amended on February 19, 1999, carbon Monoxide (CO) emissions from the WB-301 and WB-302 Process Heaters shall not exceed 0.04 lb/MMBTU. This is equivalent to total CO emissions of 22.5 tons per year from the WB-301 and WB-302 Process Heaters.

(c) Prior to start-up of the new coker (#2 Coker), the input of natural gas and natural gas equivalents to Process Heaters WB-301 and WB-302 shall be limited to a total of 1089.7 million cubic feet (MMcf) per twelve (12) consecutive month period, with compliance determined at the end of every month. For the purpose of determining compliance with this limit, every one (1.0) MMcf of refinery gas usage shall be considered equivalent to one (1.0) MMcf of natural gas usage.

(d) Pursuant to permit CP 089 2055 0003 issued on March 12, 1992, and amended on February 19, 1999, all compressor seals in volatile organic compound (VOC) service shall be purged and vented to the flare header.

(e) Pursuant to permit CP 089 2055 0003 issued on March 12, 1992, and amended on February 19, 1999, the Propane Dewaxing Unit and Asphalt Oxidizer Nos. 2 and 3 shall remain inoperative.

Compliance with these limits makes 326 IAC 2-2 (Prevention of Significant Deterioration (PSD)) and 326 IAC 2-3 (Emission Offset) not applicable.

BP Comment No. 21:

Condition D.21.4(c) incorrectly refers to ARU instead of FCU 500.

Response:

D.21.4 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 12] [40 CFR 60, Subpart GGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.
Prior to start-up of the FCU 500 after the TAR project, BP shall make a
determination as to whether 40 CFR 60, Subpart GGGa has been triggered by
component changes made on the ARU FCU 500 as a part of the projects
authorized by SSM 089-25484-00463. BP shall report the results of that
determination to IDEM. If BP determines that Subpart GGGa has been triggered,
BP shall comply with the requirements of that rule upon startup.

BP Comment No. 22:

Condition D.22.4(c) incorrectly refers to ARU instead of FCU 600.

Response:

Condition D.22.4 has been modified as follows:

**D.22.4 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 12] [40 CFR 60, Subpart GGGa]**

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps,
compressors, valves, process drains, and pressure relief devices according to the Leak
Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall
update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to
IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the
LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM,
OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements
specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors,
pressure relief devices, sampling connection systems, open-ended lines or valves, and
instrumentation systems.

(c) Prior to start-up of the FCU 600 after the TAR project, BP shall make a determination as
to whether 40 CFR 60, Subpart GGGa has been triggered by component changes made
on the ARU FCU 600 as a part of the projects authorized by SSM 089-25484-00463. BP
shall report the results of that determination to IDEM. If BP determines that Subpart
GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

BP Comment No. 23:

The references to boilers 3 and 4 should be deleted from Conditions D.23.6 and D.23.10(b), since
these boilers are no longer in operation.

Response:

Conditions D.23.6 and D.23.10 are modified as follows:

**D.23.6 Nitrogen Oxides Budget Trading Program [326 IAC 10-4]**

Until the shutdown of boilers #3, 4, 5, 6, and 7:

Pursuant to 326 IAC 10-4-1(a), the Permittee shall comply with Nitrogen Oxides Budget
Trading program for boilers #3 through #7 which are specified in Section E.11.

**D.23.10 Record Keeping Requirements**

Until the shutdown of boilers #5, 6, and 7:
(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.23.3 and D.23.9, the Permittee shall maintain a daily record of the following for the No. 1SPS Boilers:

1. operational status of each facility,
2. fuel type,
3. average daily sulfur content for each fuel type,
4. average daily fuel gravity for each fuel type,
5. total daily fuel usage for each type, and
6. heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(p) and 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.23.1(b), the Permittee shall maintain records for the Boilers #3, #4, #5, #6, and #7 as specified in the Continuous Compliance Plan.

**BP Comment No. 24:**

In Section D.24, the applicability of 40 CFR 60, Subpart J should be added for the duct burners. In addition, Condition D.24.9(b) should also reference D.24.4(c).

**Response:**

The following changes have been made:

**D.24.5 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]**

Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the No. 3SPS Boilers and the five (5) duct burners.

**D.24.9 Operating Requirement**

(a) Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003 and SPM 089-18588-00453, issued July 15, 2004, fuel oil shall not be used as fuel for the No. 3SPS Boilers.

(b) Compliance with the limits in Condition D.24.4(a), (b), (c) and (g) shall be demonstrated as specified in Condition D.0.3.

**BP Comment No. 25:**

Section D.24 does not include references to NESHAP and NSPS recordkeeping and reporting requirements as included in the other D sections.

**Response:**

**D.24.12 Record Keeping Requirements**

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.24.3 and D.24.9 the Permittee shall maintain a daily record of the following for the No. 3 SPS Boilers:
(1) operational status of each facility,

(2) fuel type,

(3) average daily sulfur content for each fuel type,

(4) average daily fuel gravity for each fuel type,

(5) total daily fuel usage for each type, and

(6) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(p) and 326 IAC 6-1-10.1(n)(5)), and to document compliance with Condition D.24.1(b), the Permittee shall maintain records as specified in the Continuous Compliance Plan.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.24.6(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(d) In order to demonstrate compliance with Condition D.24.3, the Permittee shall maintain records of monthly firing rates and CO emissions at No. 3 Stanolind Power Station boilers 1, 2, 3, 4, 6, and the five (5) duct burners.

(e) **Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.24.5, the Permittee shall maintain the records specified in Section E.2.**

(f) **Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.24.8, the Permittee shall maintain records specified in Section E.6.**
In order to demonstrate compliance with Condition D.24.4, the Permittee shall submit a quarterly summary of the monthly firing rates and CO emissions the boilers 1, 2, 3, 4, 6 and five (5) duct burners to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

Pursuant to 326 IAC 3-5-7 and to document compliance with Condition D.24.4 D.24.3, the Permittee shall submit reports of excess CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments

BP Comment No. 26:

Condition D.32.5 - requirement under 40 CFR 63, Subpart DDDDD, should be deleted.

Response:

Condition D.32.5 has been deleted, and the remaining conditions renumbered. References to the renumbered conditions have been corrected accordingly.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for the process heaters F-1 and F-2, which comprise the affected source for the large gaseous fuel subcategory.

BP Comment No. 27:

Condition D.43.3(b) references GOHT and incorrect ID no., which should be corrected to Unit ID 801.

Response:

D.43.3 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGGa]
(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of VOCs and HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at GOHT unit, located at HU unit, identified as Unit ID 801. located at HU unit, identified as Unit ID 802.

BP Comment No. 28:

Conditions D.44.4 and D.44.6 are duplicative. In addition, Condition D.44.8 does not include a compliance method for emission limits that do not have averaging periods specified in Condition D.44.3. The following statement should be added:

Compliance with the limits in Condition D.44.3(e) and (f) shall be demonstrated as specified in Condition D.0.3.

Response:

Condition D.44.6 has been deleted and the remaining conditions renumbered and Condition D.44.8 (renumbered as D.44.7) has been modified. The Table of Contents has been modified accordingly.

D.44.6 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]
Pursuant to 40 CFR 60, Subpart J, the Permittee shall comply with the requirements specified in Section E.2 for New Boiler 1 and New Boiler 2.

D.44.7 Operating Requirement

(1) In order to demonstrate compliance with D.44.3, fuel oil shall not be used as fuel for New Boiler 1 and New Boiler 2.

(2) Compliance with the limits in Condition D.44.3(e) and (f) shall be demonstrated as specified in Condition D.0.3.

BP Comment No. 29:

Condition D.45.2(a) should be clarified as follows: “The total hours of operation for each of the three firepump engines shall not exceed 500 hours per year.”

Response:

Upon further review, IDEM has determined that the emissions calculations are based on 500 hours of operation for each firepump engine. Therefore, Condition D.45.2(a) has been modified as follows:
D.45.2 Prevention of Significant Deterioration [326 IAC 2-2], Emission Offset [326 IAC 2-3] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) The total hours of operation for each of the three firepump engines shall not exceed 500 hours per year.

BP Comment No. 30:

In Condition D.35.4, GOHT and South flares should be subject to 40 CFR 60, Subpart GGGa instead of 40 CFR 60, Subpart GGG.

Response:

The following changes have been made:

D.35.4 Equipment Leaks of VOC [326 IAC 12] [40 CFR 60, Subpart GGG] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 40 CFR 60, Subpart GGG, the Permittee shall comply with the control device standards specified in Section E.13 for the 4UF, UIU, Alky, GOHT, South and DDU flares.

(b) Pursuant to 40 CFR 60, Subpart GGGa, the Permittee shall comply with the control device standards specified in Section E.25 for GOHT and South flares.

D.35.9 Record Keeping Requirements

(a) To document compliance with Condition D.35.2, pursuant to 40 CFR 63, Subpart CC, the Permittee shall maintain the records as specified in Section E.1.

(b) Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition D.35.3, the Permittee shall keep records as specified in Section E.5.

(c) Pursuant to 40 CFR 60, Subparts GGG and GGGa and to document compliance with Condition D.35.4, the Permittee shall maintain the records as specified in Section E.13 and E.25.

(d) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.35.5, the Permittee shall keep records as specified in Section E.2.

(e) Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.35.8, the Permittee shall keep records as specified in Section E.10.

(f) In order to demonstrate compliance with Condition D.35.1(e), the Permittee shall maintain records of fuel usages at the GOHT and South flares.

D.35.10 Reporting Requirements

(a) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.35.2, the Permittee shall submit reports as specified in Section E.1.

(b) Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition D.35.3, the Permittee shall submit reports as specified in Section E.5.
Pursuant to 40 CFR 60, Subparts GGG and GGGa and to document compliance with Condition D.35.4, the Permittee shall submit reports as specified in Section E.13 and E.25.

Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.35.5, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.35.8, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.10.

In order to demonstrate compliance with Condition D.35.1, the Permittee shall submit quarterly reports for pilot gas and purge gas usages at the GOHT and South flares. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).

BP Comment No. 31:
The GOHT is subject to 40 CFR 60, Subpart GGGa. The reference in Condition D.42.3 should be corrected accordingly.

Response:
The following change has been made:

D.42.3 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart VVVa][40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VVV GGGa, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of VOCs and HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at GOHT unit, identified as Unit ID 802.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

BP Comment No. 32:
The GOHT is subject to 40 CFR 63 Subpart CC, 40 CFR 61, Subpart FF, and 40 CFR 60, Subpart QQQ for wastewater streams.
Response:

Condition D.42.4 has been added as follows, and the remaining conditions have been renumbered.

**D.42.4 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14][40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ] [326 IAC 12]**

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

**BP Comment No. 33:**

Condition D.43.3(b) should reference 40 CFR 63, Subpart GGGa.

Response:

40 CFR 63, Subpart GGGa is already referenced in Condition D.43.3(c), therefore, the following change has been made:

**D.43.3 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGGa] [40 CFR 60, Subpart VVa]**

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VVa, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 E.25 for equipment leaks of VOCs and HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at GOHT unit, located at HU unit, identified as Unit ID 801.
Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

**BP Comment No. 34:**

Section D.44 (new boilers) has recordkeeping and reporting requirements under 40 CFR 60, Subpart QQQ, but does not include a condition for the applicability of this NSPS.

**Response:**

Condition D.44.6 has been added as follows. The remaining conditions in section D.44 have been renumbered as well.

**D.44.6 Wastewater / Waste Streams [40 CFR 60, Subpart QQQ][326 IAC 12]**

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

**BP Comment No. 35:**

In addition, there are a couple of additional corrections to the existing forms that we had not submitted earlier:
1. In the form on page 13 of 37 - heater F-101A should be F-101.
2. In the form on page 15 of 37 - heater B-601A should be B-601A.

**Response:**

The heater IDs have been corrected as requested.

**BP Comment No. 36:**

Conditions D.43.4 and D.43.7 are duplicative requirements.

**Response:**

Condition D.43.4 has been modified as follows to delete duplicative requirements for the HU flare:

**D.43.4 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12][40 CFR 60, Subpart J]**

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for process heaters HU-1 and HU-2 and the HU flare.

**BP Comment No. 37:**

BP requests that IDEM add report forms for the following limits:

1. New Coker heaters H-201, 202, and 203 - Emissions of CO and NOx are limited to 17.3 tons per consecutive 12-months and 18.2 tons per consecutive 12-months, respectively for each heater.
1. 12 PS heaters H-101A and 101B - Emissions of CO and NOx are limited to 29.5 tons per consecutive 12-months and 77.7 tons per consecutive 12-months, respectively for each heater.

2. 12 PS heater H-102 - Emissions of CO and NOx are limited to 27.5 tons per consecutive 12-months and 72.5 tons per consecutive 12-months, respectively.

3. COT1 and 2 - Total SO2 and CO emissions are limited to 194.8 tons per consecutive 12-months and 55.0 tons per consecutive 12-months, respectively.

4. 3 SPS and duct burners - After the installation of the duct burners and the SCRs, the firing rate (total) is limited to 24,303,535 MMBtu per consecutive 12-months.

5. 3 SPS and duct burners - Total CO emissions are limited to 260.3 tons per consecutive 12-months. This is required per Permit Condition 24.17(d).

6. DHT heater B-601A - Emissions of NOx and CO are limited to 7.3 tons per consecutive 12-months and 7.3 tons per consecutive 12-months, respectively. A reporting condition is not currently listed in section D.37 for this heater.

7. The GOHT F-901A and F-901B - Emissions of SO2 are limited to 2.3 tons per consecutive 12-months, for each heater. This is required per Permit Condition 42.9(b).

8. New HU heaters HU-1 and HU-2 - Emissions of NOx and CO are limited to 52.4 tons per consecutive 12-months and 60.4 tons per consecutive 12-months, respectively, for each heater. This is required per Permit Condition 43.13(b).

Response:

The following report forms have been added for the convenience of the Permittee:
<table>
<thead>
<tr>
<th>Facility</th>

BP Comment No. 38:

Based on the issuance date of the permit for the Asphalt Plant (2/20/07) and the proposed date of the NSPS, 40 CFR 60, Subpart GGGa, the asphalt plant should be subject to Subpart GGGa instead of Subpart GGG.

Response:

The following changes have been made:

D.32.7 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGGa, the Permittee shall comply with the requirements specified in Sections E.4 and E.13 E.25 and E.26 for valves, pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, flanges and/or other connectors in VOC service.

D.32.15 Record Keeping Requirements

(f) Pursuant to 40 CFR 60, Subpart GGGa and to document compliance with Condition D.32.7(b), the Permittee shall keep records as specified in Sections E.4 and E.13 E.25 and E.26.

D.32.16 Reporting Requirements

(e) Pursuant to 40 CFR 60, Subpart GGGa and to document compliance with Condition D.32.7(b), the Permittee shall submit to IDEM, OAQ the reports specified in Sections E.4 and E.13 E.25 and E.26.

BP Comment No. 39:

The refinery uses the facility-wide exemption under 40 CFR 63, Subpart DD - National Emission Standards for Hazardous Air Pollutants from Off site Waste and Recovery Operations, where off-site waste water is tracked for HAPs (benzene) to ensure that the total annual quantity of HAPs that is contained in the off-site material received at the plant is less than 1 megagram per year. Therefore, 40 CFR 63, Subpart DD should be referenced in Section D.36 of the permit.

Response:

Condition D.36.2 has been modified as follows:

D.36.2 Wastewater / Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ] [40 CFR 63, Subpart DD]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and
control devices subject to 40 CFR 63, Subpart CC wastewater requirements and
40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the
requirements specified in Section E.6 for individual drain systems, oil-water
separators, and closed vent systems and control devices subject to 40 CFR 60,
Subpart QQQ.

c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed
in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60,
subpart QQQ is required to comply with only the provisions of 40 CFR 63,
subpart CC specified in Section E.1.

(d) Pursuant to 40 CFR 63, Subpart DD, the Permittee shall comply with the
requirements under 40 CFR 63.680(d) specified in Section E.14 of the
permit for off-site wastewater received at the refinery.

Public Comments - Technical

Technical Comment No. 1:

The following Commenters expressed concerns related to flaring events at BP Whiting refinery,
and the environmental impact of the three new flares planned as part of the CXHO project:
Chicago and Illinois Attorney General, Legal Environmental Aid Foundation, NRDC Group, Save
the Dunes Council, RHAMC, Daniel Grelck (Lowell, IN). The comments are summarized below:

The analysis concluding that the project will result in no net emissions increases, such that NSR
is not triggered, is deeply flawed, since the netting analysis failed to account for use of flares.

a. Emissions associated with the normal operation of the flares have not been accounted
for. At least one flare is accounted for as an insignificant activity, with all other emissions
unaccounted for. The permit states the flare have insignificant emissions, however, no
operational limits have been placed on the use of the flares.

b. The new flares are a concern since they are not included in the potential emissions. On
page 8 of the Technical Support Document under Section (o), two new flares list the
maximum capacity as "TBD - To be Determined". How can the total emissions be
considered when these sources have not been included in the emission inventory? The
Commenter urges IDEM to include these emissions.

c. The only flare emissions that were factored into the netting calculation were the miniscule
amounts attributable to pilot gas and purge gas - which are the emissions when the flare
is off. The netting analysis fails to account for the increased use of existing flares that will
result from the project, which is expressly designed to make use of them in specified
circumstances.

d. The assumption that no emissions can be expected to occur from use of the refinery flare
is particularly incredible given BP Whiting's numerous past flare-related violations in
connection with the existing flares. Deviation reports show that BP repeatedly exceeded
the H2S 3-hr limit of 159 ppm, meaning that too much H2S was burned at the flare. The
facility's eight existing flares are not only very much in use at present, but in violation of
applicable CAA requirements. H2S emissions during flaring events would increase
relative to baseline flaring as the refinery will be processing higher sulfur canadian tar
sand crude oils. Even if it is true that overall reliability will improve, the change in crude slate would still increase emissions of at least SO2, PM10, PM2.5 and perhaps other pollutants.

e. BP must quantify flaring emissions - including those from startup, shutdown and malfunction events, in the flares' potential to emit and clearly commit to creditable decreases in flaring emissions. The creditable decreases must be enforceable as a practical matter and have approximately the same qualitative significance for public health and welfare as that attributed to the increase from the particular change.

f. The project will exceed significance levels for all regulated NSR pollutants once flaring emissions are properly added. The projects new high sulfur crude inputs will cause more flaring. Although the permit contain a number of provisions that concern flaring, it contains no actual limits of any kind on the frequency with which flares may be used, or on flaring emissions. The permit also fails to limit the potential to emit to the assumed zero emissions in the netting analysis.

g. The permits do not include proper BACT/LAER limits for flares and other sources. The specific measures that BP and IDEM have failed to implement concerning flare minimization performance are available for other refineries that have actually implemented the type of stringent measures required as BACT and LAER. IDEM must either establish numeric BACT or LAER limits for flares, or must present a numeric evaluation of emissions reductions expected to be achieved through work practices. Rigorous monitoring necessary for evaluating flare emissions, preventing flaring events, and ensuring enforceability is required by the CAA but missing from the draft permits. A key method of preventing unnecessary flaring is to require rigorous flare monitoring, root cause analysis of flaring, and a flare minimization plan. Current draft conditions in the permit allow unlimited flaring. Although the PSD and NA NSR netting analysis assumes that emissions associated with flare use will be zero, nothing in the draft permit actually prohibits their use, or the consequent emissions. H2S limits for flares are not a replacement for BACT/LAER for all pollutants.

h. EPA has recently issued a Notice of Violation to BP which found repeated flaring violations, demonstrating that BP is not even meeting basic flaring requirements, let alone meeting BACT/LAER requirements for the new project. According to a very recent (November 2007) Notice of Violation letter from the U.S. EPA, BP has been found to have repeatedly violated flaring and other Clean air Act requirements starting in 1986, and has continued to do so. These violations of flare monitoring requirements compound BP's failure to implement BACT and LAER controls on its flaring emissions. The violations listed in the NOV make it clear that the existing flares at the refinery - including the UIU, Alkyl, DDU and LPG flares, have already, prior to the project, undergone modifications that should have required these flares to be subject to New Source Review, and consequently BACT/LAER requirements. BP's Title V Compliance reports to IDEM also show flaring deviations.

i. Extensive data show that flaring represents an enormous source of oil refinery emissions. BP's assumption that flares will never be used for the project flies in the face of large volumes of data on flaring at other oil refineries.

j. Rigorous flare monitoring is necessary for evaluating emissions and preventing flaring, as required by the CAA but missing from the draft permit.

k. Draft permit conditions for the project allow unlimited flaring, because nothing in the permit conditions prevents individual flaring events and the associated emissions.
l. At refineries in the Bay Area sulfur dioxide emissions at refineries studied frequently exceeded 10,000 pounds, and were as high as 70,000 pounds, in a single day, while emissions of VOCs frequently exceeded thousands of pounds per day, and were recorded as high as 22,000 pounds per day. Annually, flaring events meant SOx emissions as high as 3,000 tons and VOC emissions over 1,800 tons.

m. Commenter has studied startup, shutdown, and malfunction (SSM) emissions (that is, flaring), issuing a report in 2004 documenting releases from large petrochemical plants in some states. The review of industry-filed reports showed that sometimes releases from SSM events were actually higher than total annual routine emissions reported to EPA's Toxics Release Inventory (TRI). SSM emissions of CO from Exxon Mobil's Baton Rouge facility were almost three times its reported annual CO emissions.

n. The new flares are a concern since they are not included in the potential emissions. The maximum capacity of two new flares are listed as "To be Determined" in the Technical Support Document. The maximum capacity, in millions of BTUs burned per hour is "To Be Determined" or "To be Designed".

o. The Clean Air act requires that all of the Whiting Refinery's emissions be included in the netting analysis, including emissions from the three new flares that will be built as part of the refinery's expansion projects.

p. The three burn stacks are not included in any part of the permit. Why does IDEM not require BP to install monitors on the stacks? This would allow IDEM to monitor when and how often the stacks are used.

q. Studies have shown that wind and other factors can reduce flare combustion efficiencies, which means that, although refineries typically estimate flare efficiency at 98 - 99%, more pollution is actually being released to the environment instead of being destroyed during combustion.

r. EIP (Environmental Integrity Project) found that more than half of the 37 facilities studied had SSM emissions of at least one pollutant that were 25% or more of their total reported annual emissions of that pollutant. More recent examples of SSM emissions include releases of hazardous air pollutants (HAPs) that are several tons of HAPs during one single "air emissions event".

Response:

Overall, this project is a modernization of the refinery and will result in the installation of several new units designed to operate more efficiently and with fewer malfunctions or maintenance problems. As a result, it is expected that even with the increased capacity of some of the modified units and the addition of newer, larger units, the number of flaring events will decrease. As part of the design of the new units, and the modifications to existing equipment, BP included several safety features that eliminate the need to flare during some start-up or shut-down procedures and adds redundancy to existing processes that will eliminate the need for frequent or excessive flaring. However, while we expect flaring to decrease, and as a result emissions from flaring to decrease, BP did not rely on these anticipated reductions as creditable decreases in the netting analysis. Flaring emissions that occurred during the baseline period were not counted in the baseline actual emissions. The inclusion of these emissions would have increased the baseline emissions, and given that there is an anticipated reduction in flaring emissions after the completion of the project, the overall net emission decrease from the project would be even greater. Furthermore, the project netting shows a decrease in emissions for all criteria pollutants, resulting in the project being permitted as a minor source modification. While there is expected to be a reduction in malfunctions after the modernization project, should there be unexpected
maintenance activities resulting in emissions that should be applied towards the project netting, there is sufficient room under the major modification permit threshold to account for these unexpected increases in emissions while maintaining the existing source modification permit level.

As noted by the commenters, BP will install three new flares as part of the CXHO project. These flares, which are designated as GOHT flare, South Flare, and HU flare, are included in Section A, Section D.35, Section D.43, and the TSD. The GOHT and South Flare are designed with a flare gas recirculation system that collects refinery gas from the associated emission units and recycles it back into the refinery fuel gas system. The HU flare, which is associated with the new Hydrogen Unit, will not be equipped with the flare gas recirculation system. This recirculation system is designed with sufficient capacity to collect all emissions associated with routine or normal flaring events, including routine maintenance and repair periods. In addition, the flare gas recovery system is equipped with a back-up compressor of the same capacity as the primary compressor. Operating these flares with this recirculation system is considered normal operation and the emission calculations, which include purge gas and pilot gas emissions only, is reflective of operating these units as they were intended to be operated and as they would normally be operated. The HU flare, while not equipped with the recirculation system, is designed to accommodate any flaring events resulting from malfunctions or emergencies, but will have no routine flaring that would be considered normal operation. A source’s potential emissions are based on the source’s normal operations under its physical and operational design. Operations during periods of startup, shutdown, or malfunction are not considered “normal operation.” As a consequence, emissions during such periods have not historically been required to be included in netting calculations. This approach was articulated by the U.S. Court of Appeals and followed by the United States District Court in Alabama Power and Louisiana-Pacific, respectively. The Court in Louisiana-Pacific explained:

The broad holding of Alabama Power is that potential to emit does not refer to the maximum emissions that can be generated by a source hypothesizing the worst conceivable operation. Rather, the concept contemplates the maximum emissions that can be generated while operating the source as it is intended to be operated and as it is normally operated. (United States v. Louisiana Pacific Corporation, 682 F. Supp. 1141, (D. Col. March 22, 1988), citing Alabama Power v. Costle, 636 F.2d 323 (D.C. Cir. 1979)).

With regard to flaring events that are the result of unplanned, non-routine emissions (malfunctions or emergencies), these emissions were not accounted for in the calculations under the “potential to emit” test that is being used for these new emission units. However, BP has included, as part of this project, all foreseeable projects where there will be planned shutdowns resulting in flaring. The emission calculations for these projects are included in Appendix E of the TSD and the ATSD. These calculations include the emissions resulting from flaring, which includes start-up and shutdown of the associated units. This approach is consistent with Federal and State regulations which govern air permitting and the “potential to emit” test (326 IAC 2-2-1(rr)). Given that the flares are new emission units, and they were evaluated using the traditional “potential to emit” test.

For the new flares, emission limits and monitoring requirements are included in D.35 and D.43 to make the future allowable part of the netting calculations practically enforceable and ensure compliance with 326 IAC 2-2 and 326 IAC 2-1.15. In addition to these conditions, IDEM is making the following revisions to the permit to clarify the Permittee’s obligations with regard to flaring emissions from normal operations:
(a) Following the issuance of SPM 089-25488-00453 and until the startup of New Coker (#2 Coker) and associated coke handling facilities, the Permittee shall determine, on a monthly basis, the increase in emissions of SO2, NOx, PM10, CO, Pb, Be, Hg, H2SO4, and VOC from all new, modified and existing affected emission units at this source, and shall demonstrate, that the net emissions increases from this source remain below significant levels per twelve (12) consecutive month period beginning with issuance of SPM 089-25488-00453, in accordance with the following:

(g) Emissions from the GOHT, South, and HU flares shall be calculated as follows:

Emissions (ton/month) = EF_p x HI_i x 1 ton/2000 lbs

Where:

HI = Total actual heat input for the month, in mmBtu, of all gases burned in Flare i as a result of routine, or planned non-routine activities (e.g. planned startups and shutdowns of upstream units).

EF_p = The pollutants-specific emission factor (lb/mmBTU) set out below:

For SO2:

EF_p = \( \frac{C \times MW \times P \times (1/HHV_A)}{R \times T} \)

Where,

- C = Flared gas total sulfur concentration (ppm)
- MW = Molecular Weight (lb/lbmol)
- P = Pressure (psia)
- R = Ideal Gas Constant (psia*ft3/(lbmol*R))
- T = Temperature (R)
- HHV_A = Actual flare gas higher heating value (mmBtu/mmscf)

For NOx:

EF_p = 0.068 lb/mmBtu (+ fuel nitrogen component)

For VOC:

EF_p = 0.14 lb/mmBtu

For CO:

EF_p = 0.37 lb/mmBtu

For PM10/2.5:

EF_p = 0.0075 lb/mmBtu

For Pb:
EF_p = 4.9E-7 lb/mmBtu

For Hg:
EF_p = 1.8E-7 lb/mmBtu

For Be:
EF_p = 1.18E-8 lb/mmBtu

For H2SO4:
EF_p = 3% x (SO2 EF_p) x 98/64.06

D.0.4 Recordkeeping Requirements
In order to demonstrate compliance with Condition D.0.1, the Permittee shall maintain the following records each month, upon issuance of the SPM 089-25488-00453 and until the startup of the New Coker (#2 Coker) and associated coke handling facilities:

(a) The emissions in tons, calculated in accordance with D.0.1, including fugitive emissions, of PM, PM-10, VOC, NOx, CO, Pb, Be, Hg, H2SO4, and SO2, from new emission units installed as part of the CXHO project during that month.

D.0.5 Reporting Requirements

(b) The reporting requirements in Condition D.0.5(a) shall no longer be applicable following the startup of the New Coker (#2 Coker). Start-up is defined as when the unit becomes operational only after a reasonable shakedown period, not to exceed 180 days, pursuant to 326 IAC 2-2-1 (jj)(7).

D.35.9 Continuous Monitoring – GOHT and South Flare [326 IAC 2-2]
The Total Reduced Sulfur continuous emission monitoring systems (CEMS) for the GOHT and South Flares shall be calibrated, maintained, and operated in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment. For purposes of demonstrating compliance with Condition D.0.1, the SO2 emissions from the GOHT and South Flares shall be calculated as provided in Paragraph (g) of Condition D.0.1 based on the conversion of one mole of sulfur in the gas to one mole of SO2.

D.35.910 Record Keeping Requirements

D.35.4011 Reporting Requirements

D.43.12 Continuous Monitoring – HU Flare [326 IAC 2-2]
The Total Reduced Sulfur continuous emission monitoring systems (CEMS) for the HU Flare shall be calibrated, maintained, and operated in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment. For purposes of demonstrating compliance with Condition D.0.1, the SO2 emissions from the HU Flare shall be calculated as provided in Paragraph (g) of
Condition D.0.1. based on the conversion of one mole of sulfur in the gas to one mole of S.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.43.123 Record Keeping Requirements

D.43.134 Reporting Requirements

The aforementioned revisions make clear that the Permittee is required to include, in the D.0 calculations, all emissions from the new flares that result from routine operations or from planned non-routine activities such as startups and planned (non-emergency) shutdowns. However, the language would not require BP to include emissions from emergencies, malfunctions and other unplanned events, over which it has no control, which are not required to be included in netting calculations. It will be incumbent on BP to maintain the system adequately to minimize unplanned flaring events, limiting these primarily to occurrences that can be construed as "beyond their control". This will ensure that these emissions are accounted for in the netting calculations and ensure that when these emissions are compared to the increases and decreases included in the netting analysis the project remains minor under PSD, EO, and Nonattainment NSR.

Technical Comment No. 2:

(NRDC Group) The analysis concluding that the project will result in no net emissions increases, such that NSR is not triggered, is deeply flawed, due to the following:

A. The netting analysis failed to account for other emissions sources, including venting of pressure relief devices, uncontrolled loading of petroleum products onto marine vessels, residual emissions from vessel depressurization, increased coking, wastewater ponds and their systems, coke drum depressurization, coke drum VOC and PM10 from decoking, and fugitive emissions of reduced sulfur compounds. The application also did not include reduced sulfur including H2S emissions from leaks from fugitive sources. The depressurization, cooling, and decoking operations emit H2S and other reduced sulfur compounds.

1. Coke drum depressurization emissions were omitted. The South Coast Air Quality management District (SCAQMD) has measured depressurization emissions from all refineries within its jurisdiction and is proposing to initiate rulemaking to control these emissions. These emissions are viewed as considerable. The test report from Chevron's El Segundo Refinery shows 13.75 lb of total PM and 11.16 lb of VOCs per depressurization event. BP Whiting's application indicates that the project would increase coke production from 1,638 tons per day to 6,000 tons per day. Assuming 1,000 tons per drum, the project would increase the number of depressurization event by over four per day. Thus, depressurization venting alone would increase total PM emissions by at least 10 tons per year and VOC emissions by 8 tons per year. Actual emissions are likely to be much higher.

2. Coke drum VOC and PM10 decoking emissions were omitted from the netting analysis. According to the depressurization report, after the blow down period, the top drum head remains open for cooling, and then the coke is cut. The emissions occurring during these events are similar to that during the blowdown event. PM10 and VOC emissions from further cooling and decoking could be roughly comparable to those from depressurization, and after corrections, could double or more the depressurization emissions.
3. Fugitive sulfur emissions were omitted - H2S and reduced sulfur compounds, including H2S, are PSD pollutants. Fugitive sources, such as leaks from valves, flanges, pumps, compressors and tanks are typically major sources of reduced sulfur compounds including H2S at refineries. The project will increase the emissions of these compounds due to the processing of Canadian tar sands. Reduced sulfur compounds including H2S will be emitted from fugitive components in the new units. Coke drum vapors are about 5% H2S by weight. The depressurization, cooling, and decoking events will emit H2S and other reduced sulfur compounds from all fugitive components of the Coker, including valves, connectors, and pumps. The application did not disclose that the coke drums will emit H2S.

B. The netting analysis inappropriately used AP-42 emission factors to calculate baseline emissions. Baseline actual emissions must be based on actual testing data from the unit or a similar unit. Actual emissions must be based on measurement or other concrete, source-specific evidence, and not on industry wide average emission factors. BP should recalculate its emissions using actual data from the facility.

C. The dozens of projects that were used to offset the CXHO project are too numerous and too complex for the public to analyze in the short time period allotted, and cannot be analyzed with the information provided without doing lengthy and time consuming public information requests.

Response:

A. IDEM received an application from BP Products North America, Inc. - Whiting Business Unit, which included a detailed netting analysis for the OCC project. The application, certified by the Responsible Official at BP products North America, Inc. - Whiting Business Unit, was for a project that is minor under the PSD (Prevention of Significant Deterioration), EO (Emission Offset), and NA NSR (Nonattainment NSR) rules under 326 IAC 2-2, 326 IAC 2-3, and 326 IAC 2-1.1-5, respectively. In this application, and as detailed in the calculations included as part of this permit, all new, modified, and affected emission units from which there will be an increase in emissions associated with the OCC project have been accounted for and included in the netting analysis. This includes the new wastewater tank, the new brine treatment system, and fugitive emissions from the new wastewater components (e.g. sewers, manholes, drains, etc.). This refinery does not have wastewater ponds.

In Section D.0 of the permit, the following requirement is included in order to make the netting analysis enforceable and to ensure that the OCC project is minor under PSD, EO and NA NSR:

Following the issuance of SPM No. 089-25488-00453 the Permittee shall determine, on a monthly basis, the increase in emissions of SO2, NOx, PM, PM 10, CO, Pb, Be, Hg, H2SO4 and VOC from all new, modified and existing affected emission units at this source, and shall demonstrate, that the net emissions increases from this project are below significant levels per twelve (12) consecutive month period beginning with issuance of SPM No. 089-25488-00453, in accordance with the following:

Following the issuance of SPM No. 089-25488-00453, the net emissions increases or decreases from the CXHO project, including fugitive emissions, shall be determined each month as follows:
E_{total} = \text{Emissions increases from new, modified, and affected emissions units during the past 12 month period} \\
+ \text{emissions increases from non-CXHO related projects during the past 12 month period} \\
- \text{credible emissions decreases from CXHO related changes and creditable emissions decreases from non-CXHO related projects during the past 12 month period} \\
+ \text{emissions from creditable past contemporaneous increases} \\
- \text{emissions from creditable past contemporaneous decreases.}

The emission calculations include all increases and decreases from the affected, modified, and new emission units, including fugitive emissions. This includes fugitive VOC emissions associated with leaks from valves, flanges, pumps, compressors, and tanks. It is not expected that there will be an increase in total reduced sulfur or H2S from fugitive sources, as with VOC. The additional reductions in sulfur through the modifications to the SRU complex (see Response to Technical Comment #8) will result in reductions in fugitive TRS and H2S emissions.

With regard to the vessel depressurization at the New Coker, these emissions will be routed to the flare gas recovery system, where they are captured and recycled in the refinery fuel gas system. In addition, emissions from loading of petroleum products onto marine vessels will decrease due to the installation of a vapor control system at the marine dock. The operation of this vapor control system is required by this permit making these decreases enforceable.

B. IDEM has determined that the use of AP-42 emission factors is appropriate for baseline emissions calculations, in situations where site-specific emission factors are not available. U.S. EPA allows the use of AP-42 emission factors as one of the calculation methods for the determination of baseline emissions.

C. IDEM agrees that several projects were used to offset emissions increases from the OCC project. However, IDEM contends that the details of the emissions decreases, the effective dates of these decreases, and details of past and scheduled future shutdowns are extensively documented in Appendix C to this Addendum to the Technical Support Document. These detailed analyses were also included in Appendix C of the Technical Support Document of the draft permit. Please refer to "Response to General Comment No. 1" for IDEM's response with regards to the time allotted for the public review process for this permit.

Technical Comment No. 3:

a. (RHAMC) The application of air emission standards in the permits relies heavily on the use of credits for past and future emission reductions. Federal law requires that all emission reductions for which BP takes credit be above and beyond those otherwise required by law. Are any of the reductions for which credits are claimed otherwise required by: a. administrative or judicial enforcement order; b. consent decree (other than Consent Decree #96 CV 095RL dated 1/18/2001, as described in the footnote on page 13 of the Technical Support Document); c. regulations relating to meeting Maximum Achievable Control Technology (MACT) requirements; d. regulations relating to meeting New Source Performance Standards (NSPS), Prevention of Significant Deterioration (PSD) requirements, or Lowest Achievable Emission Rate (LAER) requirements; and/or e. requirements arising from the Indiana State Implementation Plan (SIP)?

b. (RHAMC) Can BP continue to use credits if it must reduce emissions as a result of federal or state regulatory standards that are issued during the balance of the contemporaneous period? For example, the Petroleum Refinery MACT is now in the process of being amended to address residual risk (see 72 FR 50716, September 4,
2007). There are also recently proposed regulations establishing new Standards of Performance for Petroleum Refineries (see 72 FR 27178, May 14, 2007). These regulatory initiatives could result in requirements mandating emission reductions BP is now “volunteering” to do in order to create credits. Will these credits survive new regulatory initiatives enacted during the contemporaneous period?

c. (Save the Dunes Council) Some of the reductions were from projects years ago and we question if these reductions should be credited for years into the future.

Response:

IDEM believes that the reductions in emissions of all pollutants for which credits are claimed are available and are not otherwise required by NSPS, MACT or an administrative or judicial enforcement order or a consent decree (other than Consent Decree #96 CV 095RL dated 1/18/2001, as described in the footnote on page 13 of the Technical Support Document).

The creditable emissions reductions are not otherwise required by PSD-BACT or LAER requirements, since none of the new or existing emissions units at this facility are subject to PSD-BACT or LAER.

For affected units that have baseline PM-10 emissions greater than the allowable PM-10 SIP limits under 326 IAC 6.8-2-6, the baseline emissions have been adjusted to the SIP limits for estimating the PM-10 emissions increases for these affected units.

IDEM does not have the authority to consider proposed federal regulatory requirements that may or may not be effective in the future for the evaluation of the netting analysis.

No change has been made as a result of this comment.

Technical Comment No. 4:

(Chicago and Illinois Attorney General) The specific concerns related to netting are as follows:

The analysis excludes the years 2005 and 2006 without an explanation. The application was filed in November 2007. The netting analysis must include recent data, but can go back up to 10 years. The baseline years could therefore be between 1997 and 2006. The base years used for the netting analysis submitted in this application include the period 1999-2004. There is no documentation as to why 2005 and 2006 were excluded from the netting analysis. Since the 2005 and 2006 emissions data is the most recent, it should be included in the netting analysis for an accurate and complete analysis.

Response:

Under 326 IAC 2-2 (PSD rules) and 326 IAC 2-3 (Emission Offset rules) "baseline actual emissions" are defined as follows:

For an existing emissions unit other than an electric utility steam generating unit, “baseline actual emissions” means the average rate, in tons per year, at which the emissions unit actually emitted the pollutant during any consecutive twenty-four (24) month period selected by the owner or operator within the ten (10) year period immediately preceding either the date the owner or operator begins actual construction of the project or the date a complete permit application is received by the department for a permit required by this rule, except that the ten (10) year period shall not include any period earlier than November 15, 1990...(emphasis added)

Based on this definition, the Permittee has the exclusive authority to select the representative 24 month period that otherwise meet the requirements of this definition. IDEM has determined that it
is not necessary for the Permittee to submit baseline emissions from the 2005-2006 calendar years, since the Permittee chose to use baseline years (for all pollutants) from 1999 to 2004 only for the netting analysis.

Technical Comment No. 5:

A. (Chicago and Illinois Attorney General) In the netting analysis, past emissions were calculated using natural gas emission factors, even though refinery gas was the fuel most often burned historically. Many of the units have the capability of burning multiple fuels (natural gas, RFG, LPG). Emissions for netting must be based upon the fuel or fuels actually burned during the base year period. It appears that refinery gas was burned, however, emission estimates are based upon natural gas combustion emission factors, even though refinery gas often has the highest emission factor.

B. (Chicago and Illinois Attorney General) Future emissions also were calculated using natural gas emission factors, instead of considering all possible fuel sources. The future actual emissions analysis should take into account all possible fuels allowed in the permit. Failure to consider all fuels in the future actual case would require that the future case be limited to only those fuels that actually burned in the baseline period.

Response:

Since there are no specific AP-42 emission factors for combustion of refinery fuel gas, it is appropriate to use the AP-42 emission factors for natural gas for estimating the baseline emissions, unless site-specific stack test data is available. IDEM believes that the emission rate for the other regulated pollutants would be the same or slightly higher for refinery fuel gas combustion as compared to natural gas combustion. Based on that, IDEM believes that using natural gas as the basis for emissions in baseline calculations would then lead to a lower baseline estimate, which would be a conservative approach for the netting analysis. For some of the emissions units, the Permittee is required to install Continuous Emissions Monitors for measuring SO2, CO or NOx emissions to ensure compliance with the PSD minor limits. In addition, with regard to SO2 emission rates, the Permittee is required, under NSPS Subpart J, to monitor H2S concentration in the refinery fuel gas currently, and will be required, as part of the monitoring conditions of this permit, to monitor total reduced sulfur to ensure compliance with the 80 ppm limit for the refinery fuel gas. For emission units not equipped with CEMS, the Permittee is required to perform stack tests in order to verify the emission factors used in the netting analysis, as included in Section D.0 of the draft permit. The future allowable emissions for emission units capable of burning refinery fuel gas are based on emission limits and the fuel usage. IDEM believes that the performance tests included in Condition D.0.3 (as revised) are adequate to ensure compliance with the limitations on the emissions, irrespective of the fuel burned. (see Response to Technical Comment #42 for additional information related to changes to testing)

Technical Comment No. 6:

(Chicago and Illinois Attorney General) Netting Analysis: the calculation of future actual emissions appear to under-represent the maximum permitted operating capacity of many units. The ratings for many existing sources are set at levels well below the permitted capacities when making future actual emission calculations. Operating capacities during 2005-2007 should be reviewed to verify if projected values seem reasonable based upon actual levels through stack testing.

Response:

The Permittee has proposed, as part of the application for the OCC project, voluntary limitations on throughput, fuel usage, and firing rates, which are lower than the maximum capacity of these units. The draft permit included recordkeeping and reporting requirements for all new and existing
emission units that have such limitations. IDEM has determined that these requirements are adequate to ensure compliance with the emissions limitations included in the permit.

No change has been made as a result of this comment.

Technical Comment No. 7:

(Chicago and Illinois Attorney General) Stack tests are cited and the permit uses the results of these tests as emission factors, with incomplete data of which fuel was used during the tests. From the permit information provided, it is impossible to determine whether the emission factors from these stack tests have been properly applied. For example, if the stack test was conducted while burning natural gas, the emission factor is applicable to natural gas only, and vice versa.

Response:

The emission factors submitted by the Permittee (as included in the application certified by the Responsible Official) and used in the netting analysis are derived from three sources:

A. AP-42 (Fifth Edition)
B. Stack tests performed at BP-Whiting.
C. Design guarantees based on design specifications.

IDEM believes that the Permittee has adequately documented the source of the emission factors used in the netting analysis.

No change has been made as a result of this comment.

Technical Comment No. 8:

(Chicago and Illinois Attorney General)

a. The draft permit fails to adequately explain the asserted reduction in SO2 emissions. The emission calculations for SO2 for combustion show a 50% reduction in the sulfur content of the fuel. If the reduction is due to process modifications that will improve the quality of the refinery gas, this further emphasizes that the fuel being used and that will be used in the future is actually refinery gas, not natural gas.

b. The permit uses an emission factor for SO2 that underestimates the level of sulfur in the tar sands crude. H2S and reduced sulfur compounds will be emitted in higher amounts when the refinery processes tar sands crude, mostly from fugitive sources like tanks, valves, flanges, and the sulfur recovery plant. The permit does not adequately account for these additional sources of pollution.

Response:

Unless there is a condition in the permit that prohibits the use of any fuel other than natural gas at a specific emission unit, the Permittee is allowed to use refinery fuel gas as a combustion fuel at BP's Whiting facility.

The SO2 emissions calculations were submitted as part of BP's application certified by the Responsible Official. In order to demonstrate compliance with the PSD minor limits on SO2 emissions from the new and existing emission units, the Permittee is required to install and operate CEMs to monitor total reduce sulfur (TRS) and H2S, and keep monthly records of the
SO2 emissions from these units. The Permittee is also required to submit certified quarterly report forms to demonstrate compliance with the SO2 emissions limitations. IDEM believes that the monitoring and recordkeeping requirements in the permit are adequate for demonstrating compliance with the emission limitations in the permit. In addition, with regard to RFG, see Response to Technical Comment #5 above.

In addition, the capacity of the refinery’s sulfur recovery complex will increase by a factor of 3 (three) with the OCC project. The sulfur content of the RFG will be reduced through vapor recovery, amine treatment, and new claus trains, which are specifically designed to remove sulfur from fuel gas streams prior to combustion. Although Canadian crude may contain a higher sulfur content than certain other crudes currently processed by the refinery, the overall total sulfur content in refinery fuel gas combusted in the refinery will be reduced by virtue of these enhanced and additional controls.

No change has been made as a result of this comment.

**Technical Comment No. 9 (Chicago and Illinois Attorney General):**

Data provided indicates that reductions in sulfuric acid mist will be based upon continuous emission monitoring (CEM) for SO2. However, the method of quantifying sulfuric acid mist emissions should be documented, especially for those cases where sources are being shutdown and credit taken for emission reductions.

**Response:**

The methodology for the calculation for baseline and future sulfuric acid mist emissions were included in Table C.8 of the Technical Support Document for the draft permit, as submitted by the Permittee and certified by the Responsible Official. The methodology is summarized below:

Combustion emissions are assumed to include some amount of SO3 which can react with water vapor in the stack to produce sulfuric acid mist. H2SO4 mist emissions were conservatively estimated assuming 3% of the SO2 emitted is in the form of SO3. The baseline SO2 emissions are based on source-specific H2S (hydrogen Sulfide) CEMs data, and TRS (Total Reduced Sulfur) CEMs data wherever available. This is true for all existing units, including those scheduled to be shutdown for creditable emission reductions.

**Technical Comment No. 10 (Chicago and Illinois Attorney General):**

The permit uses questionable emission factors for mercury. In all cases, BP has used API/WSPA emission factors for mercury emissions. AP-42 contains higher mercury emission factors for many units, based on the combustion of natural gas. There is no supporting documentation for the justification of using API/WSPA. This appears to be contrary to IDEM's Non Rule Policy on the use of AP-42 emission factors.

**Response:**

According to the application submitted by the Permittee and certified by the Responsible Official, the emission factor for mercury for baseline and future combustion calculations are based on industry-specific mercury emission factors developed by API/WSPA [American Petroleum Institute/Western States Petroleum Association]. These emission factors for mercury emissions from fuel gas combustion are based on a study taking data from specific units in the refining industry and are therefore believed to be the most representative emission factors available. Using EPA's hierarchy of emission factors, the API emission factor for Hg is preferred due to being established more recently and proven during recent testing at several refineries. The
baseline established using this emission factor does not affect the permit level determination as the same limit is used going forward in the revised permit.

**Technical Comment No. 11 (Chicago and Illinois Attorney General):**

A dispersion analysis is needed to understand the full impact of this project. The project's impact on air quality should be quantified by air quality dispersion modeling rather than quantified by an analysis of changes in emissions. Both the PSD and the Emission Offset rules include requirements to use dispersion computer modeling to address the air quality impact of the modification and to compare the impact to various standards established by the respective rules. There are a number of factors such as stack heights and locations that can influence the dispersion characteristics of the emissions and the overall air quality impact of the project. During the course of the project, emissions may, in fact, be significantly higher than the baseline emissions. The impact on air quality during these periods has not been addressed in the draft permit documents.

**Response:**

Based on the netting analysis submitted by the Permittee, the OCC project is minor under Prevention of Significant Deterioration (PSD), Emission Offset (EO), and Nonattainment NSR rules under 326 IAC 2-2, 326 IAC 2-3, and 326 IAC 2-1.1-5. The air quality modeling required under the PSD and EO rules do not apply to this project because of the minor status of this project.

The following requirement that is included in the permit in Condition D.0.1 addresses the issue of project increases and decreases. Since the Permittee is required to demonstrate that the increases in emissions remain below significant levels under PSD and EO rules, IDEM does not have the authority to require air quality modeling analysis during the interim period of this phased construction project.

> Following the issuance of SPM No. 089-25488-00453 the Permittee shall determine, on a monthly basis, the increase in emissions of SO2, NOx, PM, PM 10, CO, Pb, Be, Hg, H2SO4 and VOC from all new, modified and existing affected emission units at this source, and shall demonstrate, that the net emissions increases from this project remain below significant levels per twelve (12) consecutive month period beginning with issuance of SPM No. 089-25488-00453, in accordance with the following:...

No change has been made as a result of this comment.

**Technical Comment No. 12 (Chicago and Illinois Attorney General):**

The permit does not comply with the current requirements in Indiana's SIP. It instead incorporates proposed preliminary revisions to the SIP that have not been approved by EPA.

**Response:**

See Response to "EPA Comment No. 2".

**Technical Comment No. 13 (Chicago and Illinois Attorney General):**

Heavy crude data - To evaluate the potential to emit from various process units in the refinery after the completion of construction of the OCC project, it is necessary to have a complete analysis of the Canadian Extra Heavy Oil including its physical properties such as ash content, viscosity, viscosity index, boiling point, and vapor pressure among others.
Response:

The emissions estimates for various emission units at this facility were included in the application submitted by the Permittee and certified by the Responsible Official. These emissions estimates were based on a significant amount of research and evaluation, including evaluations of CXHO which BP currently processes at the Whiting facility. The Whiting plant currently processes approximately 20-25% CXHO, and so the information provided is based on BP’s evaluation of this crude stock. In addition, IDEM believes that the compliance determination and monitoring requirements, and the associated recordkeeping and reporting requirements, included in this permit are adequate to demonstrate compliance with the PSD, EO, and NA-NSR minor limits included in the permit.

No change has been made as a result of this comment.

Technical Comment No. 14 (Chicago and Illinois Attorney General):

Insufficient flaring data - Section D.35 does not contain adequate data to evaluate the sufficiency of the engineering design. The footnote on page 1 states that the GOHT and South flare are equipped with a flare gas recovery system, however the maximum capacity has not been determined.

Response:

The flare gas recovery system is designed to capture and recycle emissions from the associated emission units. These emissions are recovered and utilized in the refinery fuel gas system. BP has designed a recovery system with sufficient capacity to collect all emissions associated with routine or normal flaring events, including routine maintenance and repair periods. In addition, the flare gas recovery system is equipped with a back-up compressor of the same capacity as the primary compressor.

See response to Technical Comment #1 for further information regarding flaring.

Technical Comment No. 15:

a. Susan MiHalo (Ogden Dunes, IN) The permit should contain a compliance schedule to address the violations included in U.S. EPA's Notice of Violation and Finding of Violation sent to BP on November 29, 2007.

b. (RHAMC) A fundamental purpose of the Title V permitting program is to ensure that regulated entities comply with requirements in the Clean Air Act. Under 40 C.F.R. § 70.1(b) and Clean Air Act § 504(a), each regulated major source must obtain a permit that "assures compliance by the source with all applicable requirements." A Title V permit applicant must disclose its compliance status and either certify compliance or enter into an enforceable schedule of compliance to remedy violations. 42 U.S.C. § 7661b(b); 40 C.F.R. § 70.5(c)(8-9).

Mindful of these requirements, on what basis does IDEM assert that a schedule of compliance or compliance plan is not required as part of issuing the Title 5 permit in lights of: a. the Finding and Notice of Violation issued by U.S. EPA Region 5 to BP Products North America, Inc., Whiting, Indiana on or about November 29, 2007, and, b. the Finding and Notice of Violation issued by U.S. EPA Region 5 to BP Products North America, Inc., Whiting, Indiana on or about January 25, 2007 (EPA-07-IN-03)?

The operating permits must include a compliance schedule remedying these violations. 40 CFR § 70.5(c)(8)(iii)(C). Pursuant to this section, if a facility is in violation of an
applicable requirement at the time of permit issuance, the facility's permit must include a schedule leading to compliance with that requirement. The only exemption is if the reported violation has been corrected prior to permit issuance. Applicable requirements include, among others, the requirement to comply with state implementation plan ("SIP") requirements. See 40 C.F.R. § 70.2. If a facility is in violation of an applicable requirement at the time that it receives an operating permit, the facility's permit must include a compliance schedule. See 40 C.F.R. § 70.5(c)(8)(iii)(C). The compliance schedule must contain "an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance." See 40 C.F.R. § 70.5(c)(8)(iii)(C).

c. (Save the Dunes Council) In November 2007, the U.S. EPA issued a Notice of Violation to the BP whiting facility for numerous violations of the Clean Air Act. The Commenter understands that the Clean Air Act prevents issuing a new operating permit until a compliance schedule is ordered that will rectify these violations.

d. (Chicago and Illinois Attorney General) The Attorney General's Office received from the U.S. EPA a copy of their Notice of Violation and Finding of Violation sent to BP on November 29, 2007. The permit should contain a compliance schedule to address these violations.

e. (NRDC Group) IDEM failed to require and include a schedule of compliance for the violations identified in the NOV issued to BP in connection with the Whiting Refinery. In addition, deviation reports concerning flaring submitted to IDEM indicate repeated violations of current flare emissions limitations. Under Title V of the CAA and associated regulations, IDEM was required to mandate submission of a schedule of compliance addressing these violations, and to include it in the Project Title V permit modification. BP failed to submit the required schedule of compliance. IDEM must make a determination that BP's Title V permit application is incomplete, and require submission of a schedule of compliance, and the schedule of compliance must be incorporated into the permit.

Response:

See response to "EPA Comment No. 6".

Technical Comment No. 16 (RHAMC):

In an earlier 2006 permit application, BP indicated there would be increases in CO such that PSD review would be triggered. We have reviewed the 2006 and 2007 permit applications at some length to determine the basis for the 2007 permit application's much lower calculation of projected CO emissions. Is it accurate to conclude that the 2007 permit application does not include any CO emission control equipment additional to that provided in the 2006 permit application?

Response:

There are no CO emission controls proposed in either application. The November 2007 application was a completely new application with significant changes to the original engineering and design of the OCC project. This included more specific emissions information related to vendor guaranteed emission rates for certain units, and the replacement of additional units, not originally proposed, with more modern, lower emitting units. Therefore, given that the pending permit is based exclusively on the information provided in the November 2007 application and the associated project design, it is not appropriate to compare the pending permit to the earlier application received in 2006.

No change has been made as a result of this comment.
Technical Comment No. 17:

a. (RHAMC) The most recent permit application contains some emission rates that are significantly lower than those given in the earlier, 2006 permit application. Specifically, Table 3.2 of the 2007 permit application relies on a CO emission rates of 0.04 lbs/MMBTU for Unit B-601A; the earlier permit shows an emission rate for this unit of 0.05 lbs/MMBTU. Similarly, emission rates in the 2007 permit application for H-101, H-201-203, and HU1-HU2 are, respectively, 0.019, 0.019, and 0.015 lbs/MMBTU while the emission rates for these same units in the earlier permit application were all 0.04 lbs/MMBTU. What is the basis for this change in estimated emission rates from these units?

If the lower CO emission estimates reflect a recalculation rather than additional equipment controls, shouldn’t the CO potential to emit be established at the higher estimate? In answering this question, please be mindful of the regulatory definition of potential to emit:

The maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of fuel combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable.

40 C.F.R. Sections 52.21(b)(4), 51.165(a)(1)(iii), 51.166(b)(4).

b. (Save the Dunes Council) Commenter is concerned about the Emissions Inventory in the application and urges IDEM to take a closer look at the total emissions. The first application showed a significant increase in one regulated pollutant - CO, by 420 tons per year. The current application shows a reduction in that and most regulated pollutants. However, some of the reductions were from projects years ago and the Commenter questions if these reductions should be credited for increases years into the future.

Response:

a. As explained in "Response to Technical Comment No. 16", there is no basis for comparing the details of the 2006 application with the permit application received in 2007. The PSD and EO minor limits on emission factors for all heaters were made practically enforceable in the permit by either including a requirement for conducting stack tests, or by requiring a use of a CO CEMs. IDEM has determined that it is irrelevant that the CO potential to emit should be based on the higher estimate included in the 2006 application, because the practically enforceable limitations included in the permit on the CO emission factors, along with the enforceable limitations on fuel usages at these heaters, are adequate to demonstrate compliance with the PSD and EO minor limits included in the permit.

b. Pursuant to 326 IAC 2-2 and 326 IAC 2-3, the contemporaneous period is defined as follows:

An increase or decrease in actual emissions is contemporaneous with the increase from the particular change only if it occurs between the following:

(A) The date five (5) years before construction of the particular change commences.
(B) The date that the increase from the particular change occurs.
Based on the above, IDEM has determined that past emissions reductions that occurred within the contemporaneous period from the commencement of the OCC project are creditable emissions reductions.

No change has been made as a result of this comment.

**Technical Comment No. 18:**

Several Commenters expressed concerns related to the emissions and netting calculations included in this permit, and the permit level determination. Their comments are summarized below:

a. (RHAMC) For the purpose of assessing the actual impact of BP’s proposed project on public health and the environment, it is critical that we can compare actual emissions before the modifications to projected emissions during and after those modifications. While the permit contains a list of 2003 actual emissions in tons per year from the entire facility (p. 4 of TSD), there is no comparable table that quantifies estimated actual emissions in tons per year for each year between 2003 and 2012, when the modifications/shutdowns/new units identified in the permit have all been put into place. While the permit’s focus on netting, “contemporaneous” credits and consent decree reductions may be of import in terms of legally applicable emission standards, it is the true change in air emissions before, during and after this project that will affect the health and environment that RHAMC is concerned about.

IDEM’s permit should require BP to provide information describing actual emissions for every affected individual emission unit and source identified in the permit, along with annual projections of increases/decreases from that unit, for the entire contemporaneous period, for each pollutant. This information is necessary to ensure that permit terms and conditions are practically enforceable.

IDEM’s permit should provide for the availability on its website of BP’s annual and/or semi-annual reports on actual emissions during this period so that the public can determine whether actual emissions are as projected in the draft permits.

b. BP’s actual emissions show:

PM emissions in tons per year:
2006 (actual): 544
2011 (projected): 658

This is 114 tons per year increase. It is my understanding that the limit for being considered a major modification is 15 tons per year. It is also my understanding that BP is planning on using their emission credits to decrease that number by 107.3. This leaves them with a net increase of 6.7. We all know that without use of the credits, BP would be considered a major modification and subject to stricter emission controls. I do not want my children exposed to 114 additional tons per year. These emission credits are an administrative scheme and we all know it. Please place stricter restrictions on BP to the Clean Air standards and do not allow them to be grandfathered in to lesser standards.

c. (Save the Dunes Council) The Commenter is unclear about the increases in PM and SO2 emissions. In their "Whiting Modernization Plan Update (February 2008), the company claims that there will be an increase of 114 tons of PM10 and SO2 will increase by 211 tons per year. Other information in the TSD has other numbers. What is the correct amount of increases for these regulated pollutants? How does that compare with the statements that there are no increases in regulated pollutants?
d. (Sauk-Calumet Sierra) The Commenter is concerned about increases in particulate matter, sulfur dioxide, hydrogen sulfide, lead and greenhouse gases. BP expects its expansion project to increase the facility's carbon dioxide emissions by 30 to 50 percent although carbon dioxide is not regulated under the permit.

e. (Daniel Grelck, Lowell, IN) Why is IDEM permitting BP to discharge 24% more lead emissions? When asked about the added lead exposure, the IDEM official stated that there was no lead increase. He later retracted his statement. BP said there would be an increase. Has IDEM read or even understood what is in the entire permit?

f. (Bryant Mitol, speaker) There is going to be a significant (25 - 30%) increase in lead, which is one of the most dangerous neurotoxins in this country.

g. (Kim Ferraro, Legal Environmental Aid Foundation) The Clean Air Act certainly does not prohibit BP from expanding its facility; however, the Clean Air Act does require that all of the Whiting Refinery's emissions be included in the netting analysis, including emissions from the three new flares that will be built as part of the refinery's expansion project. If these emissions are included in the calculations, the project will correctly be deemed a major modification subject to more stringent requirements. The permit should be issued with appropriate limits, including Best Available Control Technology (BACT), and Lowest achievable Emission Rate (LAER), as required for all major modifications of existing sources of air pollution under the Clean Air Act.

h. (Ann Alexander, NRDC) The pollution reductions in CO being claimed (compared to the 2006 application) are not being achieved by actually controlling emissions, but by simply not counting them at all. In short, they are not real.

i. (Larry Silvestri, speaker) Emissions of benzene, pyrene, cyanide, mercury, are not included in this permit. This permit does not quantify 15 or 20 dioxins. Insignificant activities include annual emissions of 40 tons per year of SO2, nitrous oxide, carbon dioxide and lead and other unnamed hazardous air pollutants.

Response:

The emissions of CO2 and other greenhouse gases are addressed in the response to "Technical Comment No. 34". The flare emissions are addressed in the response to "Technical Comment No. 1".

The PM, PM10, Pb, H2S and SO2 emissions calculations for the OCC project are based on the calculations submitted by the Permittee (certified by the Responsible Official) as included in Appendix C and E to this Addendum to the Technical Support Document. The netting analysis is summarized below. This source is a major source of HAPs and is subject to several NESHAPs (National Emission Standards for Hazardous Air Pollutants) as included in the E sections of the permit. IDEM does not believe that enumerating the emissions of individual HAPs is necessary as part of this permit. Lead and mercury emissions were included in Section C and E of the permit, and show a decrease in the netting analysis submitted by the Permittee (and certified by the Responsible Official).

PM and PM10 Netting Analysis:
The PM and PM10 emissions from the CXHO project are calculated from the following:

The net emissions increase of PM/PM10 from this project is the amount by which the sum of the following exceeds zero:
(a) The increase in PM/PM10 emissions from its baseline year (Calculated from the average of 24 consecutive month period within the ten year period preceding the start of construction of the project) from this proposed project:

<table>
<thead>
<tr>
<th></th>
<th>PM (tons per year)</th>
<th>PM10 (tons per year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Emissions Increase</td>
<td>138.9</td>
<td>216.7</td>
</tr>
</tbody>
</table>

(b) Voluntary enforceable reduction by BP in PM/PM10 emissions from its existing operation during the contemporaneous period (Any baseline year, allowed by USEPA and IDEM, within 5 year preceding the start of construction and up to start of the operation of the new equipment). This is allowed by the federal and Indiana PSD (Prevention of Significant Deterioration) rules.

Net effect is the reduction of more than 200 tons per year of PM and PM10 as shown in the following table. These reductions are made enforceable in the permit. The Permittee also is required to keep emissions records and submit quarterly reports to demonstrate compliance with all emissions limitations included in the permit.

<table>

SO2 Netting Analysis

Pursuant to Consent Decree (United States et. al. vs. BP Exploration and Oil, et. al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL), 10% of SO2 netting credits generated by the cessation of oil burning at heaters and boilers and reduction of SO2 concentration at the outlet of FCU600 can be used to offset emissions increases only at units that meet the definition of "Lower Sulfur Fuel Units" and "Netting Offset Generating Units". These SO2 credits cannot be used to offset increases at other emission units, including flares and Tail Gas Units (COT1 and COT2). Table C.82a shows the detailed calculations for SO2 netting analysis conducted in accordance with the requirements of the Consent Decree. The summary of the SO2 netting analysis is as follows:

Total increases in SO2 emissions at "Lower Sulfur Fuel Units" = 107.3 tpy
Total available SO2 credits from cessation of fuel oil burning = 269.4 tpy

Total increases in SO2 emissions at other "Netting/Offset Generating Units" = 149.5 tpy
Total available SO2 credits from FCU 600 consent decree reduction = 160.9 tpy
Total increases in SO2 emissions from other emission units = 203.3 tpy
Total available non-consent decree related SO2 credits = 230.1 tpy

The total available SO2 credits available as offsets in all three categories exceed the SO2 emissions increases from new, modified, affected, and future contemporaneous non-CXHO related units. Therefore, the SO2 emissions increases do not exceed the significant level for SO2.

There is no guarantee that if this project was reviewed as a major source for PSD, there will be any reduction in emissions or there will be any economically and technologically feasible controls applicable to the emissions units at this source.

**H2S and Pb Netting Analysis**

The netting analysis submitted by the Permittee (and certified by the Responsible Official) shows a reduction in emissions of H2S, and lead (Pb) as shown below (in tons per year):

No change has been made as a result of this comment.

**Technical Comment No. 19 (RHAMC):**

How will IDEM ensure that during this contemporaneous period there will not be an emission increase without a corresponding decrease, such that the facility does not emit a pollutant above the significance level at any time?

**Response:**

The following requirement that is included in the permit in Condition D.0.1 addresses the issue of project increases and decreases during the interim period from the commencement of construction to the startup of Coker #2 (which signifies the end of the CXHO project). Since the Permittee is required to demonstrate that the increases in emissions remain below significant levels under PSD and EO rules, IDEM does not have the authority to require air quality modeling analysis during the interim period of this phased construction project.
Following the issuance of SPM No. 089-25488-00453 the Permittee shall determine, on a monthly basis, the increase in emissions of SO2, NOx, PM, PM 10, CO, Pb, Be, Hg, H2SO4 and VOC from all new, modified and existing affected emission units at this source, and shall demonstrate, that the net emissions increases from this project remain below significant levels per twelve (12) consecutive month period beginning with issuance of SPM No. 089-25488-00453, in accordance with the following:

No change has been made as a result of this comment.

Technical Comment No. 20 (RHAMC):

Does the netting exercise include every emission unit and source at the refinery? If not, what units and sources are not included? How will IDEM and/or BP monitor these units to ensure that changes at the refinery, including increased production, will not lead to emission increases at these units?

Response:

The emission units included in the netting analysis submitted by the Permittee, and evaluated by IDEM, include new units, modified units and affected units that are involved in processing of the Canadian crude. Based on its evaluation, IDEM has no reason to believe that other emission units, that are affected by the project, were excluded from the netting analysis. IDEM has included comprehensive monitoring, recordkeeping, and reporting requirements in the permit which are adequate to ensure compliance with the emissions limitations in the permit and to ensure that the net increases from the OCC project remain below the significant levels. In addition, IDEM has inspectors stationed in northwest Indiana responsible for monitoring the operations at the BP refinery. One of their responsibilities will be to conduct inspections at the plant to verify compliance with the requirements of this permit.

No change has been made as a result of this comment.

Technical Comment No. 21 (RHAMC):

At the completion of its construction/modification activities, will BP be allowed to sell emission credits resulting from the reductions it anticipates?

Response:

Emissions reductions used as creditable decreases in the netting evaluation, and made enforceable through this permit, will not be available for sale. Any emission reductions that are above and beyond the reductions required as part of this netting analysis, may be available for sale, but that beyond the scope of this permitting action.

Technical Comment No. 22 (RHAMC):

When will the credits from the 2001 Consent Decree emission reductions expire? What if these credits expire before BP constructs the new/modified emission units? If so, how can the emissions from those new/modified units be offset in any way by the consent decree “credits”?

By way of background to this question, BP is taking significant credits (for SO2 and PM) from the Consent Decree excess reduction. In Table C.82 of the 2007 permit application, there is a list of “Past Contemporaneous Changes.” [Note: The draft permit uses Table 82 for everything but SO2 and Table 82a for SO2; the dates in the application Table 82 are not included in the permit Table 82.] The largest of these, at least for SO2 and PM, is from the 2001 Consent Decree and that change is described as “effective 6/01/03.” Under U.S.EPA’s new source rules, the ten-year
"lookback rule" for baseline emission is measured from the date of the permit application. See 67 Fed. Reg. 80195 (12/31/2002). But the rules indicate that credits for emission reductions during the "contemporaneous period" must have occurred between the date five years before construction of the change and the date that the increase from the change occurs.

Response:

The emission credits from the 2001 Consent Decree emissions reductions relevant to this project would expire on June 1, 2008 unless BP commences construction prior to that date. Under the major NSR regulations, commence construction refers to the project and not individual emission units. Therefore, provided construction commences on any part the project prior to June 1, 2008, even if all the modifications and new units are not fully constructed, the credits will not expire.

Based on the calculations included in the application, submitted by the Permittee and certified by the Responsible Official, IDEM and the US EPA have determined that the credits used by BP for the OCC project, some of which were generated by complying with the consent decree, are available for use in this netting analysis. Only these creditable reductions are included as part of this netting analysis. IDEM and the US EPA have coordinated on this issue and both agencies agree that the credits being utilized are consistent with the allowances established in this Federal Consent Decree.

Technical Comment No. 23 (RHAMC):

The permits rely to a great extent on CEM results for reviewing the source’s compliance status. Indeed, emission testing appears to be limited to once every five years (Section D.0.3). As the permit is unclear about where CEMs are required, can IDEM provide a complete list of units that are required to have CEMs? For those units that are not monitored by CEMs, can IDEM provide a description of how it will verify emission rates and total emissions?

Response:

Sections D.1 through D.45 in the permit already include requirements for the operation of CEMs wherever the Permittee is required to utilize CEMs for demonstrating compliance with emission limitations. For emission units that are not equipped with CEMs, IDEM has determined that the testing requirements in Section D.0.3 are adequate for demonstrating compliance with the requirements of the permit. To evaluate these requirements, you can refer to the Compliance Determination Section of the respective D sections of the permit and the Compliance Monitoring and Determination section of the Technical Support Document.

Technical Comment No. 24 (RHAMC):

What steps has IDEM taken to ensure BP has not commenced construction activity before a construction permit has issued? What are the results of any investigations?

Response:

IDEM has no knowledge of any construction activities related to the OCC project, for which prior construction approval would be required. IDEM routinely inspects this source to verify compliance with its permit and all applicable State and Federal requirements. If there was an indication during one of these inspections that construction had commenced it would be documented and the appropriate response would be taken by IDEM.
Technical Comment No. 25 (RHAMC):

On what basis does IDEM assert that the actual technology employed in the new decoking unit is not relevant to IDEM’s review of unit emissions and emission controls, as claimed by an IDEM representative during the Information Session on March 14, 2008?

Response:

The requirements included in the draft permit are based on the design specifications submitted by the Permittee. IDEM does not have the authority to dictate actual technology employed in the new decoking unit or any other process units involved in the OCC project. IDEM is obligated by regulation to evaluate the project as proposed by the applicant and determine if the project is capable of meeting all applicable State and Federal requirements. The method by which the source produces its respective products is not relevant to our evaluation.

Technical Comment No. 26 (RHAMC):

There are three new flares listed in the permit: the GOHT flare, the South Flare and the HU flare. There is also reference in the 2007 permit application to the “VRU flare.” BP asserts in its permit application that the new flares will have a gas recovery system so that no emissions will be released unless there is a problem at the plant. The permit does estimate a very small amount of emissions from the flares based on an estimate of those emergencies. Based on experiences at other comparable refineries, will the flare gas recovery system operate as BP claims, and are the estimates of the amount of emissions comparable to other refineries?

Are there any limits on emissions from the flares during periods when the gas recovery system is not functioning properly? How will these emissions be controlled and monitored?

Response:

Please see response to “Technical Comment No. 1”.

Technical Comment No. 27 (RHAMC):

Are fugitive emissions from the off-gassing of sludge that is a byproduct of new production processes included in emission estimates?

Response:

According to the application submitted by the Permittee and certified by the Responsible Official, the project includes two new processes that involve sludge handling. These include the brine treatment system and a new thermal desorption unit. The emissions from these units were included in the overall project emission calculations.

In regards to the off-site shipment of waste materials, the OCC project will result in a decrease of waste generated. The reduction will be achieved by the replacement of the existing coke yard operation with an enclosed coke handling system, the installation of the brine treatment system to remove oil and solids from a wastewater stream before it enters the sewer system and the shutdown of a treating process that contains leaded catalyst and clay.

Technical Comment No. 28 (RHAMC):

Are increased vehicle emissions related to the proposed facility construction and modification activities included in emission estimates? Does the construction permit include emission estimates related to the release of volatiles from painting and coating surfaces on new units?
Response:

According to the application submitted by the Permittee and certified by the Responsible Official, all fugitive emissions from emission units and production operations have been included in the netting analysis. Emissions generated from construction activities related to the project are not regulated.

Technical Comment No. 29 (RHAMC):

If this permit were being issued under PSD or LAER requirements, would IDEM have a basis to impose additional measures beyond those strictly mandated by NSPS? For hazardous air pollutants, doesn’t IDEM have the legal authority to develop facility specific MACT standards?

Response:

There is no guarantee that if this project was reviewed as a major modification under PSD or EO, additional controls would be determined to be economically and/or technologically feasible for the emissions units modified or added at this source. Additional evaluation would be necessary to determine what BACT (Best Available Control Technology) or LAER (Lowest Achievable Emission Rate) would be for this project. However, IDEM does not have the authority to issue a permit imposing BACT or LAER requirements for a project that is deemed minor under 326 IAC 2-2 (PSD), 326 IAC 2-3 (EO), and 326 IAC 2-1.1-5 (NA NSR). IDEM has determined that this project is minor under these regulations and therefore it has not triggered BACT and/or LAER, so no additional evaluation is necessary.

The emission units at this source are already subject to several MACT standards which are identified in Sections E. 1 through E.26 of the permit (along with NSPS requirements). IDEM would only establish a facility specific MACT standard if no MACT standard had been promulgated for the respective operation. In this case, the units involved are already subject to MACT Standards that are effective or have been promulgated by the US EPA.

No change has been made as a result of this comment.

Technical Comment No. 30 (RHAMC):

There are several, overlapping permitting activities for the BP facility, for example, the permit for the asphalt plant (#089-24068-00453), the tank-cleaning facilities (#089-6741-00453) and the diesel fuel production plant (#089-24410-00453). Will emissions from those plants change as a result of the changes to the refinery? Does the permit for the refinery modification include any credits for changes at the asphalt plant, diesel fuel plant or tank-cleaning facility?

Response:

The increases in emissions from the asphalt infrastructure project (permit no. 089-24068-00453), the tank sludge cleaning project (permit no. 089-24258-00453) are included in the netting analysis as shown in Table C.82 of Appendix C of the Technical Support Document as well in Table C.82 in Appendix C of the Addendum to the Technical Support Document. The permit numbers cited by the Commenter are in part erroneous: the tank sludge cleaning project was permitted in source modification no. 089-24258-00453, and incorporated into the Part 70 permit through permit modification no. 089-24410-00453. These source and permit modifications also included some diesel-fired emissions units, and the emissions from the entire project are included in the netting analysis. Permit number 089-6741-00453 is the Part 70 permit number, and does not include the tank cleaning operation.
Technical Comment No. 31:

It would be helpful if IDEM would include details on the amount of emissions allowed during upset events and startup, shutdown, and malfunctions before and after the permit modification. This information should include carbon monoxide, nitrogen oxides, sulfur dioxide, VOCs, particulate matter, mercury and CO2.

In addition, the public needs more details on BP’s plans to implement projects such as installation and operation of continuous ambient air quality monitoring stations around the refinery, enhanced street sweeping of roads around the refinery, and particulate matter controls on refinery trucks. If the planned modifications would affect the wastewater treatment system or pollutant discharges to Lake Michigan, additional details on these impacts must be explained in detail.

Response:

Ambient air quality monitoring is a requirement of the PSD permitting program [40 CFR 52.21(m)]. Since the OCC project results in a net decrease in emissions of criteria pollutants, and therefore does not trigger PSD permitting requirements, IDEM has determined that the installation of ambient air quality monitoring stations is not required for this project.

The OCC project will result in a decrease in fugitive dust particulate matter emissions. The current method of shipping coke offsite in trucks will be eliminated. The OCC project includes replacement of the current coke handling operations with a system that will include enclosed conveyors, an enclosed storage area, as well as enclosed and/or controlled transfer points. The new coke handling system will load coke into rail cars, thus eliminating coke truck traffic into and out of the refinery. BP will also, as part of the OCC project, comply with the updated fugitive dust control plan attached to the permit.

Pollutant discharges to Lake Michigan are addressed in the previously issued water permit for the OCC project, issued by IDEM, Office of Water Quality. Office of Air Quality does not regulate pollutant discharges to Lake Michigan. Therefore, this comment will not be addressed as part of BP Whiting’s air.

Also see Technical Response #1 for information regarding how start-up, shutdown, and malfunctions were accounted for in this permit.

Technical Comment No. 32:

IDEM needs to provide the public with the amount of permitted emissions today for each pollutant from the entire site and the proposed permitted emissions after the project is completed, including CO2.

Response:

The permitted emissions for the entire BP refinery would be the summation of allowable and potential emissions from all units currently operating at the plant. Given that this project did not affect all units at the plant, the calculations necessary for this permit are not all inclusive. The calculations included with this permit are only those necessary to evaluate the project and make the necessary regulatory determinations. The information necessary to make these expanded calculations are available to the commenter and can be done by reviewing the current permit, which is available on IDEM’s website, in its entirety.

The emissions for each regulated pollutant (except for CO2, which is addressed in Response to Technical Comment No. 4) from the entire site, after the project is completed, are provided in Appendix C and E of this Addendum to the Technical Support Document to draft permits no. 089-
The baseline emissions for each pollutant are also provided in Appendix C.

Technical Comment No. 33:

The following Commenters expressed the opinion that carbon dioxide (CO2) and other greenhouse gases should have been addressed by the permit: NRDC Group, Sauk Calumet Sierra, Save the Dunes Council, Councilman Mark Kalwinski (Hammond, IN), Susan Mihalo (Ogden Dunes, IN), Marian Byrnes (Chicago, IL), Gerry M. Weston (Chicago, IL), Kim Ferraro (Legal Environmental Aid Foundation), Daniel Grelck (Lowell, IN). Their comments are summarized below:

a. Indiana law and the Clean Air Act require the Permits to address the post-BACT emissions of greenhouse gases from the expansion. One effective way of doing so is to require BP to offset these emissions on at least a ratio of 2:1 on a carbon equivalent basis, under clear rules ensuring that the offsets are additional, verifiable, real, regionally-based, permanent, and legally and practically enforceable. We respectfully request that the draft permits not be issued in their current form, without such offsets or equivalent measures.

b. IDEM needs to provide the public with the amount of proposed CO2 emissions after the OCC project is completed. No public hearing testimony should be needed on the issue of CO2. Silent testimony is presented every day, all around the world, by dead and dying coral reefs, by drowning polar bears, by summer spells of unbearable heat and drought. Regulations IDEM is obligated to follow do not take these global disasters into account. But global warming conditions have far outrun the regulations, and it has become obvious that everything in our power should be done to curb any and all increases in CO2 emissions. IDEM regulations can and must be upgraded to prevent significant increases in CO2 emissions.

c. The project will cause a huge increase in CO2. The company estimates that there will be a 30-40% increase "currently projected to be in the range of 1.5-2 million tons per year" or as much as 4 billion pounds of this greenhouse gas. This must be reduced or mitigated and with the huge profits BP has registered, it is affordable. How is IDEM addressing CO2?

d. Methane gas is a potent greenhouse gas, 23 times stronger than CO2. Methane is present in many parts of the refinery, as a portion of the many different hydrocarbons present. Methane emissions were not evaluated as part of the Project despite the fact that operation of project components will definitely result in methane emissions. Methane emissions at refineries are often overlooked because they are frequently exempt from smog VOC regulations. Although methane is a type of volatile organic compound, it is often excluded from VOC definitions because methane was previously considered not to be a strong contributor to smog (although newer evidence shows that it IS a major contributor). However, exclusion for assessment as a smog precursor is no reason not to evaluate methane emissions as GHGs.

Examples of sources of methane emissions at oil refineries include tanks and pressure relief devices, as well as emissions of uncombusted methane from combustion sources that are never perfectly efficient. Additionally, according to US EPA, the greenhouse gas N2O is a normal product of the combustion of fossil fuels (which oil refineries obviously combust in large volumes in order to produce gas, diesel, etc.):

Mobile and stationary sources of fossil fuel combustion. N2O is a product of the reaction that occurs between nitrogen and oxygen during fossil fuel combustion. The volume
emitted varies with the fuel type, technology, or pollution control device used, as well as maintenance and operating practices.

All GHG increases as a result of the Project need to be assessed.

e. BP must at a minimum meet CAA requirements to assess the quantity of GHGs from the expansion and conduct BACT analysis for all refinery GHG sources. The expected increase in GHG emissions is greater than the PSD significance threshold, which is any emissions of each GHG. IDEM nonetheless failed to include BACT limits on increases in any of the GHGs expected from the expansion. Indeed, the Permits contain no GHG reduction commitments at all. This failure is in violation of the CAA, even more so following this year's U.S. Supreme Court ruling in Massachusetts v. EPA, 127 S.Ct. 1438, 1460 (2007), holding that CO2 and other greenhouse gases are "pollutants" under the CAA. The draft Permits must be revised to include such limits. In addition, under state law, GHG emissions that will occur after application of BACT must be offset to protect the public health.

The Permits may not issue without BACT limits and offsets for GHGs, and IDEM must declare BP's application incomplete until sufficient information to conduct BACT and offset analyses concerning GHGs is provided. BP must provide this information not only to comply with the requirements of the CAA, but to fulfill its public commitment to GHG emission reduction.

f. BP's failure to comply with these requirements, and to implement measures that will curtail GHG emissions from the Project, is particularly unfortunate in light of the Company's pronouncements concerning not only the importance of limiting GHG emissions that cause global warming, but also the availability of measures by which to do so at its refineries. Refineries including BP have recognized that greenhouse gases can be reduced at refineries. These reductions are available in particular through flare minimization, as included in the following statement made by a BP official at Stanford University more than 10 years ago:

"Our carbon dioxide emissions result from burning hydrocarbon fuels to produce heat and power, from flaring feed and product gases, and directly from the process of separation or transformation. Now we want to go further. We have to continue to improve the efficiency with which we use energy...We have already taken some steps in the right direction. In Norway, for example, we've reduced flaring to less than 20% of 1991 levels, primarily as a result of very simple, low cost measures. The operation there is now close to the technical minimum flare rate which is dictated by safety considerations."

g. The U.S. Supreme Court has held that CO2 is a CAA "Pollutant". The CAA PSD Provisions require BACT for each pollutant "subject to regulation". The significance level for CO2 and other greenhouse gases is any amount above zero. CO2 is currently regulated under the CAA Acid Rain provisions. CO2 is subject to further regulation under the CAA. A pollutant need not be specifically regulated by a Section 111 or 112 standard to be considered regulated. Under both Sections 111 and 202 of the CAA, CO2 can be regulated, and should be regulated.

h. On May 14, 2007, President Bush issued an Executive Order confirming the Supreme Court's ruling that USEPA can regulate greenhouse gases, including CO2, from motor vehicles, nonroad vehicles and nonroad engines under the Clean Air Act.21 The Executive Order directs USEPA to coordinate with other federal agencies in undertaking such regulatory action. The President's action indicates the Chief Executive is also of the opinion that carbon dioxide is subject to regulation under the Clean Air Act.
i. Other greenhouse gases such as methane and nitrous oxide are also subject to regulation.

j. The main sources of GHGs from refineries are stationary combustion, FCCU catalyst regeneration, and hydrogen process vent. Numerous opportunities exist for reduction of GHGs from these and other sources. A useful starting point are the GHG mitigation measures from the Final Environmental Impact Report for the Chevron Energy and Hydrogen Renewal Project in Richmond, California (attached as Exhibit 14). A list of measures relevant to the Whiting Refinery is as follows:

- Engage energy efficiency engineers to conduct a thorough audit of fuel, electricity and natural gas use at the Refinery to identify potential energy savings and energy efficiency improvements, and implement those feasible measures identified.
- Replace stationary, non-emergency diesel internal combustion engines.
- Retrofit or replace old process heaters to use new high efficiency burners, oxyfuel (use of oxygen instead of air), advanced controls, and/or more heat recovery.
- Add/improve heat exchangers.
- Replace existing CoGens with higher-efficiency units, or add CoGen units.
- Replace stationary, non-emergency internal combustion engines with high efficiency electric motors. Implement process efficiencies (e.g., control fouling in crude unit preheater train).
- Initiate carbon sequestration, capture and export.
- Any reduction measures recommended by the state agency for refineries.

To the extent that these measures have not or are not being conducted at the refinery or as a part of the expansion project, they should be considered in the required BACT analyses for GHGs, along with any other identified control options. Such audits, retrofits and equipment installations can provide much-needed jobs to the Indiana economy.

k. The permit may not be issued unless greenhouse gases are limited sufficiently to protect human health. Indiana law prohibits the issuance of a permit that is not "protective of public health". See 326 IAC 2-1.1-5. This prohibition is independent of the requirement that permits ensure compliance with ambient air quality standards, PSD increments, and all other applicable air pollution control rules.

Given the relative difficulty in controlling GHGs from refineries due to the many and dispersed sources of GHGs, the Whiting refinery is likely to result in a significant volume of GHG emissions even after imposition of BACT. The public health threat associated with these climate change-causing GHGs is well documented. Regional concerns from global warming are presented in the U.S. Global Change Research Program's report entitled *Climate Change Impacts on the United States: The Potential Consequences of Climate Variability and Change (National Assessment)*. The report was authored by scientists from the U.S. Geological Survey, USDA Forest Service, and numerous universities across the nation. According to the report, the Midwest is likely to face grave problems in terms of water quantity and quality due to drought and increasing heavy precipitation events, as well as dangerous increases in temperature and increases in respiratory disease due to increased pollution accompanying high temperatures.

l. (Sauk-Calumet Sierra) Tar sands crude will produce as much as three times greenhouse gas pollution as a regular barrel of oil. BP needs to adhere to more stringent pollution requirements if expansion proceeds. Pre-expansion standards are not sufficient. BP needs to at least quantify greenhouse gases that will be produced at the Whiting plant.
m. Greenhouse gas increases from the project will be large, and must be evaluated using top-down BACT analysis.

n. BP and IDEM failed to account for increased Greenhouse gases from the project and to conduct BACT analyses as required by the CAA.

Response:

Carbon dioxide (CO2) and other greenhouse gases including methane and N2O are not regulated pollutants. Consistent with the pronouncements of U.S. EPA on this subject, IDEM concludes that analysis is not required with respect to the projected emissions of CO2 from BP Whiting. Carbon dioxide is not currently subject to regulation under the CAA. The U.S. Supreme Court’s decision in Massachusetts et al. v. Environmental Protection Agency et al., held merely that CO2 was a “pollutant” and that the U.S. EPA must decide whether, or how, it should be regulated. The Court did not conclude that CO2 is a pollutant subject to regulation. In determining which pollutants are subject to regulation under the CAA, IDEM has followed the U.S. EPA interpretation that the phrase “subject to regulation” means pollutants that are subject to a statutory or regulatory provision that requires actual control of emissions of that pollutant.

The U.S. EPA has consistently determined that a pollutant such as CO2 is not a “pollutant subject to regulation” if the CAA did not require actual control of emissions of the pollutant. Moreover, this interpretation has been applied expressly to CO2. The U.S. EPA’s interpretation has been laid out in several guidance memoranda. For example, in a memorandum dated April 26, 1993 from Lydia N. Wegman, of U.S. EPA’s Office of Air Quality Planning and Standards, to U.S. EPA’s Regional Air Directors, it is specifically considered whether CO2 was subject to regulation. The memorandum states that, although the 1990 amendments to the Clean Air Act included provisions addressing carbon dioxide and methane, “these requirements involve actions such as reporting and study, not actual control of emissions.” The memorandum concluded, “if the results of these studies suggest the need for regulation, these pollutants could be reconsidered at that time for classification as pollutants subject to regulation under the Act.” More recently, in 2002, the U.S. EPA substantially revised its New Source Review (“NSR”) Program and promulgated revised rules on December 31, 2002. 67 Fed. Reg. 80290 (December 31, 2002). The revised rules substituted a new defined term, “regulated NSR pollutant” for the Act’s phrase “pollutant subject to regulation.” The phrase “regulated NSR pollutant” expressly includes only pollutants (or substances) (i) for which a national ambient air quality standard has been promulgated, (ii) that are subject to new source performance standards (“NSPS”), (iii) subject to a standard under the stratospheric ozone protection program of Title VI of the CAA, or (iv) that otherwise is subject to regulation under the Act (but generally excluding hazardous air pollutants). Indiana’s definition is essentially a verbatim replication of the federal definition.

The first three categories of the definition are similar in one aspect – they all provide for the development of substantive emission standards of the specified pollutants through a formal and comprehensive rulemaking approach. Carbon dioxide is not regulated under any of these three programs. This regulatory framework brings clarity to the fourth, catchall category, any pollutant “otherwise subject to regulation under the Act” (excluding hazardous air pollutants regulated under Section 112 of the Act). When viewed with the other three categories, it becomes clear that U.S. EPA did not intend the fourth category to include pollutants for which the Act does not require substantive emission limitations. This approach is consistent with a canon of statutory interpretation known as ejusdem generis, which provides that, where general words of description follow an enumeration of persons or things described by words of a particular and specific meaning, the general words are not to be construed in their widest extent, but are to be understood as applying only to persons or things of the same class or kind as those specifically mentioned or listed. Moreover, when the U.S. EPA added the term “regulated NSR pollutant” to the NSR rules in 2002, it listed in the preamble to the rule all the pollutants that it believed were currently regulated under the CAA. This list did not include CO2.
The U.S. Environmental Appeals Board ("EAB") has expressly held that CO2 is not "subject to regulation." In *In re Inter-Power of New York, Inc.*, 5 E.A.D. 130, 151 (EAB 1994), the EAB held that the U.S. EPA was not required to conduct a BACT analysis for CO2 and hydrogen chloride because they were "unregulated pollutants." In *re Kawaihae Cogeneration Project*, 7 E.A.D. 107, 132 (EAB 1997) the EAB again reviewed whether the U.S. EPA should have included BACT limits for CO2. The EAB held that no limits were necessary because CO2 was not considered "a regulated air pollutant for permitting purposes" because there were "no regulations or standards prohibiting, limiting, or controlling the emissions of greenhouse gases."

With the foregoing background, it is clear that Congress did not make CO2 a pollutant subject to regulation when it enacted the provisions of Section 821 of Public Law 101-549. As a part of the 1990 Amendments to the Clean Air Act, Congress included a new title IV that established an acid rain control program. In the same legislation, Public Law 101-549, Congress also enacted Section 821, which, though not codified as a part of the Clean Air Act, contained requirements supplemental to Title IV whereby certain sources are to monitor and report their emissions of carbon dioxide. However, Sec. 821 does not require sources to limit or control their carbon dioxide emissions. When Congress enacted Sec. 821 of Public Law 101-549, it was fully aware of the U.S. EPA's interpretation that the phrase "subject to regulation" meant only pollutants that were subject to actual emission controls.

**Technical Comment No. 34:**

More details on the permit flaring provisions (e.g. reporting, root cause analysis, corrective actions, and what BP does when the INEOS flare is unavailable) should be provided.

**Response:**

The OCC project at BP Whiting includes a number of upgrades to the refinery which will improve overall reliability and are expected to result in a lower frequency of startup, shutdown, and malfunction events. Additionally, flare gas recovery systems will be installed as part of the new flare systems under the OCC project. These will serve to further reduce the emissions from SSM events. BP will continue to comply with all regulatory requirements regarding flaring events. When the INEOS flare is unavailable, BP has a procedure for venting propylene storage drums and tank cars to the refinery fuel gas system. (Also see Response to Technical Comment #1 for additional information related to flaring.)

The draft permit already includes limitations on the pilot and purge gases combusted at the GOHT and South flares (in Condition D.35.1(g)). The HU flare is not designed for purging gas combustion, therefore, there is no limitation on purge gas usage for the HU flare.

**D.35.1(g)** The Permittee shall comply with the following fuel usage limits:

<table>
<thead>
<tr>
<th>Flare ID</th>
<th>Fuel Usage Limit ($10^3$ cubic feet per 12 consecutive month period)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOHT-pilot</td>
<td>3,679.2</td>
</tr>
<tr>
<td>GOHT-purge</td>
<td>24,703.2</td>
</tr>
<tr>
<td>South flare-pilot</td>
<td>3,679.2</td>
</tr>
<tr>
<td>South flare-purge</td>
<td>28,908.0</td>
</tr>
</tbody>
</table>

**Technical Comment No. 35:**

a. (Councilman Mark Kalwinski, Hammond, IN) It is of concern that USEPA has initiated enforcement action against BP for making modifications to the plant, increasing
emissions while allegedly not following the permit process. If USEPA's position is substantiated, then continued monitoring should be implemented so real reduction of emissions are provided to the public - this way the public can make decisions based on accurate information.

b. BP has projected that it will increase its emissions of microscopic particulate matter by 21 percent annually after the project is complete. According to the America Lung Association, more than 2000 peer reviewed studies since 1996 have validated research that particle pollution can cause illness, hospitalization and premature death.

Members of the Calumet Project placed a metal collection plate in a residential area near the BP refinery for two weeks in September of 2007. Following prescribed quality control procedures, Coalition members wiped a square ten centimeter area on a clean sample collection paper supplied by a U.S. EPA approved laboratory. The sample wipe was chilled to keep the material from deteriorating, packaged, and shipped overnight to the EPA approved lab for testing. The results were forwarded to an internationally recognized expert, Dr. Mark Cherniak, for interpretation.

Dr. Cherniak identified five hazardous substances from the particle fallout from Whiting for major concern. He calculated the measured densities to present them in micrograms per square meter so they could be compared to EPA health standards. All of the five are substances that are polyaromatic hydrocarbons (PAHs) whose effects include increased risk of cancer that may develop over a long exposure even at low levels. Dr. Cherniak is convinced that this sample represents a health risk to the people who have to breathe it day in and day out.

The commenter cannot simply tolerate a 21% increase in dangerous particle pollution from the BP refinery tar sands expansion. This is an Environmental Injustice not only for the community of Whiting but surrounding communities as well. The commenter poses the following questions:

1. Will IDEM monitor the air at BP and the surrounding neighborhood on a daily basis with real time monitoring?

2. Will IDEM monitor the air at BP and the surrounding area around Lake Michigan for particulate matter that falls into the lake, Northwest Indiana's drinking water and a natural resource, for a 3 mile radius with real time monitoring?

c. Are there monitors in Lake County and will IDEM review the existing monitoring system to assure compliance?

d. (Carolyn Marsh) How many IDEM air monitors will check the air for pollutants at Whiting, East Chicago and Hammond under the air permit?

Response:

IDEM operates an extensive network of monitoring sites in Lake County, many near BP. The following list is for sites near BP. All sites are EPA approved and operated as specified by EPA rule requirements. Indiana has a robust, EPA-approved QA/QC program. A map of monitoring sites was provided at the BP Whiting public meeting and hearing.

PM$_{2.5}$: The standard monitoring cycle for PM$_{2.5}$ is every three days. IDEM operates sites at East Chicago - Franklin School, Hammond-Purdue, and Hammond - Robertsdale on this schedule. There is also a continuous monitor at Robertsdale. A speciated PM$_{2.5}$ monitor is operated at Hammond - Purdue.
PM<sub>10</sub>: East Chicago - Franklin School, East Chicago - Water Filtration Plant, and Hammond - Robertsdale. These are 1 in 6 day samplers.

Ozone: Whiting High School and Hammond CAAP - continuous during May - October (Ozone season).

SO<sub>2</sub>: Hammond CAAP - continuous.

Lead: East Chicago - Water Filtration and Hammond CAAP.

Toxics: East Chicago - Water Filtration, Whiting H.S., and Hammond CAAP

Technical Comment No. 37 (NRDC Group):

The draft Permit fails to require all practical and economically feasible control methods for virtually all new emission units and modifications of existing emission units. These include the following:

- SCR should be used on all combustion sources with a firing rate of 50 MMBtu/hr or more, designed to remove 90% of the NOx;
- SCR should be used on FCUs regenerator gases, designed to remove 90% of the NOx;
- Oxidation catalysts should be used on all combustion sources with a firing rate of 50 MMBtu/hr or more, designed to remove at least 90% of the CO and 50% of the VOC;
- Pall filters should be used on the FCU regenerator gases, designed to remove 99.99% of the PM;
- A scrubber should be used on the FCU regenerator gases, designed to remove >95% of the SO2;
- Fuel sulfur content should be limited to no more than 20 ppmv total sulfur, expressed as H2S on a 4-hour average, achievable using Sulfatreat and other sulfur removal technologies;
- Cooling towers should be equipped with drift eliminators, designed with a 0.0005% drift rate;
- A wet electrostatic precipitator should be used to control sulfuric acid mist emissions from the sulfur recovery units;
- Leakless components should be used where available;
- Tanks should be vented to a vapor recovery system designed to remove >99% of the hydrocarbon vapors.

Response:

IDEM has determined that none of the new or existing emission units at this facility are subject to BACT or LAER, based on the determination that the project is minor under 326 IAC 2-2 (PSD rules), 326 IAC 2-3 (Emission Offset rules) and 326 IAC 2-1.1-5 (Nonattainment NSR rules, NA NSR). The draft permit requires the Permittee to demonstrate compliance with the limitations established in the permit, including federal and state regulations that are applicable to the emission units. Therefore, IDEM does not have the authority to require additional controls beyond those necessary to meet the limits included and established in this permit.
Technical Comment No. 38:

a. (NRDC Group) IDEM failed to conduct BACT analysis for increased PM2.5 emissions from the project as required by the CAA. The permits impermissibly substitute regulation of PM10 for PM2.5. This surrogate approach not only violates the letter of the law, but fails to guarantee that increases in particulate matter from the project will be offset by qualitatively equal or less harmful reductions, in violation of state and federal "netting" regulations.

The permits must directly apply nonattainment NSR regulations to PM2.5. The proposed Whiting Refinery expansion will be located in an air quality control region designated nonattainment for ozone and fine particulate matter (PM2.5). 70 Fed. Reg. 944 (Jan. 5, 2005). As the result of a formal rulemaking by USEPA, this designation determines the applicable NSR program unless and until USEPA redesignates the area or the designation is overturned by a court of law. See 326 IAC 2-3-2(a) (nonattainment NSR); 326 IAC 2-2-2(b) (PSD); 326 IAC 2-3-2(a) (emissions offset regulations apply to a major modification constructed in an area designated “as of the date of submittal of a complete application,” as nonattainment “for a pollutant for which the stationary source or modification is major”); 40 C.F.R. 81.300 (revision procedure for designations). Thus, the permits must comply with the nonattainment NSR rules for PM2.5.

As USEPA notes, fine particles are believed to pose the “largest health risks,” due to their ability to lodge deeply in the lungs. PM2.5 is associated with aggravation of respiratory and cardiovascular disease, lung disease, asthma attacks, cardiovascular problems such as heart attack and arrhythmia, and even premature death. Children and the elderly are particularly susceptible to the negative impacts of PM2.5, the former because their immune and respiratory systems are still developing and the latter because their systems are weak and compromised. For these reasons, it is crucial that the Permits contain the appropriate and mandated direct limits on PM2.5.

However, nowhere did BP or IDEM actually apply the nonattainment NSR requirements to the proposed project's PM2.5 emissions. They instead treated PM2.5 as if it were PM10, then used the nonattainment NSR regulations for PM10 to address PM2.5: “OAQ is following the U.S. EPA’s guidance to regulate PM10 emissions as a surrogate for PM2.5 emissions pursuant to the requirements of Emission Offset, 326 IAC 2-3.” TSD at p. 3 of 32. This use of PM10 as a surrogate for PM2.5 violates federal and state law. BP must resubmit its permit application with a direct assessment of PM2.5, including application of nonattainment NSR requirements to the project’s PM2.5 emissions, and IDEM must reissue the Permits with appropriate direct limits on PM2.5.

Use of PM10 as a surrogate for PM2.5 violates Indiana and Federal law. Using PM10 as if it were PM2.5 violates federal and state law. The Clean Air Act contains specific requirements regarding areas whose air quality violates the National Ambient Air Quality Standards, or NAAQS. USEPA since 1997 has distinguished PM2.5 from PM10, most importantly by setting different NAAQS for each. Both the federal and Indiana NSR program treat PM2.5 and PM10 separately in terms of attainment designations in relation to these separate standards. Thus, the proposed Whiting Refinery will be located in an area designated as “attainment” for PM10 and nonattainment for PM2.5.

USEPA has expressly recognized that fine particles, or those less than 2.5 micrometers in diameter, are “very different” from coarse particles (from 2.5 to 10 micrometers) in terms of sources, characteristics, and potential health effects. These differences mean that states will have to “evaluate different sources for controls, to consider controls of one or more precursors in addition to direct PM emissions, and to adopt different control
strategies” in order to implement the PM2.5 NAAQS compared to the PM10 NAAQS. Grounding these needs is the engineering reality that controls designed for capture of PM10 (consisting primarily of filterable particles) do not effectively capture PM2.5 (made up in large part of condensable particles).

Indiana law prohibits IDEM from issuing a permit unless the permit is protective of the public health and will not cause or contribute to a violation of the NAAQS. 326 IAC 2-1.1-5(a)(1) and (4). In addition, the Indiana nonattainment offset provisions apply to a source that emits a “significant emissions increase” and “significant net emissions increase” of a “regulated NSR pollutant.” 326 IAC 2-3-2(c)(1). A “regulated NSR pollutant,” in turn, includes “any pollutant for which a national ambient air quality standard has been promulgated.” As stated above, USEPA has issued separate NAAQS for PM2.5 and PM10 based on the differences between them. BP and IDEM therefore must determine directly whether the project will result in a significant emissions increase and significant net emissions increase of PM2.5 to ensure protection of the public health and compliance with the NAAQS.

Under Indiana law, a significant emissions increase and significant net emissions increase in PM2.5 triggers nonattainment NSR. The agency must apply the regulation as written, which requires offsets where the source will result in a “significant emissions increase” and “significant net emissions increase.” 326 IAC 2-3-2(c)(1) (emphasis added). The lack of a numeric significance level for PM2.5 in the Indiana regulations does not absolve IDEM from determining directly whether the project will result in a significant emissions increase and significant net emissions increase. Rather, these numeric significance levels only apply to the pollutants listed at 326 IAC 2-3-1(qq) (“significant” in reference to a net emissions increase “to emit any of the following pollutants”.

If a numeric significance level were a prerequisite to determining whether a pollutant triggers offset requirements, the Indiana regulations would limit “significant” for all regulated NSR pollutants to the numeric list at 326 IAC 2-3-1(qq). The regulations instead state that this list only determines whether a significant emissions increase will occur for “a regulated NSR pollutant.” 326 IAC 2-3-1(rr) (emphasis added). Thus, a gap exists in the numeric significance levels – but not in the triggering provision itself. The triggering provision instead continues to require that BP and IDEM determine whether the project will result in a “significant emissions increase” and “significant net emissions increase” of PM2.5 to ensure protection of the PM2.5 NAAQS, due to the differences between PM2.5 and PM10 described above. No such determination of significance has occurred for PM2.5 from the Whiting Refinery, and thus the permits cannot issue.

IDEM cannot rely on guidance that is in conflict with statutory and regulatory requirements, and is no longer technically justified. IDEM based its decision to pretend that the expansion project’s PM2.5 emissions were PM10 on “U.S. EPA’s guidance to regulated PM10 emissions as a surrogate for PM2.5 emissions pursuant to the requirements of Emission Offset, 326 IAC 2-3.” TSD at 3 of 32. The TSD does not provide any additional explanation identifying this guidance or justification for the agency’s reliance on it. Therefore, these comments will address reliance on USEPA guidance in terms of the “Seitz Memo”35 and “Page Memo”36 of which Commenters are aware. Reliance on these documents, or any similar guidance, is improper and invalidates BP’s and IDEM’s so-called analysis of PM2.5. Reliance is improper for three primary reasons, as follows.

First, IDEM cannot rely on USEPA guidance that does not have the force of law where, as here, that guidance is in conflict with statutory and regulatory requirements.37 As discussed above, federal and state law require BP and IDEM to analyze directly and
directly ensure compliance with the PM2.5 NAAQS. The Seitz Memo clearly states that it does not bind states, local governments and the public as a matter of law.

Second, USEPA’s recommended use of PM10 as a surrogate for PM2.5 expired by its own terms when USEPA published the final PM2.5 implementation rule in September 2007. The 1997 Seitz Memo provided interim guidance for implementing the new PM2.5 NAAQS. This now nearly ten-year-old memo stated that sources could use the PM10 surrogacy approach to meet NSR requirements until certain difficulties were resolved, most notably with respect to monitoring, emissions estimation, and air quality modeling. The more recent, but still dated for the purposes of the BP project, Page Memo reaffirmed the surrogacy approach specifically for nonattainment NSR. The Page Memo noted that U.S. EPA recommended using PM10 as a surrogate for PM2.5 “until [U.S. EPA] promulgate[s] the PM2.5 implementation rule.”

Not more than six months later, USEPA published a proposed PM2.5 implementation rule. The proposed rule made clear that the surrogacy approach would expire when the proposed rule was finalized:

Once this PM2.5 implementation rule is finalized, States will have the necessary tools to implement a major NSR program for PM2.5. States will no longer be permitted to implement a nonattainment major NSR program for PM10 as a surrogate for the PM2.5 nonattainment major NSR program.

Under the Title V regulations, major sources have an obligation to include in their Title V permit applications all emissions for which the source is major and all emissions of regulated air pollutants. The definition of regulated air pollutant in 40 C.F.R. 70.2 includes any pollutant for which a NAAQS has been promulgated, which would include both PM10 and PM2.5. To date, some permitted entities have been using PM10 emissions as a surrogate for PM2.5 emissions. Upon promulgation of this rule, EPA will no longer accept the use of PM10 as a surrogate for PM2.5.

BP and IDEM therefore had nearly two years notice that the surrogate approach was about to expire, well in advance of BP’s submission of its applications. Most notably, the company and agency had notice prior to the application version serving as the basis for the present Permits, submitted in the fall of 2007 many months after promulgation of the final PM2.5 rule. The April 2007 final rule clearly affirms USEPA’s rejection of the surrogacy approach: “the EPA will no longer accept the use of PM10 emissions information as a surrogate for PM2.5 emissions information given that both pollutants are regulated by a National Ambient Air Quality Standard and therefore are considered regulated air pollutants.” Reliance on guidance that USEPA itself has abandoned is in direct conflict with the NSR requirements.

Third, technical difficulties in directly implementing the PM2.5 NAAQS that grounded the interim guidance back in 1997 have been resolved. USEPA itself noted in the preamble to the November 2005 Proposed PM2.5 Implementation Rule that these technical concerns have been resolved: “As discussed in this preamble, those difficulties have been resolved in most respects, and where they have not been, the proposal contains appropriate provisions to account for it.” USEPA also has included the PM2.5 algorithms in the AERMOD air quality computer modeling program, the recommended model for short distance air quality assessment, thus formally resolving the Seitz’ Memo’s concerns about PM2.5 modeling capabilities. The Permits Cannot Rely on Reductions in Less Harmful PM10 in Order to “Net Out” of Nonattainment NSR for PM2.5.

Using PM10 as a surrogate for PM2.5 means that some increases in PM2.5 are likely to be offset by decreases in PM10. Such substitution of decreases in less harmful pollution
for more harmful increases violates the federal and state nonattainment NSR “netting” provisions. BP and IDEM must instead only offset PM10 increases with PM10 decreases and PM2.5 increases with PM2.5 decreases. Direct offset of PM10 and PM2.5 with in-kind reductions will meet the requirement that the refinery not offset more harmful emission increases with less harmful emission decreases. Otherwise, the netting calculations for particulate matter are in error.

In order to be creditable for netting purposes in a nonattainment area, a reduction in emissions at an existing unit must have “approximately the same qualitative significance for public health and welfare as that attributed to the increase from the particular change.” 326 IAC 2-3-1(dd)(3)(B)(v)(DD). This provision mirrors and must be at least as stringent as the parallel federal requirement, 40 C.F.R. § 51.166(b)(3)(vi)(c) (qualitative public health significance); see 40 C.F.R. 51.155(a)(7)(iv) (state implementation plan PSD provisions must be “more stringent than or at least as stringent in all respects” as the corresponding federal provision), whose purpose is to prevent proposed units from netting reductions in less harmful emissions against increases in more harmful emissions. 45 Fed Reg 52676 at Lexis p. 41 (1980). Thus, under both federal and Indiana law, a creditable reduction in emissions must be approximately as harmful, or less harmful, to public health and welfare than a proposed increase.

As described above, USEPA has found that the health effects associated with PM2.5 differ significantly from those linked to PM10, and that PM2.5 poses the largest health risks. A ton of PM10 therefore is not qualitatively the same as a ton of PM2.5 regarding impacts on public health. Using PM10 as a surrogate for PM2.5 in the nonattainment netting calculations means that neither BP nor IDEM can show that increases in very harmful PM2.5 will be sufficiently mitigated by creditable decreases with respect to health. A search of the permit documents shows that IDEM nowhere made the required determination that any of the claimed decreases met the qualitative public health significance criteria, let alone that decreases solely in PM10 from the project are of the same qualitative public health significance as the increases in PM10 and PM2.5 taken separately. The netting determinations for particulate matter in general and PM2.5 in particular therefore are unsupported, and the permits cannot issue.

b. (RHAMC) Why hasn't IDEM and/or BP separately calculated PM 2.5 emissions and impacts?

c. (Save the Dunes Council) PM2.5 is a special concern due to health concerns and the current air conditions.

Response:

The PM2.5 implementation rules were not effective at the time the Permittee submitted a complete permit application and are still not effective at this time. All references to particulate emissions in the permit and supporting documentation are stated as "PM" and include PM, PM10 and PM2.5 (filterable PM, filterable and condensable PM10). PM10 and PM2.5 emissions are assumed to be equal to total PM emissions for the Emission Offset minor limitations. For these analyses, IDEM has used the approach approved by the U.S. EPA to use PM10 as a surrogate for PM2.5.

On April 25, 2007, the U.S. EPA finalized its PM2.5 implementation rule. However, the U.S. EPA decided not to include the NSR program in the implementation rule and stated that, “because there was an interim surrogate NSR program in place” (which allowed states to use PM10 as a surrogate between the effective date of the PM2.5 NAAQS designation and until the U.S. EPA promulgates major NSR regulations for the implementation of PM2.5), EPA would finalize the NSR part of the rule in a separate rulemaking at a later date. On September 21, 2007, the U.S.
EPA proposed a separate rulemaking that proposed PM2.5 increments, Significant Impact Levels, and a Significant Monitoring Concentration to facilitate implementation of the PM2.5 PSD program. The preamble to that rule cites the interim surrogate policy for use of PM10 in lieu of PM2.5 as part of a transition program for PM2.5 implementation in NSR. The latter implementation rule has not been finalized.

Technical Comment No. 39:

a. (NRDC Group) BP and IDEM have provided insufficient information to determine whether the emissions calculations adequately account for higher levels of pollutants in tar sands crude oil. Crude oil extracted from Canadian tar sands, although still insufficiently studied in many respects, has been shown to contain higher levels of sulfur, nitrogen, harmful metals and other pollutants than conventional crude, and in some cases than other types of heavy crude. The application lacks any chemical composition data for the crude oils that are currently processed and those that will be processed, preventing any meaningful review of the impact of the change in crude slate on emissions. There is no way to tell from the information submitted by BP to IDEM whether BP took this fact into account in calculating its emissions. This is a critical omission, because factoring in this higher level of pollutants, to the extent that has not been done, could result in increased emissions that would trigger NSR requirements, including of hydrogen sulfide, reduced sulfur compounds, sulfuric acid mist, sulfur dioxide, lead, mercury, and beryllium, among others.

More generally, it is critical from a public health standpoint that the pollutant impact of refining tar sands crude be fully understood and appropriately controlled. As noted above, permits in Indiana must be “protective of public health,” independently from ensuring compliance with ambient air quality standards, PSD increments, and all other applicable air pollution control rules. 326 IAC 2-1.1-5. The permit thus must be based on a full accounting of these pollutants. Mercury is a potent neurotoxin. In addition, the U.S. EPA has determined that nickel refinery dust and nickel subsulfide are human carcinogens. According to one tar sands company, “The bitumen in the Canadian oil sands contains vanadium, nickel, and other metals in significantly larger quantities than occur in most other oils.” Nickel, vanadium and other metals occur in such high concentrations that companies are considering metals recovery from waste products.

Concerning mercury, the most recent study on mercury in crude in Canada includes data for one bitumen blend coming out of Alberta. Compared to conventional crude from Canada, the bitumen blend had a higher mercury content (range 5.0 – 10.7 parts per billion (ppb)). The synthetic crude (i.e., upgraded bitumen) oil samples from Alberta had mercury generally in the range of 0.1 – 2.4 ppb, with one sample having a much higher mercury concentration than even the bitumen (43.6 ppb). For the most part, conventional crude had concentrations below 2 ppb.

Specifically with respect to mercury, BP’s emissions factor for mercury from its FCUs is based on “engineering estimates,” which are not provided in the Alternative Emissions Factor Request form set forth above. While emissions from the FCUs are correlated with the mercury content of the expected crude feedstock (i.e., tar sands bitumen), it is impossible to confirm that, and assess its significance for the Project’s emissions, unless we can get the technical documentation for this engineering estimate from BP.

We note in addition that when USEPA promulgated its National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries, mercury from CCU catalyst regeneration vents was not included in the rule. After conducting a review of available data and technology, EPA concluded, “There are a number of emerging technologies (such as activated carbon injection) but none have been shown to be applicable to CCU...
catalyst regeneration vents. Therefore, the MACT floor for Hg is determined to be no control for both new and existing units." In other words, the mercury that is burned off during catalyst regeneration is being emitted uncontrolled. In the absence of MACT controls for these sources, IDEM should, at minimum, require that mercury emissions from catalyst regeneration vents be monitored using DIAL or other appropriate technology.

b. (Susan MiHalo, Ogden Dunes, IN) Commenter has read that tar sands contain higher levels of harmful metals and other pollutants than conventional crude oil. The Vanadium and mercury levels are of particular concern, and IDEM should verify that the levels are indeed what they should be.

Response:

According to the application submitted by the Permittee and certified by the Responsible Official, there will be a net decrease in emissions of hydrogen sulfide, reduced sulfur compounds, sulfuric acid mist, sulfur dioxide, lead, mercury and beryllium. According to this application, and IDEM’s evaluation of the information submitted therein, there is no increase in the air emissions of harmful metals, including nickel and vanadium. As with normal refinery processing, with the OCC project, the Ni and V and other metals contained in the Canadian crude will be retained in the "bottoms" during processing and are not emitted to the air.

With regard to Mercury, the Canadian crude to be processed as part of the OCC project has a similar mercury content to that of the crudes currently processed at the refinery. The following table provides a comparison of mercury contents of the principal crudes refined by Whiting pre- and post OCC. As indicated there, the weighted average mercury content of Whiting’s overall crude slate is expected to decline after OCC.

There is very little information on mercury in FCCU emissions, and the data that are available are difficult to interpret due to the large number of values below detection. For example, a paper by Rene Bertrand and Jeffrey Siegel published in the October, 2002 edition of Environmental Progress (copy attached) reported the mercury concentrations in 23 samples of FCCU flue gas. Of these, 19 showed no detectable levels at a median detection limit of 7.51x10^{-6} lbs/1,000 lbs of coke burned. For the four samples that did show detectable levels, the median concentration was 2.27 x 10^{-5} lbs/1,000 lbs of coke burned while the mean was 5.24 x 10^{-5} lbs/1,000 lbs of coke burned. The difference between the median and mean for these four samples indicates that the mean was heavily influenced by a single high value that was probably an outlier.

Given these concerns and the fact that over 80% of the reported values showed no detectable mercury, BP considered an emission factor of 1.0 x 10^{-6} to be a reasonable engineering estimate. Two factors should be noted, however. First, the project would not result in a significant increase in mercury even if this emission factor were off by a factor of 700. Second, as discussed above, BP expects the overall mercury content of its crude slate to decline after OCC. As the commenter recognizes, this will mean that mercury emission factor from the FCCU will also decline as a result of OCC.
Technical Comment No. 40 (Barbara and Steven Fredman, Granger, Indiana):

As citizens of Indiana who live downwind from Whiting, the Commenter is very concerned that BP will be using heavy crude oil from Canada that without proper equipment will be adding more pollutants into the air. St. Joseph County has a difficult time reaching air quality standards as they now stand without adding more contaminants into the air.

Response:

U.S. EPA established standards for several criteria pollutants. Among these are SO2, NOx, Ozone, and Fine Particulates (PM2.5). Emissions from most industrial sources include or affect these pollutants. According to the application submitted by the Permittee (certified by the Responsible Official), SO2 and NOx emission increases from this project have been offset by reductions and shutdowns elsewhere in the facility. Therefore, there will be no net NOx or SO2 increases. Based on this, the air quality in St. Joseph County will not be negatively impacted by the changes at BP. Since SO2 and NOx emissions do not increase, SO2 and NOx concentrations will not increase.

SO2 and NOx are "precursors", pollutants that react chemically downwind from the emissions source, to form PM2.5. Analyses performed on collected samples collected in St. Joseph County indicate that SO2 and NOx are major contributors to PM2.5 formation in that area. If these pollutants do not increase, neither should PM2.5 concentrations.

Similarly, ozone is formed by downwind chemical reactions of Volatile Organic Compounds (VOCs) and NOx. According to the application submitted by the Permittee (certified by the Responsible Official), VOCs associated with this project also are offset by reductions across the facility. Therefore, modifications to this facility will not increase measured ozone concentrations in St. Joseph County.

Technical Comment No. 41:

a. (NRDC Group) IDEM failed to require and include a schedule of Compliance for the violations identified in the NOV issued to BP on November 29, 2007, in connection with the Whiting refinery. Specifically, the NOV set forth detailed allegations concerning (i) a major modification to the facility’s fluidized catalytic cracking unit designated as FCU 500 and to the UIU Flare at the facility, without compliance with NSR and NSPS requirements; (iii) violation of SO2 and reduced sulfur compound emission and monitoring limits at the sulfur recovery plant, and (iv) failure to conduct required performance testing and submit the results of the HCl emissions from Ultraformers 3 and 4 as required by the Refinery MACT II. The NOV further documented the health impacts of these violations, which include, among other things, respiratory illness, heart disease, lung damage, and premature death.

In addition, deviation reports concerning flaring submitted to IDEM indicate repeated violations of current flare emissions limitations. Specifically, BP repeatedly exceeded the H2S 159 parts per million (ppm) 3-hour limit, meaning that too much H2S was burned in the flare. EPA limits H2S burned in the flare because when burned, H2S turns into harmful sulfur oxide emissions to the atmosphere.

Under Title V of the CAA and associated regulations, IDEM was required to mandate submission of a schedule of compliance addressing these violations, and to include it in the Project Title V permit modification. CAA § 503(b)(1) requires that permit applicants "submit with the permit application a compliance plan describing how the source will comply with all applicable requirements under this chapter“. 40 CFR 70.5(c)(8)(iii)(C),
promulgated pursuant to this provision, states that a permit application must include the following:

A schedule of compliance for sources that are not in compliance with all applicable requirements at the time of permit issuance. Such a schedule shall include a schedule of remedial measures, including an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. In New York Public Interest Research Group v. Johnson, 427 F.3d 172 (2nd Cir. 2005) the court made clear that, where non-compliance has been demonstrated, agencies are obligated under the CAA to require a schedule of compliance in a Title V permit regardless of whether there has been an adjudicated determination of liability. The court found that an NOV – like the NOV issued to BP in November – was sufficient evidence of violations to require a schedule of compliance.

BP failed to submit the required schedule of compliance; and consequently, the Title V permit modification does not include one. IDEM must make a determination that BP’s Title V permit application is incomplete, and require submission of a schedule of compliance to address all violations identified in the USEPA NOV, and the schedule of compliance must be incorporated into the permit.

b. (RHAMC) A fundamental purpose of the Title V permitting program is to ensure that regulated entities comply with requirements in the Clean Air Act. Under 40 C.F.R. § 70.1(b) and Clean Air Act § 504(a), each regulated major source must obtain a permit that “assures compliance by the source with all applicable requirements.” A Title V permit applicant must disclose its compliance status and either certify compliance or enter into an enforceable schedule of compliance to remedy violations. 42 U.S.C. § 7661b(b); 40 C.F.R. § 70.5(c)(8-9).

Mindful of these requirements, on what basis does IDEM assert that a schedule of compliance or compliance plan is not required as part of issuing the Title 5 permit in lights of: a. the Finding and Notice of Violation issued by U.S. EPA Region 5 to BP Products North America, Inc., Whiting, Indiana on or about November 29, 2007, and, b. the Finding and Notice of Violation issued by U.S. EPA Region 5 to BP Products North America, Inc., Whiting, Indiana on or about January 25, 2007 (EPA-07-IN-03)?

The operating permits must include a compliance schedule remedying these violations. 40 CFR § 70.5(c)(8)(iii)(C). Pursuant to this section, if a facility is in violation of an applicable requirement at the time of permit issuance, the facility’s permit must include a schedule leading to compliance with that requirement. The only exemption is if the reported violation has been corrected prior to permit issuance. Applicable requirements include, among others, the requirement to comply with state implementation plan (“SIP”) requirements. See 40 C.F.R. § 70.2. If a facility is in violation of an applicable requirement at the time that it receives an operating permit, the facility’s permit must include a compliance schedule. See 40 C.F.R. § 70.5(c)(8)(iii)(C). The compliance schedule must contain “an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance.” See 40 C.F.R. § 70.5(c)(8)(iii)(C).

Response:

Please see response to “EPA Comment No. 6”.

Technical Comment No. 42 (NRDC Group):

The permit does not contain practically enforceable emission restrictions, production and operating conditions, monitoring, and recordkeeping to assure that emissions remain below the significance thresholds. The Permits do not limit all sources to ensure the emissions remain below significance thresholds, as it is required to do by law. The Permits also do not contain limits for all pollutants and sources as set out in the TSD. Finally, some of the limits are not enforceable as a practical matter.

A. Emissions Limits Are Missing

The Application and TSD claim the facility nets out of NSR review for H2S, reduced sulfur compounds, sulfuric acid mist, beryllium, lead, and mercury. However, the Permits do not contain any limitations on the emission of these substances nor require any testing to demonstrate that the claimed reductions and future potential emissions are achieved. Thus, the claim that the Project nets out of NSR review is a hollow promise, and inconsistent with applicable CAA requirements.

B. Testing Is Inadequate

The Permits require NOx CEMS on some combustion sources, but otherwise require only stack testing every five years for only one representative source from an arbitrary group of alleged similar sources. This is not adequate to assure that the emission reductions and future potential emissions assumed in the netting analysis are achieved in practice.

The claimed emission reductions can only be enforced through appropriate monitoring, testing and reporting of emissions. An appropriate hierarchy for specifying monitoring to determine compliance is: (1) continuous direct measurement where feasible; (2) initial and periodic direct measurement where continuous monitoring is not feasible; (3) use of indirect monitoring, e.g. surrogate monitoring, where direct monitoring is not feasible; and (4) equipment and work practice standards where direct and indirect monitoring are not feasible. NSR Manual, p.13. The Permits do not comport with this guidance, and in some instances do not require any testing to demonstrate that the emission limits will be complied with when the source is operating.

First, testing should be required for every fired source, not just one out of the proffered groupings as fired sources, even when superficially identical, can differ from unit to unit as refinery fired sources are not off-the-shelf technology. Hundreds of stack tests of boilers and refinery heaters from across the country demonstrate that emissions are highly variable and depend upon the degree of air preheat, age of the unit, maintenance practices, type of burners, etc. The Permits must be modified to require testing of all emission units, not just one from a grouping.

Second, the infrequent testing does not provide sufficient data to determine if the assumptions used in the netting analysis are realized. Further, it is not adequate to allow IDEM, U.S. EPA or the public to ensure compliance with the Permit limits. It is feasible to directly and continuously monitor CO, VOC, and NOx emissions from all heaters, boilers, and other fired sources. The draft Permits only require continuous emission monitors for NOx from some fired sources. It is also feasible to conduct more frequent stack tests. Annual or more frequent testing is feasible, is commonly required for similar facilities, and should be required here. Finally, annual fugitive emission inventories for PM/PM10 and VOCs are required elsewhere and should be required here. Thus, the draft Permits should be modified to require more frequent direct emission testing.

Response:

A. The netting analysis submitted by the Permittee (and certified by the Responsible Official) shows a net decrease in emissions for H2S, reduced sulfur compounds, sulfuric acid
mist, Pb, Be, and mercury. The decreases from the shutdown of existing units are made enforceable in the permit by requiring the unit to be shutdown prior to the completion of the OCC project. The increases from new emission units are based on the potential to emit of these pollutants as estimated by the Permittee. The resulting creditable decreases exceed the potential emissions increase for these pollutants, so it is not necessary to establish limits.

With regard to the adequacy of testing requirements in the draft permit, IDEM has reviewed the testing requirements included in the draft permit, and in response to that evaluation, has revised the requirements to include a significant increase in the number of units to be tested and requirements to test units on a more frequent basis. The revised schedule includes representative testing of less significant heater units on a more frequent basis than other recently-permitted refineries, aggressively addresses failed tests and retesting. Emissions from these heater units are minimal in regards to the overall project and facility. These units have been conservatively categorized by size, and emission characteristics, and all units in each category must be tested. The fuel gas combustion sources are similar in construction and operation, and thus are expected to have consistent combustion and emission characteristics, since they burn refinery fuel gas that comes from a common origin. Variations in emissions that may occur at these sources due to differences in heater size and age were also considered. In order to obtain a representative selection of sources to test, the emission sources were divided into categories. These categories were defined by type of unit, age of the unit, size (e.g. firing rate in MMBtu/hour), and emission factor. The result was multiple groups, which range in size from 1 to 9 units, containing units that for a given pollutant, are expected to have the same emission rate in lbs/MMBtu and that utilize the same fuel.

In addition to the aforementioned testing requirements included in this permit, there are a significant number of units which have CEMs that monitor both NOx and CO emissions. For SO2, the source monitors the refinery fuel gas continuously for total reduced sulfur and H2S to ensure compliance with the 80 ppm limit on sulfur content, ensuring compliance with SO2 limitations across the facility for units combusting refinery fuel gas.

We believe, with these revisions, the compliance monitoring and emission testing included in this permit are sufficient for assuring compliance with the limitations in the permit on a continuous basis.

In regards to annual fugitive emission inventories, the permit already includes a requirement, pursuant to D.0, to account for fugitive emissions to demonstrate compliance with the PSD and EO minor limitations in the permit.

The following changes the testing requirements have been made to D.0.3:

D.0.3 Testing Requirements

(a) Tests shall be conducted on new, modified and affected emission units that are included in the CXHO project, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes both filterable and condensible PM-10. For heaters with a maximum heat input greater than or equal to 100 MMBTU/hr and FCU 500 and FCU 600, these tests shall be repeated at least once every three years from the date of the previous valid compliance demonstration. For heaters with a maximum heat input greater than or equal to 50 MMBTU/hr but less than 100 MMBTU/hr and the SRU COT 1 and COT2, these tests shall be repeated at least once every four years from the date of the previous valid compliance demonstration. For heaters with a maximum heat input less than 50 MMBTU/hr, these tests shall be repeated at least once every five years from the date of the previous valid compliance.
demonstration. **Subsequent compliance demonstrations shall include testing of a different emission unit than the emission unit tested for the previous compliance demonstration until all units within a group have been tested.**

(b) Tests shall be conducted in accordance with the following deadlines:

1. For a group that includes new or modified emission units (CO-1a, CO-1d, CO-3b, PM/VOC-1, PM/VOC-2, PM/VOC-3, PM/VOC-4a, PM/VOC-4b, VOC-6, PM/VOC-7, NOx-1, NOx-2, NOx-4, NOx-8, NOx-12), tests shall be conducted on one of the representative heaters in that group: within 180 days of startup of a new emission unit, or modification of an existing emission unit within that group.

2. For a group that includes only existing affected units (CO-1b, CO-1c, CO-2, CO-3a, CO-4, PM/VOC-5a, PM/VOC-5b, PM/VOC-5c, PM/VOC-5d, PM/VOC-8, PM/VOC-9, NOx-2, NOx-3, NOx-5, NOx-6, NOx-7, NOx-9, NOx-10, NOx-11), tests shall be conducted on one of the representative heaters in that group within 180 days of the start-up of the New Coker (#2 Coker) and the re-start of the No. 12 Pipestill (after the completion of the permitted modifications), whichever occurs later.

(c) The emissions units to be tested in order to demonstrate compliance with Prevention of Significant Deterioration (326 IAC 2-2), Emission Offset (326 IAC 2-3) and Nonattainment NSR (326 IAC 2-1.1-5) minor limits shall be grouped as follows:

(d) Within 180 days of the startup of New Coker (#2 Coker) and the re-start of the No. 12 Pipestill (after the completion of the permitted modifications), whichever occurs later, in order to demonstrate compliance with the PM-10 emission factor limit from the SCR stacks at No. 3 Stanolind Power Station (3 SPS), testing shall be conducted on one (1) of the five (5) stacks for 3 SPS boiler/SCR stacks, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes filterable and condensible PM-10. This test shall be repeated at least once every three years from the date of the previous valid compliance demonstration.

(d) In the event that a unit tested within a group exceeds an allowable emission limit established in the permit, the emission rate from that test shall be utilized to determine compliance with applicable emission limits at the other units within that group until such time as the Permittee conducts testing which demonstrates compliance with the applicable emission limits.

(e) Compliance with the emissions limits for each emission unit or test group shall be determined as follows:

\[
T = \left( \sum_{i=1}^{n} T_i \right) / n
\]

Where:
- \( T \) = average of IDEM approved stack test results for emission unit or all units within that same group over a 12 month period
- \( T_i \) = average of multiple runs during Test \( #i \)
- \( n \) = number of IDEM approved stack tests during 12 month period
Technical Comment No. 43 (Carolyn Marsh)

Is the hazardous waste landfill on BP’s property at the wastewater treatment plant next to Lake Michigan still active as a landfill? If so, what is the amount of hazardous waste sludge from the refining of Canadian tar sands oil discharged into it? Will the handling, loading and transportation of non-hazardous waste sludge to the Newton County landfill, discharge regulated and/or non-regulated pollutants into the air? If so, what are the pollutants? Will the handling, loading and transportation of hazardous waste sludge to the Sarnia Ontario Canada landfill, discharge regulated and/or non-regulated pollutants into the air? If so, what are the pollutants?

Response:

According to the application submitted by the Permittee and certified by the Responsible Official, all fugitive emissions increases from the OCC project have been included in the netting analysis. This would include fugitive emissions from all truck traffic and material handling at the source.

With regard to the onsite disposal of waste materials, BP does not operate an active hazardous waste landfill next to Lake Michigan. BP’s fluidized bed incinerator which previously processed hazardous waste has been shutdown. BP has no plans to place any hazardous wastes generated at the refinery at the site. Some solid waste will continue to be generated at the refinery, although the OCC project has been designed to minimize the amount of waste generated. The refinery disposes of waste materials at various landfills, which may include Newton County and Sarnia landfill, in accordance with all state & federal regulations.

Technical Comment No. 44 (Mark Kalwinski, Councilman, City of Hammond):

Given opinions regarding IDEM not considering flare emissions, a 30-40% increase in CO2 emissions (4 billion pounds per year) and a 114 ton increase in PM emissions, IDEM should evaluate the permit and modify as necessary.

Response:

Please see the responses to "Technical Comment No. 1" for the flaring issue and "Technical Comment No. 18" for PM emissions.

Technical Comment No. 45 (Jim Sweeney, Schererville, IN):

Commenter asked whether BP using the best and latest technology for the controls in this permit?

Response:

According to the application submitted by the Permittee (certified by the Responsible Official), the OCC project is minor under PSD (Prevention of Significant Deterioration), EO (Emission Offset) and Nonattainment NSR rules, which means that the emissions units included in this project are not subject to Best Available Control Technology (BACT) or Lowest Achievable Emission Rate (LAER). BP is however adding additional controls and installing lower emitting units as part of this project and will be required to operate these controls and achieve very stringent limitations as part of this permit to ensure that the project is minor.
Technical Comment No. 46:

(Randall Maull) As an employee for a local chemical worker's union, one of the Commenter's duties was to calibrate the monitoring device for SO2 standards. The standard was 300 parts per million. The standard here is 600 parts per million of SO2.

Response:

IDEM believes that the emission limitations and standards in the permit are as required by state and federal regulations.

Public Comments - General

General Comment No. 1:

Many commenters extended their support to this project for the reasons summarized below. These Commenters urged IDEM to issue the construction and operating permits for the CXHO project.

a. Fuel Cost and Availability
   Many commenters expressed that not issuing the permit would adversely impact the supply of gasoline and diesel fuel available for consumers. They stated that the use of more Canadian crude oil will help minimize dependence on foreign oil supplies and reduce the chance of the disruption of crude oil deliveries. Some commenters stated that other domestic crude oil sources are in decline, while Canada has substantial crude oil. They stated that the project will result in increased refinery capacity and increased fuel supplies, which should stabilize the market and reduce future fuel costs.

b. Economic Impact
   Many commenters expressed that the BP's proposed project will result in a positive economic impact to the area. They expressed that the many needed construction jobs and permanent jobs will be created by the project and the resulting revenue will create economic growth throughout the area. Some commenters stated that BP's investment will keep it at its current location and reduce the chance that it will relocate to some other area or country.

c. Better Air Quality
   Commenters stated that the proposed air permit meets or exceeds regulatory standards and protects human health and the environment, significantly reducing regulated air emissions to below previous levels.

d. Other Causes of Poor Air Quality and Urban Sprawl
   Lake County's air pollution is affected by air pollution from rural areas and Illinois. Rural areas burn leaves and trash. Stress and pollutants inside the home also cause poor air quality and illness. Urban sprawl, with the resulting long distance commuter traffic also increases pollution. Why is there no fight against urban sprawl?

e. BP is a good corporate citizen
   Commenters stated that BP makes positive contributions to area causes that need BP's assistance.

f. Certainty in Environmental Permitting
   Commenters noted that it is important to the economic development that environmental permit applicants be able to rely on the environmental permit application and issuance process as defined by federal and state law when considering the state of Indiana for such projects.
Decisions should be based on fact and not misinformation and fear mongering from radical environmentalist and some of the media.

Response:

IDEM acknowledges the opinion expressed by all Commenters who support this project. As stated in IDEM’s Technical Support Document, the permit will result in a decrease in regulated emissions from the previous baseline level, resulting in better air quality. OAQ recognizes that concerns outside of air quality are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM, OAQ’s air permit review, by law, cannot address issues for which it does not have direct regulatory authority.

General Comment No. 2:

Several Commenters expressed their opposition to the draft permits for the proposed modernization at the BP Whiting facility. Many of these Commenters also urged IDEM to grant additional time for citizens to review the permit (this issue has been addressed in response to "General Comment No. 2". Comments which included technical details have been included in the section titled "Technical Comments". Comments opposing the permit that include specific issues have been addressed in other responses in this "General Comments" section. The reasons for opposition to the permit and/or request for additional time for review are summarized below.

a. Public Health

Many commenters stated that the Indiana Department of Environmental Management should make public health the highest concern when permitting this project. Pollution emissions from the project will cause health problems for local residents. The project will significantly increase sulfur dioxide, particulate matter, soot and lead. Lead causes brain damage in children, sulfur dioxide and particulate matter cause an increase in lung disease, and air pollutants cause cancer. This area has a higher than national average cancer rate. IDEM should decrease emissions. IDEM should protect public health, not BP or jobs. BP will not go out of business if forced to stop all pollution in the air, soil and water of our home environment. Citizens deserve a healthy and safe community. Indiana’s water is polluted with mercury and the air is polluted with pesticides and herbicides. This area has high concentrations of asthma and other pollution related illnesses. A hospital that serves ill people should not support a corporate initiative that creates pollution and makes people ill.

b. Michigan and Canadian Air Quality

Southwest winds in the summer season presently contribute to smog days in the area of Sarnia, ON, and Port Huron, MI. Shell Canada is in the process of investigating the feasibility of building a large refinery about 20 miles south of Sarnia. The probability that these two projects would combine to add pollutants is a concern. The area is located within and surrounded by Canada’s Chemical Valley.

c. Public Involvement and Extension of Time

Commenters stated that IDEM has abrogated its duty to serve the public trust by failing to allow for meaningful public involvement in the permitting process. IDEM should have extended the public commenting period to allow for meaningful public participation and review of these extremely complex permits with over 6,000 pages to read. IDEM should allow a BP emissions offset credit to expire in June 2008 to allow more time for public review. IDEM should take more time with a project that has been called "[T]he most destructive project on earth" by the Environmental Defense Fund.
(Natural Resources Defense Counsel Comment) Given time, many more significant problems could be identified with these permits. Unfortunately, despite multiple requests for an extension of time for meaningful review of the permits, additional time was not granted. The permits - collectively thousands of pages long, are spectacularly complex, even by ordinary air permitting standards. Moreover, although a request (from the Illinois Attorney General, with whom Commenters are collaborating) for the documents in IDEM’s files associated with the project permits was submitted in September 2007, IDEM did not actually begin responding to this request until February 2008. On February 8, IDEM produced 6,410 pages of permit documents. On February 22, February 27, March 12 and March 19, IDEM produced thousands of pages of additional document. IDEM has acknowledged that not even all of the relevant documents have been made available. Simply reviewing all of the documents in the initial February 8 shipment would require more than 500 hours. Experienced engineers consulted by the Commenter have described the netting calculations as the most complex they have ever seen.

(Legal Environmental Aid Foundation Comment) It is incomprehensible that IDEM will not allow the minimum to review more than 6,000 pages of highly complex technical data simply because this facility that IDEM is regulating wants to take advantage of an emission offset credit to avoid the more stringent requirements under PSD and new source review, offset credits that will expire on June 1st.

It is difficult to get documents from IDEM. I’ve been to IDEM many times and never received the documents I was looking for. The permitting process is flawed, and there is a lack of transparency. The draft permits and permit records are complex and the public notice and comment period is short. IDEM should let BP’s emission reduction credits expire by waiting until after June 2008 to issue the permits.

d. Environmental Disaster
Commenters stated that BP is about to embark on one of the largest environmental disasters of our time-refining tar sands from Canada. The current technology is insufficient to provide for an environmentally acceptable approach to refining Canadian sand/shale crude oil.

e. Global Warming
The BP project will significantly increase the emissions of carbon dioxide from the plant, an additional 1.5 to two million tons per year. Carbon dioxide is causing global warming worldwide. Not only will this project directly impact the citizens of Indiana, and the residents of this region, but people, animals, and the ecosystem of North America. BP should sequester the carbon dioxide that it will produce. Carbon dioxide emissions should be lowered, not increased. BP estimates that carbon dioxide emissions will be increased by 30 to 40 percent, to as mush as 4 billion pounds. The federal Clean Air Act requires that carbon dioxide emissions be evaluated and controlled as an air pollutant, pursuant to New Source Review and the United States Supreme Court’s recent decision in Massachusetts v. EPA, 127 S. Ct. 1438 (2007). BP must limit its greenhouse gas emissions within legal parameters. The Midwest will be negatively impacted by global warming with increased drought, increased highly acidic rainfall, decreased river and lake levels, longer heat waves, more extreme single day temperatures, increased health problems and premature death. BP needs to follow Conoco-Phillips example and offset its greenhouse gas emissions on a two-to-one carbon basis.

f. Alternative Sources of Energy
BP should instead invest in clean energy and solar energy programs. Solar components are built in Indiana and should be used here.

g. Tar Sand Mining and Related Refining
Shale and tar sand oil extraction causes horrendous Canadian environmental damage. Tar sand mining uses up local water to create a water and oil slurry. Tar sand mining is not cost effective. Tar sands oils should be thought of as a temporary fuel source and not a long-term solution. Tar sands mining will devastate an area in Alberta the size of the state of Virginia and uses more energy to process than conventional fuel.

h. BP’s Environmental Record
In the annual report for British Petroleum, in 2006, BP was identified as a potential responsible party to 800 superfund sites. BP is not cleaning up the sites, they are creating more.

i. Lake County Ambient Air Monitors
The current air monitors in Lake County should be reviewed to ensure compliance.

j. Schedule of Compliance
The permits need to contain a schedule of compliance to address the violations that U.S. EPA found in its Notice of Violation sent to BP in November 2007.

k. BP is a Foreign Corporation
BP is a foreign corporation; most of its profits will not go to America or Americans.

Response:

a. Public Health
IDEM would not issue these permits if the permit terms were not protective of human health and the environment. BP’s projected air emission increases for the project are being offset by recent actual emission reductions and projected reductions. These reductions include voluntary reductions done in the past five years and future emission reductions from existing equipment. The draft permits make these reductions legally binding. The net effect of all the BP air emission increases and decreases is a net reduction in BP’s permitted air emissions. The draft permits require BP to reduce emissions by setting lower fuel usage limits for existing units and to further reduce emissions by adding new control equipment to existing equipment. The draft permits further require BP to reduce emissions by permanently shutting down older process heaters, the Fluidized Bed Incinerator and the #3 Ultraformer Unit.

The net emission reductions made enforceable by the permit will result in significant air emission decreases. Total particulate matter will decrease by 281 tons per year (TPY) and coarse particulate matter (PM10) will decrease by 41 TPY. Sulfur dioxide emissions will decrease by 200 TPY, total reduced sulfur emissions will decrease by 76 TPY and hydrogen sulfide emissions will decrease by 15 TPY. Carbon monoxide emissions will decrease by 23 TPY. Nitrogen oxides will decrease by 0.6 TPY. Volatile organic compound emissions will decrease by 14 TPY. Beryllium emissions will decrease by 0.005 TPY. Mercury emissions will decrease by 0.001 TPY. Lead emissions will decrease by 0.02 TPY.

IDEM has prepared the permits with all the applicable regulatory requirements to protect human health and the environment. IDEM’s role as the environmental regulator is to make sure that BP is complying with all air pollution control laws. IDEM has no authority to require BP to reduce all of its emissions to zero.

b. Michigan and Canadian Air Quality
Ozone and ozone precursor emissions can travel great distances and impact areas far removed from the emission point. Emissions from the BP refinery could possibly travel over 300 miles and impact eastern Michigan and Canada. However, there is no evidence or indication that BP emissions are causing any significant impact on the air quality in those areas. IDEM also has no authority in these BP permit actions to consider the effect of a possible future Canadian refinery project.
c. Public Involvement and Extension of Time

OAQ notified the public that the two draft BP permits were available for public comment by mailing a notice to interested parties. IDEM also published the notice in The Post Tribune newspaper in Merrillville, in Lake County, and The Times newspaper in Munster in Lake County on February 11, 2008. The draft permit documents were made available for review at the Whiting Public Library, 1735 Oliver Street, Whiting, IN 46394, at IDEM's Northwest Regional Office, 8315 Virginia Avenue, Suite, Merrillville, IN 46410, at IDEM's main office in Indianapolis and at http://www.in.gov/idem/ on the internet. In addition, on February 11, 2008, IDEM issued a notice that it would conduct a public hearing and public meeting regarding the draft permits on March 14, 2008, at the Hammond Civic Center. This Public Notice that was mailed to interested parties. The notice was published in the Post Tribune newspaper in Merrillville and The Times newspaper in Munster. IDEM posted the notice on IDEM’s website. After receiving requests to extend the comment period, IDEM made the decision to extend the public comment period to March 21, 2008, in order to give the public more time to comment. Because the last day of the public comment period fell on a day when IDEM offices were to be closed for business due to a state holiday, IDEM notified the public on its website that all comments must be postmarked or delivered in person by March 24, 2008, which was the next business day that IDEM was open.

IDEM considers all written comments, whether they are submitted in hardcopy or electronically. Under Indiana’s air permit rules, specifically 326 Indiana Administrative Code 2-7-17, OAQ gives the public at least 30 days to submit written comments. OAQ set the public comment period deadline at March 24, 2008, which set the public notice period at 42 days.

IDEM believes that the length of the comment period was sufficient and appropriate. IDEM received a substantial number of comments within the public comment period, including numerous comments sent by e-mail and oral comments submitted during the public hearing. The technical comments IDEM received were very detailed and thorough showing extensive review of the draft permit documents.

IDEM would not have accepted and initiated processing of the permit application as received on November 1, 2007 if IDEM had determined that the permit could not be processed in a timely and correct manner. IDEM is obligated to issue permits within 120 days (plus 45 days for public meeting and hearing) of receipt of a complete application unless there are delays that meet requirements under title 326 of the Indiana Administrative Code.

IDEM has endeavored to respond to all information requests as promptly and efficiently as possible. In response to these numerous requests, IDEM has produced volumes of records, including the permit applications, supplemental information, letters and electronic mail regarding the project.

IDEM has no authority to delay the issuance of the permits simply to allow for BP’s emission reduction credits to expire. IDEM wants to encourage BP and all regulated sources in Indiana to make voluntary pollution reductions beyond what IDEM can require by law. Not allowing BP to use these reductions would discourage sources from making such voluntary reductions.

d. Environmental Disaster

IDEM has prepared the permits with all the applicable regulatory requirements to protect human health and the environment. IDEM has no authority to consider whether better tar crude oil refining technology may be available in the future.

e. Global Warming
Carbon dioxide (CO₂) is not currently “subject to regulation” under the federal Clean Air Act (CAA). The U.S. Supreme Court’s decision in Massachusetts v. Environmental Protection Agency, held that CO₂ was a “pollutant” and that the U.S. EPA must decide whether, or how, it should be regulated. The Court did not conclude that CO₂ is a pollutant “subject to regulation.” In determining which pollutants are “subject to regulation” under the CAA, IDEM has followed the U.S. EPA interpretation that the phrase “subject to regulation” means pollutants that are subject to a statutory or regulatory provision that requires actual control of emissions of that pollutant.

The U.S. EPA has consistently determined that a pollutant such as CO₂ is not a “pollutant subject to regulation” if the CAA did not require actual control of emissions of the pollutant. Moreover, this interpretation has been applied expressly to CO₂. The U.S. EPA’s interpretation has been laid out in several guidance memoranda. For example, in a memorandum dated April 26, 1993 from Lydia N. Wegman, of U.S. EPA’s Office of Air Quality Planning and Standards, to U.S. EPA’s Regional Air Directors, it is specifically considered whether CO₂ was subject to regulation. The memorandum states that, although the 1990 amendments to the Clean Air Act included provisions addressing CO₂ and methane, “these requirements involve actions such as reporting and study, not actual control of emissions.” The memorandum concluded, “if the results of these studies suggest the need for regulation, these pollutants could be reconsidered at that time for classification as pollutants subject to regulation under the Act.”

More recently, in 2002, the U.S. EPA substantially revised its New Source Review (“NSR”) Program and promulgated revised rules on December 31, 2002. 67 Fed. Reg. 80290 (December 31, 2002). The revised rules substituted a new defined term, “regulated NSR pollutant” for the Act’s phrase “pollutant subject to regulation.” The phrase “regulated NSR pollutant” expressly includes only pollutants (or substances) (i) for which a national ambient air quality standard has been promulgated, (ii) that are subject to new source performance standards (“NSPS”), (iii) subject to a standard under the stratospheric ozone protection program of Title VI of the CAA, or (iv) that otherwise is subject to regulation under the Act (but generally excluding hazardous air pollutants).

Indiana’s definition is essentially a verbatim replication of the federal definition. The first three categories of the definition are similar in one aspect – they all provide for the development of substantive emission standards of the specified pollutants through a formal and comprehensive rulemaking approach. Carbon dioxide is not regulated under any of these three programs. This regulatory framework brings clarity to the fourth, catchall category, any pollutant “otherwise subject to regulation under the Act” (excluding hazardous air pollutants). When viewed with the other three categories, it becomes clear that U.S. EPA did not intend the fourth category to include pollutants for which the Act does not require substantive emission limitations.

This approach is consistent with a canon of statutory interpretation known as ejusdem generis, which provides that, where general words of description follow an enumeration of persons or things described by words of a particular and specific meaning, the general words are not to be construed in their widest extent, but are to be understood as applying only to persons or things of the same class or kind as those specifically mentioned or listed. Moreover, when the U.S. EPA added the term “regulated NSR pollutant” to the NSR rules in 2002, it listed in the preamble to the rule all the pollutants that it believed where currently regulated under the CAA. This list did not include CO₂.

The U.S. Environmental Appeals Board (“EAB”) has expressly held that CO₂ is not “subject to regulation.” In In re Inter-Power of New York, Inc., 5 E.A.D. 130, 151 (EAB 1994), the EAB held that the U.S. EPA was not required to conduct a BACT analysis for CO₂ and hydrogen chloride because they were “unregulated pollutants.” In In re Kawaihae Cogeneration Project, 7 E.A.D. 107, 132 (EAB 1997) the EAB again reviewed whether the U.S. EPA should have included BACT limits for CO₂. The EAB held that no limits were necessary because CO₂ was not considered “a
regulated air pollutant for permitting purposes" because there were “no regulations or standards prohibiting, limiting, or controlling the emissions of greenhouse gases.”

Therefore, carbon dioxide is not a regulated pollutant under Indiana law. IDEM does not have the jurisdiction to consider the effects of global warming caused by carbon dioxide. IDEM applies the air permitting rules contained in title 326 of the Indiana Administrative Code.

f. Alternative Sources of Energy
IDEM recognizes that the concerns expressed about the use of alternative sources of energy are important to those who expressed them. These concerns do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review by law cannot address issues for which it does not have direct regulatory authority.

g. Tar Sand Mining and Related Refining
IDEM recognizes that the concerns expressed in opposition to mining tar sands are important to those who expressed them. These concerns do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review by law cannot address issues for which it does not have direct regulatory authority.

h. BP’s Environmental Record
IDEM recognizes that the concerns expressed regarding BP’s possible liability for superfund cleanups are important to those who expressed them. These concerns do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review by law cannot address issues for which it does not have direct regulatory authority.

i. Lake County Ambient Air Monitors
IDEM, OAQ conducts ambient air monitoring for ozone, course particulate matter, fine particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide, lead and air toxics at locations around Indiana. The locations of these ambient air monitoring sites is described at http://www.in.gov/idem/programs/air/amb/index.html on the internet, with links to other pages that display the levels of concentration of each monitored pollutant. IDEM does an annual review of the monitoring network to insure optimal placement of the air monitors.

j. Schedule of Compliance
This issue is addressed in IDEM’s response to EPA Comment No. 6 in the technical comment section above.

k. BP is a Foreign Corporation
IDEM recognizes that the concern expressed that BP is a foreign corporation whose profits will not go to Americans is important to those who expressed them. These concerns do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review by law cannot address issues for which it does not have direct regulatory authority.

General Comment No. 3:

a. (RHAMC) Is BP contemplating expanding the refinery, for example, by purchased the NI Source Whiting Clean Energy Facility or any other emission units or sources not presently part of its permitted activities?

b. (Carolyn Marsh, Legal Environmental Aid Foundation) BP wants to buy the Whiting Clean Energy plant. Now they will be supplying steam to the refinery. When BP buys this plant, how is it going to impact the air pollution as well?
Response:

The Whiting Clean Energy plant is not considered part of the BP plant and is not considered in the processing of the current draft permits. IDEM has determined that these are separate sources pursuant to the definition of major source under 326 IAC 2-7-1(22). Based on this determination the operation of this facility will have no impact on the permitting of this project.

General Comment No. 4

(Save the Dunes Council) The Commenter recognizes and supports the air emissions that have been reduced by BP. However, many of the reductions were because of rules and regulations passed by EPA and the Indiana Air Pollution Control Board. How many of the reductions were beyond what was required by law?

Response:

The emission reductions relied upon for this netting analysis are beyond what is required by rule and/or regulation.

General Comment No. 5

IDEM’s Permit Process
Several Commenters stated that IDEM has done a poor job in following the law and protecting the regions air quality, without concern for human health or the environment. Commenters stated that IDEM lacks morals, favors industry, is trampling on the little guy and behaves unethically. IDEM's job is to protect the public from pollution. IDEM should not give in to corporate greed. It is revolting that the agencies charged with protecting the public from the effects of pollution (IDEM and the EPA) would actually ignore their first priorities to accommodate the financial concerns of a discharger. This stinks of political interference from the notoriously pro-corporate administrations in Indianapolis and Washington, D.C. The center for Public Integrity recently reported this about the Centers for Disease Control and Prevention: A recent investigation by the Center for Public Integrity disclosed that the nation's top public health agency blocked the publication of an exhaustive federal study of environmental hazards in the eight Great lakes states, reportedly because it contained such potentially "alarming information" as evidence of elevated infant mortality and cancer rates. The Center reported that Chris De Rosa, a top government scientist with the Centers for Disease Control and Prevention, was demoted after he pushed the agency to publish the Great Lakes report and other studies. BP should be boycotted. If IDEM decides to go through with granting this permit IDEM can expect to be sued.

Response:

The BP permits include all applicable requirements found in both federal and state regulations and is protective of air quality. The notice of issuance of the permits contains information on how any person who does not agree with the final permits may petition the Indiana Office of Environmental Adjudication for review of the permits.

General Comment No. 6:

Even though the air we breathe is free and is not considered a natural resource does IDEM weigh in the moral and ethical responsibility it has to the environment and the community that surrounds the Whiting BP refinery for Environmental Justice issues of air space violations?
Response:

IDEM recognizes that these concerns are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review, by law, cannot address issues for which it does not have direct regulatory authority, such as air space violations.

General Comment No. 7 (Susan Eleuterio and Tom Sourlis):

The Commenters state that IDEM’s Office of Water Quality’s mission is to monitor, protect and improve Indiana’s water quality to ensure its continuous use as a drinking water source, habitat for wildlife, recreational resource, and economic asset. Why is there not a similar mission concerning Indiana’s air quality?

Response:

IDEM’s core mission is to protect human health and the environment while allowing for environmentally sound activities of industrial, agricultural, commercial and governmental operations vital to a prosperous economy. The Office of Air Quality’s objectives are to improve air quality to meet the National Ambient Air Quality Standards and to reduce health risks; improve compliance rates; and provide quality, timely permit service.

General Comment No. 8 (Sauk-Calumet Sierra):

The Commenter hereby requests that:

• BP quantify and make available to the general public current and projected greenhouse gas emissions for the years 2008 (base), 2018, 2028.
• BP consider voluntarily setting stricter standards for greenhouse gas emissions.
• BP consider voluntarily setting stricter standards for regulated air pollutants not limited to particulate matter, sulfur dioxide, hydrogen sulfide, lead.
• BP become a leader in finding solutions to and preventing global warming.

Response:

IDEM recognizes that these concerns are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review by law cannot address issues for which it does not have direct regulatory authority.

General Comment No. 9:

a. (Save the Dunes Council) Why was the Public Hearing scheduled on a Friday night during the winter? The Public Hearing was disappointing due to the lack of professionalism during the conduct of the hearing. It was a hostile situation without enough police to make people safe.

b. (Kurt Oldenbrook, IN) The public meeting was stacked with BP employees and their families. Most were probably paid to be there. This is and has been a common occurrence in Indiana for the last half century.

Response:

The public meeting and public hearing were scheduled on a day that a local facility large enough to hold the expected number of people was available. Over 1,000 people attended the meeting and hearing. The meeting and hearing were conducted in an orderly and efficient manner. Every
person who wished to speak was able to do so. Law enforcement officers were present inside and outside the facility and they maintained the peace. All persons, no matter their relationship to the source, are invited to attend and participate in IDEM public meetings and public hearings.

General Comment No. 10 (Save the Dunes Council):

The Commenter supports the permanent shutdown of the sludge incinerator and pointed out during the water permitting that this was a source of mercury that should be eliminated.

Response:

IDEM acknowledges this comment.

General Comment No. 11:

a. Lake Michigan Water Quality
Many commenters expressed concern regarding the impact of emissions from BP and other industries on the waters of Lake Michigan and its tributaries. Noting the value of these fresh water resources for drinking water and recreation, the commenters urged IDEM to not allow BP and other industries to destroy the water quality of Lake Michigan. The commenters stated that IDEM should not spoil a potential source of revenue to grant variances to industrial giants.

b. Truck Traffic
Commenter urges IDEM to deny BP’s request for an air emissions permit for their planned $3.8 billion expansion of the Whiting refinery. Commenter stated that residents do not need a fleet of trucks, driving down our highways hauling asphalt products and most likely oozing asphalt vapors (volatile organic compounds) stinking up the air.

c. Refinery Odor and Improper Disposal
Commenters noted that on or around March 19, 2008, there was an undetermined amount of naphtha that escaped from the refinery that panicked residents for over 20 miles away. Why doesn’t IDEM have odor and noise regulations for industry? Other commenters noted other odors from BP and from other area industry. Recently, BP has made national news for the improper disposal of the side-products of gas refining into Lake Michigan. Should an outfit that is so careless really be permitted to expand, let alone continue? It is time to make moral decisions, instead of economic ones.

Response:

IDEM recognizes that these concerns are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s air permit review by law can address only issues that are part of the air pollution control regulations. Truck traffic and truck air emissions outside of the BP property are not subject to IDEM’s air permitting process. IDEM does not regulate noise or odor. However, odor can be an indication that a process is not operating correctly. Citizens should report the details of any unusual odor to IDEM’s air compliance inspector Ramesh Tejuja at IDEM’s Northwest Regional Office, (219) 757-0282. The BP permits contain specific compliance determination requirements, compliance monitoring requirements, record keeping requirements and reporting requirements to insure that BP is in continuing compliance with all applicable regulations.

General Comment No. 12:

a. Texas City Explosion
Several Commenters stated that BP’s plant in Texas City, Texas had an explosion three years ago that resulted in 15 deaths and more than 170 injuries. The U.S. Chemical Safety and Hazard Investigation Board released a video "Anatomy of a Disaster" that examines causes of the blast. The video states that years of budget cuts paved the way for the tragedy by limiting training, reducing staff and deferring maintenance and upgrades. BP continues to dispute that finding and has said the company found no link between cost cuts and the disaster. BP agreed to pay a 373 million dollar fine and admit criminal wrongdoing. BP does not have a good safety record in Texas City, Texas therefore I see no reason to trust BP with the safety of the people in Whiting.

b. OSHA Penalty
OSHA has fined the Whiting plant $384,250 for fines in violations. The Whiting Clean Energy plant, owned by NiSource, had a crash, chalking up 32.8 million dollars in losses.

Response:

IDEM recognizes that these concerns are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM’s permit review, by law, cannot address issues for which it does not have direct regulatory authority. The BP permits contain specific compliance determination requirements, compliance monitoring requirements, record keeping requirements and reporting requirements to insure that BP is in continuing compliance with all applicable regulations.

OSHA (Occupational Safety and Health Administration) federal regulations cover most private sector workplaces. Its mission is to prevent work-related injuries, illnesses, and deaths by issuing and enforcing rules (called standards) for workplace safety and health. IDEM’s permit review, by law, cannot address issues for which it does not have direct regulatory authority.

General Comment No. 13 (Margaret Laney, Aurora, IL):

We understand that the modernization project at Whiting will increase greenhouse gas emissions upon completion in 2011, as the facility will be processing more Canadian crude oil. Greenhouse gas emissions are a global issue, which is why BP is advocating for a single, mandatory, U.S. federal greenhouse gas emissions registry and a national cap and trade program. BP also supports development of policies to promote technological innovation and the growth of low-carbon businesses. It is not appropriate for the pending IDEM air permits to address greenhouse gas emissions because there not an appropriate regulatory program in place today to serve as the basis.

Response:

IDEM acknowledges this comment.

General Comment No. 14 (Thomas M. McDermott, Jr., Mayor, City of Hammond):

Based on the comments received during the public comment period, the Commenter knows that IDEM will now take a second look at the proposed permits to determine if any changes or modifications are necessary. The Commenter hopes that the data provided in BP’s permit applications, and the comments made by the public will be incorporated into the final permits. In addition, the Commenter requests that once the permits are issued they be closely monitored so that the predicted environmental benefits will be realized in the timeframes set out in the approved permits.
Response:

IDEM considers all written comments, whether they are submitted in hardcopy or electronically. Under Indiana’s air permit rules, IDEM determines if changes to the draft permit are warranted. IDEM believes that the specific compliance determination requirements, compliance monitoring requirements, record keeping requirements and reporting requirements as included in the final permits will ensure compliance with the emission limitations and standards set forth in the permits.

General Comment No. 15

(Carolyn Marsh, Legal Environmental Aid Foundation) Neither Whiting nor East Chicago has departments of environmental management. Will IDEM increase the number of employees in the region to monitor and react quickly to any mishaps and accidents at the refinery?

Response:

IDEM has a regional office located in Merrillville, Indiana. The compliance inspectors responsible for this facility work at this office and are therefore within a reasonable distance to respond promptly to compliance issues identified by local citizens. Citizens can contact IDEM’s air compliance inspector, Ramesh Tejuja, at the Northwest Regional Office, by calling (219) 757-0282.

General Comment No. 16 (Georg Smolka)

If the CAFE standards had been improved instead of allowing MPG values for cars in this country to continue to drop, a lot of this necessity for oil would not be here.

Response:

OAQ recognizes that these concerns are important to those who expressed them; however, they do not have a direct impact on how IDEM reviews and makes decisions on air permit applications. IDEM, OAQ’s permit review by law cannot address issues for which it does not have direct regulatory authority. All requirements for new vehicle fuel economy are set by the U.S. EPA.

### Applicable Requirements

- **Particulate Matter**
- **VOC**
- **Hazardous Air Pollutants (HAPs)**
  - VOC from Pet. Refineries IAC 4-1 and 8-2.
  - VOC for Tanks, 326 IAC 8-4-3 and 8-9.
  - VOC for Gasoline Dispensing Facility, 326 IAC 8-4-6(b).
  - VOC for Bulk Gas Terminals and Equipment Leaks, 326 IAC 8-4-4 and 8-9.
  - Continuous Monitoring of Emissions, 326 IAC 3-5.
  - Petroleum Refineries Terminals MACT, 40 CFR 63 Subpart EEEE Organic Liquid Distribution MACT.
  - Petroleum Refineries Terminals MACT, 40 CFR 60 Subpart J Petroleum Refineries Terminals.
  - VOC Reductions, 326 IAC 8-7.
  - NOx Trading Program, 326 IAC 7-4.1-3.
  - PM 10 SIP, 6.8-2-6, 6.8-6-3, and 6.8-1-2.

### Waste Operations

- **Ballast Water Treatment Plant**
  - WWTP 21.
  - Remediation System.
  - Marketing Terminal.
  - Remediation 22.
  - Mechanical Shop.
  - Terminal 22.
  - Cooling Towers.
  - Marine Dock Facility.
  - Marine Dock Facility.
  - Cogen 3.
  - Gas Oil Hydrotreating Unit.
  - 2 2.
  - Distillate Hydrotreating Unit.
  - Cogen Steam Transfer Line.
  - Marine Dock Facility.
  - Recycling Plant.
  - Gas Oil Hydrotreating Unit.
  - Distillate Hydrotreating Unit.
  - Drums.
  - Gas Oil Hydrotreating Unit.
  - Recycling Plant.
  - Gas Oil Hydrotreating Unit.
  - Gas Oil Hydrotreating Unit.
  - Concrete Crusher.
  - Drums.
  - Gas Oil Hydrotreating Unit.
  - Recycling Plant.

### Particular

- **Butane, Propane, and Propylene Storage and Loading Facilities**
  - Light ends.
  - Butane.

### Last Updated

03/21/2008
Footnotes:

X Regulation is applicable to unit.

X¹ Applicability only to fuel gas system on unit.

X² Previously exempt due to age of unit, now required per Consent Decree.

X³ All or part of the process equipment covered by this section may be subject to this regulation. Applicability to be determined during construction of OCC Project.

1 No affected facilities (compressor, "equipment") constructed or modified after Jan 4, 1983 per 40 CFR 60.590(b).

2 Modification of affected facilities does not meet definition under 40 CFR 60.590(c).

3 Unit does not have equipment (i.e. pumps, valves, etc.) in VOC service.

4 Unit does not have equipment that contains or contacts a fluid (liquid or gas) w/ >10% wt benzene.

5 Unit does not contain equipment w/ > or = 5% HAPs, no controls required.

6 Unit does not have volatile organic liquid storage vessels or petroleum liquid storage vessels subject to 8-4-3 or 8-9.

7 Unit does not manufacture or store asphalt.

8 No affected facilities (i.e. petroleum or volatile organic liquid storage tanks) constructed or modified after June 11, 1973.

9 Unit does not have a vacuum system or wastewater separator (oil/water).

10 Unit does not have a CEM.

11 Does not meet applicability per 40 CFR 60.100.

12 No affected facilities constructed or modified after May 4, 1987 per 40 CFR 60.690(a)(1) or all Group 1 wastewater streams controlled per 40 CFR 61 Subpart FF.

13 Accounted under 6BQ exemption per 40 CFR 61.342(e).

14 Reserved.

15 Facilities not included in 326 IAC 6.8-10.

16 Unit does not have an emission source covered under PM and/or SO2 SIP rule.

17 Reserved.

18 Reserved.

19 Reserved.

20 Per 40 CFR 60.14(e)(5) - the addition of a pollution control device would not be a modification.

21 Unit does not have process streams, only wastewater.

22 Unit is subject to another rule.

23 Not applicable per 40 CFR 63 Subpart UUU.

24 Unit does not have equipment subject to the NOx budget trading program in 326 IAC 10-4 or 326 IAC 24-3.
All off-site waste water processed on the refinery properties meets the exemption under 40 CFR 63 Subpart DD (per 40 CFR 63.680(d)). The total quantity of HAP is monitored and remains below 1 mega gram per year.

No affected facilities (compressor, "equipment") constructed or modified after Nov. 7, 2006 per 40 CFR 60.590a(b).

This unit does not have any organic liquid distribution operations per 40 CFR 63.2334 and 40 CFR 63.2338(c).

No affected facilities (i.e. fluid catalytic cracking unit catalyst regenerator or fuel gas combustion device) constructed or modified after June 11, 1973.

Unit does not have equipment (i.e. gasoline loading racks) subject to 40 CFR 60, Subpart XX.

Unit does not have marine loading operations subject to 40 CFR 63, Subpart Y.

Unit does not have site remediation activities subject to 40 CFR 63, Subpart GGGG.

Unit not subject to the specific VOC reduction requirements for Lake county in 326 IAC 8-7.

Unit does not have any equipment (i.e. boilers) constructed or modified after June 19, 1984.

Unit does not have any equipment (i.e. internal combustion engines) constructed or modified after July 11, 2005.

Unit does not have emissions of particulate matter.

Unit does not have a cold cleaning degreaser subject to 326 IAC 8-3-2 and 8-3-5.

Unit does not have gasoline dispensing operations subject to 326 IAC 8-4-6(b).

Unit does not have bulk gasoline terminal operations subject to 326 IAC 8-4-4 and 8-4-9.

Unit does not have affected facilities (asphalt storage tank) constructed or modified after May 26, 1981 per 40 CFR 60.470(b).

New units will not be subject to these requirements (i.e., not constructed with asbestos-containing material).

As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same CO emission factors.

The carbon monoxide (CO) emission factors from AP-42 are used in the refinery industry as a standard when source specific data is not available. Based on most current source specific data.

Based on stack test performed for BP Whiting Refinery in March 1993.

Based on stack test performed for BP Whiting Refinery in September 2003.

Based on design requirements.

Based on stack test performed for BP Whiting Refinery in March 2002.

Based on design requirements.

Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:

- A -Excellent - Developed only from the highest rated test data taken from a randomly chosen facilities in the industry population.
- B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
- C - Average - Developed from highly rated test data from a reasonable number of facilities.
- D - Below Average - Developed from highly rated test data from a small number of facilities.
- E - Inadequate - Developed from poorly rated test data from a small number of facilities.
- N/A - No data available for this factor.

Sources are being reduced for at least one pollutant.
The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively burned.

Existing unit being shutdown as part of CXHO project.

Existing unit being shutdown within the CXHO project contemporaneous period.

The Lead emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 factor is assigned a 1EF D Rating.

D - Below Average - Developed from highly rated test data from a small number of facilities.

B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.

## Emission Factor Source References

1. Emissions are based on API/NSPFA Emission Factors for Boilers / Heaters using Process Gas, 1996 (Table ES-1).
2. Justification References

* Emission factor based on Engineering Estimate.
As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively

Existing unit being shutdown as part of CXHO project.

Existing unit being shutdown within the CXHO project contemporaneous period.

The Beryllium emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:

<table>
<thead>
<tr>
<th>Quality Rating</th>
<th>Test Data Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>C - Average</td>
<td>Developed from highly rated test data from a reasonable number of facilities.</td>
</tr>
<tr>
<td>A - Excellent</td>
<td>Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.</td>
</tr>
</tbody>
</table>

The particulate matter (PM) emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each refiner has the flexibility to choose their own emission factors. PM emission factors are classified into types of PM (i.e., filterable, total, and respirable), and are modeled by source category, and are calculated in units of lb/MMBtu. Each PM factor is evaluated and rated by a "Factor Expert" and is classified into one of the following categories: AOS, BOS, COS, FOS, GOS, HOS, IOS, JOS, KOS, and LOS. SPS is a specific point source, and Utilities is a general source category. All units in this table are calculated in lb/MMBtu. The particulate emission factors from PM-15 are the same particulate emission factors.

The emission factors from PM-15 are calculated in units of lb/MMBtu. The emission factors from PM-15 are calculated in units of lb/MMBtu. The emission factors from PM-15 are calculated in units of lb/MMBtu.

The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Only the combustion of natural gas will emit SO2 and therefore emissions will be continuous throughout the CXHO project contemporaneous period. Based on future potential SO2 emissions. Calculation based on sulfur dioxide (SO2) emissions. SO2 emissions were calculated using hydrogen sulfide (H2S) CEMS data, and TRS testing data where available.

**Calculation Methodology**

Combustion emissions are assumed to include some amount of sulfur dioxide (SO2) which can react with water vapor present in the stack to produce sulfuric acid mist (H2SO4 mist) as shown in Equation C-8-1.

\[
\text{SO}_2 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{SO}_4
\]

H2SO4 mist emissions are conservatively calculated by assuming 3% of the SO2 emitted by the heater is in the form of SO3.

**Table Notes**

- Calculation based on sulfur dioxide (SO2) emissions. SO2 emissions were calculated using hydrogen sulfide (H2S) CEMS data, and TRS testing data where available.
- Calculation based on future potential sulfur dioxide (SO2) emissions. SO2 emissions were calculated using the future design fuel gas total sulfur.
- Justification References
- Based on baseline year source specific data (SO2 emissions CEMS data).
- Based on future potential SO2 emissions.
- Existing unit being shut down within the CXHO project contemporaneous period. Existing unit being shut down as part of CXHO project. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Only the combustion of natural gas will emit SO2 and therefore sulfuric acid mist.

**Emission Factor Source References**

- See EF Reference1
- See EF Reference2

**Calculation Equation**

\[
\text{SO}_2 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{SO}_4
\]
As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Only combustion of natural gas produces SO2 emissions.

Existing unit being shutdown as part of CXHO project.

Inherent to the process design, the pressure swing adsorption (PSA) offgas does not contain any sulfur compounds.

Based on anticipated vendor guarantee to satisfy design requirement.

Future projected emissions based on anticipated operation of FCU 500 and 600. 20 ppm concentration is the basis for the proposed tpy limit.

Baseline actual emissions calculated using Hydrogen sulfide (H2S) CEMS data and TRS sampling. Future actual emissions based on CXHO design for total sulfur in the fuel gas.

U.S. EPA. AP-42. Fifth Edition. Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources. Chapter 1, Section 1.4

Future SO2 ppm based on anticipated operation to achieve future projected emission rate.

Baseline actual emissions calculated using H2S and remaining Total Reduce Sulfur (TRS) CEMS data.

New Coker (#2 Coker)
As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower. The new hydrogen unit cooling tower will be operated separately from refinery operations. VOC emissions are only applicable to cooling towers serving existing unit being shutdown as part of CXHO project.

**Note:** The table contains emissions data for various processes, including hourly and annual emissions for sulfur, VOC, NOx, and SO2. The data is presented in a tabular format with columns for process unit, heating, sulfur, VOC NOx, and SO2 emissions. The emissions are measured in various units, such as tons, MMBtu/hr, and lb/MMBtu, with associated concentrations and concentrations in parts per million (ppm) or other relevant units.
Because sulfur is a naturally occurring element, the concentration of sulfur in the natural gas is dependent on the source of the natural gas. It is expected that the sulfur concentration will vary depending on the source of the fuel gas. Consequently, process units having significant emission rates based on sulfur concentration have been identified for further consideration for alternative fuel sources.

</table>

Notes: PM10 SIP limits for PSD applicability purposes, which includes both filterable and condensable PM 10. PM2.5 emissions however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions. Emissions are being reduced for at least one pollutant.

** Hourly emission rate represents annual average hourly emissions.

*** Based on future capacity of 1300 LTPD sulfur production. Conservatively assumes that all H2S present in sulfur is emitted during the loading process.

** Conservatively assumes that all H2S present in sulfur is emitted during the loading process.

*** In the future, sulfur pits will be controlled and routed back to the SRU process, therefore there will be no H2S emissions from the sulfur pits.

*The difference in the amount of H2S in the sulfur before and after loading is assumed to be emitted to the atmosphere as part of the loading process.*

**SO2 concentration is calculated based on average daily H2S and TRS CEMS Data.**

The Beavon-Stretford combustor temperature ramps up if the H2S concentration approaches 10 ppm. BP Whiting has estimated that approximately 30% of the TRS/H2S sulfur is converted to SO2 after the combustion temperature ramps up.

---

### Sulfur Loading Emissions

**The difference in the amount of H2S in the sulfur before and after loading is assumed to be emitted to the atmosphere as part of the loading process.**

*Heavy metal emission rate represents annual average hourly emissions.*

**Sulfur pit loading emissions have only been included for the H2S/TRS baseline years of 2000-2001.**

* The total flow to the Beavon-Stretford TGU in 2003 was 261,933.7 ton/yr based on data recorded by the BP Whiting PI data collection system.

Note the PM10 emission limit provided in the PM10 SIP is 0.110 lb/ton. Therefore, in 2003 the PM10 emissions were below this limit (359.2 lb PM10/yr)/(261,933.7 ton/yr) = 0.0014 lb/ton.

\[
EF = k \times 0.0032 \times \left( \frac{U}{3} \right)^{1.3} \times \left( \frac{M}{2} \right) \text{ lb PM} \text{ ton coke handled}\]

1 Percentage of operating time in normal and emergency scenarios provided by coke handling contract
2 Emission factors provided in AP-42 Section 13.2.4 (January 1995).
3 Based on average annual wind speed for Chicago, IL in U.S. EPA TANKS 4.0.9d.
4 Based on assumed worst case moisture content of petroleum coke
5 Percentage control provided by enclosed conveyors and water spray
6 Percentage control provided by enclosed building and water spray.
7 Hourly emission rate represents annual average hourly emissions.

#### Coke Yard Surface Area

- **Exposed Pile Surface Area**
- **Volume of Coke Stored**
- **Volume of Cone**
- **Radius of Pile**
- **Exposed Pile Surface Area**

1. Average tons of coke produced per day based on annual coke production (on a dry basis) in 2001 and 2002, which was 1,138,511,050 and 1,036,797,400 lb/yr, respectively, adjusted to 10% moisture.
2. Pile surface area is estimated based on the production of coke and pile height.
3. Coke yard surface area estimated from aerial image of coke yard.
4. Based on Chapter 4 of the 1988 EPA Report “Control of Open Fugitive Dust Sources”. (EPA - 450/3-88-008)
5. The PM₁₀ emission factor is estimated to be half of the PM emission factor based on 1988 EPA Report (EPA - 450/3-88-008).
6. The PM₁₀ emissions are assumed to be equal to PM₂.₅ emissions.
7. Surface material silt content for storage pile from silt testing done on comparable coke pile.
8. Surface material silt content for coke yard from silt testing on comparable coke yard.
9. The number of wet days with at least 0.01 inches of precipitation is based on a 47 year average for Chicago, IL from the National Climate Data Center.
10. Based on four years (1997-2001) of meteorological data at Midway Airport.
11. Hourly emission rate represents annual average hourly emissions.

\]

**Footnotes:**

1. Total coke handled based on average daily production during the baseline period.
2. The current coke handling includes three transfer points: (1) the drop into storage pile 3A or 3B from the front end loader (FEL), (2) loading out of storage pile 3A or 3B by a FEL, and (3) the drop into the truck from the FEL.
3. Emission factors provided in AP-42 Section 13.2.4 (November 2006).
4. Based on average annual wind speed for Chicago, IL in U.S. EPA TANKS 4.0.9d.
5. Based on average moisture content for coke material handled provided by Natalie Grimmer via email on 1/4/2007.
6. Hourly emission rate represents annual average hourly emissions.
7. The PM\(_{2.5}\) emissions are assumed to be equal to PM\(_{10}\) emissions.

\]

**Footnotes:**

1. Each truck travels a total of 1.6 miles within the Whiting Refinery on paved and swept roads.

2. Emission factors provided in AP-42 Section 13.2.1 (November 2006).

3. Particle size multiplier k from AP-42 Table 13.2.1-1 (November 2006).

4. Road surface silt loading is from Table 13.2.1-4 and is based on the average silt loading for the iron and steel production industry.

5. Since each truck travels 0.8 miles unloaded (weighing 15 tons) and 0.8 miles loaded (weighing 36.5 tons), the average truck weight is 25.8 tons.

6. The number of wet days with at least 0.01 inches of precipitation is based on a 47 year average for Chicago, IL from the National Climate Data Center.

7. The emission factor for vehicle fleet exhaust, break and tire wear is from AP-42 Table 13.2.1-2 (November 2006).

8. Hourly emission rate represents annual average hourly emissions.

9. The PM$_{10}$ emissions are assumed to be equal to PM$_{2.5}$ emissions.
Table C.37. 2001-2002 Fugitive Emissions from Unpaved Roads

### Coke Fugitive Dust from Unpaved Roads

- **Average Tons of Coke Produced per day**: 1,638.9 tons/day
- **Average Tons of Coke per Truck**: 21.5 ton/truck
- **Feet Driven Per Truck within Coke Yard**: 640 feet/truck
- **Feet Driven Per Front End Loader (FEL)**: 1,320 FEL feet driven/truck
- **Vehicle Miles Traveled by Average Trucks**: 3,373 VMT/yr
- **Vehicle Miles Traveled by Average FEL**: 6,956 VMT/yr

</tbody>
</table>

**EF** = \[ k \left( \frac{s}{12} \right) \left( \frac{W}{3} \right)^{\frac{1}{3}} \left( \frac{N - P}{N} \right) \] (lb/VMT)

### Footnotes:

1. Each truck travels either 360 ft (Pile 3A) or 280 ft (Pile 3B) each way to and from the coke pile inside the coke yard.

Note the FEL vehicle miles traveled are similarly calculated assuming either 480 ft (Pile 3A) or 120 ft (Pile 3B) of distance from the coker to the coke pile and an additional 40 ft of distance between the 3A or 3B coke pile and the truck being loaded. Note that given the capacity of the FEL relative to the trucks, each FEL trip must be made twice per each truck loaded.

2. Emission factors provided in AP-42 Section 13.2.2 (November 2006).

3. Emission constants k, a, and b from AP-42 Table 13.2.2-2.

4. Surface material silt content from silt testing performed at comparable coke yard.

5. Since each truck travels the same distance unloaded (weighing 15 tons) and loaded (weighing 36.5 tons), the average truck weight is 25.8 tons.

6. Since each FEL travels the same distance unloaded (weighing 42.1 tons) and loaded (weighing 54.6 tons), the average FEL weight is 48.4 tons.

7. The number of wet days with at least 0.01 inches of precipitation is based on a 47 year average for Chicago, IL from the National Climate Data Center.

8. The PM2.5 emissions are assumed to be equal to PM10 emissions.

1 United States, et al v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

2 LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000) = 95%) and (1-2,000/10,000) = 80%)

A/V/O monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance “Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives” (October 2000).

Relief Valves are controlled.

</table>

1. The FCU 600 Allowable Emissions were calculated using the maximum capacity of 80 (1000 bbl/day) and the ratio of coke burned to fresh feed, which is based on historical FCU 600 usage.
2. The Consent Decree limits FCU 600 to an SO₂ concentration of 50 ppm at 0% excess O₂.
3. Pursuant to the BP Whiting Consent Decree, up to ten percent (10%) of the SO₂ reduction credits generated by the FCU 600 SO₂ emissions reduction to 50 ppm could be used for netting SO₂ emissions increases that result from the construction or modification of "netting/offset generating units".

</table>

1. Emission decreases represent creditable emissions decreases when the future potential emissions are less than the baseline emissions.
2. Based on interim guidance from US EPA, PM$_{10}$ is evaluated based on significant emission rate thresholds established for PM$_{10}$. The current PM$_{10}$ SIP limits filterable PM$_{10}$ emissions and compliance is based on reference test method 201A (which only quantifies filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PM$_{10}$ baseline on the PM$_{2.5}$/PM$_{10}$ SIP limits for PSD applicability purposes, which includes both filterable and condensable PM$_{10}$. PM$_{2.5}$ emissions are not regulated by the Lake County PM$_{10}$ SIP, however, to be conservative, BP Whiting has adjusted PM$_{2.5}$ baseline emissions in the same manner as for PM$_{10}$ emissions.

Selected 24-month period is based on calendar years.
1 FDU New Units from Table C.61.
2 PSD Affected Units from 'Evaluation of Project Impacts on Existing Unit' (Table C.71 through C.86).
3 Emissions decreases for past contemporaneous projects are being made enforceable as part of the CICHO Project. The emissions decreases were documented in the respective permit applications.
4 Unit shutdown values based on average past actual emissions for baseline period.
5 Unit shutdown values for non-contemporary CICHO projects are based on a 24-month period average past actual emissions.
6 JLU Reformation emissions based on data recorded by BP Whiting data collection system.
7 Marine Deck VOC emissions based on 2003-2004 total average emissions contributed to 10 ng of VOCs for greenhouse gas loading.
8 Cooling Cascading Towers 2, 3, and 4 will be controlled to 0.01% liquid drift. Note half of the Cooling Tower 2 modules are already controlled to 0.005% liquid drift. Contemporaneous to the CICHO Project the other modules will be controlled to high efficiency drift eliminators.
9 No creditable NOx decrease was taken for the shutdown of the 1SPS boilers per the consent decree.
10 The FCU 500 WARP emergency/malfunction flaring emissions are assumed to be equivalent to the FCU 600 WARP emissions. The projects will be similar; however, the FCU 500 WARP release rates have not yet been estimated site design is not complete.
11 The FCU 560 WARP emergency/malfunction flaring emissions are assumed to be equivalent to the FCU 500 WARP emissions. The projects will be similar; however, the FCU 560 WARP release rates have not yet been estimated site design is not complete.
12 Based on interim guidance from US EPA, PMd is evaluated based on significant emission rate thresholds established for PMd. The current PMd SIP limits filterable PMd emissions and compliance is based on reference test method (filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PMd baseline on the principle that filterable and condensable PMd, PMd or by the Lake County PMd SIP, however, to be conservative. BP Whiting has adjusted PMd baseline in the same manner for PMd emissions.

-2.82

**Total VOC Emissions Associated with Added Components and Additional Controls (tons/yr):**

-2.50

---

2. LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 85%, respectively based on a 500 ppmv/leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000 = 85%)
3. 30% control estimate per TCEQ Guidance "No Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000)
4. There is 1 new relief valve and 47 existing RV's - previously routed to the atmosphere (through the blowdown stack) that are now routed to the DDU flare. The existing RV's were previously controlled with a water spray chamber that is presumed to be capable of 90% control.

---

¹ EPA Emission Factors EPA-453/R-95-017, Table 2-6
² LD&R Control efficiency for pumps and valves in gas and light liquid service are 95% and 85%, respectively based on a 500 ppmv/leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000 = 85%)
³ AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

</table>

* Event emission rate represents one worst case emergency/malfunction scenario event. Annual emission rate represents the estimated annual average total duration of worst case emergency/malfunction events.

**SO2 Emissions Calculation:**

SO2 MW (lb/lb-mole) = 64

SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

**General Assumptions Used in Calculations:**

- Variable
- Value
- Units
- 1,000,000 ft^3
- P
- 14.7 psia
- R
- 10.73 psia-ft^3/lbmol-R
- T
- 527.7 R
- md
- 2596.15 lbmols/MMscf
- 385.1851 scf/lbmol

**Other Notes:**

- Natural gas Higher Heating Value (Btu/scf) = 1020
- Regulatory applicability for 40 CFR 63, Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63, Subpart CC since they are exempted from the definition in 40 CFR 63.641
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would release one time per year, although this is an unlikely scenario.
- RV release gas combustion emission factors for PM/PM10/PM2.5, Lead, Mercury, and Beryllium are from AP-42 Section 1.4 (July 1995). Emission factors for VOC, NOx, and CO are from AP-42 Section 13.5 (September 1991). The emissions for SO2 are calculated using the Ideal Gas Law, where $n = \frac{P \times V}{R 	imes T}$.
- No modifications to the flare, flare knockout drum, or piping from the knockout drum to the flare required. The 11A WARP project ties existing blowdown RVs to the DDU Flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header system.
- For releases to the flare, flare knockout drum, or piping from the knockout drum, the flare required modifications to accommodate the worst case emergency/relief scenarios when considering the worst case emergency/malfunction for the current operations. The 11A WARP project integrates the existing blowdown RVs to the DDU Flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header system.
- Refer to the application text for more information.
### Fugitive Emission Calculations for WARP at 11C Pipestill

Note that these counts also include work to control RVs for the 11B Coker that are part of the 11C WARP Project.

- **LDAR Program**: Monitoring per Consent Decree\(^1\)
- **Factor Type**: Refinery Screening

---

\(^1\) United States, et.al v. BP Exploration & Oil, et.al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

\(^2\) LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 85%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 85%)

\(^3\) There are 2 new relief valves and 74 existing RV's - previously routed to the atmosphere (through the blowdown stack) that are now routed to the DDU flare. The existing RVs were previously controlled with a water spray chamber that is presumed to be capable of 90% control.

**Notes**
Note that the work for 11B is associated with the 11C WARP project.

### General Assumptions Used in Calculations

- Natural gas Higher Heating Value (Btu/scf) = 1020
- The 11B WARP project ties existing blowdown RVs to the DDU Flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header tie-ins.
- No modifications to the flare, flare knockout drum, or piping from the knockout drum to the flare required modifications to accommodate the worst case emergency relief scenarios when considering the worst case relief scenarios for the current operations.
- Emission factors for VOC, NOx, and CO are from AP-42 Section 13.5 (September 1991). The emissions for SO2 are calculated.
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.

### SO2 Emissions Calculation

SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

\[
\text{SO2 emissions} = \text{mass flow rate of SO2} \times \text{concentration of sulfur in gas stream} \times \text{molecular weight of SO2} \div \text{ideal gas constant} \div \text{temperature} \div \text{pressure} 
\]

### Ideal Gas Law

\[
PV = nRT 
\]

where:
- \( P \) is the pressure (psia)
- \( V \) is the volume (ft³)
- \( n \) is the number of moles
- \( R \) is the ideal gas constant (14.7 psi ft³/psia mol)
- \( T \) is the temperature (°R)

### VOC, NOx, and CO

Emission factors for VOC, NOx, and CO are from AP-42 Section 13.5 (September 1991). The emissions for SO2 are calculated.

### Other Notes

- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.
### General Assumptions Used in Calculations

- **Ideal Gas Law** used to determine the moles of gas per MSCF ($P \times V = n \times R \times T$)

### Other Notes:
- The 11C WARP project ties existing blowdown RVs to the DDU Flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header system.
- No modifications to the flare, flare knockout drum, or piping from the knockout drum to the flare are required. These modifications are necessary to accommodate the worst case emergency relief scenarios for the current operations.
- Regulatory applicability for 40 CFR 63, Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63, Subpart CC since they are exempted from the definition in 40 CFR 63.641.
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.

1 United States, et.al v. BP Exploration & Oil, et.al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL
2 LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%) AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps. 30% control estimate per TCEQ Guidance "No Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).
3 There are no new relief valves and 41 existing RV’s - previously routed to the atmosphere (through the blowdown stack) that are now routed to the FCU flare. The existing RVs were previously controlled with a water spray chamber that is presumed to be capable of 90% control.
Increased Sewer Emissions from FCU600 WARP Project due to Added Equipment

Other Notes:
- Major gas header blowdown: Valve #5/6
- The FCU 600 WARP project (new existing blowdown) will tie existing blowdown systems and consist of emergency RVs only. Nitrogen will be used as the purge gas for the new header lines
- No modifications to the new, first header blowdown system or tying into the existing header, so no new required notifications to accommodate the new header emergency vent system where considering the worst case relief scenario for the current operations
- RV release gas combustion emission factors for PM/PM10/PM2.5, Lead, Beryllium, and Mercury are from AP-42 Section 1.4 (September 1991). Emission factors for VOC, NOx, and CO are from AP-42 Section 13.5 (September 1991). The emissions for SO2 are calculated

---

2. LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 85%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 85%).
3. LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition.
4. There are no new relief valves and 4 existing RV's - previously routed to the atmosphere (through the blowdown stack) that are now routed to the VRU flare. The existing RVs were previously controlled with a water spray chamber that is presumed to be capable of 90% control.

**Other Notes:**
- Natural gas Higher Heating Value (Btu/scf) = 1020
- Regulatory applicability for 40 CFR 63, Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63, Subpart CC since they are exempted from the definition in 40 CFR 63.641.
- It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.

</table>

**Conversion to Ammonium Sulfate**

- SCR Impact on Boilers: 3.0% conversion rate.
- Duct Burners: 1.1 MMBtu/hr, 4.7 lb/MMscf, 43.3 lb/MMscf.

**NOx emissions calculated above are pre-SCR, uncontrolled emissions.**

- Conversion Rate: 3.0%
- NOX Reduction (from inlet to SCR): 95%

**Assumptions:**

- Maximum Heat Input Capacity = 575 MMBtu/hr * 5 Boilers * 96.5% availability at 3SPS.
- Projected actual gas usage rates are based on assuming 8,760 hours of operation at the maximum permitted capacity.
- No... the CXHO project and the Ideal Gas Law.
- Fuel Gas Heating Value = 1203.3 BTU/scf
- Natural Gas Heating Value = 1020 BTU/scf
- Ammonium Sulfate Molecular Weight = 132.14
- Sulfur Trioxide Molecular Weight = 80.06
- Sulfur Dioxide Molecular Weight = 64.06
- Sulfuric Acid Mist Molecular Weight = 98.07
- BP is conservatively considering that all of the SO\(_3\) emitted can form both condensable particulate matter and sulfuric acid mist.

**Part 70 Permit Required?**

- Yes, Yes, Yes, Yes, No

**Project Emissions Increase**

- for major NSR applicability

**Potential 3SPS Gas Usage Rate (based on maximum heat input capacity and utilization factor):**

- MMscf/year = 20,196.89
- EF Unit lb/hr tpy = 24.45 lb/MMscf

**Potential Duct Burner SO2 Emissions:**

- 26.44 lb/MMscf
- 246.9 lb/MMscf

**Total VOC Emissions (tons/yr): 0.88**

2. LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to 10,000 ppmv leak definition for screening factors (i.e., (1-500/10,000) = 95% and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).
## Required Boiler Heat Input (MMBTU/hr)** (2 boilers at 580 MMBtu/hr each at 97.5% total annual utilization)

8760 Hours of Operation

** EF Notes:

1. NOx factor based on manufacturer’s guarantee (control technology/technique to be determined).
2. SO2 emissions will be limited to 24.9 tpy per boiler and emissions will be calculated based on total sulfur in refinery fuel gas. Natural gas blending will be used, if necessary.
3. CO based on AP-42 Table 1.4-2.
4. PM10/PM2.5 emission factor based on AP-42 Table 1.4-2 total particulates (condensable and inhalable). Note that additional PM10/PM2.5 emissions were added, assuming that an SCR may be added to the boilers and 3% conversion of SO2 emissions to SO3 and ammonium sulfate.
5. CO based on manufacturer’s guarantee.
6. Refinery fuel gas heating value assumed to be 1200 BTU/scf.
7. VOC based on AP-42 Section 1.4 for natural gas.
8. Lead, beryllium, and mercury emissions based on AP-42 Section 1.4 for natural gas.
9. Sulfuric Acid Mist emissions based on assumed conversion percentage of SO2 to SO3 and the assumption that all SO3 converts to sulfuric acid mist.

**Future Potential CO Emissions - Past Actual CO Emissions**
Tank 8

Tank 8 is an oil/water separator that currently handles the wastewater associated with the 11 Pipe Stills. This is a new oil/water separator system that may eventually replace Tank 8, however, both may operate for a period of time.

Total VOC Emissions (tons/yr): 2.43

---

1 United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

2 LDAR control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 ppmv leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance “Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives” (October 2000).

Relief Valves are controlled.
Diesel Fire Pump Engines Emissions

</tbody>
</table>

Notes

- Emission factors are from AP-42 Section 3.3, Table 3.3-1 (10/96) and NSPS Subpart IIII.
- VOC emission factor is the sum of the TOC emission factors for exhaust and crankcase.
- PM is assumed to be equal to PM<sub>10</sub> for the purposes of these calculations. It should be noted that AP-42 Section 3.3 does not include a PM emission factor, and footnote b of Table 3.3-1 indicates that all particulate is assumed to be less than 1 micrometer.
- Emission factors noted in red are emission standards for engine 300~600 HP, per 40 CFR 60, Subpart IIII
- Emission estimates are based on the lower of AP-42 emission factors and Subpart IIII emission limits
- 40 CFR Subpart IIII limits NOx = NHHC. NOx assumed emitted at Subpart IIII limit and VOC emitted at AP-42 factor levels.
- SO2 emission factor based on NSPS limit of 500 ppm fuel sulfur content and calculations below.

Sample Calculation

NOx emissions from compressor (lb/hr) = 390 hp 7.8 g NOx lb 100% 3 engines = 20.12 lb NOx/hr

SO2 emission factor calculation:

\[ \text{SO2 emission factor (lb SO2/g diesel)} = \frac{0.0005 \text{ lb S}}{7.1 \text{ lb diesel}} + \frac{2 \text{ lb SO2}}{7000 \text{ MMBtu}} \times 453.6 \text{ g MMBtu} = 0.161 \text{ g SO2/g diesel} \]

Conversion factors found in AP-42 Table 3.3-1 were used above to calculate engine fuel efficiency in MMBtu/hp-hr

Potential Uncontrolled SVOC and VOC emissions (tpy) 17.00

Potential Controlled SVOC and VOC emissions (tpy) 0.85

Based on 40 CFR 61, Subpart FF requirements; Note that carbon actually provides a 99.9% control efficiency if monitored for breakthrough and changed after breakthrough is detected (per carbon system vendors); however, 95% used as a conservative measure in accordance with regulatory requirements.

Based on system design (range of 18,000 to 20,000, depending on solids percentage of feed) and typical design solids concentration ratio of sludge processed in dewatering system (pre to post dewatering system).

Based on system design of thermal desorption system * concentration ratio of dewatering system (range of 18,000 to 20,000, depending on solids percentage of feed) and engineering estimate based on relative non-volatility of material remaining in sludges after processing steps prior to dewatering system. Note that most of the oil will be recovered in the dewatering and thermal desorption system.

Based on system design of thermal desorption system * concentration ratio of dewatering system (range of 18,000 to 20,000, depending on solids percentage of feed) and engineering estimate based on relative non-volatility of material remaining in sludges after processing steps prior to dewatering system. Note that most of the oil will be recovered in the dewatering and thermal desorption system.
Thermal Desorption System

The thermal desorption system is a closed system with the exception of vents for the processed solids system, the noncondensible stream that is vented to the system burners, and the burner emissions. Refer to the application for a detailed description.

Noncondensible Hydrocarbons Routed to Burner

Assumes that negligible amounts of organic material will be left in recovered solids after thermal desorption and that all the material that is not recovered is included in the noncondensibles portion. Note that the noncondensible portion will consist of hydrocarbons that do not condense at above 150 to 160 degrees F such as methanes and propanes.

</tr>
</tbody>
</table>

Based on the previous experience of the vendor with other waste streams that contain sulfur compounds, hydrogen sulfide in the stream from the thermal desorption unit is typically absorbed in the condensed oil and elemental sulfur typically remains in the solids. The sulfur emissions from the fuel burned in the burner typically are greater than those from the supplemental noncondensible stream.

Processed Solids System

It is presumed that negligible amounts of VOC will be emitted from the recovered solids since they have been processed through the thermal desorption system. In addition, the recovered solids system will be enclosed for the rehydration process and routed to a wet scrubber. Therefore, the controlled emissions are presumed to be negligible.
### Diesel Fired Burner Emissions

The thermal desorption system is equipped with two burners that burn distillate fuel. In addition, the noncondensible vapor stream is routed through the burners for destruction of the lighter hydrocarbons that are not recovered in the oil. Note that the noncondensible portion will consist of hydrocarbons that do not condense at above 150 to 160 degrees F such as methanes and propanes.

#### Notes

- Notes
- The emissions associated with the diesel burners are higher than emissions when burning process gas; therefore, the diesel burner emissions will be used for potential emissions estimates.

The criterion pollutants are from Tables 1.3-1 and 1.3-2. The concentration of sulfur compounds in the noncondensible stream will mostly be H2S. Other reduced sulfur compounds that are expected to condense in the oil phase with the hydrocarbons.
## Fugitive Emission Calculations for Dewatering and Thermal Desorption System

It is conservatively assumed that the components are in light liquid or vapor service, although the components may be in heavy liquid service. Only the new components associated with the new portions of the sludge handling system are included here.

### Total VOC Emissions (lbs/day): 3.46

### Total VOC Emissions (tons/yr): 0.83

---

1. United States, e.t al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL
2. LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000) = 95%) and (1-2,000/10,000) = 95%
3. AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.
4. 30% control estimate per TCEQ Guidance “Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives” (October 2000).
Source Description and Location

Source Name: BP Products North America Inc., Whiting Business Unit.
Source Location: 2815 Indianapolis Blvd., Whiting Indiana 46394
County: Lake
SIC Code: 2911 and 2869
Operation Permit No.: T 089-6741-00453
Operation Permit Issuance Date: December 14, 2006
Significant Source Modification No.: 089-25484-00453
Significant Permit Modification No.: 089-25488-00453
Permit Reviewer: Madhurima Moulik

Source Definition

This stationary source consists of two (2) plants, with a third plant located on an adjacent site:

(a) The Whiting Refinery (previously designated 089-00003), located at 2815 Indianapolis Boulevard, Whiting, Indiana 46394; and
(b) The Marketing Terminal (previously designated 089-00004), located at 2530 Indianapolis Boulevard, Whiting, Indiana 46394.
(c) INEOS USA LLC (designated as 089-00076), 2357 Standard Avenue, Whiting, IN 46394.

Since the two (2) plants (Whiting Refinery and the Marketing Terminal) are located on contiguous or adjacent properties, the plants are under common control of the same entity, and the Whiting Refinery supports the Marketing Terminal, the two (2) plants are considered one (1) source.

In the case of the BP Whiting refinery and the INEOS USA LLC chemical plant, neither plant has a major role in the day-to-day operations of the other plant. There is no contract between the two companies concerning the acceptance or usage of raw materials. Each plant is free to obtain raw materials from other sources. The chemical plant has obtained raw materials from other sources in the past when the refinery has been unable to supply it. Neither plant provides a majority of its output to the other plant. Neither plant has the right to assume control of the other under any circumstance. The INEOS chemical plant purchases steam, water, wastewater service and a raw material stream from the BP refinery. If the refinery were to cease operations, the chemical plant could continue to operate. The BP refinery purchases a hydrocarbon stream from the chemical plant. It also sends by-products to the INEOS chemical plant’s flare. The flared by-products come from the venting of rail cars and the depressurizing of drums. The refinery does not rely on the hydrocarbon stream in order to produce its principal products. The refinery does not rely on the INEOS flare. If the INEOS chemical plant were to cease operations, the refinery could continue to operate. The refinery has a procedure in place on what steps its employees take when the INEOS flare is unavailable. Neither plant is dependent on the other to operate.

Since there is no common control, the refinery and the chemical plant are not part of the same major source. There is no need to examine the other two criteria under the definition of major source. Therefore, the chemical plant is not included in this Title V Operating Permit. The chemical plant will receive a separate operating permit.
Existing Approvals

The source was issued Part 70 Operating Permit No. 089-6741-00453 on December 14, 2006. The source has since received the following approvals:

(a) First Minor Source Modification No. 089-23783-00453, issued on February 20, 2007;
(b) Second Minor Source Modification No. 089-24258-00453, issued on March 30, 2007;
(c) First Significant Permit Modification No. 089-24068-00453, issued on May 21, 2007; and

County Attainment Status

The source is located in Lake County.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Status</th>
</tr>
</thead>
<tbody>

<tr>
<td>CO</td>
<td>Attainment</td>
</tr>
<tr>
<td>Lead</td>
<td>Attainment</td>
</tr>
</tbody>
</table>

Note: Effective on October 25, 2006, 326 IAC 1-4-1 has been revised to revoke the one-hour ozone standard and redesignate Lake County to attainment for the Sulfur Dioxide standard.

(1) On December 22, 2006 the United States Court of Appeals, District of Columbia issued a decision that served to partially vacate and remand the U.S. EPA’s final rule for implementation of the eight hour National Ambient Air quality Standard for ozone. South Coast Air Quality Mgmt. Dist. v. EPA, 472 F.3d 882 (D.C. Cir., December 22, 2006), rehearing denied 2007 U.S. App. LEXIS 13748 (D.C. Cir., June 8, 2007). The U.S. EPA has instructed IDEM to issue permits in accordance with its interpretation of the South Coast decision as follows: Lake County was previously designated as a severe non attainment area prior to revocation of the one hour ozone standard, therefore, pursuant to the anti backsliding provisions of the Clean Air Act, any new or existing source must be subject to the major source applicability cut offs and offset ratios under the area’s previous one hour standard designation. This means that a source must achieve the Lowest Achievable Emission Rate (LAER) if it exceeds 25 tons per year of VOC emissions and must offset any increase in VOC emissions by a decrease of 1.3 times that amount.

On January 26, 1996 in 40 CFR 52.777(i), the U.S. EPA granted a waiver of the requirements of Section 182(f) of the CAA for Lake and Porter Counties, including the lower NOX threshold for nonattainment new source review. Therefore, VOC emissions alone are considered when evaluating the rule applicability relating to the 1 hour ozone standards. Therefore, VOC emissions were reviewed pursuant to the requirements for nonattainment new source review.

(2) Volatile organic compounds (VOC) and Nitrogen Oxides (NOx) are regulated under the Clean Air Act (CAA) for the purposes of attaining and maintaining the National Ambient Air Quality Standards (NAAQS) for ozone. Therefore, VOC and NOx emissions are considered when evaluating the rule applicability relating to the ozone standards. Lake County has been designated as nonattainment for the 8-hour ozone standard. Therefore, VOC and NOx emissions were reviewed pursuant to the requirements for nonattainment new source review.
(3) U.S. EPA, in the Federal Register Notice 70 FR 943 dated January 5, 2005, has designated Lake County as nonattainment for PM2.5. On March 7, 2005 the Indiana Attorney General’s Office, on behalf of IDEM, filed a lawsuit with the Court of Appeals for the District of Columbia Circuit challenging U.S. EPA’s designation of nonattainment areas without sufficient data. However, in order to ensure that sources are not potentially liable for a violation of the Clean Air Act, the OAQ is following the U.S. EPA’s guidance to regulate PM10 emissions as a surrogate for PM2.5 emissions pursuant to the requirements of Emission Offset, 326 IAC 2-3.

(4) Lake County has been classified as attainment or unclassifiable for PM10, SO2, NO2, CO, and lead. Therefore, these emissions were reviewed pursuant to the requirements for Prevention of Significant Deterioration (PSD), 326 IAC 2-2.

(5) Fugitive Emissions
Since this type of operation is in one of the twenty-eight (28) listed source categories under 326 IAC 2-2, the fugitive PM and VOC emissions are counted toward determination of PSD and Emission Offset applicability.

### Source Status

The table below summarizes the potential to emit of the entire source, prior to the proposed modification, after consideration of all enforceable limits established in the effective permits:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Emissions (tons/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM</td>
<td>&gt;100</td>
</tr>
<tr>
<td>PM10</td>
<td>&gt;100</td>
</tr>
<tr>
<td>SO2</td>
<td>&gt;100</td>
</tr>
<tr>
<td>VOC</td>
<td>&gt;100</td>
</tr>
<tr>
<td>CO</td>
<td>&gt;100</td>
</tr>
<tr>
<td>NOx</td>
<td>&gt;100</td>
</tr>
</tbody>
</table>

(1) This existing source is a major stationary source, under PSD (326 IAC 2-2), because a regulated pollutant is emitted at a rate of 100 tons per year or more, and it is one of the twenty-eight (28) listed source categories, as specified in 326 IAC 2-2-1(gg)(1).

(2) This existing source is a major stationary source under Emission Offset (326 IAC 2-3) and Nonattainment NSR (326 IAC 2-1.1-5) because the nonattainment regulated pollutants PM10 (as surrogate for PM2.5), VOC and NOx are emitted at a rate of 100 tons per year or more.

(3) These emissions are based upon the 2003 emissions data submitted to IDEM, OAQ.

The table below summarizes the potential to emit HAPs for the entire source, prior to the proposed modification, after consideration of all enforceable limits established in the effective permits:

<table>
<thead>
<tr>
<th>HAPs</th>
<th>Potential To Emit (tons/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single HAPs</td>
<td>&gt;10</td>
</tr>
<tr>
<td>TOTAL HAPs</td>
<td>&gt;25</td>
</tr>
</tbody>
</table>

This existing source is a major source of HAPs, as defined in 40 CFR 63.41, because HAP emissions are greater than ten (10) tons per year for a single HAP and greater than twenty-five (25) tons per year for a combination of HAPs. Therefore, this source is a major source under Section 112 of the Clean Air Act (CAA).
Actual Emissions

The following table shows the actual emissions from the source. This information reflects the 2003 OAQ emission data.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Actual Emissions (tons/year)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.03*</td>
</tr>
</tbody>
</table>

* No data provided for other HAPs. Source stated in their application that they are a major source of HAPs.

Description of New and Modified Emission Units and Units Scheduled for Shutdown as Part of CXHO

On November 1, 2007, the Office of Air Quality (OAQ) received an application from BP Products North America Inc., Whiting Business Unit to modify their refinery, located at 2815 Indianapolis Blvd, Whiting, Indiana, in Lake County. The modifications at the plant are being performed to accommodate additional processing of Canadian Extra Heavy Crude Oil (CXHO), and will be referred to as the CXHO Project (also known as the Operation Canadian Crude [OCC] project). The following are the new and the modified emission units (including shutdown of units as part of CXHO project), and new control devices for existing emissions units.

(a) New Coker (#2 Coker), which processes heavy crude fractions into coke, and new Coke Handling System. These facilities are identified as Unit 800 and are rated at 6,000 tons of coke per day. The New Coker heaters H-201, H-202, and H-203 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New Coker (#2 Coker) heater stacks have continuous emissions monitors (CEMS) for NOx and CO. The No. 11B Coker and Coke Pile, heaters H-101, H-102, H-103, and H-104 will be replaced by the New Coker (#2 Coker) and Coke Handling System and heaters H-201, H-202, and H-203 as part of the CXHO project. The facility includes the following emission sources and may include insignificant activities:

(1) Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted to</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-201</td>
<td>208</td>
<td>800-01</td>

</tr>
<tr>
<td>H-202</td>
<td>208</td>
<td>800-02</td>
<td>Low-NO(_{x}) burners and selective catalytic reduction</td>
</tr>
<tr>
<td>H-203</td>
<td>208</td>
<td>800-03</td>
<td>Low-NO(_{x}) burners and selective catalytic reduction</td>
</tr>
</tbody>
</table>

(2) Storage and handling (including up to 10 transfer points) of the bulk material comprised of a partially enclosed crusher, enclosed conveyors, enclosed storage, day bins, and rail car load out under the main operating scenario. In order to minimize fugitive emissions from the coke handling process, transfer points 1 and 10 will include enclosed conveyors and transfer points 2 through 9 will use enclosed buildings, and water sprays. Coke handling operations will be expected to operate under this main operating scenario for at least 95% of operating hours annually.
There will also be an alternative operating scenario, which will consist of three enclosed conveyors with unenclosed transfer points. Coke handling operations are expected to operate under this alternate operating scenario for no more than 5% of operating hours annually.

(3) The Coker is connected to the South flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) One (1) storage tank, identified as TK-6255, with a maximum storage capacity of 14,028,000 gallons storing coker resid at a vapor pressure less than 0.5 psia. Tank TK-6255 is equipped with a fixed roof.

(5) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(b) The Gas Oil Hydrotreater (GOHT) Unit, identified as Unit ID 802 and rated at 120,000 barrels per day. The GOHT reduces the sulfur and nitrogen content of the FCU feed and improves the hydrogen content. Operation of the GOHT will enable the FCU to meet gasoline sulfur specifications and to improve FCU conversion yields. The GOHT Unit will be constructed as part of the CXHO Project and includes the following emission units:

(1) Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>F-901B</td>
<td>47</td>
<td>802-02</td>
<td>Ultra low-NO\textsubscript{X} burners</td>
</tr>
</tbody>
</table>

(2) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(3) The GOHT Unit vents to the GOHT Flare, used to control VOC emissions during emergency situations, unit startups and shutdowns.

(c) The New Hydrogen (New HU), identified as Unit ID 801 commissioned as part of the CXHO Project, produces 99+% pure hydrogen needed for the refinery hydrotreating processes. The New HU produces high purity hydrogen by reacting steam with methane. The New HU heaters HU-1 and HU-2 are equipped with Selective Catalytic Reduction (SCR) for control of NO\textsubscript{x}. The New HU heater stacks have continuous emissions monitors (CEMS) for NO\textsubscript{x} and CO. The New HU includes the following sources of emissions and may include insignificant activities listed in Section A.4 of this permit:

(1) Process heaters comprising of:

<table>
<thead>
<tr>

</table>

* HU Heaters HU-1 and HU-2 combust both natural gas and PSA tail gas with a fuel ratio of no more than 25% natural gas and the remainder PSA tail gas.
(2) One cooling tower (HU Cooling Tower) rated at 14,000 gallons per minute recirculation rate controlled by high efficiency drift eliminators.

(3) The new Hydrogen Unit is connected to the HU Flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The HU Flare will be operated with a water seal or nitrogen purge. As such, there will be no purge gas emissions from the HU Flare. The HU Flare exhausts to S/V 801-03.

(4) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(d) New 12 Pipe Still Heaters - Three (3) new heaters:

The No. 12 Pipe Still Heaters identified as H-1AN, H-1AS, H-1B, H-2, H-1CN, H-1CS, and H-1CX will be shutdown and replaced by heaters H-101A, H-101B, and H-102 as part of the CXHO project.

(e) Nos. 11A and 11C Pipe Stills

(1) Ultra low-NOx burners will be installed on the 11C PipeStill (11CPS) heater identified as H-200.

(2) One (1) redundant oil water separation system (identified as Tank 8a), permitted in 2008, with a maximum storage capacity of 124,800 gallons, equipped with a carbon canister for VOC control.

(3) As part of the No. 11A PS and No. 11C PS WARP, permitted in 2008, the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C will be shutdown, with the emergency pressure relief discharge that was previously routed to the blowdown stacks being re-routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COV's.

(f) New Distillate Hydrotreating Unit Heater

Replacement DHT Unit Heater B-601A, to be constructed as part of CXHO project. As part of the CXHO Project, DHT Unit Heater B-601 will be replaced with a 41.9 MMBtu per hour natural gas fired heater, identified as B-601A. NOx emissions are controlled by ultra low NOx burners having an emission rate of 0.04 pounds per million Btu heat input or less. Emissions are exhausted to a stack identified as 720-01.

(g) Sulfur Recovery Unit Complex

(1) Two (2) Claus Offgas Treaters (COT), identified as COT1 and COT2 to be installed as part of the CXHO project, thermal oxidation systems which combust natural gas, each rated at 72 mmBTU/hr, exhausting at stacks S/V 162-06 and 162-07.
(2) Two (2) sulfur storage tanks, identified as SH-1 and SH-2, each with a maximum storage capacity of 1,008,000 gallons and used to store molten sulfur exhausting to stacks S/V 163-09 and 162-10. These tanks will be constructed as part of the CXHO Project and are both fixed roof tanks controlled by a caustic scrubber.

(3) Two (2) modular degassing units, to be installed as part of the CXHO project, which remove gases that are emitted during the cooling of molten sulfur. The gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

(4) Two (2) sulfur pits (Sulfur Pits D and E), to be installed as part of the CXHO project, used to store molten sulfur and the vents routed to either COT 1 and/or COT 2.

(5) The B/S TGU, SBS TGU, SRU Standby Incinerator and SBS cooling tower will be decommissioned as part of the CXHO project.

(h) Wastewater Treatment Plant (WWTP), identified as Unit ID 544:

(1) One (1) storage tank (identified as Tank 5052) having a maximum storage capacity of 11,676,000 gallons, to be constructed as part of the CXHO Project. This tank will be used as a stormwater equalization tank and is equipped with an external floating roof.

(2) A brine treatment system with seven (7) wastewater tanks with vertical fixed roofs, constructed as part of CXHO project, identified as:

(A) TK-105A, with a storage capacity of 867,180 gallons;
(B) TK-105B, with a storage capacity of 867,180 gallons;
(C) TK-101, with a storage capacity of 66,096 gallons;
(D) TK-102, with a storage capacity of 66,096 gallons;
(E) TK-103, with a storage capacity of 66,096 gallons;
(F) TK-104A, with a storage capacity of 89,943 gallons; and
(G) TK-104B, with a storage capacity of 89,943 gallons.

(i) Oil Movements, identified as Unit 640: Miscellaneous changes to storage tanks as follows:

(1) The following new and replacement tanks:

<table>

(k) The Isomerization Unit (ISOM), identified as Unit ID 210, was constructed in 1985 as a conversion of the No.2 Ultraformer. The Isomerization process converts low octane naphtha into high octane gasoline blending components. This unit is connected to flare stack S/V 220-04, the UIU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. As part of the CXHO project, the ISOM heater H-1 will be modified by replacing several burners with larger burners, with rated capacity remaining at 190 MMBTU/hr. The facility includes the following emission sources and may include insignificant activities:

(1) One (1) natural gas, refinery gas, or liquefied petroleum gas-fired Process Heater H-1, modified as part of CXHO, rated at 190 MMBtu/hr and vented to stack S/V 210-01.

(l) A vapor recover unit to be installed on the Marine Dock Loading Operation to control gasoline loading emissions. The vapor recovery unit will control gasoline loading operations to 10 mg of VOC emissions per liter of product.

(m) The No.3 Ultraformer Unit (No. 3 UF), identified as Unit ID 220, commissioned in 1958. The majority of the unit was shutdown in March 2007, including the H-1, H-2 and F-7 heaters, catalyst-filled reactors and the internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process. The unit consists of the C-2 Splitter Tower, the D-18 flare gas separator, D-24 knock-out drum and associated piping. The No. 3 Ultraformer is connected to flare stack S/V 220-04, the UIU flare, to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance and reactor regenerations. The No.3 Ultraformer includes the following sources of emissions and may include insignificant activities listed in Section A.4 of this permit.

(n) Additional hydrotreating of feed and use of sulfur reducing catalysts will be used to achieve an SO2 emissions limit of 37 ppm (at 0% oxygen) at the outlet of FCU 600.

(o) New flares used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

The flares are identified as follows:

<table>
<thead>
<tr>
<th>Flare</th>
<th>Stack ID.</th>
<th>Date of Installation</th>

</table>
(p) Two (2) new boilers, identified as New Boiler 1 and New Boiler 2, permitted in 2008, each rated at 580 million BTU per hour, equipped with low-NOx burners and/or Selective Catalytic Reduction (SCR) for control of NOx.

(q) As part of the CXHO Project, a vapor recovery system will be installed on the Marine Dock Loading operations to control emissions from gasoline loading.

(r) No. 3 Stanolind Power Station (3 SPS): The low NOx burners, induced flue gas recirculation (IFGR) system, and over fired air (OFA) system will be replaced by conventional burners and Selective Catalytic Reduction (SCR) on Boilers #1, 2, 3, 4, and 6.

(s) Five (5) direct fired duct burners, constructed as part of CXHO project, rated at 41 mmBTU/hr each, equipped with low NOx burners and controlled by a SCR, to preheat the exhaust from the No. 3 SPS boilers before being routed to the SCR.

(t) As part of CXHO, LDAR monitoring will be applied for pumps in heavy liquid service throughout the refinery to reduce fugitive VOC emissions.

(u) The Fluidized Bed Incinerator will be shut down, and replaced by a dewatering and thermal desorption system for processing sludge, permitted in 2008 including dissolved air flotation skimmings (DAF) and API oil/water separator sludge. The dewatering system will be equipped with a wet scrubber and carbon canister system and the thermal desorption unit will be equipped with a vapor recovery system to optimize absorption of hydrocarbons. The feed rate capacities at the dewatering system and thermal desorption systems are 22,500 tons of feed per year and 9,000 dry tons of solids per year, respectively. This facility includes the following emission sources and may include insignificant activities listed in Section A.4 of the permit:

1. Two (2) centrifuges;
2. Two (2) sludge surge tanks;
3. One (1) oil/water mixture surge tank;
4. One (1) enclosed auger transfer system;
5. One (1) vapor recovery system including: an oil condensing/scrubbing system, a water condensing/scrubbing system, and an oil water separator. Uncondensed vapors from this system are routed to the two (2) diesel fired burners for destruction of VOCs.

Insignificant Activities:

(a) Three (3) emergency firepump engines, identified as Firepump 1, 2 and 3, permitted in 2008, each rated at 390 HP.

(b) One (1) concrete crushing process, permitted in 2008, with a maximum processing capacity of 120 tons per hour, having two (2) transfer points.

(c) As part of the VRU 100/200 Whiting Atmospheric Relief Project (WARP), permitted in 2008, the pressure relief discharges that vented to the existing VRU 100/200 vent stack are being re-routed to the VRU flare.

(d) VRU 100/200 turnaround (TAR) project, permitted in 2008, for the repair or replacement of tower trays, and increasing existing pumping and cooling capacities, with no associated increase in emissions of any regulated pollutants.

(e) As part of the FCU 500 WARP, permitted in 2008, the FCU 500 blowdown stack will be shutdown and the pressure relief discharges that vent to the blowdown stack will be re-routed to the VRU flare.
(f) The FCU 500 turnaround (TAR) project, permitted in 2008, for the repair or replacement of the power recovery turbine, and the air ring for the catalyst regenerator. The increases in emissions from FCU 500 TAR are already accounted for as CXHO project related emissions increases.

(g) As part of the FCU 600 WARP, permitted in 2008, to shutdown the existing FCU 600 blowdown stack and the pressure relief discharges that were vented to the blowdown stack will be re-routed to the FCU flare. As part of the FCU 600 WARP, permitted in 2008, the FCU 600 blowdown stack will be shutdown and the pressure relief discharges that vent to the blowdown stack will be re-routed to the VRU flare.

(h) The FCU 600 turnaround (TAR) project, permitted in 2008, for the repair or replacement of the main fractionator overhead condensers, the slurry and pump around system, unit pump replacement, FCU flare tip replacement, addition of a soot blower, and additional controls to reduce plugging on the SCR. The increases in emissions from FCU 600 TAR are already accounted for as CXHO project related emissions increases.

(i) Two (2) diesel fired burners rated at 4 mmBTU/hr each, for the thermal desorption system.

(j) Vapor Recovery Unit VRU 400, for the New Coker.

### Enforcement Issues

IDEM is aware that on November 29, 2007, U. S. EPA issued a Notice of Violation to BP Products North America, Inc., for alleged violations of Clean Air Act requirements for its Whiting refinery. Some of the units specified in the Notice of Violation are affected units in the CXHO project. The U. S. EPA is reviewing this matter and will take appropriate actions.

### Emission Calculations

The Permittee has submitted emissions calculations for new units, modified units, and affected units that are included in the CXHO project. IDEM, OAQ has verified this information. See Appendix A of this document for detailed emissions calculations.

### Permit Level Determination – Part 70

Pursuant to 326 IAC 2-1.1-1(16), Potential to Emit is defined as “the maximum capacity of a stationary source or emission unit to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or type or amount of material combusted, stored, or processed shall be treated as part of its design if the limitation is enforceable by the U. S. EPA, IDEM, or the appropriate local air pollution control agency.”

The following table is used to determine the appropriate permit level under 326 IAC 2-7-10.5. This table reflects the PTE before controls. Control equipment is not considered federally enforceable until it has been required in a federally enforceable permit.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

* This includes increases in fugitive VOC emissions from the increases in the number of valves, pumps, flanges, compressors, relief valves, open-ended lines, and sampling connections (source-wide), fugitive PM and PM-10 emissions from New Coker, and fugitive CO emissions from New HU.

** There is no increase in the potential to emit of pollutants from modified heaters 3UF H-1, BOU heater F-401, and ISOM heater H-1.

This source modification is subject to 326 IAC 2-7-10.5(f)(4)(D), because it is a modification with potential to emit greater than twenty-five (25) tons per year of PM, PM10, SO2, VOC, CO and NOx. Additionally, the modification will be incorporated into the Part 70 Operating Permit through a significant permit modification issued pursuant to 326 IAC 2-7-12(d)(1) because it cannot qualify as minor permit modification pursuant to 326 IAC 2-7-12(b)(1)(C)(ii) or as administrative amendment under 326 IAC 2-7-11 due to the significant changes in compliance determination and monitoring requirements.

## Permit Level Determination – PSD or Emission Offset

The table below summarizes the potential to emit, reflecting all limits, of the emission units. Any control equipment is considered federally enforceable only after issuance of this Part 70 source modification, and only to the extent that the effect of the control equipment is made practically enforceable in the permit.

<table>

</tbody>
</table>

\textsuperscript{1} The details of the phased construction of new emissions units, installation of control devices on existing emissions units, and scheduled shutdown of existing emissions units are included in Appendix A of this Technical Support Document. Net emissions decreases are shown within brackets ( ).
2 The details of the net emissions increases and decreases are included in Appendix A of this Technical Support Document, Table C.82, C.82a and C.83.

3 Methodology for limited PTE calculations:
For new, modified, and existing process heaters, after scheduled phased shutdown of emissions units or reduction in emissions have occurred:

Potential to Emit (limited) in tons per 12 consecutive month period = Limited fuel usage (mmBtu per 12 consecutive month period) x emission factor (lb/mmBtu)

4 In addition to scheduled shutdown of existing emissions units, the following reductions in emissions are scheduled as part of the CXHO project:

   (A) The firing rates at the following existing affected heaters (unmodified) will be limited in future as part of the CXHO project:

   Facility   Heaters:
   T1A PS and 11C PS: H-1X, H-2, H-3, H-200, H-300
   4UF: F-1, F-2, F-3, F-4, F-5, F-6, F-7, F-8A, F-8B
   ARU: F-200A, F-200B
   BOU: F-401
   CFHU: F-801A, F-801B, F-801C
   CRU: F-101, F-102

   Facility   Heaters
   DDU: WB-301, WB-302
   HU: B-501

   (B) A vapor recovery unit/vapor condensation unit will be installed at the marine loading dock, reducing VOC emissions during gasoline loading operations.

   (C) Additional hydrotreating of feed and use of sulfur reducing catalysts will be used to achieve an SO2 emissions limit of 37 ppm (at 0% oxygen) at the outlet of FCU 600

   (D) Low-NOx and ultra low-NOX burners will be installed on some existing heaters.

   (E) High efficiency liquid drift eliminators will be installed on Cooling Towers 3,4 and half of the modules on Cooling Tower 2.

5 Commissioner’s Order No. 2007-01 has been issued with revised limits for several affected units. However, for affected units that have baseline PM-10 emissions greater than the allowable PM-10 SIP limits under 326 IAC 6.8-2-6, the baseline emissions have been adjusted to the SIP limits for estimating the PM-10 emissions increases for these affected units. The Emission Offset minor limits (PM2.5, with PM-10 as surrogate) for these affected units have been set at 0.0075 pounds per million cubic feet of fuel gas burned.

6 VOC netting analysis performed per 326 IAC 2-3 for VOC emissions evaluation based on the NSR program effective under the 8-hour ozone standard. Pursuant to South Coast Air Quality Mgmt. Dist. v. EPA, 472 F.3d 882 (D.C. Cir., December 22, 2006), the VOC de minimis threshold of 25 tons per year has been used for applicability determination of emission offset rules as follows:
<table>
<thead>
<tr>
<th>VOC Project Emissions Increase (tpy)</th>
<th>225.6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Net Emissions Increase (NEI) with Past Contemporaneous Increases and Decreases</td>
<td>-14.8</td>

</tr>
</tbody>
</table>

*** Pursuant to Consent Decree (United States et. al. vs. BP Exploration and Oil, et. al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL), 10% of SO2 netting credits generated by the cessation of oil burning at heaters and boilers and reduction of SO2 concentration at the outlet of FCU600 can be used to offset emissions increases only at units that meet the definition of "Lower Sulfur Fuel Units" and "Netting Offset Generating Units". These SO2 credits cannot be used to offset increases at other emission units, including flares and Tail Gas Units (COT1 and COT2). Table C.82a shows the detailed calculations for SO2 netting analysis conducted in accordance with the requirements of the Consent Decree. The summary of the SO2 netting analysis is as follows:

Total increases in SO2 emissions at "Low Sulfur Fuel Units" = 107.3 tpy
Total available SO2 credits from cessation of fuel oil burning = 269.4 tpy

Total increases in SO2 emissions at other "Netting/Offset Generating Units" = 149.5 tpy
Total available SO2 credits from FCU 600 consent decree reduction = 160.9 tpy

Total increases in SO2 emissions from other emission units = 203.3 tpy
Total available non-consent decree related SO2 credits = 230.1 tpy

The total available SO2 credits available as offsets in all three categories exceed the SO2 emissions increases from new, modified, affected, and future contemporaneous non-CXHO related units. Therefore, the SO2 emissions increases do not exceed the significant level for SO2.

<sup>A</sup> Not a PSD regulated Pollutant

(a) This modification to an existing major stationary source is minor because the net emissions increases for all regulated pollutants are less than the PSD significant levels. Therefore, pursuant to 326 IAC 2-2, PSD requirements do not apply.

(b) Lake County has been designated as nonattainment for PM2.5 in 70 FR 943 dated January 5, 2005. According to the April 5, 2005 EPA memo titled “Implementation of New Source Review Requirements in PM2.5 Nonattainment Areas” authored by Steve Page, Director of OAQPS, until EPA promulgates the PM2.5 major NSR regulations, states should assume that a major stationary source’s PM10 emissions represent PM2.5 emissions. IDEM will use the PM10 nonattainment major NSR program as a surrogate to address the requirements of nonattainment major NSR for the PM2.5 NAAQS. A significant emissions increase would be a net emissions increase or the potential of fifteen (15) tons per year or greater of PM10. BP Products North America, Inc. – Whiting Business Unit has limited the potential to emit of PM10 from the modification to less than fifteen (15) tons per year. Therefore, assuming that PM10 emissions represent PM2.5 emissions, 326 IAC 2-1.1-5 does not apply for PM2.5.

(c) Pursuant to the South Coast Air Quality Mgmt. Dist. v. EPA, 472 F.3d 882 (D.C. Cir., December 22, 2006) decision, any new or existing source must be subject to the major source applicability cut offs and offset ratios under the area’s previous one hour standard designation for VOCs. This modification to an existing major stationary source is minor because the net emissions increases for VOCs are less than significant levels under the de minimis evaluation as included in Appendix C, Table C.83. Therefore, pursuant to 326 IAC 2-3, Emission Offset requirements do not apply.
Federal Rule Applicability Determination

The following federal rules are applicable to the following new and modified emission units:

**New and Replacement Storage Tanks:**

(Note: The applicabilities of the NESHAPs, NSPSs and state rules to storage tanks at refineries are based on the tank storage capacities, and the vapor pressures of the liquids stored in the tanks. The following table summarizes these parameters for the new and modified tanks involved in the CXHO project):

<table>
<thead>
<tr>
<th>Tank ID</th>

</table>

(a) The refinery is subject to 40 CFR Part 63, Subpart CC - National Emission Standards for Hazardous Air Pollutants from Petroleum Refineries because this plant is a major source of hazardous air pollutants (HAPs) and is a petroleum refinery.

The storage tanks TK-6255 and TK-3637 are all located at a petroleum refinery and are associated with a petroleum refining process unit. All of these tanks meet the definition of Group 2 storage vessels at an existing refinery. Therefore, these tanks are subject to the requirements of 40 CFR 63.646 (Storage Vessel Provisions) of 40 CFR 63, Subpart CC. However, pursuant to 40 CFR 63.640(n)(1), storage tanks which are also subject to the provisions of 40 CFR 60, Subpart Kb, are required to comply only with the requirements of 40 CFR 60, Subpart Kb, except as provided in 40 CFR 63.640(n)(8).

(1) The storage tank TK-6255 is not subject to 40 CFR 60, Subpart Kb - Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984, since the vapor pressures of the liquids stored in this tank is less than 3.5 KPa. In addition, there is no control requirements for this tank under 40 CFR 63.640(n)(1). However, the tank is subject to the requirements under 40 CFR 63.640(l)(1) through l)(3).

(3) The proposed modification to Tank 3637 meets the definition of reconstruction under 40 CFR60.15(b), and therefore this tank shall be subject to the requirements under 40 CFR 60, Subpart Kb. The requirements under this subpart are included in Section E.9 of the permit. The Permittee shall also demonstrate compliance with 40 CFR 63, Subpart CC, through compliance with 40 CFR 60, Subpart Kb.)
The storage tank TK-5052 and the seven (7) tanks in the new brine wastewater treatment facility are wastewater tanks that meet the definition of a Group 1 wastewater stream, and is subject to 40 CFR 63.647 (Wastewater Provisions) under 40 CFR 63, Subpart CC. Pursuant to 40 CFR 63.647, tank 5052 is required to comply with the requirements of 40 CFR 61.340 through 61.355 of 40 CFR 61, Subpart FF.

The two new sulfur storage tanks, TK-SH-1 and TK-SH-2 are used to store only molten sulfur and do not store any HAPs or VOCs. Therefore, these tanks are not subject to 40 CFR 63, Subpart CC or 40 CFR 60, Subpart Kb.

The storage tanks TK-6255, TK-5052 (used as a stormwater equalization tank), the seven (7) tanks in the new brine wastewater treatment facility and distribution facilities at this source are not subject to 40 CFR 63, Subpart EEEEE - National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline), because pursuant to 40 CFR 63.2406, organic liquids for purposes of this subpart do not include the following liquids:

(i) Gasoline (including aviation gasoline), kerosene (No. 1 distillate oil), diesel (No. 2 distillate oil), asphalt, and heavier distillate oils and fuel oils;
(ii) Any fuel consumed or dispensed on the plant site directly to users (such as fuels for fleet refueling or for refueling marine vessels that support the operation of the plant);
(iii) Hazardous waste;
(iv) Wastewater;
(v) Ballast water.

Pursuant to 40 CFR 63.2338(b), storage tank D-424 (which stores organic liquids) and any equipment at this source that meets the definition of an affected source under 40 CFR 63.2334 shall comply with the requirements of 40 CFR 63, Subpart EEEE.

**Oil Water Separation Systems**

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ. The proposed new oil water separation system (Tank 8a) is subject to the requirements under 40 CFR 60, Subpart QQQ.

**Existing, New and Modified Boilers and Heaters**

(a) The new and modified heaters H-201 (new), H-202 (new), H-203 (new), F-901A (new), F-901B (new), HU-1 (new), HU-2 (new), H-101A (new), H-101B, (new), H-102 (new), F-401 (modified), and ISOM Heater H-1 (modified) are subject to 40 CFR 60, Subpart J – Standards of Performance for Petroleum Refineries, since these are fuel gas combustion devices at a petroleum refinery. These requirements are included in section E.2 of the permit.

The new DHT heater B-601a is natural gas-fired only, and is not a fuel gas combustion device. Therefore, B-601a is not subject to the requirements of 40 CFR 60, Subpart J.

(b) Existing boilers and process heaters BP Products North America, Inc. – Whiting Business Unit were subject to the requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAP) 40 CFR Part 63, Subpart DDDDD (Industrial, Commercial, and Institutional Boilers and Process Heaters). The new heaters H-201 (new), H-202 (new), H-203 (new), F-901A (new), F-901B (new), HU-1 (new), HU-2 (new), H-101A (new), H-101B, H-102 (new) and B-601a (new) would have been subject to 40 CFR 63, Subpart DDDDD, National Emission Standards for Hazardous Air Pollutants for Industrial Commercial, and Institutional Boilers and Process Heaters, since these units are all classified as process heaters which fall under the large gaseous fuel subcategory. However, on July 30, 2007, 40 CFR Part 63, Subpart DDDDD has been vacated in its entirety.
New and Modified Process Units: Coker, GOHT, HU, No. 3 UF

(a) The emission units located at the refinery are subject to the requirements of 40 CFR 63.648 (Equipment Leak Standards) and must comply with the requirements of 40 CFR 60, Subpart GGGa. Pursuant to 40 CFR 60, Subpart GGG, the Permittee shall comply with the requirements specified in 40 CFR 60, Subpart VVa. The following new and modified emission units are subject to this rule: the new Coker, identified as Unit 800, the Gas Oil Hydrotreater Unit (GOHT), identified as Unit 802, the new Hydrogen Unit (New HU), identified as Unit ID 801. The requirements of 40 CFR 60, Subpart VVa are included in Section E.26 of the permit.

(b) The following new and modified emission units, New Coker, identified as Unit 800, the Gas Oil Hydrotreater Unit (GOHT), identified as Unit 802, the new Hydrogen Unit (New HU), identified as Unit ID 801 are subject to the requirements of 40 CFR 60 Subpart GGGa - Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries (326 IAC 12) pursuant to 40 CFR 60.590. Pursuant to 40 CFR 60, Subpart GGGa, these units must be operated in compliance with 40 CFR 60, Subpart VVa. The applicable requirements for 40 CFR 60, Subpart VVa are included in Section E.26 of the draft permit.

(c) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 (40 CFR 63, Subpart CC) and E.4 (40 CFR 60, Subpart VVa) for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at the new and modified process units, the new Coker, GOHT, and New HU.

(d) The new coker, GOHT, and HU, are not subject to 40 CFR 63, Subpart UUU - National Emission Standards for Hazardous Air Pollutants from Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units, since none of these units are involved in processes regulated by this NESHAP.

Modified Sulfur Recovery Unit – Unit ID 162 (including COT1 and COT2 Offgas Treaters)

(a) The Sulfur Recovery Unit (SRU), is subject to the New Source Performance Standard, 40 CFR 60, Subpart GGGa - Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries (326 IAC 12) because this unit will be modified as part of the CXHO project after January 4, 1983.

(b) The Sulfur Recovery Unit (SRU) is subject to the New Source Performance Standard, 40 CFR 60, Subpart J, since it is a sulfur recovery plant that has been constructed and will be modified after October 4, 1976.

(c) The Sulfur Recovery Unit (SRU) is subject to 40 CFR 63, Subpart UUU - National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units. Therefore, the offgas treaters identified as COT1 and COT2 are subject to 40 CFR 63, Subpart UUU.

(d) The two (2) new offgas treaters identified as COT1 and COT2 are subject to the requirements of 40 CFR 60, Subpart J – Standards of Performance for Petroleum Refineries, since these are tail gas units serving a Claus Sulfur Recovery Plant.

New Dewatering and Thermal Desorption System

(a) The thermal desorption unit burners will be subject to the requirements for fuel gas combustion devices under 40 CFR 60, Subpart J, since the noncondensible vapors from the process will be routed to the burners.

(b) The individual drain systems, oil-water separators, and closed-vent systems and control devices constructed as part of the new dewatering and thermal desorption system shall be subject to the requirements under 40 CFR 61, Subpart FF, as this project might affect existing benzene waste streams.
(c) The thermal desorption system used to dry sludge is not subject to the requirements under 40 CFR 61, Subpart E (National Emissions Standards for Mercury) since it does not meet the definition of a sludge dryer as defined in 40 CFR 61.51(m). The thermal desorption system will not be used to reduce the moisture content in the sludge by heating to temperatures above 65 deg F directly with combustion gases. The sludge will be heated indirectly with combustion gases.

**New Flares – New GOHT flare, New Coker flare, SRU flare, and HU flare**

(a) The new flares identified as GOHT flare, South flare, and HU flare are subject to the control device requirements under 40 CFR 63, Subpart CC, since these flares are used for control of process vents.

(b) The new flares identified as GOHT flare, South flare, and HU flare are not subject to the requirements of 40 CFR 61, Subpart J, since these flares are not used as controls for emission units operating in benzene service.

(c) The new flares identified as GOHT flare, South flare, and HU flare are subject to the control device requirements under 40 CFR 60, Subpart J, since these flares are used for control of process vents.

(d) The new flares identified as GOHT flare, South flare, and HU flare are subject to the control device requirements under 40 CFR 63, Subpart GGGa, since these units are control devices for units that are subject to 40 CFR 63, Subpart GGGa.

**Applicability of Compliance Assurance Monitoring to New and Modified Emissions Units**

Pursuant to 40 CFR 64.2, Compliance Assurance Monitoring (CAM) is applicable to new or modified emission units that involve a pollutant-specific emission unit and meet the following criteria:

1. has a potential to emit before controls equal to or greater than the major source threshold for the pollutant involved;
2. is subject to an emission limitation or standard for that pollutant; and
3. uses a control device, as defined in 40 CFR 64.1, to comply with that emission limitation or standard.

**New and Modified Heaters**

The new and modified heaters H-201 (new), H-202 (new), H-203 (new), F-901A (new), F-901B (new), HU-1 (new), HU-2 (new), H-101 (new), H-102 (new), B-601A (new), F-401 (modified), and ISOM Heater H-1 (modified) do not use control devices to meet the applicable PM and PM-10, VOC, CO, or SO2 emissions limitations and are therefore not subject to CAM for these pollutants.

The following table is used to identify the applicability of each of the criteria, under 40 CFR 64.1, to new or modified process heaters involved in the CXHO project, for NOx:

<table>
<thead>
<tr>
<th>Emission Unit</th>
<th>Control Device Used</th>
<th>Emission Limitation (Y/N)</th>
<th>Controlled PTE (tons/year)</th>
<th>Major Source Threshold (tons/year)</th>
<th>Large Unit (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Boilers: New Boiler 1 and New Boiler 2

The following table is used to identify the applicability of each of the criteria, under 40 CFR 64.1, to the new boilers identified as New Boiler 1 and New Boiler 2, for NOx and CO:

<table>
<thead>
<tr>
<th>Emission Unit</th>
<th>Control Device Used</th>
<th>Emission Limitation (Y/N)</th>
<th>Controlled PTE (tons/year)</th>
<th>Major Source Threshold (tons/year)</th>
<th>Large Unit (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Boiler 1 and</td>
<td>None</td>
<td>Y</td>
<td>NOx - 322.0</td>
<td>100</td>
<td>Y</td>
</tr>
<tr>
<td>New Boiler 2</td>
<td></td>
<td></td>
<td>CO - 118.9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Pursuant to 40 CFR 64.2(b)(vi), CAM does not apply if the Part 70 permit specifies a continuous compliance determination method, as defined in 40 CFR 64.1. New Boiler 1 and New Boiler 2 are required to operate a CEMS for both NOx and CO. Therefore, CAM does not apply to these boilers.

No. 3 Stanolind Power Station SCR Project

The following table is used to identify the applicability of each of the criteria, under 40 CFR 64.1, to the No. 3 SPS boilers identified as boilers 1, 2, 3, 4, and 6 for NOx and CO:

<table>
<thead>
<tr>
<th>Emission Unit</th>
<th>Control Device Used</th>
<th>Emission Limitation (Y/N)</th>
<th>Controlled PTE (tons/year)</th>
<th>Major Source Threshold (tons/year)</th>
<th>Large Unit (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boiler #1</td>
<td>SCR</td>
<td>Y</td>
<td>&lt;100</td>

</tr>
</tbody>
</table>
Based on this evaluation, the requirements of 40 CFR Part 64, CAM are not applicable to any of the new or modified units as part of this PSD/Significant Source Modification since none of the units are classified as large units as defined in 40 CFR 64. The applicability of CAM to the above units will be re-evaluated as part of the Part 70 permit renewal.

<table>

The applicabilities of state rules to emissions units at this source are as follows:

326 IAC 2-2 (Prevention of Significant Deterioration), 2-3 (Emission Offset), and Nonattainment NSR (326 IAC 2-1.1-5)
PSD, Emission Offset, and Nonattainment NSR applicability is discussed under the Permit Level Determination - PSD and Emission Offset section.

326 IAC 2-4.1 (Major Sources of Hazardous Air Pollutants (HAP))
The operation of this petroleum refinery will greater than ten (10) tons per year for a single HAP and greater than twenty-five (25) tons per year for a combination of HAPs. Therefore, 326 IAC 2-4.1 would apply to the emissions units at this source, however, pursuant to 326 IAC 2-4.1-1(b)(2), because this source is specifically regulated by several NESHAPs including 40 CFR 63, Subparts CC, J, QQQ, and FF, which was issued pursuant to Section 112(d) of the CAA, the new and modified emissions units under the CXHO project are exempt from the requirements of 326 2-4.1.

326 IAC 6.8-1-2 (Particulate Emissions Limitations: Lake County)
Pursuant to 326 IAC 6.8-1-2, particulate matter emissions from each of the new heaters, H-101A, H-101B, H-102, H-201, H202, H-203, F-901A, F-901B, B-601A, HU-1, HU-2, and the two new offgas treaters/thermal oxidizers for the SRU complex identified as COT1 and COT2 shall not exceed 0.03 grains per dry standard cubic foot.

Pursuant to 326 IAC 6.8-1-2(b)(3), the particulate matter emissions from New Boiler 1 and New Boiler 2 shall be no greater than one-hundredth (0.01) grain per dry standard cubic foot (dscf).

326 IAC 6.8-2 (Lake County: PM₁₀ Emission Requirements)
The new process heaters H-101A, H-101B, H-102, H-201, H202, H-203, F-901A, F-901B, B-601, HU-1, HU-2, and the two new offgas treaters/thermal oxidizers for the SRU complex identified as COT1 and COT2 involved in the CXHO project are not specifically listed under 326 IAC 6.8-2. Therefore, these units are not subject to 326 IAC 6.8-2.

326 IAC 6.8-8 (Lake County: Continuous Compliance Plan)
The new process heaters H-101A, H-101B, H-102, H-201, H202, H-203, F-901A, F-901B, B-601, HU-1, and HU-2 are not specifically listed under 326 IAC 6.8-2 through 326 IAC 6.8-11. Therefore, pursuant to 326 IAC 6.8-1-1(a)(1), 326 IAC 6.8-8 does not apply to these heaters.

326 IAC 6.8-10 (Lake County: Fugitive Particulate Matter)
The New Coker and Coke Pile that will replace the existing Coker and Coke Pile has potential to emit of fugitive PM of greater than five (5) tons per year. Therefore, it is subject to the requirements of 326 IAC 6.8-10 for batch material transfer, continuous transfer, wind erosion from storage piles, and material transportation activities, and material processing facilities, as needed.
326 IAC 6.8-2-6 (Lake County PM-10 Emissions Limitations: BP Products North America, Inc.)

BP has requested a Commissioner’s Order with revised PM-10 limits that for some units are higher than the SIP limits in 326 IAC 6.8-2-6, pending a rulemaking for amendments to the Lake County PM-10 rule (326 IAC 6.8-2-6) which is scheduled for preliminary adoption on September 5, 2007. IDEM has determined that the revised limits will still demonstrate attainment of the PM-10 NAAQS, and the revised emissions limits do not represent increases in actual emissions but rather a more accurate quantification of actual existing emissions. Under 326 IAC 6.8-1-2(i), less restrictive limitations may be established by the Commissioner provided the restrictive limitations guarantee the attainment and maintenance of the particulate matter NAAQS.

Pursuant to 326 IAC 6.8-1-2(i) and 326 IAC 6.8-1-5, the Commissioner’s Order No. 2007-01 allows BP to comply with the revised PM-10 limits as follows:

<table>
<thead>
<tr>
<th>Unit I.D.</th>
<th>PM-10 Limit (lb/MMBTU) (SIP)</th>
<th>PM-10 Limit (lb/hr) (SIP)</th>
<th>Revised PM-10 Limit (lb/MMBTU) (Commissioner’s Order No. 2007-01)</th>
<th>Revised PM-10 Limit (lb/hr) (Commissioner’s Order No. 2007-01)</th>

</table>

326 IAC 7-4.1 (Lake County Sulfur Dioxide (SO2) Emission Limitations)

Pursuant to 326 IAC 7-4.1-1, the COT1 and COT2 offgas treaters/thermal oxidizers in the SRU complex shall burn natural gas only as supplemental fuel.

The PTE of SO2 from each of the new heaters H-101A, H-101B, H-102, H-201, H-202, H-203, F901-A, F-901B, B-601A, HU-1, and HU-2 is less than 25 tons per year. Therefore, pursuant to 326 IAC 7-1.1-1, these units are not subject to the SO2 emissions limitations in 326 IAC 7-4.1-1.
The PTE of SO₂ from each of the two (2) new diesel fired burners at the dewatering and thermal desorption system is less than 25 tons per year. Therefore, pursuant to 326 IAC 7-1.1-1, these units are not subject to the SO₂ emissions limitations in 326 IAC 7-4.1-1.

The PTE of SO₂ from each of the duct burners used in the SCR for the 3 SPS boilers is less than 25 tons per year. Therefore, pursuant to 326 IAC 7-1.1-1, these units are subject to the SO₂ emissions limitations in 326 IAC 7-4.1-1.

The PTE of SO₂ from New Boiler 1 and New Boiler 2 shall each be limited to less than 25 tons per year, by blending natural gas with the refinery fuel gas used. Therefore, pursuant to 326 IAC 7-1.1-1, these units are not subject to the SO₂ emissions limitations in 326 IAC 7-4.1-1. The SO₂ emissions will be monitored based on a TRS (total reduced sulfur) CEMS for the mixing drum for the fuel blend used at these boilers.

326 IAC 8-4-2 (Petroleum Refineries)
Pursuant to 326 IAC 8-4-2(2), the Permittee shall equip the wastewater (oil/water) separator Tank 8a, any forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when in actual use.

326 IAC 8-4-3 (Petroleum Liquid Storage Facilities)
Pursuant to 326 IAC 8-4-3, storage tank TK-3637 has a storage capacity of greater than 39,000 gallons and contain volatile organic compounds with true vapor pressure greater than 1.52 psi. Therefore, TK-3637 is subject to the requirements of this rule.

The other storage tanks involved in the CXHO project, TK-6255 and 5052 store liquids with true vapor pressure less than 1.52 psi, and are therefore not subject to the requirements of 326 IAC 8-4-3.

The new tanks SH-1 and SH-2 will be used to store molten sulfur, and are therefore not subject to this rule.

326 IAC 8-4-8 (Leaks from Petroleum Refineries; Monitoring; Reports)
The new and modified emissions units involved in the CXHO project are located at a petroleum refinery and are subject to the requirements under 326 IAC 8-4-8. Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

326 IAC 8-9 (Volatile Organic Liquid Storage Vessels)
Pursuant to 326 IAC 8-9-2(8), storage tank TK-3637 which is subject to 40 CFR 60, Subpart Kb, are exempt from the requirements of 326 IAC 8-9.

The other storage tanks involved in the CXHO project, TK-6255 and 5052 have storage capacities greater than 39,000 gallons but store VOLs with true vapor pressures of less than 0.75 psia. Therefore, these tanks are subject to the recordkeeping and notification requirements under 326 IAC 8-9-6(h) only.

326 IAC 10-4 NOx Budget Program
Pursuant to 326 IAC 10-4, New Boiler 1 and New Boiler 2, with rated capacities exceeding 250 mmBTU/hr, will be subject to the requirements under 326 IAC 10-4, if constructed prior to 2009. Pursuant to 326 IAC 10-4-16 (Sunset) units constructed in 2009 and later shall not be subject to the NOx Budget requirements under 326 IAC 10-4.
Permits issued under 326 IAC 2-7 are required to ensure that sources can demonstrate compliance with all applicable state and federal rules on a continuous basis. All state and federal rules contain compliance provisions, however, these provisions do not always fulfill the requirement for a continuous demonstration. When this occurs IDEM, OAQ, in conjunction with the source, must develop specific conditions to satisfy 326 IAC 2-7-5. As a result, Compliance Determination Requirements are included in the permit. The Compliance Determination Requirements in Section D of the permit are those conditions that are found directly within state and federal rules and the violation of which serves as grounds for enforcement action.

If the Compliance Determination Requirements are not sufficient to demonstrate continuous compliance, they will be supplemented with Compliance Monitoring Requirements, also in Section D of the permit. Unlike Compliance Determination Requirements, failure to meet Compliance Monitoring conditions would serve as a trigger for corrective actions and not grounds for enforcement action. However, a violation in relation to a compliance monitoring condition will arise through a source’s failure to take the appropriate corrective actions within a specific time period.

The Compliance Determination and Monitoring Requirements applicable to this modification are as follows:

1. In order to demonstrate compliance with SO2, CO, and NOx emissions limitations, the Total Reduced Sulfur, CO and NOx continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with the SO2, CO, and NOx emissions limits for process heaters that are equipped with these CEMS in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

2. In order to demonstrate compliance with the NOx emissions limitations, the SCRs shall be operated as necessary to meet the NOx emissions limits for heaters H-201, H-202 and H-203.

3. In order to demonstrate compliance with PM and PM-10 emissions limitations, the liquid drift eliminator shall be in operation and control PM and PM-10 emissions from the Cooling Towers 2, 3, 4, 7, 8 and HU cooling tower at all times that the Cooling Towers are in operation.

4. In order to demonstrate compliance with Condition D.1.2, following the installation of the low-NOx burners the heater H-200 shall operate using only low-NOx burners.

5. In order to demonstrate compliance with Condition D.2.2, the Permittee shall operate the heaters HU-1, HU-2, H-201, H-202, and H-203 using only low-NOx burners.

6. In order to demonstrate compliance with Condition D.42.3(a), the heaters F-901A and F-901B shall operate using only ultra low-NOx burners.

7. Pursuant to 326 IAC 6.8-10-4 (formerly 326 IAC 6-1-11.1), the Permittee shall control fugitive particulate matter emissions from the New Coker and Coke Pile according to the updated Fugitive Dust Control Plan (FDCP) submitted on January 30, 2008, included as Appendix C. If it is determined that the control procedures specified in the FDCP do not demonstrate compliance with the fugitive emissions limitations, IDEM, OAQ may require that the FDCP be revised and submitted for approval.

8. In order to demonstrate compliance with the PM, PM-10, CO, SO2, NOx, and VOC emissions limitations for the new and modified process heaters, the Permittee shall follow the following testing requirements:
(a) Tests shall be conducted on at least one new, modified or affected emission units from each identified testing group that are included in the CXHO project, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes both filterable and condensible PM-10. These tests shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

(b) Tests shall be conducted in accordance with the following deadlines:

(1) For a group that includes new or modified emission units: within 180 days of the installation of a new emission unit, or modification of an existing emission unit within that group.

(2) For a group that includes only existing affected units: within 180 days of the startup of New Coker.

(c) The emissions units to be tested in order to demonstrate compliance with Prevention of Significant Deterioration (326 IAC 2-2), Emission Offset (326 IAC 2-3) and Nonattainment NSR (326 IAC 2-1.1-5) minor limits shall be grouped as follows:

</tbody>
</table>

(d) Within 180 days of the startup of New Coker (#2 Coker), in order to demonstrate compliance with the PM-10 emission factor limit from the SCR stacks at No. 3 Stanolind Power Station (3 SPS), testing shall be conducted on one (1) of the five (5) stacks for 3 SPS boiler/SCR stacks, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes filterable and condensible PM-10. This test shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

(e) Compliance with the emissions limits for each emission unit or test group shall be determined as follows:

\[
T = \frac{\left( \sum T_i \right)}{n}
\]

Where:

- \( T \) = average of IDEM approved stack test results for emission unit or all units within that same group over the previous 12 month period
- \( T_i \) = average of multiple runs during Test #i
- \( n \) = number of IDEM approved stack tests during previous 12 month period

(9) After the installation of the continuous BTU analyzer at the mixing drums for supplying fuel to heaters and boilers, the continuous BTU analyzer shall be calibrated, maintained, and operated for determining compliance with the firing rate limits for heaters.

(a) Continuously monitor the fuel flow rates at the heaters and boilers;
(b) Conduct a monthly analysis of fuel gas samples taken once per week in order to determine monthly averaged BTU content of the fuel gas in the mixing drums prior to installation of the continuous BTU analyzers; and

(c) Determine the monthly firing rates for the heaters based on the fuel flow rates at each heater and the monthly averaged BTU content of the fuel gas in the mixing drums.

(10) After the startup of the New Coker, in order to demonstrate compliance with the PSD, EO and nonattainment NSR minor limits, the exhaust from WARP projects at FCU 500, FCU 600 and No. 11 PS shall be routed to the designated flares with a flame present at all times.

(11) Within 180 days of the installation of the VRU or VCU at the marine loading dock, the Permittee shall perform VOC testing at the outlet of the VRU/VCU when loading gasoline utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. This test shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

Compliance with the emissions limit for the VRU/VCU shall be determined as follows:

\[ T = \frac{\sum_{i=1}^{n} T_i}{n} \]

Where:

\[ T = \text{average of IDEM approved stack test results over the previous 12 month period} \]
\[ T_i = \text{average of multiple runs during Test } #i \]
\[ n = \text{number of IDEM approved stack tests during previous 12 month period} \]

(12) After the installation of the VRU/VCU at the marine loading dock, the VRU/VCU shall be in operation and control VOC emissions at all times gasoline loading is being performed at the marine loading dock.

(13) The Permittee shall take weekly measurements of the total dissolved solids (TDS) in the water input to Cooling Towers No. 2, 3, 4, 7, 8 and HU cooling tower. If the TDS limitation is exceeded, the Permittee shall perform quantitative water analyses and shall take the remedial action necessary to correct the problem.

(14) The Permittee shall visually inspect the water going to Cooling Towers No. 2, 3, 4, 7 and 8 for liquid VOC, including but not limited to the indication of a sheen, at least once per week. If VOC is observed, the Permittee will take the remedial action necessary to correct the problem.

(15) The new and modified emissions units involved in the CXHO project are located at a petroleum refinery and are subject to the requirements under 326 IAC 8-4-8. Pursuant to 326 IAC 8-4-8, for the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

(16) For all pumps involved in heavy liquid service, in order to demonstrate compliance with the PSD, EO, and nonattainment NSR minor limits, the Permittee shall control leaks of VOC according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. An instrument reading of 2000 parts per million (ppm) or greater shall constitute a leak for pumps in heavy liquid service. The Permittee shall update the LDAR Plan to indicate that the methodologies in 40 CFR 60.482 shall apply to all pumps in heavy liquid service and shall submit a copy of the revised LDAR Plan to IDEM, OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.
These compliance determination and monitoring conditions are necessary in order to ensure compliance with the emissions limitations in the permit. Compliance with the emissions limits, in conjunction with the startup and shutdown schedule of emissions units and installation schedule for control devices and the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant thresholds at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable.

**Proposed Changes**

The modified A, D, and E sections of the permit No: T 089-6741-00453 have been included in their entirety as Appendix D to this Technical Support Document. These changes have been summarized below:

1. Section A.3 of the permit has been modified in order to incorporate description changes related to the CXHO project.

2. In December 2005 Innovene USA LLC, a wholly owned subsidiary of BP, sold the INEOS Whiting chemical plant to INEOS. INEOS is a separate corporation that is not owned by BP. Due to this changed relationship, IDEM, OAQ has decided to reexamine whether the BP Whiting refinery and the INEOS chemical plant are part of the same major source. Section A.2 has been updated accordingly.

3. The following D and E sections have been revised in order to incorporate descriptive changes and include emissions limitations and standards, compliance determination, compliance monitoring, recordkeeping and reporting requirements for new and existing units related to the CXHO project.

(4) The NESHAP for Site Remediation, 40 CFR 63, Subpart GGGGG has been incorporated in its entirety. Section E.21, which included a short version of this NESHAP, has been modified as shown in Appendix D to this Technical Support Document.

(5) The Table of Contents has been modified to incorporate new conditions and renumber existing conditions in the permit.
In addition, the changes listed below have been made to Sections B and C of the Part 70 Operating Permit No. 089-6741-00453 (strikeout to show deletions and bold to show additions):

**Change No. 1:**

The IDEM, OAQ, Compliance Section telephone and fax numbers have been revised throughout the permit. The mailcodes have been added to the addresses of Office of Air Quality - Compliance, Permits, Compliance Data, Technical Support and Modeling and Asbestos sections.

**Change No. 2:**

The clean unit and pollution control project (PCP) provisions of the U.S. EPA's NSR Reform rules were vacated on June 24, 2005 by a United States Court of Appeals for the District of Columbia. Condition C.21 has been modified as follows:

C.21 General Record Keeping Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-6] [326 IAC 2-2] [326 IAC 2-3]

(a) Records of all required monitoring data, reports and support information required by this Permit shall be retained for a period of at least five (5) years from the date of monitoring sample, measurement, report, or application. These records shall be physically present or electronically accessible at the source location for a minimum of three (3) years. The records may be stored elsewhere for the remaining two (2) years as long as they are available upon request. If the Commissioner or the Hammond Department of Environmental Management, makes a request for records to the Permittee, the Permittee shall furnish the records to the Commissioner or the Hammond Department of Environmental Management, within a reasonable time.

(b) Unless otherwise specified in this permit, all record keeping requirements not already legally required shall be implemented within ninety (90) days of the effective date of this permit.

(c) If there is a reasonable possibility that a “project” (as defined in 326 IAC 2-2-1(qq) or 326 IAC 2-3-1(ll)) at a major source other than projects at a clean unit at a source with a Plant-wide Applicability Limitation (PAL) which is not part of a “major modification” (as defined in 326 IAC 2-2-1(ee) or 326 IAC 2-3-1(z)) may result in significant emissions increase and the Permittee elects to utilize the “projected actual emissions” (as defined in 326 IAC 2-2-1(rr) or 326 IAC 2-3-1(mm), the Permittee shall comply with the following:

1. Prior to commencing the construction of “project” (as defined in 326 IAC 2-2-1(qq) or 326 IAC 2-3-1(ll)) document and maintain the following records:
   
   (A) A description of the project;
   
   (B) Identification of any emissions unit whose emissions of a regulated new source review pollutant could be affected by the project;
   
   (C) A description of the applicability test used to determine that the project is not a major modification for any regulated NSR pollutant, including:

   (i) Baseline actual emissions;
   
   (ii) Projected actual emissions;
   
   (iii) Amount of emissions excluded under section 326 IAC 2-2-1(rr)(2)(A)(iii) or 326 IAC 2-3-1(mm)(2)(A)(iii); and
(iv) An explanation for why the amount was excluded, and any netting calculations, if applicable.

(2) Monitor the emissions of any regulated NSR pollutant that could increase as a result of the project and that is emitted by any emissions unit identified in (1)(B) above; and

(3) Calculate and maintain a record of the annual emissions, in tons per year on a calendar year basis, for a period of five (5) years following resumption of regular operations after the change, or for a period of ten (10) years following resumption of regular operations after the change if the project increases the design capacity of or the potential to emit that regulated NSR pollutant at the emission unit.

Change No. 3

Pursuant to 40 CFR 63.2338(b), storage tank D-424 (which stores organic liquids) and any equipment at this source that meets the definition of an affected source under 40 CFR 63.2334 shall comply with the requirements of 40 CFR 63, Subpart EEEE.

Conditions C.25, C.26, C.27, and C.28 of the permit, which include the requirements under 40 CFR 63, Subpart EEEE have been deleted and the requirements of 40 CFR 63, Subpart EEEE that pertain to storage tank D-424 are included in Section E.24.

C.25 General Provisions Relating to HAPs [326 IAC 20-1] [40 CFR Part 63, Subpart A] [Table 12 to 40 CFR Part 63, Subpart EEEE] [40 CFR 63.2398]

(a) The provisions of 40 CFR Part 63, Subpart A- General Provisions, which are incorporated by reference as 326 IAC 20-1-1, apply to any storage vessel at this source that is subject to the provisions of 40 CFR 63, Subpart EEEE, except when otherwise specified by Table 12 to 40 CFR Part 63, Subpart EEEE. The Permittee shall comply with these requirements on and after the effective date of the National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution, Non-Gasoline.

(b) Since the applicable requirements associated with the compliance options are not included and specifically identified in this permit, the permit shield authorized by the B section of this permit in the condition titled Permit Shield, and set out in 326 IAC 2-7-15 does not apply to paragraph (a) of this condition.

The Permittee shall comply with the following requirements for any storage vessel at the source that is subject to the provisions of 40 CFR 63, Subpart EEEE (National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution, Non-Gasoline). A copy of this rule is available on the US EPA Air Toxics Website at http://www.epa.gov/ttn/atw/orgliq/orgliqpg.html.

(a) Pursuant to 40 CFR 63.2342(b)(1), the Permittee shall comply with the emission limitations, operating limits, and work practice standards for any existing affected sources no later than the date three (3) years after the effective date of the final rule for 40 CFR Part 63, Subpart EEEE, except as provided in paragraph (b)(2) of 40 CFR 63.2342.
(b) Pursuant to 40 CFR 63.2342(b)(2), any floating roof storage tanks at existing affected sources shall be in compliance with the work practice standards in Table 4 to 40 CFR Part 63, Subpart EEEE, at all times after the next degassing and cleaning activity, or within 10 years after the effective date of the final rule for 40 CFR Part 63, Subpart EEEE, whichever occurs first. If the first degassing and cleaning activity occurs during the 3 years following the effective date of the final rule for 40 CFR Part 63, Subpart EEEE, the compliance date is the date three (3) years after the effective date of the final rule for 40 CFR Part 63, Subpart EEEE.

(c) Since the applicable requirements associated with the compliance options are not included and specifically identified in this permit, the permit shield authorized by the B section of this permit in the condition titled Permit Shield, and set out in 326 IAC 2-7-15 does not apply to paragraphs (a), (b), and (c) of this condition.

(d) The definition in 40 CFR 63, Section 63.2 and in 40 CFR 63.2406 are applicable to this Permittee.

C.27 Notifications Requirements [40 CFR 63.2382]

The Permittee shall submit the following notifications for all storage vessels subject to the requirements of 40 CFR 63, Subpart EEEE:

(a) Initial Notification. The Permittee shall submit the Initial Notification no later than 120 calendar days after the effective date of 40 CFR Part 63, Subpart EEEE.

(b) The Permittee shall submit the Notification of Intent to conduct a performance test at least 60 calendar days before it is initially scheduled to begin as required in 40 CFR Part 63, Section 63.7(b)(1).

(c) Notification of Compliance Status. If the Permittee are required to conduct a performance test, design evaluation, or other initial compliance demonstration as specified in Table 5, 6, or 7 to 40 CFR Part 63, Subpart EEEE, the Permittee shall submit a Notification of Compliance Status. The Notification of Compliance Status shall include the information required in 40 CFR Part 63, Section 63.999(b) and in paragraphs (d)(2)(i) through (viii) of 40 CFR 63.2382.

C.28 Requirement to Submit a Significant Permit Modification Application [326 IAC 2-7-12] [326 IAC 2-7-5]

The Permittee shall submit an application for a significant permit modification to IDEM, OAQ to include information regarding which compliance option or options will be chosen in the Title V permit.

(a) The significant permit modification application shall be consistent with 326 IAC 2-7-12, including information sufficient for IDEM, OAQ to incorporate into the Title V permit the applicable requirements of 40 CFR 63, Subpart EEEE, a description of the affected source and activities subject to the standard and a description of how the Permittee will meet the applicable requirements of the standard.

(b) The significant permit modification application shall be submitted no later than the date the Notification of Compliance Status is due.

(c) The significant permit modification application shall be submitted to:

Indiana Department of Environmental Management
Permits Branch, Office of Air Quality
100 North Senate Avenue
Indianapolis, Indiana 46204-2251
Change No. 4:

The boilers and process heaters at this source were subject to the requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAP) 40 CFR 63, Subpart DDDD (Industrial, Commercial, and Institutional Boilers and Process Heaters). However, on July 30, 2007, 40 CFR 63, Subpart DDDD has been vacated in its entirety.

The permit conditions that included requirements under this NESHAP have been deleted throughout the entire permit.

**Conclusion and Recommendation**

The construction and operation of this proposed modification shall be subject to the conditions of the attached proposed Significant Source Modification No. 089-25484-00453 and Significant Permit Modification No. 089-25488-00453. The staff recommend to the Commissioner that this Significant Source Modification No. 089-25484-00453 and Significant Permit Modification No. 089-25488-00453 be approved.

Emission Factor Source References
1 Based on stack test performed for BP Whiting Refinery in March 1993.
2 U.S. AP-42. EPA. Fifth Edition. Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources, Chapter 1, Section 1.4, “Natural Gas Combustion,” Table 1.4-1. EMISSION FACTORS FOR NITROGEN OXIDES (NOx) AND CARBON MONOXIDE
3 Based on stack test performed for BP Whiting Refinery in March 2002.
4 Based on stack test performed for BP Whiting Refinery in September 2003.

Justification References
₈ Based on most current source specific data.
₉ The carbon monoxide (CO) emission factors from AP-42 are used in the refinery industry as a standard when source specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:
A - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population. 
B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
C - Average - Developed from highly rated test data from a reasonable number of facilities.
D - Below Average - Developed from highly rated test data from a small number of facilities.
₃ Based on on stack test performed for BP Whiting Refinery in March 2002.
₄ Based on stack test performed for BP Whiting Refinery in September 2003.

Emission Unit References
₇ Existing unit being shutdown within the CXHO project contemporaneous period.
₈ Existing unit being shutdown as part of CXHO project.
₉ The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same CO emission factors.
₀ As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

### Emission Factor Source References

### Justification References

1. The Lead emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:
   A. Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.
   B. Above Average - Developed from the highest rated test data from a reasonable number of facilities.
   C. Average - Developed from highly rated test data from a reasonable number of facilities.
   D. Below Average - Developed from highly rated test data from a small number of facilities.

### Footnotes

* Existing unit being shutdown within the CXHO project contemporaneous period.

* Existing unit being shutdown as part of CXHO project.

* The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same lead emission factors.

* As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

### Codes

- **New**: New Unit
- **Mod**: Modified Unit
- **Cont**: Controlled
- **Oth**: Other Unit
- **SD**: Shutdown

* Emissions are being reduced for at least one pollutant.

### Emission Factor Source References

1. Emissions are based on API / WSPA Emission Factors for Boilers / Heaters using Process Gas, 1998 (Table ES-1).
2. Emission factor based on Engineering Estimate.

### Footnotes

* Existing unit being shutdown within the CXHO project contemporaneous period.
* Existing unit being shutdown as part of CXHO project.
* The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same mercury emission factors.
* As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

Emission Factor Source References

Justification References
2. The Beryllium emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:
   A - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.
   B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
   C - Average - Developed from highly rated test data from a reasonable number of facilities.
   D - Below Average - Developed from highly rated test data from a small number of facilities.

Footnotes
4. Existing unit being shutdown within the CXHO project contemporaneous period.
5. Existing unit being shutdown as part of CXHO project.
6. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same beryllium emission factors.
7. As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

**Emission Factor Source References**
1. Based on stack test performed for BP Whiting Refinery.
3. Natural Gas Combustion; Table 1.4-1. EMISSION FACTORS FOR NITROGEN OXIDES (NOx) AND CARBON MONOXIDE (CO) FROM NATURAL GAS COMBUSTION SMALL BOILERS; (July 1998).
4. Based on stack test performed for BP Whiting Refinery in March 2002.
5. Based on stack test performed for BP Whiting Refinery in September 2003.
6. Based on Permit Limit.
8. Based on stack test performed for BP Whiting Refinery in March 1993.
11. Based on design requirement.

**Justification References**
13. The Nitrogen Oxides (NOx) emission factors from AP-42 are used in the refinery industry as a standard when source specific data is not available.
14. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:
   A - Excellent - Developed from the highest rated test data taken from many randomly chosen facilities in the industry population.
   B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
   C - Average - Developed from highly rated test data from a reasonable number of facilities.
   D - Below Average - Developed from highly rated test data from a small number of facilities.
15. Emission factor based on emission limit in Draft Title V operating permit.
16. Future emissions are assumed to be in compliance with Consent Decree. Baseline emissions were corrected to Consent Decree levels.
17. Based on anticipated vendor guarantee to satisfy design requirement.

**Emission Factor Source References**
18. Based on most current source specific data.
19. Existing unit being shutdown within the CXHO project contemporaneous period.
20. Existing unit being shutdown as part of CXHO project.
21. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same NOx emission factors.
22. As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.
23. As part of the CXHO project, BP Whiting will be installing Ultra-Low NOx burners on heater 11C PS H-200 to generate creditable emission reductions.

### Notes

- PM: Particulate Matter
- AP-42: Air Pollution Prevention Guidelines
- EF: Emission Factor
- Btu: British Thermal Unit

**Baseline and Future Potential:**

- Baseline: Actual emissions before any control measures are implemented.
- Future Potential: Potential emissions after control measures are implemented.

**Emission Factors (lb/MMBtu):**

- lb/MMBtu: Pounds per million British thermal units.
- Emission factors represent the amount of PM emitted per unit of energy input.

**Justification:**

- N/A: Not applicable
- Design: Design values
- Guarantee: Guarantee values

**Source Specific:**

- Source-specific emission factors may vary depending on specific process conditions.

**AP-42:**

- Emission standards and guidelines from the US Environmental Protection Agency (EPA).

As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

Half of the Cooling Tower 2 modules were controlled by high efficiency drift eliminators in the baseline period.

The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have

Existing unit being shutdown as part of CXHO project.

Based on most current source specific data.

Based on anticipated vendor guarantee to satisfy design requirement.

The particulate matter (PM) emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each

Emission Factor Source References

Based on stack test performed for BP Whiting Refinery in June 2005.

Based on material balance including average total dissolved solids and recirculation rates from 1999 to 2004 along with design requirements of drift eliminators.

Based on design requirement.

* Emissions are being reduced for at least one pollutant.

Emission Unit References

Codes

The particulate matter (PM) emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each

AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:

Emission Units in lb/MMBtu

Q - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

R - Below Average - Developed from highly rated test data from a reasonable number of facilities.

S - Average - Developed from highly rated test data from a reasonable number of facilities.

T - Poor - Developed from lower rated test data from a small number of facilities.

U - Below Average - Developed from highly rated test data from a small number of facilities.

V - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

W - Below Average - Developed from highly rated test data from a small number of facilities.

X - Average - Developed from highly rated test data from a reasonable number of facilities.

Y - Poor - Developed from lower rated test data from a small number of facilities.

Z - V - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

0 - Below Average - Developed from highly rated test data from a small number of facilities.

1 - Average - Developed from highly rated test data from a reasonable number of facilities.

2 - Poor - Developed from lower rated test data from a small number of facilities.

3 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

4 - Below Average - Developed from highly rated test data from a small number of facilities.

5 - Average - Developed from highly rated test data from a reasonable number of facilities.

6 - Poor - Developed from lower rated test data from a small number of facilities.

7 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

8 - Below Average - Developed from highly rated test data from a small number of facilities.

9 - Average - Developed from highly rated test data from a reasonable number of facilities.

A - Poor - Developed from lower rated test data from a small number of facilities.

B - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

C - Below Average - Developed from highly rated test data from a small number of facilities.

D - Average - Developed from highly rated test data from a reasonable number of facilities.

E - Poor - Developed from lower rated test data from a small number of facilities.

F - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

G - Below Average - Developed from highly rated test data from a small number of facilities.

H - Average - Developed from highly rated test data from a reasonable number of facilities.

I - Poor - Developed from lower rated test data from a small number of facilities.

J - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

K - Below Average - Developed from highly rated test data from a small number of facilities.

L - Average - Developed from highly rated test data from a reasonable number of facilities.

M - Poor - Developed from lower rated test data from a small number of facilities.

N - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

O - Below Average - Developed from highly rated test data from a small number of facilities.

P - Average - Developed from highly rated test data from a reasonable number of facilities.

Q - Poor - Developed from lower rated test data from a small number of facilities.

R - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

S - Below Average - Developed from highly rated test data from a small number of facilities.

T - Average - Developed from highly rated test data from a reasonable number of facilities.

U - Poor - Developed from lower rated test data from a small number of facilities.

V - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

W - Below Average - Developed from highly rated test data from a small number of facilities.

X - Average - Developed from highly rated test data from a reasonable number of facilities.

Y - Poor - Developed from lower rated test data from a small number of facilities.

Z - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

0 - Below Average - Developed from highly rated test data from a small number of facilities.

1 - Average - Developed from highly rated test data from a reasonable number of facilities.

2 - Poor - Developed from lower rated test data from a small number of facilities.

3 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

4 - Below Average - Developed from highly rated test data from a small number of facilities.

5 - Average - Developed from highly rated test data from a reasonable number of facilities.

6 - Poor - Developed from lower rated test data from a small number of facilities.

7 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

8 - Below Average - Developed from highly rated test data from a small number of facilities.

9 - Average - Developed from highly rated test data from a reasonable number of facilities.

A - Poor - Developed from lower rated test data from a small number of facilities.

B - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

C - Below Average - Developed from highly rated test data from a small number of facilities.

D - Average - Developed from highly rated test data from a reasonable number of facilities.

E - Poor - Developed from lower rated test data from a small number of facilities.

F - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

G - Below Average - Developed from highly rated test data from a small number of facilities.

H - Average - Developed from highly rated test data from a reasonable number of facilities.

I - Poor - Developed from lower rated test data from a small number of facilities.

J - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

K - Below Average - Developed from highly rated test data from a small number of facilities.

L - Average - Developed from highly rated test data from a reasonable number of facilities.

M - Poor - Developed from lower rated test data from a small number of facilities.

N - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

O - Below Average - Developed from highly rated test data from a small number of facilities.

P - Average - Developed from highly rated test data from a reasonable number of facilities.

Q - Poor - Developed from lower rated test data from a small number of facilities.

R - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

S - Below Average - Developed from highly rated test data from a small number of facilities.

T - Average - Developed from highly rated test data from a reasonable number of facilities.

U - Poor - Developed from lower rated test data from a small number of facilities.

V - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

W - Below Average - Developed from highly rated test data from a small number of facilities.

X - Average - Developed from highly rated test data from a reasonable number of facilities.

Y - Poor - Developed from lower rated test data from a small number of facilities.

Z - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

0 - Below Average - Developed from highly rated test data from a small number of facilities.

1 - Average - Developed from highly rated test data from a reasonable number of facilities.

2 - Poor - Developed from lower rated test data from a small number of facilities.

3 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

4 - Below Average - Developed from highly rated test data from a small number of facilities.

5 - Average - Developed from highly rated test data from a reasonable number of facilities.

6 - Poor - Developed from lower rated test data from a small number of facilities.

7 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

8 - Below Average - Developed from highly rated test data from a small number of facilities.

9 - Average - Developed from highly rated test data from a reasonable number of facilities.

A - Poor - Developed from lower rated test data from a small number of facilities.

B - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

C - Below Average - Developed from highly rated test data from a small number of facilities.

D - Average - Developed from highly rated test data from a reasonable number of facilities.

E - Poor - Developed from lower rated test data from a small number of facilities.

F - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

G - Below Average - Developed from highly rated test data from a small number of facilities.

H - Average - Developed from highly rated test data from a reasonable number of facilities.

I - Poor - Developed from lower rated test data from a small number of facilities.

J - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

K - Below Average - Developed from highly rated test data from a small number of facilities.

L - Average - Developed from highly rated test data from a reasonable number of facilities.

M - Poor - Developed from lower rated test data from a small number of facilities.

N - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

O - Below Average - Developed from highly rated test data from a small number of facilities.

P - Average - Developed from highly rated test data from a reasonable number of facilities.

Q - Poor - Developed from lower rated test data from a small number of facilities.

R - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

S - Below Average - Developed from highly rated test data from a small number of facilities.

T - Average - Developed from highly rated test data from a reasonable number of facilities.

U - Poor - Developed from lower rated test data from a small number of facilities.

V - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

W - Below Average - Developed from highly rated test data from a small number of facilities.

X - Average - Developed from highly rated test data from a reasonable number of facilities.

Y - Poor - Developed from lower rated test data from a small number of facilities.

Z - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

0 - Below Average - Developed from highly rated test data from a small number of facilities.

1 - Average - Developed from highly rated test data from a reasonable number of facilities.

2 - Poor - Developed from lower rated test data from a small number of facilities.

3 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

4 - Below Average - Developed from highly rated test data from a small number of facilities.

5 - Average - Developed from highly rated test data from a reasonable number of facilities.

6 - Poor - Developed from lower rated test data from a small number of facilities.

7 - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.

<sup>1</sup> Emission Factors in lb/MMBtu

<sup>2</sup> Source Specific

<sup>3</sup> Guarantee

<sup>4</sup> Design
Based on interim guidance from US EPA, PM2.5 is evaluated based on significant emission rate thresholds established for PM10. The current PM10 SIP limits filterable PM10 emissions and condensable PM10 emissions and condensable PM10 emissions and condensable PM10 emissions. PM2.5 emissions are not regulated by the Lake County PM10 SIP, however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions.

5. U.S. EPA. AP-42. Fifth Edition. Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources. Chapter 1, Section 13.2.4
9. Table C.7. Emission Factors for PM10 and PM2.5 (Filterable + Condensable) Emissions

**Justification References**

The total particulate matter (PM) emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:

- **A** - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.
- **B** - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
- **C** - Average - Developed from highly rated test data from a small number of facilities.
- **D** - Below Average - Developed from lower rated test data from a small number of facilities.
- **E** - Poor - Developed from lower rated test data from a small number of facilities.

**Emission Unit References**

- In addition, existing unit being shuttered due to
- Existing unit being shuttered to
- The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same particulate emission factors.
- Half of the Cooling Tower 2 modules were controlled by high efficiency drift eliminators in the baseline period.
- As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.
- Based on interim guidance from US EPA, PM2.5 is evaluated based on significant emission rate thresholds established for PM10. The current PM10 SIP limits filterable PM10 emissions and condensable PM10 emissions and condensable PM10 emissions and condensable PM10 emissions. PM2.5 emissions are not regulated by the Lake County PM10 SIP, however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions.

### Emission Factor Source References

1. Calculation based on sulfur dioxide (SO\(_2\)) emissions. SO\(_2\) emissions were calculated using hydrogen sulfide (H\(_2\)S) CEMS data, and TRS testing data where available.

2. Calculation based on future potential sulfur dioxide (SO\(_2\)) emissions. SO\(_2\) emissions were calculated using the future design fuel gas total sulfur.

### Justification References

3. Based on baseline year source specific data (SO\(_2\) emissions CEMS data).

4. Based on future potential SO\(_2\) emissions.

### Emission Unit References

5. Existing unit being shutdown within the CXHO project contemporaneous period.

6. Existing unit being shutdown as part of CXHO project.

7. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Only the combustion of natural gas will emit SO\(_2\) and therefore sulfuric acid mist.

### Calculation Methodology

Combustion emissions are assumed to include some amount of SO\(_3\), which can react with water vapor present in the stack to produce sulfuric acid mist (H\(_2\)SO\(_4\) mist) as shown in Equation C-8-1.

**Equation C-8-1**

\[
SO_3 + H_2O \leftrightarrow H_2SO_4
\]

H\(_2\)SO\(_4\) mist emissions are conservatively calculated by assuming 3% of the SO\(_3\) emitted by the heater is in the form of SO\(_4\).

### Emission Factor Source References

### Justification Reference

The Volatile Organic Compound (VOC) emission factors from AP-42 are used in the refinery industry as a standard when site specific data is not available. Each AP-42 emission factor has a quality rating which indicates the quality of the test(s) used to develop the factor. The ratings are as follows:

- A - Excellent - Developed only from the highest rated test data taken from many randomly chosen facilities in the industry population.
- B - Above Average - Developed from the highest rated test data from a reasonable number of facilities.
- C - Average - Developed from highly rated test data from a reasonable number of facilities.
- D - Below Average - Developed from highly rated test data from a small number of facilities.
- N/A - Based on source specific vapor pressure, temperature, and molecular weight.

Based on anticipated vendor guarantee to satisfy design requirement.

### Emission Unit References

1. Existing unit being shutdown within the CXHO project contemporaneous period.
2. Existing unit being shutdown as part of CXHO project.
3. The new hydrogen unit heaters HU-1 and HU-2 will burn both natural gas and PSA tail gas. Both fuel sources are conservatively assumed to have the same VOC emission factors.
4. The new hydrogen unit cooling tower will be operated separately from refinery operations. VOC emissions are only applicable to cooling towers serving petroleum refinery operations.
5. As part of the CXHO project, BP Whiting will be making modifications to the main fractionator tower.

</table>

1. Hourly emission rate represents annual average hourly emissions.
2. Calculation accounts for annual average design refinery fuel gas higher heating value of 1,203.3 Btu/scf.
| Process and Units | Code | Process Unit | Usage | PM2.5 | PM10 | PM 
|-------------------|------|--------------|-------|-------|------|------
|                  |      |              |       |       |      |      

Table C.12. 1999 Combustion Emissions

- PM2.5 emissions are adjusted to reflect the impact of PM10 emissions on PM2.5 concentrations.
- PM10 emissions are regulated at a significant emission rate threshold established for PM2.5.
- The measured PM2.5 emissions are based on regulatory data collected by the BP Whiting PI data collection system, averaged for the reporting year.

* Emissions are being reduced for at least one pollutant.
1
Hourly emission rate represents annual average hourly emissions.
2
Based on interim guidance from US EPA, PM2.5 is evaluated based on significant emission rate thresholds established for PM
10. The current PM10 SIP limits filterable PM10 emissions and compliance is based on reference test method 201A (which only quantifies filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PM10 baseline based on the
PM10 SIP limits for PSD applicability purposes, which includes both filterable and condensable PM
10. PM2.5 emissions are not regulated by the Lake County PM
10 SIP, however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions.

Codes

Based on interim guidance from US EPA, PM2.5 is evaluated based on significant emission rate thresholds established for PM. The current PM2.5 SP limits include PM2.5 emissions and compliance is based on reference test method 2010 (which only quantifies filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PM2.5 baseline based on the PM2.5 SP limits for PM2.5 applicability purposes, which includes both filterable and condensable PM2.5 in emissions not regulated by the Los Angeles PM2.5 SP, however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions.

*Figures exclude de minimis units as defined by the US EPA.

1. The PM2.5 SP limits include PM2.5 emissions and compliance is based on reference test method 2010 (which only quantifies filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PM2.5 baseline based on the PM2.5 SP limits for PM2.5 applicability purposes, which includes both filterable and condensable PM2.5 in emissions not regulated by the Los Angeles PM2.5 SP, however, to be conservative, BP Whiting has adjusted PM2.5 baseline emissions in the same manner as for PM10 emissions.

2. Sulfur Concentration based on the measured sulfur content as recorded by the BP Whiting PI data collection system, averaged for reporting year. Phases I180, 178, 178, 180, 180, and 180 also include T11 year T1S.

3. Sulfur Concentration based on the measured sulfur content as recorded by the BP Whiting PI data collection system, averaged for reporting year. Phases L180, 178, 178, 180, 180, and 180 also include T11 year T1S.

**Notes:**

1. Hourly emission rate represents annual average hourly emissions.
2. Total CO emissions from the COT 1 and 2 are estimated to be 350 tons. Combustion emissions are calculated using vendor emission factors (See Table 1) and are based on the amount of natural gas combusted at the units.
3. Emissions of Total Reduced Sulfur from the COTs and sulfur loading are assumed to be equal to emissions of H2S.
4. Emissions of Total Reduced Sulfur from the COTs and sulfur loading are assumed to be equal to emissions of H2S.
5. Each COT is capable of operating to accommodate the total SRU train loading of 1800 LTPD for the purpose of redundancy.
6. Based on future capacity of 1800 LTPD sulfur production. Conservatively assumes that all H2S present in sour gas is emitted during the loading process.
7. In the future, sulfur pits will be controlled and routed back to the SRU process, therefore there will be no H2S emissions from the sulfur pits.

</table>

* The total flow to the Beavon-Stretford TGU in 1999 was 309,785.9 ton/yr based on data recorded by the BP Whiting PI data collection system.

Note that the PM10 emission limit provided in the PM10 SIP is 0.110 lb/ton. Therefore, in 1999 the PM10 emissions were below this limit (359.0 lb PM10/yr)/(309,785.9 ton/yr) = 0.0012 lb/ton.

**Note:** The total flow to the Beavon-Stretford TGU in 2003 was 261,933.7 ton/yr based on data recorded by the BP Whiting PI data collection system.

* The SO2 concentration is calculated based on average daily H2S and TRS CEMS Data.

** The Beavon Stretford combustor temperature ramps up if the H2S concentration approaches 10 ppm. BP Whiting has estimated that approximately 30% of the TRS/H2S sulfur is converted to SO2 after the combustion temperature ramps up.

1. Hourly emission rate represents annual average hourly emissions.
2. Half of the Cooling Tower 2 modules were controlled prior to the CXHO Project. Contemporaneous to the CXHO Project, the other modules will be controlled with high-efficiency drift eliminators.
3. Note the recirculation rate used in this calculation is half of the total Cooling Tower recirculation rate.
4. The new hydrogen unit cooling tower will be operated separately from refinery operations. VOC emissions are only applicable to cooling towers serving petroleum refinery operations.

**Cooling Tower VOC Emission Calculation**

\[ \text{VOC Emission} = (R + M) \times EF_{PM2.5} \]

Where,
\( R \) = Recirculation rate (1,000 gal/min)
\( M \) = Make-up rate (1,000 gal/min)

\[ \text{Make Up Rate} = M_{\text{avg}} + \frac{R_{\text{avg}}}{R_{\text{avg}}} \]

Where,
\( M_{\text{avg}} \) = Average make-up rate for existing cooling towers 1 through 6 (gpm)
\( R_{\text{avg}} \) = Recirculation rate for new cooling tower (gpm)
\( R_{\text{avg}} \) = Average recirculation rate for existing cooling towers 1 through 6 (gpm)

**Cooling Tower PM/PM10/PM2.5 Emission Factor Calculation**

\[ PM / PM10 / PM2.5 = EF_{PM} \times EF_{PM10} \times EF_{PM2.5} = \frac{\text{TDS}_{\text{design}}}{\text{TDS}_{\text{AP}} - \text{TLDFPMEFPM}} \]

Where,
\( EF_{PM10} \) = AP-42 Emission Factor for PM10 (lb/1000 gal)
\( TLD_{\text{design}} \) = Design total liquid drift (%) 
\( TLD_{\text{AP}} \) = Design total liquid drift (%) 
\( TDS_{\text{design}} \) = Estimated future total dissolved solid content (mg/L)
\( TDS_{\text{AP}} \) = Total dissolved solid content used in AP-42 (mg/L)

**Cooling Tower PM/PM10/PM2.5 Emission Calculation**

\[ PM / PM10 / PM2.5 = (R + M) \times EF_{PM} \]

Where,
\( R \) = Recirculation rate (1,000 gal/min)
\( M \) = Make-up rate (1,000 gal/min)

</tbody>
</table>

**Emission Calculation**

- **Coke Storage**
  - Coke Produced (ton yr⁻¹) = Amount of Coke Produced (ton day⁻¹) * 365 day yr⁻¹
  - Days Coke Loaded = 5 days week⁻¹ * 52 weeks year⁻¹ = 260 day yr⁻¹
  - Average Coke Stored (ton day⁻¹) = Coke Produced (ton yr⁻¹) / 260 day yr⁻¹
  - Volume of Coke Stored (ft³) = Average Coke Stored (ton day⁻¹) * 2,000 lb ⁻¹ * ft³ / 56 lb ⁻¹
  - Volume of Cone = \( \frac{1}{3} \pi r^3 \)
  - Radius of Pile = \( \sqrt{\frac{3 * 71,296.36 \text{ ft}^3}{\pi * 14 \text{ ft}}} \) = 69.73 ft
  - Exposed Pile Surface Area (acre) = \( \pi * r^2 * \frac{1 \text{ acre}}{43,560 \text{ ft}^2} \)

- **Surface Material silt content for storage pile from silt testing done on comparable coke pile.**
- **Surface material silt content for coke yard from silt testing on comparable coke yard.**
- **The number of wet days with at least 0.01 inches of precipitation is based on a 47 year average for Chicago, IL from the National Climate Data Center.**
- **Based on four years (1997-2001) of metrological data at Midway Airport.**
- **Hourly emission rate represents annual average hourly emissions.**

### Emission Calculation

- **EF** = \( k \times 0.0032 \times \left( \frac{U}{5} \right)^{1.3} \left( \frac{M}{2} \right)^{1.4} \left( \frac{\text{lb PM}}{\text{ton coke handled}} \right) \)

### Footnotes:

1. Total coke handled based on average daily production during the baseline period.
2. The current coke handling includes three transfer points: (1) the drop into storage pile 3A or 3B from the front end loader (FEL), (2) loading out of storage pile 3A or 3B by a FEL, and (3) the drop into the truck from the FEL.
3. Emission factors provided in AP-42 Section 13.2.4 (November 2006).
4. Based on average annual wind speed for Chicago, IL in U.S. EPA TANKS 4.0.9d.
5. Based on average moisture content for coke material handled provided by Natalie Grimmer via email on 1/4/2007.
6. Hourly emission rate represents annual average hourly emissions.
7. The PM\textsubscript{2.5} emissions are assumed to be equal to PM\textsubscript{10} emissions.
Table C.36. 2001-2002 Fugitive Emissions from Paved Roads

Coke Fugitive Dust from Paved Roads

Average Tons of Coke Produced per day 1,638.9 tons/day
Average Tons of Coke per Truck 21.5 ton/truck
Miles Driven Per Truck at Refinery 1.6 miles/truck

Vehicle Miles Traveled by Average Truck\(^1\) 44,518 VMT/yr

<tr>
<td>Emission Factor for Exhaust, Brake Wear and Tire Wear (C)(^7)</td>
<td>0.00047</td>
<td>0.00047</td>
<td>lb/VMT</td>
</tr>
</tbody>
</table>

Emission Calculation

\[
EF = \left[ k \left( \frac{sL}{2} \right)^{0.65} \left( \frac{W}{3} \right)^{1.5} - C \left( 1 - \frac{P}{4N} \right) \right] (\text{lb/VMT})
\]

Footnotes:

\(^1\) Each truck travels a total of 1.6 miles within the Whiting Refinery on paved and swept roads.

\(^2\) Emission factors provided in AP-42 Section 13.2.1 (November 2006).

\(^3\) Particle size multiplier k from AP-42 Table 13.2.1-1 (November 2006).

\(^4\) Road surface silt loading is from Table 13.2.1-4 and is based on the average silt loading for the iron and steel production industry.

\(^5\) Since each truck travels 0.8 miles unloaded (weighing 15 tons) and 0.8 miles loaded (weighing 36.5 tons), the average truck weight is 25.8 tons.

\(^6\) The number of wet days with at least 0.01 inches of precipitation is based on a 47 year average for Chicago, IL from the National Climate Data Center.

\(^7\) The emission factor for vehicle fleet exhaust, brake and tire wear is from AP-42 Table 13.2.1-2 (November 2006).

\(^8\) Hourly emission rate represents annual average hourly emissions.

\(^9\) The PM\(_{2.5}\) emissions are assumed to be equal to PM\(_{10}\) emissions.

### Total VOC Emissions (Tons/yr):
- 0.32

---

¹ United States, et.al v. BP Exploration & Oil, et.al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

² LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

Relief Valves are controlled

Total VOC Emissions (Tons/yr): **23.68**

---

1 United States, et.al v. BP Exploration & Oil, et.al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL.

2 LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

1. The VOC percent efficiency of 98.5% is based on a proprietary technology that promotes the combustion of coke to completion.
2. Hourly emission rate represents annual average hourly emission.
3. Baseline year NOx and SO2 concentrations have adjusted downward to the concentration limits from Consent Decree 4th Amendment.
4. CO, NOx, and SO2 emissions are based on a stoichiometric factor of 11.6 lbs flue gas generated per lb of coke burned. Note that this factor is on a 0% O2 basis. Therefore, the ppm values used in the calculations for CO, NOx, and SO2 must be on a 0% O2 basis. For CO, CO2 concentrations are corrected to 0% O2 in the calculation. For NOx and SO2, the ppm values do not need an additional correction to 0% O2 since the consent decree limits, which are already on a 0% O2 basis, are used.

</table>

1. The VOC percent efficiency of 98.5% is based a proprietary technology that is used in the catalyst regenerators to promote the combustion of coke to completion.

2. Hourly emission rate represents annual average hourly emissions.

3. Baseline year NOX and SO2 concentrations have adjusted downward equal to the concentration limits from Consent Decree 4th Amendment.  For CO, the CO concentrations are corrected to 0% O\textsubscript{2} in the tpy calculation.  For NOX and SO2, the ppm values used in the calculations for CO, NO\textsubscript{X} and SO2 must on a 0% O\textsubscript{2} basis.  For CO\textsubscript{2}, the CO\textsubscript{2} concentrations are corrected to 0% O\textsubscript{2} in the tpy calculation.  For NO\textsubscript{X} and SO\textsubscript{2}, the ppm values do not need an additional correction to 0% O\textsubscript{2} since the consent decree limits, which are already on a 0% O\textsubscript{2} basis, are used.

4. CO, NO\textsubscript{X} and SO\textsubscript{2} emissions are based on a stoichiometrically derived factor of 11.6 lbs flue gas generated per lb of coke burned.  Note that this factor is on a 0% O\textsubscript{2} basis.  Therefore, the ppm values used in the calculations for CO, NO\textsubscript{X} and SO\textsubscript{2} must on a 0% O\textsubscript{2} basis.  For CO\textsubscript{2}, the CO\textsubscript{2} concentrations are corrected to 0% O\textsubscript{2} in the tpy calculation.  For NO\textsubscript{X} and SO\textsubscript{2}, the ppm values do not need an additional correction to 0% O\textsubscript{2} since the consent decree limits, which are already on a 0% O\textsubscript{2} basis, are used.

</table>

1. The FCU 600 Allowable Emissions were calculated using the maximum capacity of 80 (1000 bbl/day) and the ratio of coke burned to fresh feed, which is based on historical FCU 600 usage.
2. The Consent Decree limits FCU 600 to an SO₂ concentration of 50 ppm at 0% excess O₂.
3. Pursuant to the BP Whiting Consent Decree, up to ten percent (10%) of the SO₂ reduction credits generated by the FCU 600 SO₂ emissions reduction to 50 ppm could be used for netting SO₂ emissions increases that result from the construction or modification of “netting/offset generating units”.

1 Emission decreases represent creditable emissions decreases when the future potential emissions are less than the baseline emissions.

2 Based on interim guidance from US EPA, PM$_{2.5}$ is evaluated based on significant emission rate thresholds established for PM$_{10}$. The current PM$_{10}$ SIP limits filterable PM$_{10}$ emissions and compliance is based on reference test method 201A (which only quantifies filterable particulate matter). Although not required, BP Whiting has conservatively adjusted the PM$_{10}$ baseline based on the PM$_{10}$ SIP limits for PSD applicability purposes, which includes both filterable and condensable PM$_{10}$. PM$_{2.5}$ emissions are not regulated by the Lake County PM$_{10}$ SIP, however, to be conservative, BP Whiting has adjusted PM$_{2.5}$ baseline emissions in the same manner as for PM$_{10}$ emissions.

**Notes:**
1. New DHT heater F-901A controlled by ultra-low NOx burners. Note this heater is replacing the existing DHT heater.
2. New GoHT heaters F-901A and F-901B controlled by ultra-low NOx burners.
3. UOP's H2, H3, H4, H5, H6, H7, and H22 are being replaced with like-for-like replacement heaters. Therefore, the new heaters are considered new.
4. New Coker (2) Coker heaters in COT 1, COT 2, and COT 3 are controlled by ultra-low NOx burners and SRU.
5. New Cooling Towers based on 0.001% Liquid Drift Factor achieved with high efficiency drift eliminators.
6. These new SRU Claus heaters have no direct emissions and are vented through new Claus Offgas Towers (COTs).
7. flare emissions based on normal operation (i.e., purge gas flow rate).
8. Hydrogen Plant (3rd Party SMR) heaters HU-1 and HU-2 are controlled by the NOx burners and SRU.
9. Additional CO fugitive emissions are included to account for general process fugitive emissions.
10. All Fugitives emissions except for Tanks SH-1 and SH-2 are calculated using U.S. EPA's TANKS 4.0 Program.
11. Additional SO2 fugitive emissions associated with new coke handling are included to account for general process fugitive emissions.
12. Total reduced sulfur (TRS) emissions from Tanks SH-1 and SH-2 were estimated based on anticipated TRS concentration after caustic scrubber.
13. * Note SO2 emissions from the COT 1 and COT 2 include future sulfur loading emissions.
14. VOC emissions from the COT 1 and COT 2 include future sulfur loading emissions.

---

1. United States, et. al. v. BP Exploration & Oil, et. al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL.
2. Selected 24-month period is based on calendar years.
3. DOE New Units from Table C-1.
4. DOE Affected Units from “Evaluation of Project Impacts on Existing Units” (Tables C-7 through C-9).
5. The Consent Decree specifies that no more than ten percent (10%) of the SO₂ emission reduction credits generated by the cessation of oil burning could be used for netting SO₂ emissions increases that result from the construction or modification of lower sulfur fuels units that meet the criteria for “lower sulfur fuel generating units”. Therefore, any reduction beyond the emissions increases from “lower sulfur fuels units” cannot be used to offset other increases and are not carried forward in this netting analysis.
6. The Consent Decree specifies that no more than ten percent (10%) of the SO₂ emission reduction credits generated by the FCU-500 SO₂ emissions reduction to 50 ppm could be used for netting SO₂ emissions increases that result from the construction or modification of “netting/offset generating units”. Therefore, any reduction beyond the emissions increases from “netting/offset generating units” cannot be used to offset other increases and are not carried forward in this netting analysis.

January 7, 2008 - REVISION
Table C.83. Project VOC de minimis Test

Per 326 IAC 2-3-1(q), a de minimis increase of VOC from a modification in a serious or severe ozone nonattainment area, means an increase that does not exceed twenty-five (25) tons per year when the net emissions increases from the proposed modification are aggregated on a pollutant specific basis with all other net emissions increases from the source over a five (5) consecutive calendar year period prior to, and including, the year of the modification. This modification is expected to commence operation in 2011, and therefore the net emissions changes from projects taking place between 2007 and 2011 have been considered for this evaluation.

¹ PM₁₀ SIP Limit for the FCU 500 and FCU 600 are provided in lb/1,000 lb coke burned, not lb/MMBtu.
² PM₁₀ SIP Limit for the Beavon-Stretford TGU is provided in lb/ton, not lb/MMBtu.
³ Rated Capacity from Title V Permit (Permit No. T069-6741-00453)
⁴ Rated Capacity for 3UF Heater H-1 based on rated capacity used to establish PM SIP limits.
⁵ As part of the COKHO project, BP Whiting will be making modifications to the main fractionator tower.
### Table C.85 Concrete Crushing Emissions

| Total Concrete to be Crushed | 18,000.0 tons |
| Total Transfer Points       | 2             |
| Hours of Operation per day  | 10 hours/day  |
| Concrete Processed per day  | 1,200 tons/day|
| Concrete Processed per hour | 120 tons/hour |

Notes:

1. The number of catch basins are provided, but are not included in the total emissions calculations since they are storm water catch basins. Emissions from these catch basins are expected to be negligible in comparison to the other process sewer drains included.

<td>4.0 lb/Event</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note:**
- Event emission rate represents one worst-case emergency/malfunction scenario event. Annual emission rate represents the estimated annual average total duration of worst-case emergency/malfunction events.
- SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

**Major New Source Review Thresholds:**
- No

**General Assumptions Used in Calculations**
- V = 1,000,000 ft³
- P = 14.7 psia
- R = 10.73 psia-ft³/lbmol-R
- T = 527.7 R
- m = 2596.15 lb-moles/MMscf
- d = 385.1851 scf/lbmol

**Other Notes:**
- Natural gas higher heating value (Btu/scf) = 1020
- Regulatory applicability for 40 CFR 63, Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63, Subpart CC since they are exempted from the definition in 40 CFR 63.641.
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is unlikely to occur.

**Environmental Impact:**
-

**Total VOC Emissions Associated with Added Components and Additional Controls (tons/yr): -4.21**

---

1 United States, et al vs BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL.

2 LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%).

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

3 There are 2 new relief valves and 74 existing RV's - previously routed to the atmosphere (through the blowdown stack) that are now routed to the DDU flare. The existing RV's were previously controlled with a water spray chamber that is presumed to be capable of 90% control.

*Notes:

## 11B Emergency Relief Valves to the DDU Flare

Note that the work for 11B is associated with the 11C WARP project.

### General Assumptions Used in Calculations

- Natural gas Higher Heating Value (Btu/scf) = 1020
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.

### Emission Factors

<table>
<thead>
<tr>
<th>Unit</th>
<th>Emission Factor</th>
<th>Value</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td></td>
<td></td>
<td>lb/MMscf</td>
</tr>
<tr>
<td>PM</td>
<td></td>
<td></td>
<td>lb/MMscf</td>
</tr>
<tr>
<td>Hg</td>
<td></td>
<td></td>
<td>lb/MMscf</td>
</tr>
</tbody>
</table>

### Emission Calculations

- SO2 MW (lb/lb-mole) = 64
- SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

### Notes

- The 11B WARP project only includes Blowdown RVs (RVs) to tie existing blowdown RVs to the DDU Flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header tie-ins.
- The NH3 mass flow is the sum of the purge gas flow from purge lines to the new header system.
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.
- Regulatory applicability for 40 CFR 63 Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63 Subpart CC because they are exempted from Subpart CC by definition in 40 CFR 63.641.
- RV relief gas combustion emission factors for PM/PM10/PM2.5, Lead, Mercury, and Beryllium are from AP-42 Section 114 (July 1998). Emission factors for VOC, NOx, and CO are from AP-42 Section 115 (December 1991). The emissions for SO2 are calculated using the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

**Total Predicted Flue Gas Emissions**

- **PM10/PM2.5**
- **CO**
- **Pb**
- **PMSO2**
- **Be**
- **VOC**
- **Hg**

**Other Notes:**

- Natural gas higher heating value (Btu/scf) = 1,000,000 ft^3/P*V=n*R*T
- The 11C PS WWRF project has existing blowdown valves, which are part of the flare header system and consists of emergency RVs only. Nitrogen will be used as the purge gas for the new header line.
- The boundaries for the new flare knockout are the flange at the knockout drum for the blowdown headers. This was established based on the worst case emergency relief scenarios for the current operations.
- The blowdowns from the 11C PS WWRF project will be new and not used as part of the existing blowdown system. The new system will consist of a single knockout drum before the existing blowdown headers to the existing WWRF relief valve.
- The HHV and sulfur content was conservatively estimated based on the range of material that could be released. It was also conservatively assumed that each RV would lift one time per year, although this is an unlikely scenario.

**Calculations:**

- SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.

Total VOC Emissions (tons/yr): **0.43**

¹ United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

² LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 ppmv basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

Relief Valves are controlled

---

<sup>1</sup> United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL.

<sup>2</sup> LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000) = 95% and (1-2,000/10,000) = 80%).

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000) = 95% and (1-2,000/10,000) = 80%).

<sup>3</sup> There are no new relief valves and 41 existing RV's - previously routed to the atmosphere (through the blowdown stack) that are now routed to the FCU flare. The existing RVs were previously controlled with a water spray chamber that is presumed to be capable of 90% control.

Total VOC Emissions (Tons/yr): 0.30

\(^1\) United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

\(^2\) LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., \((1-500/10,000) = 95\%\) and \((1-2,000/10,000) = 80\%\)).

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

Relief Valves are controlled

**Note:**
1. Event emission rate represents one worst case emergency/malfunction scenario event. Annual emission rate represents the estimated annual average total duration of worst case emergency/malfunction events.
2. SO2 Emissions Calculation:
   \[ \text{SO}_2 \text{ MW (lb/lb-mole)} = 64 \]
   SO2 emissions are calculated based on the concentration of sulfur in the gas stream, the ideal gas law, and the molecular weight of SO2.
3. General Assumptions Used in Calculations
   - Ideal Gas Law used to determine the moles of gas per MSCF (P*V=n*R*T)
   - Emission factors for PM/PM10/PM2.5, Lead, Beryllium and Mercury are from AP-42 Section 1.4
   - Emission factors for VOC, NOx, and CO are from AP-42 Section 13.5 (September 1991). The emissions for SO2 are calculated
   - The VRU WARP project ties existing blowdown RVs to the VRU header tie-in system from VRU 100 and VRU 200 and consists of emergency RVs only.
   - It was also conservatively assumed that each RV would lift once a year, although this is an arbitrary assumption.

**Other Notes:**
- Regulatory applicability for 40 CFR 63, Subpart CC will not change as a result of the project. Emergency RVs are not miscellaneous process vents per 40 CFR 63. Subject RVs are expected to be covered under Subpart CC.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.

**Soil Emission Rates:**
- Subject RVs are expected to be covered under Subpart CC.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.
- The VRU WARP project integrates the emergency relief valves from the VRU 100 and VRU 200 header systems to the VRU Flare header system.

**Total VOC Emissions (Tons/yr):** 0.04

¹ United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

² LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance "Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives" (October 2000).

Relief Valves are controlled.

### Assumptions:

- Maximum Heat Input Capacity = 575 MMBtu/hr *5 Boilers *96.5% availability at 3SPS
- Projected actual gas usage rates are based on assuming 8,760 hours of operation at the maximum permitted capacity.
- No change in gas usage.
- No change in fuel consumption.
- Projected fuel gas use based on maximum heat input capacity of 575 MMBtu/hr, 96.5% availability at 3SPS.
- Refinery Fuel Gas HHV (BTU/scf) 1203.33
- Natural Gas Heating Value = 1020 BTU/scf
- Ammonium Sulfate Molecular Weight = 132.14
- Sulfur Trioxide Molecular Weight = 80.06
- Sulfur Dioxide Molecular Weight = 64.06
- Sulfuric Acid Mist Molecular Weight = 98.07
- BP is conservatively considering that all of the SO\textsubscript{3} emitted can form both condensable particulate matter and sulfuric acid mist.

Total VOC Emissions (tons/yr): **0.88**

¹ United States, et al. v. BP Exploration & Oil, et al., Northern District of Indiana, Hammond Division, Civil Action No. 2:96 CV 095 RL

²LD&R control efficiency for pumps and valves in gas and light liquid service are 95% and 80%, respectively based on a 500 ppmv leak definition for valves and 2000 ppmv compared to the 10,000 leak definition basis for screening factors (i.e., (1-500/10,000 = 95%) and (1-2,000/10,000) = 80%)

AVO monitoring equivalent to 30% control is applied to all flanges and heavy liquid valves and pumps.

30% control estimate per TCEQ Guidance “Air Permit Technical Guidance for Chemical Sources: Equipment Leak Fugitives” (October 2000).
New Boilers

1131 Required Boiler Heat Input (MMBTU/hr)* (2 boilers at 580 MMBtu/hr each at 97.5% total annual utilization)

** EF Notes:
1) NOx factor based on manufacturer's guarantee (control technology/technique to be determined)
2) SO2 emissions will be limited to 24.9 tpy per boiler and emissions will be calculated based on total sulfur in refinery fuel gas. Natural gas blending will be used, if necessary.
3) PM based on AP-42 Table 1.4-2.
4) PM10/PM2.5 emission factor based on AP-42 Table 1.4-2 total particulate (condensible and filterable); Note that additional PM10/PM2.5 emissions were added, assuming that an SCR may be added to the boilers and 3% conversion of SO2 emissions to SO3 and ammonium sulfate.
5) CO based on manufacturer's guarantee.
6) Refinery fuel gas heating value assumed to be 1200 BTU/scf
7) VOC based on AP-42 Section 1.4 for natural gas
8) Lead, beryllium, and mercury emissions based on AP-42 Section 1.4 for natural gas.
9) Sulfuric Acid Mist emissions based on assumed conversion percentage of SO2 to SO3 and the assumption that all SO3 converts to sulfuric acid mist.

New Tank 8 Oil/Water Separator System

- **Maximum average daily estimated flow rate of material through the new Tank 8 oil/water separator (gal/day)**: 100,000
  - Based on design estimates
- **VOC Emission Factor (lb/kgal)**: 0.2
  - Covered Oil/Water Separator from AP-42 Table 5.1-2 (1/95)
- **VOC Emissions (lbs/day)**: 20
  - Maximum average daily flow rate * VOC Emission Factor
- **VOC Emissions (tpy)**: 3.7
  - VOC Emissions lbs/day * 365 days /yr * 1 ton/2,000 lbs

Note that the oil/water separator will be subject to the requirements of 40 CFR 61, Subpart FF and will be equipped with carbon canisters to control emissions.

Note that a new junction box and new manhole and sewer drain may be installed, depending on the final location chosen within the refinery.
## Fugitive Emission Calculations for Tank 8 OWS Replacement

**LDAR Program:** Monitoring per Consent Decree¹;  
**Factor Type:** Refinery Screening  

(EPA Emission Factors EPA-453/R-95-017, Table 2-6)

**Annual Hours of Service:** 8760

Total Emissions (lb/hr) = 0.42
Total Emissions (lb/hr) = 2.94
Total Emissions (lb/hr) = 0.98
Total Emissions (lb/hr) = 0.73

Notes
Emission factors are from AP-42 Section 3.3, Table 3.3-1 (10/96) and NSPS Subpart III.
VOC emission factor is the sum of the TOC emission factors for exhaust and crankcase.
PM is assumed to be equal to PM10 for the purposes of these calculations. It should be noted that AP-42 Section 3.3 does not include a PM emission factor, and footnote b of Table 3.3-1 indicates that all particulate is assumed to be less than 1 micrometer.
Emission factors noted in red are emission standards for engine 300–600 HP, per 40 CFR 60, Subpart III.
Emission estimates are based on the lower of AP-42 emission factors and Subpart III limits emission limits.
40 CFR Subpart III limits NOx + NMHC. NOx assumed emitted at Subpart III limit and VOC emitted at AP-42 factor levels.
SO2 emission factor based on NSPS limit of 500 ppm fuel sulfur content and calculations below.

Sample Calculation
NOx emissions from compressor (lb/hr) =

Noncondensible Hydrocarbons Routed to Burner

 Assumes that negligible amounts of organic material will be left in recovered solids after thermal desorption and that all the material that is not recovered is included in the noncondensibles portion. Note that the noncondensible portion will consist of hydrocarbons that do not condense at above 150 to 160 degrees F such as methanes and propanes.

Based on the previous experience of the vendor with other waste streams that contain sulfur compounds, hydrogen sulfide in the stream from the thermal desorption unit is typically absorbed in the condensed oil and elemental sulfur typically remains in the solids. The sulfur emissions from the fuel burned in the burner typically are greater than those from the supplemental noncondensible stream.

Processed Solids System

 It is presumed that negligible amounts of VOC will be emitted from the recovered solids since they have been processed through the thermal desorption system. In addition, the recovered solids system will be enclosed for the rehydration process and routed to a wet scrubber. Therefore, the controlled emissions are presumed to be negligible.
Potential Emissions Calculations for Diesel-Fired Burner for Thermal Desorption System

Diesel Fired Burner Emissions

The thermal desorption system is equipped with two burners that burn distillate fuel. In addition, the noncondensible vapor stream is routed through the burners for destruction of the lighter hydrocarbons that are not recovered in the oil. Note that the noncondensible portion will consist of hydrocarbons that do not condense at above 150 to 160 degrees F such as methanes and propanes.

**Emissions**

- **NOx** Emissions (lb/hr) = 8 MMBtu / 10,000,000 Btu / lb / gal / kgal / 20 lb = 1.18 lb/hr
- **Emissions** (tpy) = 5.15 lb/day * 60 days = 309 lb/year

**Other Pollutants**

- **Lead** Emissions (lb/hr) = 9 lb / 10^12 Btu = 0.00 lb/hr
- **Mercury** Emissions (lb/hr) = 3 lb / 10^12 Btu = 0.00 lb/hr
- **Beryllium** Emissions (lb/hr) = 3 lb / 10^12 Btu = 0.00 lb/hr
- **Benzene** Emissions (lb/hr) = 2.14E-04 lb / 10^12 Btu = <0.01 lb/hr

**Notes**

- Emission Factors taken from AP-42 Section 1.3 tables 1.3-1, 1.3-2, 1.3-3 assuming boiler fired by No. 2 oil (9/98).
- VOC emission factor is NMTOC factor from AP-42 Section 1.3-3 (9/98).
- SO2 emission factor = 142 * Fuel Sulfur % (AP-42, Section 1.3, Table 1.3-1, 9/98).
- PM10 emission factor is sum of filterable and condensable factors from Tables 1.3-1 and 1.3-2.
- PM is assumed to be equal to filterable factor only for purposes of these calculations.
- *Other pollutant emission factors are from Tables 1.3-9 and 1.3-10. The benzene emission factor is in lb/kgal.

The thermal desorption system will use the existing diesel tank associated with the FBI system. In addition, the thermal desorption system will use less fuel than the existing FBI system has used in the past; therefore, no increases associated with the tank are included.

Sample Calculation

\[
\text{NOx Emissions (lb/hr)} = \frac{8 \text{ MMBtu}}{10,000,000 \text{ Btu}} \times \frac{1 \text{ lb}}{7.05 \text{ lb}} \times \frac{1 \text{ gal}}{1000 \text{ gal}} \times \frac{1 \text{ kgal}}{20 \text{ lb}} = 1.18 \text{ lb/hr}
\]
Potential Emissions Calculations for Diesel-Fired Burner for Thermal Desorption System

Process Gas Stream Combustion Emissions:

Note that the distillate fuel use will be adjusted as the noncondensible portion provides heat input capacity such that the maximum rating of the burners will remain at 4 MMBtu/hr each. Therefore, the emissions calculated for the burners should account for all combustion emissions; however the emissions from the combustion of the vapors are calculated below for reference in determining if the emissions are higher when firing process gas in lieu of some of the diesel.

</tbody>
</table>

- **Basis for emission calculations:**
  - Molal volume for VOC and SO2 calculated using ideal gas law at standard temperature and pressure.
  - Vapor molecular weight of distillate number 2 from TANKS 4.09.
  - Conversion factor (L/cf) = 28.32 L/cf.

- **Conservatively based on natural gas heat input and the maximum capacity of the burner**
  - SO2 Emission Rate (lb/hr) = 0.06 lb/hr
  - SO2 Emission Rate (tpy) = 0.28 lb/tpy

The emissions associated with the diesel burners are higher than emissions when burning process gas; therefore, the diesel burner emissions will be used for potential emissions estimates.

**Notes**

- Emissions factors for NOx, CO, PM10, and PM2.5 are from AP-42 Section 1.4 tables 1.4-1 and 1.4-2 (7/98) assuming combustion similar to natural gas. PM is assumed to be equal to PM10 and PM2.5 for the purposes of these calculations.
- Molar volume for VOC and SO2 calculated using ideal gas law at standard temperature and pressure.
- These calculations are conservative as the noncondensible stream is not likely to contain as much hydrogen sulfide as the refinery fuel gas.
- Note that it is presumed that the sulfur compounds in the noncondensible stream will mostly be H2S. Other reduced sulfur compounds that could be formed in the thermal desorption unit have similar boiling points to the hydrocarbons that are condensed and recovered, and these other sulfur compounds are expected to condense in the oil phase with the hydrocarbons.
Fugitive Emission Calculations for Dewatering System and Thermal Desorption System

SECTION A  SOURCE SUMMARY

This permit is based on information requested by the Indiana Department of Environmental Management (IDEM), Office of Air Quality (OAQ) and Hammond Department of Environmental Management. The information describing the source contained in conditions A.1 through A.3 and A.4 is descriptive information and does not constitute enforceable conditions. However, the Permittee should be aware that a physical change or a change in the method of operation that may render this descriptive information obsolete or inaccurate may trigger requirements for the Permittee to obtain additional permits or seek modification of this permit pursuant to 326 IAC 2, or change other applicable requirements presented in the permit application.

A.1 General Information [326 IAC 2-7-4(c)] [326 IAC 2-7-5(15)] [326 IAC 2-7-1(22)]

The Permittee owns and operates a stationary refinery and marketing terminal.

Source Address: 2815 Indianapolis Blvd, Whiting, Indiana 46394-0170
Mailing Address: P.O. Box 710, Whiting, Indiana 46390-170
General Source Phone Number: 219-473-3179
SIC Code: 2911
County Location: Lake
Source Location Status: Nonattainment for PM2.5 and 8-hour ozone standard
Attainment for all other criteria pollutants
Source Status: Part 70 Permit Program
Major Source, under PSD and Emission Offset Rules
Major Source, Section 112 of the Clean Air Act
1 of 28 Source Categories

A.2 Part 70 Source Definition [326 IAC 2-7-1(22)]

This stationary source consists of two (2) plants, with a third plant located on an adjacent site:

(a) The Whiting Refinery (previously designated 089-00003), located at 2815 Indianapolis Boulevard, Whiting, Indiana 46394; and

(b) The Marketing Terminal (previously designated 089-00004), located at 2530 Indianapolis Boulevard, Whiting, Indiana 46394.

(c) INEOS USA LLC (designated as 089-00076), 2357 Standard Avenue, Whiting, IN 46394.

Since the two (2) plants (Whiting Refinery and the Marketing Terminal) are located on contiguous or adjacent properties, the plants are under common control of the same entity, and the Whiting Refinery supports the Marketing Terminal, the two (2) plants are considered one (1) source.

In the case of the BP Whiting refinery and the INEOS USA LLC chemical plant, neither plant has a major role in the day-to-day operations of the other plant. There is no contract between the two companies concerning the acceptance or usage of raw materials. Each plant is free to obtain raw materials from other sources. The chemical plant has obtained raw materials from other sources in the past when the refinery has been unable to supply it. Neither plant provides a majority of its output to the other plant. Neither plant has the right to assume control of the other under any circumstance. The INEOS chemical plant purchases steam, water, wastewater service and a raw material stream from the BP refinery. If the refinery were to cease operations, the chemical plant could continue to operate.
The BP refinery purchases a hydrocarbon stream from the chemical plant. It also sends by-products to the INEOS chemical plant’s flare. The flared by-products come from the venting of rail cars and the depressurizing of drums. The refinery does not rely on the hydrocarbon stream in order to produce its principal products. The refinery does not rely on the INEOS flare. If the INEOS chemical plant were to cease operations, the refinery could continue to operate. The refinery has a procedure in place on what steps its employees take when the INEOS flare is unavailable. Neither plant is dependent on the other to operate.

In regards to the refinery and the chemical plant, neither plant has a major role in the day-to-day operations of the other plant. There is no contract between the two companies concerning the acceptance or usage of raw materials. Each plant is free to obtain raw materials from other sources. The chemical plant has obtained raw materials from other sources in the past when the refinery has been unable to supply it. Neither plant provides a majority of its output to the other plant. Neither plant has the right to assume control of the other under any circumstance.

Since there is no common control, the refinery and the chemical plant are not part of the same major source. There is no need to examine the other two criteria under the definition of major source. Therefore, the chemical plant is not included in this Title V Operating Permit. The chemical plant will receive a separate operating permit.

### A.3 Emission Units and Pollution Control Equipment Summary [326 IAC 2-7-4(c)(3)]

This stationary source consists of the following emission units and pollution control devices:

(a) Nos. 11A and 11C Pipe Stills built in 1956, with a rated capacity of 220,800 barrels per day, and identified as Unit ID 120 process crude into various hydrocarbon fractions based on boiling points. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. The following process heaters, all of which are fired by natural gas, refinery gas, or liquified petroleum gas:

<table>

2. Two (2) vacuum hot wells (D-21, constructed in 1990 and D-26, constructed in 1997) and one (1) sump (D-20, constructed in 1990), with D-20, D-21, and D-26 each venting to S/V 120-07, at No. 11 A Pipe Still.

3. One (1) vacuum hot well (D-300), constructed in 1995 venting to S/V 120-08 at No. 11C Pipe Still.
The vacuum tower overhead system consists of a series of condensers, steam ejectors, and vacuum pumps. The majority of the overhead vapors are condensed and drained to the hotwell, which is pumped back to the front end of the unit for reprocessing. The gas compressors pull the remaining vapor that is not condensed in the overhead system into the wet gas system, where the hydrocarbon is reprocessed by downstream units. A thermocouple system (with temperature alarm) is used to monitor the vacuum on the system.

(4) Leaks from equipment in the process, including pumps; compressors (K4 and K4A at No. 11A Pipe Still and K300A and K300-B at the No. 11C Pipe Still); pressure relief devices; sampling connection systems; open-ended lines or valves; and instrumentation systems.

(5) One (1) storage tank (identified as Tank 3030) with a maximum storage capacity of 847,000 gallons. This tank was installed in 1957 and is equipped with an external floating roof.

(6) One (1) oil water separation system (identified as Tank 8) with a maximum storage capacity of 124,800 gallons.

(7) One (1) redundant oil water separation system (identified as Tank 8a), permitted in 2008, with a maximum storage capacity of 124,800 gallons, equipped with a carbon canister for VOC control.

(8) As part of the No. 11A PS and No. 11C PS WARP, permitted in 2008, the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C will be shutdown, with the emergency pressure relief discharge that was previously routed to the blowdown stacks being re-routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COV's.

(b) No. 11B Coker, which processes heavy crude fractions into coke, and Coke Pile. These facilities are identified as Unit 120 and are rated at 2,000 tons of coke per day. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Four (4) process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-101</td>
<td>200 (total)</td>
<td>120-04</td>
<td>None</td>
</tr>
<tr>
<td>H-102</td>

<tr>
<td>H-104</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(2) Storage and handling of the bulk material. Fugitive emissions are controlled by keeping the coke wetted and having a 15’ sheet piling wall surrounding the coke pile. The coke pile height will not exceed 15’.

(3) The No. 11B Coker is connected to the DDU flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) Leaks from process equipment, including pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges and other connectors.
(Note: The No. 11B Coker and Coke Pile, heaters H-101, H-102, H-103, and H-104 will be replaced by the New Coker (#2 Coker) and Coke Handling System and heaters H-201, H-202, and H-203 as part of the CXHO project, identified later in this section).

New Coker (#2 Coker), constructed as part of CXHO project, which processes heavy crude fractions into coke, and new Coke Handling System. These facilities are identified as Unit 800 and are rated at 6,000 tons of coke per day. The New Coker (#2 Coker) heaters H-201, H-202, and H-203 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New Coker (#2 Coker) heater stacks have continuous emissions monitors (CEMS) for NOx and CO. The existing Coker and Coke Pile will be replaced as part of the CXHO Project. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

(1) Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted to</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>H-203</td>
<td>208</td>
<td>800-03</td>
<td>Low-NOX burners and selective catalytic reduction</td>
</tr>
</tbody>
</table>

(2) Storage and handling (including up to 10 transfer points) of the bulk material comprised of a partially enclosed crusher, enclosed conveyors, enclosed storage, day bins, and rail car load out under the main operating scenario. In order to minimize fugitive emissions from the coke handling process, transfer points 1 and 10 will include enclosed conveyors and transfer points 2 through 9 will use enclosed buildings, and water sprays. Coke handling operations will be expected to operate under this main operating scenario for at least 95% of operating hours annually.

There will also be an alternative operating scenario, which will consist of three enclosed conveyors with unenclosed transfer points. Coke handling operations are expected to operate under this alternate operating scenario for no more than 5% of operating hours annually.

(3) The Coker is connected to the South flare system (included in Section D.35). The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) One (1) storage tank, identified as TK-6255, with a maximum storage capacity of 14,028,000 gallons storing coker resid at a vapor pressure less than 0.5 psia. Tank TK-6255 is equipped with a fixed roof.

(5) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.
No. 12 Pipe Still, constructed in 1959 and to be modified as part of the CXHO Project, which processes crude into various hydrocarbon fractions based on boiling points, identified as Unit ID 130, and is rated at 336,000 barrels per day. Heaters identified as H-1AN, H-1AS, H-1B, H-2, H-1CN, H-1CS, and H-1CX will be shutdown and replaced by heaters H-101A, H-101B, and H-102 as part of the CXHO project. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following process heaters, all of which are fired by natural gas, refinery gas, or liquified petroleum gas:

a No longer in service -- was rated at 120 MMBtu/hour.
b No longer in service -- was exhausted to stack 130-03.

(2) One (1) vacuum hot well, identified as D-7, constructed in 1995, and venting to S/V 130-05. The vacuum tower overhead system consists of a series of condensers, steam ejectors, and vacuum pumps. The majority of the overhead vapors are condensed and drained to the hotwell, which is pumped back to the front end of the unit for reprocessing. The gas compressors pull the remaining vapor that is not condensed in the overhead system into the wet gas system, where the hydrocarbon is reprocessed by downstream units. A thermocouple system (with temperature alarm) is used to monitor the vacuum on the system.

(3) Leaks from process equipment.

(d) The Sulfur Recovery Unit (SRU) Facility, identified as Unit ID 162, originally constructed in 1971 and expanded in 1981 and 1995, and rated at 600 long tons per day, to be modified as part of the CXHO Project, increasing the capacity to 1,300 long tons per day of sulfur. The facility includes the following and may also include insignificant activities listed in Section A.4 of this permit:
Three (3) three-stage Claus sulfur recovery trains, identified as A, B, and C, and two (2) additional three-stage Claus sulfur recovery trains installed after modification, identified as D and E trains.

One (1) Beavon-Stretford tail gas unit (B/S TGU), a reduction system with a burner capacity of 24.3 MMBtu per hour, exhausting at stack S/V 162-02. The B/S TGU will be decommissioned as part of the CXHO project.

One (1) tail gas unit (SBS TGU), an oxidation system with a burner capacity of 40 MMBtu per hour, exhausting at stack 162-04. The SBS TGU will be decommissioned as part of the CXHO project.

One (1) caustic soda scrubbing tower to control sulfur dioxide emissions from the SBS TGU. The caustic soda scrubbing tower will be decommissioned as part of the CXHO project.

One (1) cooling tower, identified as the SBS cooling tower, used to remove sodium bisulfite from the caustic scrubbing tower exhaust stream, equipped with a high-efficiency mist eliminator, and exhausting at stack 162-05. The SBS cooling tower will be decommissioned as part of the CXHO project.

Gas quenching and cooling towers other than the SBS cooling tower, to be decommissioned as part of the CXHO project.

One (1) quench separator with mist eliminators, to be decommissioned as part of the CXHO project.

One (1) gas cooler and water condenser with sulfur dioxide stripper, to be decommissioned as part of the CXHO project.

Caustic soda storage tanks and sodium bisulfite storage tanks, and handling equipment, to be decommissioned as part of the CXHO project.

One (1) standby incinerator, used only in the event of an emergency, having stack ID S/V 162-01. The standby incinerator will be decommissioned as part of the CXHO project.

One (1) flare, exhausting to stack S/V 162-03 which controls H₂S and VOC emissions during emergency situations, unit start-ups/shut-downs, and preparation of equipment for maintenance. Refinery or natural gas is used as a constant purge stream. Pilot gas is natural gas.

One (1) modular degassing unit, which removes gases that are emitted during the cooling of molten sulfur. Removed gases are vented to the SBS TGU. Removed gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

Two (2) modular degassing units, to be installed as part of the CXHO project, which remove gases that are emitted during the cooling of molten sulfur. The gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

Three (3) sulfur pits, (Sulfur Pits A, B, and C) used to store molten sulfur with their vent stacks routed to the B/S TGU and/or the SBS. As part of the CXHO project, the vents from the sulfur pits A, B and C will be routed to either COT 1 and/or COT 2.
(15) Two (2) sulfur pits (Sulfur Pits D and E), to be installed as part of the CXHO project, used to store molten sulfur and the vents routed to either COT 1 and/or COT 2.

(16) One (1) sour water storage tank, identified as TK-431, having a maximum storage capacity of 845,600 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

(17) One (1) sour water storage tank, identified as TK-410, permitted in 2008, having a maximum storage capacity of 4,351,200 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

(18) Two (2) Claus Offgas Treaters (COT), identified as COT1 and COT2, to be installed as part of the CXHO project, thermal oxidation systems which combust natural gas, each rated at 72 mmBTU/hr, exhausting at stacks S/V 162-06 and 162-07.

(19) Two (2) sulfur storage tanks, identified as SH-1 and SH-2, each with a maximum storage capacity of 1,008,000 gallons and used to store molten sulfur exhausting to stacks S/V 163-09 and 162-10. These tanks will be constructed as part of the CXHO Project and are both fixed roof tanks controlled by a caustic scrubber.

Main Operating Scenario Pre-CXHO:
Approximately 80% of tail gases from the three trains are sent to the B/S TGU, with the remainder sent to the SBS TGU.

Alternate Operating Scenario #1 Pre-CXHO:
One train and the B/S TGU are not operated. Tail gases from the other two trains are sent to the SBS TGU.

Alternate Operating Scenario #2 Pre-CXHO:
The B/S TGU is not operated. Tail gases from the three trains are sent to the SBS TGU.

Alternate Operating Scenario #3 Pre-CXHO:
The SBS TGU is not operated. Tailgases from the three trains are sent to the B/S TGU.

Main Operating Scenario Post-CXHO:
The tail gases from the five trains are sent to both of the COTs.

Alternate Operating Scenario #1 Post-CXHO:
One of the COTs is not operated and the tail gases from the five trains are sent to the other COT.

Vapor Recovery Unit 100 (VRU-100) identified as Unit ID 241, and Vapor Recovery Unit 200 (VRU-200) identified as Unit ID 231, permitted for turnaround (TAR) in 2008 to repair or replace tower trays and increase existing pumping and cooling capacities. Gasoline and lighter products from the FCUs are separated in the VRUs using a series of distillation towers. The VRUs are connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes leaks from process equipment including one (1) compressor (identified as J-3E located at
VRU-100), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system. The facility may also include insignificant activities listed in Section A.4 of this permit.

(2) As part of the VRU 100/200 Whiting Atmospheric Relief Project (WARP), permitted in 2008, the pressure relief discharges that vented to the existing VRU 100/200 vent stack are being re-routed to the VRU flare.

(f) (A) The Vapor Recovery Unit 300 (VRU 300), identified as Unit ID 150. Light ends and naphtha are separated in the VRU using a series of distillation towers. This unit is connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

(1) One (1) off-gas knock out drum (D-400) which exhausts to flare stack S/V 241-01.

(2) Leaks from process equipment, including two (2) compressors (identified as K-340 and K-351), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation system.

(B) Vapor Recovery Unit VRU 400 for the New Coker (#2 Coker) to be installed as part of the CXHO Project.

(g) The Alkylation Unit, identified as Unit ID 140, combines isobutane with butylenes and propylenes to produce alkylate. The alkylate, a high octane naphtha, is blended into gasoline. This unit was built in 1961 and expanded in 1989. This unit is connected to flare stack S/V 140-01, the Alky Flare, to control VOC emissions emitted during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

(1) One (1) off gas knock-out drum (D-22), which exhausts to flare stacks S/V 140-01.

(2) One (1) spent acid stripper drum (D-13), which exhausts to flare stacks S/V 140-01.

(3) One (1) spent caustic drum (D-32), which exhausts to flare stacks S/V 140-01.

(4) Leaks from process equipment, including two (2) compressors (identified as K-1 and K-1A), valves, pumps, pressure relief devices, sampling connection systems, and instrumentation system.
(h) The Propylene Concentration Unit (PCU), identified as Unit ID 145, purifies propylene for sale to chemical plants and eventual manufacture into polypropylene plastic. This unit also has a treating system, which purifies propane. This unit is connected to flare stack S/V 140-01 (the Alky Flare). The flare controls VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes a caustic degassing drum (D-100) that is vented to flare stack S/V 140-01 and leaks from process equipment, including one compressor (identified as k-104), pumps, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation system. This facility may include insignificant activities listed in Section A.4 of this permit.

(i) The Isomerization Unit (ISOM), identified as Unit ID 210, was constructed in 1985 as a conversion of the No.2 Ultraformer. The Isomerization process converts low octane naphtha into high octane gasoline blending components. This unit is connected to flare stack S/V 220-04, the UIU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. As part of the CXHO project, the ISOM heater H-1 will be modified by replacing several burners with larger burners, with rated capacity remaining at 190 MMBTU/hr. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit.

1. One (1) natural gas, refinery gas, or liquified petroleum gas-fired Process Heater H-1, modified as part of CXHO, rated at 190 MMBtu/hr and vented to stack S/V 210-01.

2. One (1) Flare Knock-out Drum (D-18) with emissions vented to vessel D-24, which exhausts to flare stack S/V 220-04.

3. Leaks from process equipment, including one (1) compressor (identified as K1), pumps, valves, process drains and pressure relief devices.

(j) The Aromatic Recovery Unit (ARU), identified as Unit ID 242, consists of the ARU 200 section and the ARU 300 section. The primary function is to remove light ends from naphtha to obtain a more desirable reforming feed. Its secondary function is to separate xylene, a chemical feedstock, from the Ultraformer product. The ARU utilizes a series of distillation towers to purify reformer feed and another set of towers to separate chemical feedstocks. The ARU includes the following process units and may also include insignificant activities listed in Section A.4 of this permit.

1. The following process heaters, which are fired with refinery gas, natural gas or liquified petroleum gas.

<table>

2. The ARU is connected to the 4UF flare stack, S/V 224-06. The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

3. Leaks from process equipment.
The Blending Oil Unit (BOU), identified as Unit ID 250, uses hydrogen to convert sulfur to hydrogen sulfide and remove it from distillate and gas oil streams to meet product specifications. The hydrogen sulfide is sent to the Claus Trains for further processing. **As part of the CXHO Project, the BOU heater F-401 will be modified by replacing burners, with rated capacity remaining at 35 mmBTU/hr.** The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. One process Furnace F-401, constructed in 1972, and modified as part of CXHO, which vents to stack ID S/V 250-01. The furnace is rated at 35 million Btu and is fired by natural gas, refinery gas or liquid petroleum gas.

2. Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

No. 2 Treatment Plant, identified as unit 601, removes disagreeable odors from various naphtha streams using a catalytic process. This facility has only fugitive emissions and/or other emissions that are considered insignificant.

No. 4 Treatment Plant, identified as unit 602, removes disagreeable odors from various naphtha and distillate streams using a catalytic process. This facility has only fugitive emissions and/or other emissions that are considered insignificant. **The No. 4 Treatment Plant will be decommissioned as part of the CXHO project.**

Butane, Propane and Propylene Storage and Loading Facilities, identified as Unit ID 604, includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:

1. One (1) butane storage cavern located in South Tank Field.

2. Seven (7) pressurized butane storage spheres located southwest of the main Refinery near the J&L Tank Field with a capacity of 1,050,000 gallons each.

3. Propane (LPG) storage caverns and above-grade pressurized storage vessels located near the J&L Tank Field.

4. Propane (LPG) railcar loading facilities located near the J&L Tank Field. These can also be used for loading butane into railcars.

5. Pressurized polymer grade propylene (PGP) and refinery grade propylene (RGP) storage vessels located at the northeast end of the Refinery.

6. Propylene truck and railcar loading facilities located at the north east end of the Refinery, with emissions vented to the PIB flare, which is owned and operated by INEOS USA, LLC (Plant I.D. 089-00076).

7. One (1) LPG loading area flare stack having stack number S/V 604-01, installed in 1986, which is used as a safety device which burns any vented gases that might result from relieving pressure on equipment.

8. Leaks from process equipment.
The No. 3 Ultraformer Unit (No. 3 UF), identified as Unit ID 220, commissioned in 1958. The majority of the unit was shutdown in March 2007, including the H-1, H-2 and F-7 heaters, catalyst-filled reactors and the internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process. The unit consists of the C-2 Splitter Tower, the D-18 flare gas separator, D-24 knock-out drum and associated piping. Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>

One (1) flare gas separator (D-18) with emissions vented to vessel D-24, which exhausts to flare stack S/V 220-04.

Five (5) catalyst-filled reactors, which are vented to flare stack S/V 220-04 during the initial catalyst depressuring and catalyst purging steps of the regeneration process.

One (1) internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process, which removes HAP emissions.

Leaks from process equipment, including one (1) compressor (identified as K-1), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

The No. 4 Ultraformer Unit (No. 4 UF), identified as Unit ID 224, built in 1972, upgrades low-octane naphtha to gasoline blending material and chemical feedstocks. The front-end of the unit is a desulfurization section. The reforming section consists of a series of process furnaces and catalyst-filled reactors in which the naphtha is heated and converted from straight chain to aromatic compounds. The reactor products are separated by distillation for further processing or blending into gasoline. A new reactor will be installed as part of the CXHO project. The No. 4 Ultraformer has a regeneration furnace which heats regeneration gas for use in catalyst regenerating. Reactors are taken off-line and vented to the atmosphere during regeneration. The No. 4 Ultraformer includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:
(1) Nine (9) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

(2) One (1) flare (identified as the 4UF flare), exhausting at stack S/V 224-06. The 4UF flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance, and reactor regenerations.

(3) Six (6) catalyst-filled reactors, which are vented to flare stack S/V 224-06 during the initial catalyst depressuring and catalyst purging steps of the regeneration process.

(4) Leaks from process equipment, including two (2) compressors (identified as K-1 and K-7), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(5) One (1) caustic scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process, which removes HAP emissions. The scrubber system includes:

(A) One (1) caustic scrubber exhausting to stack 224-07;

(B) One (1) carbon adsorption system used to treat waste scrubber liquor prior to disposal; and

(C) Caustic feed unloading, storage, and transfer equipment.

(q) The Hydrogen Unit (HU), identified as Unit ID 698, commissioned in 1993, produces 99+% pure hydrogen needed for the refinery hydrotreating processes. The HU produces high purity hydrogen by reacting steam with methane. The reaction is carried out by heating the mixture in a furnace and reacting it in the presence of a catalyst. The HU includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:
(1) One (1) natural gas, refinery gas or liquified petroleum gas fired B-501 Process Heater rated at 366.3 MMBtu/hr, which exhausts at stack S/V 698-01. The Process Heater is equipped with low-NOₓ burners.

(2) One (1) DDU Flare exhausting at stack S/V 698-02, burning natural gas as the pilot gas, used to control VOC emissions during emergency situations, unit startups and shutdowns and depressuring equipment for maintenance.

(3) Leaks from process equipment.

(r) The Distillate Desulfurizer Unit (DDU), identified as Unit ID 700, commissioned in 1993, removes sulfur from petroleum distillates. Distillate feed is mixed with hydrogen, heated in process furnaces and passed over a catalyst bed to convert sulfur compounds to H₂S. The DDU includes the following emissions sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Process Heater WB-301, rated at 64.8 MMBtu/hr and exhausting to stack S/V 700-01. The Process Heater is equipped with low-NOₓ burners and burns natural gas, refinery gas, or liquified petroleum gas.

(2) Process Heater WB-302, rated at 83.7 MMBtu/hr and having stack ID S/V 700-02. The Process Heater is equipped with low-NOₓ burners and burns natural gas, refinery gas, or liquified petroleum gas.

(3) Leaks from process equipment.

(4) The Distillate Desulfurization Unit is connected to the DDU Flare System. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns and depressuring equipment for maintenance.

(s) The Cat Feed Hydrotreating Unit (CFHU), identified as Unit ID 171, built in 1982, removes sulfur from and improves the quality of gas oil feed to the Fluidized Cracking Units. The No. 4 Ultraformer Flare Stack, S/V 224-06, is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The CFHU is connected to the No. 4 Ultraformer flare stack. The flare is used to control VOC emissions, unit startups and shutdowns, and preparation of equipment for maintenance. The CFHU includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

(2) Leaks from process equipment.
The Catalytic Refining Unit (CRU), identified as Unit ID 201, which removes sulfur from petroleum naphthas and distillates. Naphtha or distillate feed is mixed with hydrogen, heated in process furnaces and passed over a catalyst bed inside one of two reactor trains, identified as D-114 and D-105, to convert sulfur compounds to hydrogen sulfide. Hydrogen sulfide is subsequently removed from the product by distillation followed by scrubbing with an amine. The CRU includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. Two (2) heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>
<tr>

<td>Low-NOx Burners</td>
</tr>
</tbody>
</table>

2. The CRU is connected to the UIU flare stack, S/V 220-04. The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

3. Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

**Main Operating Scenario:**
The CRU operates as a naphtha hydrotreater. Maximum production under this scenario is 27,000 barrels per day.

**Alternative Operating Scenario:**
The CRU operates as a distillate hydrotreater. Maximum production under this scenario is 40,000 barrels per day.

The Fluidized Catalytic Cracking Unit (FCU) 500, constructed in 1945, identified as Unit ID 230 and rated at 115,000 barrels per day. This facility converts hydrocarbons that boil above 500 °F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 500 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. One (1) catalyst regenerator. Flue gas from the regenerator passes through an ammonia injection system, a waste heat recovery unit that generates steam, an Electrostatic Precipitator for particulate matter control, and is exhausted through stack S/V 230-01. The ammonia injection system includes aqueous ammonia injection and handling equipment. Aqueous ammonia is transferred from the FCU 600 SCR system’s storage tanks.

2. Three (3) catalyst storage bins, one each for spent, equilibrium, and fresh catalyst. Particulate emissions from the spent catalyst storage bin, identified as Bin F-52, are controlled by one (1) cyclone, which exhausts to stack S/V 230-03.

3. One (1) flare exhaust at stack S/V 241-01 (VRU Flare). The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.
(4) Leaks from process equipment, including two (2) compressors (identified as J-3D and J-3G), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system.

(5) As part of the FCU 500 WARP, permitted in 2008, the FCU 500 blowdown stack will be shutdown and the pressure relief discharges that vent to the blowdown stack will be re-routed to the VRU flare.

(6) The FCU 500 turnaround (TAR) project, permitted in 2008, for the repair or replacement of the power recovery turbine, and the air ring for the catalyst regenerator. The increases in emissions from FCU 500 TAR are already accounted for as CXHO project related emissions increases.

(v) The Fluidized Catalytic Cracking Unit (FCU) 600, constructed in 1946, identified as Unit ID 240 and rated at 80,000 barrels per day. This facility converts hydrocarbons that boil above 500 °F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 600 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) catalyst regenerator. Flue gas from the regenerator passes through a waste heat recovery unit, which generates steam and an Electrostatic Precipitator for particulate matter control. The flue gas is then directed to a selective catalytic reduction (SCR) system, which chemically reduces nitrogen oxide emissions by reaction with injected ammonia, and is exhausted through stack S/V 240-01.

(2) Two catalyst storage bins, one each for equilibrium and fresh catalyst. (Spent catalyst is stored in Bin F-52, which is associated with FCU 500.)

(3) One (1) flare exhausting at stack ID S/V 230-02 (FCU Flare). The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) Leaks from process equipment, including two (2) wet gas compressors (identified as J-3D and J-3E), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system.

(5) As part of the FCU 600 WARP, permitted in 2008, to shutdown the existing FCU 600 blowdown stack and the pressure relief discharges that were vented to the blowdown stack will be re-routed to the FCU flare.

(6) The FCU 600 turnaround (TAR) project, permitted in 2008, for the repair or replacement of the main fractionator overhead condensers, the slurry and pump around system, unit pump replacement, FCU flare tip replacement, and additional controls to reduce plugging on the SCR. The increases in emissions from FCU 600 TAR are already accounted for as CXHO project related emissions increases.

(w) A portion of No. 1 Stanolind Power Station (SPS) constructed in 1928 and identified as Unit ID 501. The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas, are NOx budget units:
(1) The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas:

</tbody>
</table>

Note: The boilers in No. 1 Stanolind Power Station are scheduled to be shut down as part of the Consent Decree 2:96 CV 095 RL.

(2) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(x) A portion of No. 3 Stanolind Power Station (SPS) constructed as listed below and identified as Unit ID 503. The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas, are NOx budget units:

(1) The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas:

After CXHO: The low-NOx burners, IFGR and OFA will be replaced by conventional burners and a Selective Catalytic Reduction (SCR) system on Boilers # 1, 2, 3, 4, 6.

(2) Five (5) direct-fired duct burners, permitted in 2008, rated at 41 mmBTU/hr each, equipped with low NOx burners and controlled by a Selective Catalytic Reduction (SCR) system.

(2)-(3) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.
Hazardous Waste Treatment System:

Fluid Bed Incinerator (FBI), identified as Unit ID 510, equipped with a wet venturi scrubber, wet electrostatic precipitator (WESP) and a carbon bed absorber. This is a refinery pollution control system for hazardous waste materials and regulated under the Resource Conservation and Recovery Act (RCRA) and the Hazardous Waste Combustion MACT Standards. It is designed to treat API separator sludge, DAF skimmings and biological solids from the waste water treatment plant. The WESP and carbon bed absorber were installed in 2003. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following incinerator fired by No.2 fuel oil:

<table>

Dewatering and thermal desorption system for processing sludge, permitted in 2008, including dissolved air flotation skimmings (DAF) and API oil/water separator sludge. The dewatering system will be equipped with a wet scrubber and carbon canister system and the thermal desorption unit will be equipped with a vapor recovery to optimize absorption of hydrocarbons. The feed rate capacities at the dewatering system and thermal desorption systems are 22,500 tons of feed per year and 9,000 dry tons of solids per year, respectively. This facility includes the following emission sources and may include insignificant activities listed in Section A.4 of the permit:

(1) Two (2) centrifuges;
(2) Two (2) sludge surge tanks;
(3) One (1) oil/water mixture surge tank;
(4) One (1) enclosed auger transfer system;
(5) One (1) vapor recovery system on the thermal desorption unit including: an oil condensing/scrubbing system, a water condensing/scrubbing system, and an oil water separator. Uncondensed vapors from this system are routed to the two (2) diesel fired burners for destruction of VOCs.

Insignificant Activity:

(6) Two (2) diesel fired burners rated at 4 mmBTU/hr each, for the thermal desorption system.
(z) Wastewater Treatment Plant (WWTP), identified as Unit ID 544. This facility treats the water used in the refining process that comes into contact with oil or chemicals. In the first step, the heavier solids are removed at the inlet to the WWTP and the floating oil is skimmed from the surface of the wastewater in the API separator boxes. The oil is then recycled back to the refinery. The water is then aerated in the Air Flotation Unit where additional solid impurities are floated and skimmed. Thereafter, it moves to the Activated Sludge Plant where special bacteria digest the remaining contaminants. The water then passes through a clarifier and then eight (8) final filters before being returned to Lake Michigan. This facility includes the following emission sources and may also include insignificant activities listed in section A.4 of this permit:

(1) The following units are equipped with closed vent systems: oil sump P-1, oil sump P-2, and Diffused Air Floatation (DAF) Secondary Boxes, which vent to a biofilter and carbon canisters; Tank 569 is equipped with a conservation vent.

(2) The following units are equipped with a fixed-roof or floating roof: Interceptor Box, Diversion Box (from Tank 5051 to DAF), DAF Flash Mixer, DAF Influent Channel, DAF Effluent Channel, DAF Primary Boxes, and DAF Sump.

(3) One (1) storage tank (identified as Tank 5051) having a maximum storage capacity of 10,000,000 gallons, constructed in 1988 and equipped with an external floating roof.

(4) One (1) storage tank (identified as Tank 5050) having a maximum storage capacity of 10,000,000 gallons, constructed in 1988. This tank is used for storm event and upset impoundments.

(5) Seven (7) oil-water/solids separator units enclosed with a fixed-roof: Bar Screen, #7 API Separator Fixed Cover, #7 API Separator Primary Inlet, #7 API Separator Secondary Inlet, #7 API Separator Secondary Outlet, #7 API Separator Inlet Channel Section, and #7 API Separator Gear Boxes.

(6) One (1) storage tank (identified as Tank 5052) having a maximum storage capacity of 11,676,000 gallons, to be constructed as part of the CXHO Project. This tank will be used as a stormwater equalization tank and is equipped with an external floating roof.

(7) A brine treatment system with seven (7) wastewater tanks with vertical fixed roofs, constructed as part of CXHO project, identified as:

(A) TK-105A, with a storage capacity of 867,180 gallons;  
(B) TK-105B, with a storage capacity of 867,180 gallons;  
(C) TK-101, with a storage capacity of 66,096 gallons;  
(D) TK-102, with a storage capacity of 66,096 gallons;  
(E) TK-103, with a storage capacity of 66,096 gallons;  
(F) TK-104A, with a storage capacity of 89,943 gallons; and  
(G) TK-104B, with a storage capacity of 89,943 gallons.

(aa) Oil Movements, identified as Unit 640. This facility is used to store, blend, and ship products. Gasoline blending components are custom blended into various grades of gasoline. Additive and other compounds are blended into the products to give them their unique characteristics. Furnace oil and other distillates are also blended using components from process units or storage. Crude oil and feedstocks for process units and products are also stored at this location. Product loading operations include the pipeline and railcar racks. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:
(1) One (1) internal floating roof storage tank identified as 3730, storing ethanol, constructed in 1955, with a maximum storage capacity of 1,050,721 gallons.

(2) Ten (10) external floating roof storage tanks storing petroleum hydrocarbon with vapor pressure less than 15 psia, comprising the following tanks:

(5) One (1) oil-water separator identified as the J&L Separator.

(6) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(bb) The general facility remediation system, identified as Unit 999. Remediation includes multiple well point systems. The well point system extracts groundwater, which may have a small hydrocarbon fraction. Depending on the VOC concentration, emissions generated by these systems may be routed to the atmosphere or to a thermal oxidizer. Additionally, one or more systems may route to the same oxidizer. Each system uses a common horizontal vacuum header to collect groundwater through a series of wells, and any entrained air is discharged through a vent at the vacuum pump. Recovered groundwater is then transferred to either a vapor/liquid separation tank or directly to another unit for further processing/treatment. Remediation includes the following emission sources and may also include insignificant activities listed in section A.4 of this permit.

(1) The following well point systems:

(cc) The Mechanical Shop, identified as Unit 693. The Mechanical Shop includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. Two (2) Heat Treat Furnaces that are considered insignificant sources.
2. Leaks from facility fuel gas lines.

(dd) One bulk truck loading facility, identified as the Marketing Terminal, and consisting of one (1) truck loading rack, constructed in 1972 and modified in 1992, comprised of 7 bays used for loading gasoline products and fuel oil. Four bays are dedicated to loading distillates, while the other three bays are dedicated to loading gasoline products. The maximum throughput for the truck loading facility is 1,103,760,000 gallons per year. Emissions of volatile organic compounds are controlled using a vapor combustion unit (identified as VCU).

(ee) **Cooling Towers** constructed prior to 1995, including the following:

1. One (1) cooling tower (identified as Cooling Tower No.6), constructed in 1996, with a maximum capacity of 20,000 gallons of water per minute. Cooling Tower No.6 is located at the No.12 Pipestill.

2. **Cooling Towers** (constructed prior to 1980), with controls installed as part of the CXHO project:

<table>
<thead>
<tr>
<th>Cooling Tower</th>
<th>Recirculation Rate/Make-up rate (gallons/minute)</th>
<th>Control Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cooling Tower 2*</td>

<td>high efficiency liquid drift eliminators</td>
</tr>
<tr>
<td>Cooling Tower 4</td>
<td>44,000/1,085</td>
<td>high efficiency liquid drift eliminators</td>
</tr>
</tbody>
</table>

*Half of the Cooling Tower 2 modules were controlled prior to the CXHO Project. Contemporaneous to the CXHO Project the other modules will be controlled with high efficiency drift eliminators.

3. **Cooling Towers** to be installed as part of the CXHO project:
Cooling Tower | Recirculation Rate/Make-up rate (gallons/minute) | Control Devices
--- | --- | ---
Cooling Tower 7 | 21,000/451 | high efficiency liquid drift eliminators
Cooling Tower 8 | 90,000/2956 | high efficiency liquid drift eliminators

(ff) One (1) Asphalt Facility used to store, blend and transfer asphalt products. The facility has six blenders used for loading asphalt into railcars and trucks. Process heaters are used to keep certain tanks at the proper temperature for shipping. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following two (2) process heaters:

<table>
<thead>
<tr>
<th>Process Heater ID</th>
<th>Heat Input Capacity (MMBtu/hr)</th>
<th>Fuel</th>
<th>Control Device</th>

Under 40 CFR 60, Subpart UU, storage tanks TK-SP-1, TK-SP-2, TK-LG-1 through TK-LG-9, and TK-LG-12 through TK-LG-17 are each considered an affected facility.

Under 40 CFR 63, Subpart CC, storage tanks TK-3573, TK-SP-1 through TK-SP-4, TK-LG-1 through TK-LG-17 are each considered as Group 2 storage vessels that are part of the existing affected source.

(5) The following heated vertical storage tank, with a fixed cone roof, in heavy liquid service, storing volatile organic liquids that have a vapor pressure less than 0.0435 psia, and exhausting to the atmosphere:

<table>
<thead>

</tbody>
</table>

Under 40 CFR 63, Subpart CC, storage tank TK-3570 is considered as a Group 2 storage vessel that is part of the existing affected source.

(6) one (1) truck loading rack, approved for construction in 2007, comprised of six (6) loading bays used for loading liquid asphalt product, with a total maximum loading capacity of 800,000 tons of asphalt product per year, exhausting to the atmosphere or to a biofilter system for odor control.

(7) one (1) rail car loading rack, approved for construction in 2007, comprised of twenty-eight (28) loading bays used for loading liquid asphalt product, with a total maximum loading capacity of 800,000 tons of asphalt product per year, exhausting to the atmosphere or to a biofilter system for odor control.

(8) Equipment leaks of VOC and HAP from valves, pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, flanges and/or other connectors.

Under 40 CFR 60, Subpart GGG, valves, pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, flanges and/or other connectors in VOC service, are considered part of the existing affected source.
(gg) One (1) pipeline (Cogen Steam Transfer Line) connecting BP’s boilers (identified as emission units 501 and 503) with Whiting Clean Energy’s heat recovery steam operator. The pipeline is used to exchange steam between the two facilities. The pipeline was constructed in 2001.

(hh) One (1) pipeline (US Steel Stream Transfer Line) connecting BP’s steam header with US Steel East Chicago (Plant ID #089-00300). This pipeline was constructed 2005 through 2006 and is used to transfer steam from BP to US Steel.

(ii) One (1) Marine Dock Facility used to store and transfer products. The facility has three dock berths. A process heater is used to keep certain tanks at the proper temperature for shipping. As part of the CXHO Project, a vapor recovery/control system will be installed on the Marine Dock Loading operations to control emissions from gasoline loading. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) natural gas-fired process heater (identified as Marine Dock Heater F-100), having a maximum heat input capacity of 7 MMBtu per hour.

(2) One (1) storage tank (identified as BT-1), constructed in 1990, with a maximum storage capacity of 706,000 gallons and used to store petroleum hydrocarbons with a vapor pressure less than 15 psia. The tank is equipped with a fixed roof and an internal floating roof.

(3) One storage tank (BT-002), constructed in 1968, permitted for modification in 2008, with a maximum storage capacity of 874,944 gallons, used to store petroleum hydrocarbons with a vapor pressure less than 15 psia, with a fixed roof and an internal floating roof.

(jj) The refinery operates eight eleven hydrocarbon flares. The flares are used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

The flares are identified as follows:

<table>
<thead>
<tr>
<th>Flare</th>

GOHT Flare*** | 802-03 | Installed as Part of CXHO | H = 316 ft. D = 3.5 ft | GOHT | TBD | Fuel Gas and Natural Gas
South Flare*** | 800-04 | Installed as Part of CXHO | H = 350 ft. D = 5 ft | New Coker (#2 Coker), 12PS, Sulfur Recovery Complex | TBD | Fuel Gas and Natural Gas

* - During emergencies or flare outages, some emission units or streams may be controlled by an alternate flare system that complies with the same applicable requirements as the flare normally used to control the emissions for those units.

** - Owned and operated by INEOS USA, LLC. (Plant I.D. 089-00076).

*** - Flares are equipped with a flare gas recovery system. The recovered gas streams will be sent to vapor recovery/treating area for removal of H₂S and heavy components before being utilized in the refinery fuel gas system.

(kk) The OSBL area includes the pipe alleys, laboratory dock and waste transfer pad. The pipe alleys contain pipes that transfer hydrocarbon streams from one process unit to another or to storage. This facility includes leaks from process equipment, including open-ended valves or lines and flanges. This facility also contains area drains and an oil/water separator. This facility may also include insignificant activities listed in section A.4 of this permit.

(ii) The Distillate Hydrotreating (DHT) Unit, identified as Unit ID 720 and rated at 45,000 barrels per day, which removes sulfur from petroleum distillates. Distillate feed is mixed with hydrogen, heated in a process furnace and passed over a catalyst bed to convert sulfur compounds to H₂S. The DHT Unit was constructed in 2005/2006 and includes the following emission units:

1. DHT Unit Heater B-601, rated at 20 MMBtu per hour and constructed in May 2005. As part of the CXHO Project, DHT Unit Heater B-601 will be replaced with a 41.9 MMBtu per hour natural gas fired heater, identified as B-601A. NOₓ emissions are controlled by ultra low-NOₓ burners having an emission rate of 0.04 pounds per million Btu heat input or less. Emissions are exhausted to a stack identified as 720-01.

2. Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

The DHT Unit shares the DDU Flare, used to control VOC emissions during emergency situations, unit startups and shutdowns.

(mm) The Gas Oil Hydrotreater (GOHT) Unit, identified as Unit ID 802 and rated at 120,000 barrels per day. The GOHT reduces the sulfur and nitrogen content of the FCU feed and improves the hydrogen content. Operation of the GOHT will enable the FCU to meet gasoline sulfur specifications and to improve FCU conversion yields. The GOHT Unit will be constructed as part of the CXHO Project and includes the following emission units:

1. Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-901A</td>

<td>47</td>
<td>802-02</td>
<td>Ultra low-NOₓ burners</td>
</tr>
</tbody>
</table>
(2) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(2) The GOHT Unit vents to the GOHT Flare, used to control VOC emissions during emergency situations, unit startups and shutdowns.

(nn) The New Hydrogen (New HU), identified as Unit ID 801 constructed as part of the CXHO Project, produces 99+% pure hydrogen needed for the refinery hydrotreating processes. The New HU produces high purity hydrogen by reacting steam with methane. The New HU heaters HU-1 and HU-2 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New HU heater stacks have continuous emissions monitors (CEMs) for NOx and CO. The New HU includes the following sources of emissions and may include insignificant activities listed in Section A.4 of this permit:

(1) Process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted to</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>HU-1</td>

</tr>
<tr>
<td>HU-2</td>
<td>920*</td>
<td>801-02</td>
<td>Low-NOx burners and selective catalytic reduction</td>
</tr>
</tbody>
</table>

* HU Heaters HU-1 and HU-2 combust both natural gas and PSA tail gas with a fuel ratio of no more than 25% natural gas and the remainder PSA tail gas.

(2) One cooling tower (HU Cooling Tower) rated at 2,000 gallons per minute recirculation rate controlled by high efficiency drift eliminators.

(3) The new Hydrogen Unit is connected to the HU Flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The HU Flare will be operated with a water seat or nitrogen purge. As such, there will be no purge gas emissions from the HU Flare. The HU Flare exhausts to S/V 801-03.

(3) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(oo) Two (2) new boilers, identified as New Boiler 1 and New Boiler 2, permitted in 2008, each rated at 580 million BTU per hour, equipped with low-NOx burners and/or Selective Catalytic Reduction (SCR) for control of NOx, using either blended natural gas and refinery gas or only refinery fuel gas. A separate TRS CEMS shall be installed to measure the sulfur content of the fuel gas or fuel gas-natural gas blend fed to New Boiler 1 and New Boiler 2.

A.4 Insignificant Activities [326 IAC 2-7-1(21)] [326 IAC 2-7-4(c)] [326 IAC 2-7-5(15)]

This stationary source also includes the following insignificant activities, as defined in 326 IAC 2-7-1(21):

(a) Paved and unpaved roads and parking lots with public access, including road sweeping [326 IAC 6.8-10-3] [326 IAC 2-7-1(21)(G)(xiii)];
(b) Asbestos abatement projects regulated by 326 IAC 14-10 [326 IAC 2-7-1(21)(G)(xvi)];

(c) The following equipment related to manufacturing activities not resulting in the emission of HAPs: brazing equipment, cutting torches, soldering equipment, welding equipment [326 IAC 6.8-1-2(a)] [326 IAC 2-7-1(21)(G)(vi)(EE)];

(d) Machining where an aqueous cutting coolant continuously floods the machining interface [326 IAC 6.8-1-2(a)] [326 IAC 2-7-1(21)(G)(vi)(BB)];

(e) Stockpiled soils from soil remediation activities that are covered and waiting transport for disposal [326 IAC 6.8-10-3] [326 IAC 2-7-1(21)(G)(xii)];

(f) Emission units with PM and PM\textsubscript{10} emissions less than five (5) tons per year, SO\textsubscript{2}, NO\textsubscript{x}, and VOC emissions less than ten (10) tons per year, CO emissions less than twenty-five (25) tons per year, lead emissions less than two-tenths (0.2) tons per year, single HAP emissions less than one (1) ton per year, and combination of HAPs emissions less than two and a half (2.5) tons per year [326 IAC 2-1.1-3(e)(1) and 326 IAC 2-7-1(21)(A)-(C)]:

   (1) FCU catalyst handling including truck loading/unloading [326 IAC 6.8-1-2(a)];
   (2) Power Station soot blows [326 IAC 6.8-1-2(a)];
   (3) General excavations for site remediation activities [326 IAC 6.8-10-3];
   (4) Fugitive dust from coke yard, sulfur piles, and sulfur pits [326 IAC 6.8-10-3]; and
   (5) Soil Screening [326 IAC 6.8-10-3].

(g) Emissions from a laboratory, as defined in 326 IAC 2-7-1(21)(D).

(h) Combustion activities related to the following [326 IAC 2-7-1(21)(G)(i)]:

   (1) Space heaters, process heaters, heat treat furnaces, or boilers using the following fuels:

   (i) Natural gas, provided the heat input of the unit is equal to or less than 10 MMBtu/hr.

   (ii) The following five (5) natural gas-fired hot oil heaters, each approved for construction in 2007, and each considered an insignificant activity, as defined in 326 IAC 2-7-1(21)(G)(i)(AA)(aa):

<table>
<thead>

</tr>
</tbody>
</table>

*Hot oil heater H-LG-3 will exhaust to a steam generator that will be used to heat rejected loads of asphalt during unloading.

   (iii) Propane, liquified petroleum gas, or butane, provided the heat input of the unit is equal to or less than 6 MMBtu/hr.
Fuel oil, provided the heat input of the unit is equal to or less than 2 MMBtu/hr and the fuel contains equal to or less than 0.5% sulfur by weight.

Equipment powered by diesel fuel fired or natural gas fired internal combustion engines of capacity equip to or less than 500,000 Btu per hour.

Combustion source flame safety purging on startup.

One (1) fuel dispensing operation, constructed in 2005, dispensing less than or equal to 1,300 gal/day into motor vehicle fuel tanks and with emissions less than the insignificant activity emission thresholds in 326 IAC 2-7-1(21)(A) through (C). The dispensing facility consists of a vapor balance system to control emissions and the following two (2) storage tanks [326 IAC 8-4-6]:

(A) One (1) gasoline storage tank, constructed in 2005, having a maximum storage capacity of 12,000 gallons.

(B) One (1) diesel storage tank, constructed in 2005, having a maximum storage capacity of 6,000 gallons.

The following VOC and HAP storage containers [326 IAC 2-7-1(21)(G)(iii)]:

(1) Storage tanks with capacity less than or equal to one thousand (1,000) gallons and annual throughputs equal to or less than twelve thousand (12,000) gallons.

(2) Vessels storing lubricating oils, hydraulic oils, machining oils, or machining fluids.

Production related activities, including the application of oils, greases, lubricants, and non-volatile material such as temporary protective coatings [326 IAC 2-7-1(21)(G)(vi)(AA)].

Degreasing operations that do not exceed 145 gallons per twelve (12) months, except if subject to 326 IAC 20-6 [326 IAC 2-7-1(21)(G)(vi)(CC)] [326 IAC 8-3-2] [326 IAC 8-3-5].

Cleaners and solvents with a vapor pressure equal to or less than 0.3 psia at 100°F or 0.1 psia at 68°F and for which the combined use for all materials does not exceed 145 gallons per 12 months [326 IAC 2-7-1(21)(G)(vi)(DD)].

Closed loop heating and cooling systems [326 IAC 2-7-1(21)(G)(vi)(FF)].

Ground water oil recovery wells [326 IAC 2-7-1(21)(G)(vii)(BB)].

Activities associated with the treatment of wastewater streams with an oil and grease content less than or equal to 1% by volume [326 IAC 2-7-1(21)(G)(ix)(AA)].

Water run-off ponds for petroleum coke-cutting and coke storage piles [326 IAC 2-7-1(21)(G)(viii)(BB)].

Any operation using aqueous solvents containing less than or equal to 1% by weight of VOCs excluding HAPs [326 IAC 2-7-1(21)(G)(viii)(DD)].

Non-contact cooling tower systems with either natural draft or forced and induced draft systems not regulated under a NESHAP [326 IAC 2-7-1(21)(G)(viii)(FF)].
Activities associated with the transportation and treatment of sanitary sewage, provided discharge to the treatment plant is under the control of the owner or operator, that is, an on-site sewage treatment facility [326 IAC 2-7-1(21)(G)(viii)(CC)].

Repair activities including the following [326 IAC 2-7-1(21)(G)(x)]:

1. Replacement or repair of ESPs, bags in baghouses, and filters in other air filtration equipment.
2. Heat exchanger cleaning and repair.
3. Process vessel degassing and cleaning to prepare for internal repairs.

Coke conveying operations, as provided in 326 IAC 2-7-1(21)(G)(xiv).

Equipment used to collect any material that might be released during a malfunction, process upset, or spill cleanup, including catch tanks, temporary liquid separators, tanks, and fluid handling equipment [326 IAC 2-7-1(21)(G)(xix)].

Blowdown for sight glasses, boilers, cooling towers, compressors, or pumps [326 IAC 2-7-1(21)(G)(xx)].

Emergency generators meeting one of the following criteria [326 IAC 2-7-1(21)(G)(xxii)(BB)]:

1. Gasoline generators not exceeding 110 horsepower.
2. Diesel generators not exceeding 1,600 horsepower.
3. Natural gas turbines or reciprocating engines not exceeding 16,000 horsepower.

Other activities associated with emergencies, including on-site fire training approved by the department and stationary fire pump engines [326 IAC 2-7-1(21)(G)(xxii)]

A warehouse identified as the Calumet Warehouse that includes the following emission sources and may also include other insignificant activities listed in Section A.4 of this permit [326 IAC 6.8-1-2(b)]:

1. Kewanee Boiler No. 1 with a maximum design capacity of 5.5 MMBtu/hr heat input and is natural gas-fired only, venting to stack, S-1.
2. Kewanee Boiler No. 2 with a maximum design capacity of 5.5 MMBtu/hr heat input and is natural gas-fired only, venting to stack, S-2.

Routine maintenance and repair of buildings, structures, or vehicles at the source where air emissions from those activities would not be associated with any production process, including the following [326 IAC 2-7-1(21)(G)(xvii)]:

1. Purging of gas lines.
2. Purging of vessels.

Flue gas conditioning systems and associated chemicals, such as the following [326 IAC 2-7-1(21)(G)(xviii)]:

1. Sodium sulfate.
(2) Ammonia.

(3) Sulfur trioxide.

(dd) Purge double block and bleed valves [326 IAC 2-7-1(21)(G)(xxiv)].

(ee) Filter or coalescer media changeout [326 IAC 2-7-1(21)(G)(xxv)].

(ff) Three (3) emergency firepump engines, identified as Firepump 1, 2 and 3, permitted in 2008, each rated at 390 HP.

(gg) One (1) concrete crushing process, permitted in 2008, with a maximum processing capacity of 120 tons per hour, having two (2) transfer points.

A.5 Part 70 Permit Applicability [326 IAC 2-7-2]

This stationary source is required to have a Part 70 permit by 326 IAC 2-7-2 (Applicability) because:

(a) It is a major source, as defined in 326 IAC 2-7-1(22);

(b) It is a source in a source category designated by the United States Environmental Protection Agency (U.S. EPA) under 40 CFR 70.3 (Part 70 - Applicability).
## Facility Description [326 IAC 2-7-5(15)]

Emissions units - new, modified and affected by CXHO project, including the following:

### New Process Heaters
- DHT B-601A
- GOHT F-901A and F-901B
- 12 PS H-101A, H-101B and H-102
- New Coker (#2 Coker) H-201, H-202, and H-203
- New Hydrogen Unit HU-1 and HU-2

### Modified Process Heaters
- 11C PS H-200
- BOU F-401
- ISOM H-1

### Affected Process Heaters
- 11A PS H-1X, H-2, H-3
- 11C PS H-300
- 4UF F-1, F-2, F-3, F-4, F-5, F-6, F-7, F-8A, F-8B
- ARU F-200A, F-200B
- CFHU F-801A, F-801B, F-801C
- CRU F-101, F-102
- DDU WB-301, WB-302
- HU B-501

### Cooling Towers
- Existing (affected) Cooling Towers 2, 3, 4
- New Cooling Tower 7
- New Cooling Tower 8
- New HU Cooling Tower

### SRU
- New Claus Offgas Treaters (COTs) 1 and 2

### New Flares
- GOHT Flare
- South Flare
- HU Flare

### Fugitive emission components from new units
- DHT
- GOHT
- 12 PS
- #2 Coker
- SRU
- OSBL
- HU

### New Storage Tanks
- TK-6255
- TK-SH-1 and TK-SH-2
- TK-5052

Emission Limitations and Standards [326 IAC 2-7-5(1)]

**D.0.1 Prevention of Significant Deterioration** [326 IAC 2-2], **Nonattainment NSR** [326 IAC 2-1.1-5] and **Emission Offset** [326 IAC 2-3] Minor Limits

(a) Following the issuance of SPM 089-25488-00453 and until the startup of New Coker (#2 Coker) and associated coke handling facilities, the Permittee shall determine, on a monthly basis, the increase in emissions of SO2, NOx, PM, PM-10, CO and VOC from all new, modified and existing affected emission units at this source, and shall demonstrate, that the net emissions increases from this source remain below significant levels per twelve (12) consecutive month period beginning with issuance of SPM No. 089-25488-00453, in accordance with the following:
Following the issuance of SPM No. 089-25488-00453, and until the startup of the New Coker (#2 Coker) and associated coke handling facilities, the net emissions increases or decreases from the CXHO project, including fugitive emissions, shall be determined each month as follows:

\[
E_{\text{total}} = E_{\text{increases from new, modified, and affected emissions units during the past 12 month period}} + E_{\text{increases from non-CXHO related projects during the past 12 month period}} - \text{creditable emissions decreases from CXHO related changes and creditable emissions decreases from non-CXHO related projects during the past 12 month period} + E_{\text{from creditable past contemporaneous increases}} - E_{\text{from creditable past contemporaneous decreases}}.
\]

(b) Emissions from Boilers and Process Heaters shall be calculated as follows:

(1) For new heaters to be installed as part of the CXHO project, including replacement heaters, for pollutants that do not have a CEMS, the monthly emissions shall be calculated as follows:

\[
\text{Emissions} \left( \frac{\text{ton}}{\text{mo}} \right) = (EF) \times HI \times \frac{1 \text{ton}}{2,000 \text{lb}}
\]

Where:

\[HI = \text{Total actual heat input into unit i, in mmBtu, for the month}\]
\[EF = \text{Emission factor (lb/mmBTU) for heater as represented in Table D.0.1 or a more representative emission factors as verified through source testing per Condition D.0.3.}\]

(2) Emissions increases each month from the existing modified and affected process heaters and boilers not equipped with a CEMS shall be calculated as follows based on the emission factors in Table D.0.1 or a more representative emission factors as verified through source testing per Condition D.0.3:

\[
\text{Emissions} \left( \frac{\text{ton}}{\text{mo}} \right) = \left( (HI_A \times EF_A) - (HI_B \times EF_B) \right) \times \frac{1 \text{ton}}{2,000 \text{lb}}
\]

Where,

\[HI_A = \text{Actual Heat Input (mmBtu/mo)}\]
\[HI_B = \text{Baseline heat input (mmBTU/mo)}\]
\[EF_A = \text{Actual emission factor (lb/mmBTU)}\]
\[EF_B = \text{Baseline emission factor (lb/mmBTU)}\]

**Table D.0.1 Emission Factors in lb/mmBTU**

<table>
<thead>
<tr>
<th>Process Unit</th>
<th>VOC</th>
<th>NOx</th>
<th>CO</th>
<th>PM</th>
<th>PM10/PM2.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>for SCRs</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* This factor will be 0.05 lb/mmBTU following installation of low NOx burners.
** CO emissions will be measured using a CO analyzer.
*** Includes PM10/PM2.5 generated from SCR

(3) Emissions increases of SO₂ shall be calculated as follows:

\[
SO₂ \text{ Emissions} = \left( D_A \cdot SO₂ \text{ EF}_A \cdot \frac{1}{HHV_A} - D_B \cdot SO₂ \text{ EF}_B \cdot \frac{1}{HHV_B} \right) \cdot \frac{1 \text{ ton}}{2,000 \text{ lb}}
\]

Where,

\[
D_A = \text{Actual Heat Input (mmBtu/mo)}
\]

\[
D_B = \text{Baseline heat input (mmBTU/mo)}
\]

\[
HHV_A = \text{Actual Fuel gas higher heating value (mmBtu/mmcf)}
\]

\[
HHV_B = \text{Baseline Fuel gas higher heating value (mmBtu/mmcf)}
\]

\[
SO₂ \text{ EF}_A = \text{Actual SO₂ emission factor (lb/mmcf)}
\]

\[
SO₂ \text{ EF}_B = \text{Baseline SO₂ emission factor (lb/mmcf)}
\]

The SO₂ emission factor is a function of the total sulfur concentration in the fuel gas and is calculated from the Ideal Gas Law as follows:

\[
SO₂ \text{ EF} = \frac{C \cdot MW \cdot P}{R \cdot T}
\]

Where,

\[
C = \text{Fuel gas total sulfur concentration (ppm)}
\]

\[
MW = \text{Molecular Weight (lb/lbmol)}
\]

\[
P = \text{Pressure (psia)}
\]

\[
R = \text{Ideal Gas Constant (psia*ft³/(lbmol*R))}
\]

\[
T = \text{Temperature (R)}
\]

Until total sulfur monitors are installed on the fuel gas system, total sulfur in the fuel gas shall be determined as follows:

Total sulfur (ppm) = H₂S (ppm) + Mercaptan (ppm)

Where,

\[
H₂S (ppm) = \text{concentration of H₂S in fuel gas as measured by existing fuel continuous H₂S analyzers.}
\]

Mercaptan (ppm) = 111 ppm (or a revised average concentration based on sampled data)

(c) Emissions increases from FCU 500 and FCU 600 shall be calculated as follows:

(A) SO₂, NOₓ, and CO emissions increases or decreases (actual emissions for that month - baseline emissions) shall be calculated from CEMS data collected at the FCU 500 and FCU 600 exhaust stacks using the following formulas:
\[
Emissions \left( \frac{\text{ton}}{\text{mo}} \right) = \left[ C_A \cdot \text{coke}_A \cdot \left( 11.6 \frac{\text{lb Exhaust Gas}}{\text{lb coke}} \right) \frac{\text{MW Pollutant}}{\text{MW Exhaust Gas}} \cdot 1 \frac{\text{ton}}{2,000 \text{ lb}} \right] - \left[ C_B \cdot \text{coke}_B \cdot \left( 11.6 \frac{\text{lb Exhaust Gas}}{\text{lb coke}} \right) \frac{\text{MW Pollutant}}{\text{MW Exhaust Gas}} \cdot 1 \frac{\text{ton}}{2,000 \text{ lb}} \right]
\]

Where,

- \( C_A \) = Actual Pollutant concentration (ppm) at 0% excess oxygen
- \( \text{coke}_A \) = Actual Total coke burned (lb/mo)
- \( C_B \) = Baseline Pollutant concentration (ppm) at 0% excess oxygen
- \( \text{coke}_B \) = Baseline Total coke burned (lb/mo)

Ratio of Exhaust Gas (lb):coke (lb) = 11.6 per refinery engineering estimates

(B) VOC and PM/PM_{10}/PM_{2.5} emissions increases or decreases (actual emissions - baseline emissions) shall be calculated based on the increase in the amount of feed to the unit and the calculated coke burn rate combined with the following emission factors:

\[
\text{VOC Emissions} \left( \frac{\text{ton}}{\text{mo}} \right) = \left[ \text{EF}_A \cdot \text{Feed}_A \cdot \frac{1}{2,000 \text{ lb}} \right] - \left[ \text{EF}_B \cdot \text{Feed}_B \cdot \frac{1}{2,000 \text{ lb}} \right]
\]

Where for FCU 500 and FCU 600:

- \( \text{EF}_A \) = 3.3 lb VOC/1000 barrels of feed
- \( \text{Feed}_A \) = Actual Feed (1000 barrels feed/month)
- \( \text{EF}_B \) = 3.3 lb VOC/1000 barrels of feed
- \( \text{Feed}_B \) = Baseline Feed (1000 barrels feed/month)

\[
\text{PM/PM}_{10}/\text{PM}_{2.5} \text{ Emissions} \left( \frac{\text{ton}}{\text{mo}} \right) = \left[ \text{EF}_A \cdot \text{coke}_A \cdot \frac{1}{2,000 \text{ lb}} \right] - \left[ \text{EF}_B \cdot \text{coke}_B \cdot \frac{1}{2,000 \text{ lb}} \right]
\]

Where for FCU 500:

- \( \text{EF}_A \) = 0.465 lb PM/PM_{10}/PM_{2.5} per 1000 lb coke burned
- \( \text{coke}_A \) = Actual coke burn rate (1000 lb/month)
- \( \text{EF}_B \) = 0.465 lb PM/PM_{10}/PM_{2.5} per 1000 lb coke burned
- \( \text{coke}_B \) = Baseline coke burn rate (1000 lb/month)

Where for FCU 600:

- \( \text{EF}_A \) = 0.35 lb PM/PM_{10}/PM_{2.5} per 1000 lb coke burned
- \( \text{coke}_A \) = Actual coke burn rate (1000 lb/month)
- \( \text{EF}_B \) = 0.35 lb PM/PM_{10}/PM_{2.5} per 1000 lb coke burned
- \( \text{coke}_B \) = Baseline coke burn rate (1000 lb/month)
(d) The Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM, OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

Fugitive VOC emissions from valves, pumps, and flanges shall be determined as follows:

\[ \text{VOC Emissions (tpy)} = N \times (CE_{\text{comp}}) \times \left[ (EF_{\text{leak}} \times \text{Leak}) + EF_{\text{no-leak}} \times (1 - \text{Leak}) \right] \times VOC_{\text{comp}} \]

Where:

\[ \begin{align*}
N & = \text{No. of components added or removed (valve/pump/flare/drain/relief device)} \\
VOC_{\text{comp}} & = \text{Percent VOC service for component} \\
\text{Leak} & = \text{Fraction of components experiencing leaks} \\
CE_{\text{comp}} & = \text{LDAR Control efficiency for the type of component (valve/pump/flare/drain/relief device)} \\
EF_{\text{leak}} & = \text{EPA's refinery screening emission factor (leak) for type of component} \\
EF_{\text{no-leak}} & = \text{EPA's refinery screening emission factor (no leak) for type of component} \\
\end{align*} \]

For purposes of this calculation, new components are considered “added” on the date that a new or modified process unit starts up.

The decreases in fugitive VOC emissions from valves, pumps, flanges, drains and pressure relief devices, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for VOC for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

(e) For all emissions units involved in heavy liquid service, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. An instrument reading of 2000 parts per million (ppm) or greater shall constitute a leak for pumps in heavy liquid service. The Permittee shall update the LDAR Plan to indicate that the methodologies in 40 CFR 60.482 shall apply to all pumps in heavy liquid service and shall submit a copy of the revised LDAR Plan to IDEM, OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

VOC emissions decreases from existing pumps in heavy liquid service shall be determined as follows:

\[ \text{Emissions decrease (tpy)} = N \times (CE_{\text{project}} - CE_{\text{current}}) \times \left[ (EF_{\text{leak}} \times \text{Leak}) + EF_{\text{no-leak}} \times (1 - \text{Leak}) \right] \times VOC_{\text{comp}} \]

Where:

\[ \begin{align*}
N & = \text{No. of existing heavy liquid pumps} \\
VOC_{\text{comp}} & = \text{Fraction of heavy liquid components in VOC service} \\
CE_{\text{project}} & = \text{Proposed control efficiency due to enhanced LDAR monitoring} \\
\end{align*} \]
CE\textsubscript{current} = Current control efficiency
EF\textsubscript{leak} = EPA's refinery screening emission factor (leak)
EF\textsubscript{no-leak} = EPA's refinery screening emission factor (no leak)
Leak = Fraction of components experiencing leaks

(f) PM and PM-10 Emissions decreases from existing cooling towers (due to installation of any liquid drift eliminator) shall be calculated based on the following:

\[
\text{Emissions decrease} = \text{Baseline Emissions} - \text{Actual Emissions}
\]

Actual PM/PM-10 emissions =
\[
(\text{Recirculation Rate} + \text{Make-up Rate}) \text{ (gal/min)} \times \text{AP42 Ef} \times (0.019 \text{ lb/1,000 gal}) \\
\frac{(\text{TLD}_{\text{design}}/\text{TLD}_{\text{AP-42}})}{(\text{TDS}_{\text{allowable}}/\text{TDS}_{\text{AP-42}})}
\]

Where:

\[
\text{TLD} = \text{Total liquid drift, percentage} \\
\text{TDS} = \text{Total dissolved solids, mg/L}
\]

Compliance Determination Requirements

D.0.2 Operating Requirements

(a) After the installation of the continuous BTU analyzers at fuel mixing drums, in order to demonstrate compliance with emissions limitations, the continuous BTU analyzer shall be calibrated, maintained, and operated for determining compliance with the firing rate limits for heaters and boilers that are new, modified or affected units related to the CXHO project.

(b) Prior to the installation of the continuous BTU analyzers, in order to demonstrate compliance with the firing rate limits on heaters and boilers involved in the CXHO project, the Permittee shall:

(1) Continuously monitor the fuel flow rates at the heaters and boilers;

(2) Conduct a monthly analysis of fuel gas samples taken once per week in order to determine monthly averaged BTU content of the fuel gas in each mixing drum; and

(3) Determine the monthly firing rates for heaters and boilers based on the fuel flow rates at each heater and boiler and the monthly averaged BTU content of the fuel gas in the mixing drums.

D.0.3 Testing Requirements

(a) Tests shall be conducted on new, modified and affected emission units that are included in the CXHO project, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes both filterable and condensible PM-10. These tests shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

(b) Tests shall be conducted in accordance with the following deadlines:
(1) For a group that includes new or modified emission units (CO-1, PM/VOC-1, PM/VOC-2, PM/VOC-3, PM/VOC-4, VOC-6, PM/VOC-7, NOx-1, NOx-4, NOx-8, NOx-12), tests shall be conducted on one of the representative heaters in that group: within 180 days of the installation of a new emission unit, or modification of an existing emission unit within that group.

(2) For a group that includes only existing affected units (CO-2, CO-3, CO-4, PM/VOC-5, PM/VOC-8, PM/VOC-9, NOx-2, NOx-3, NOx-5, NOx-6, NOx-7, NOx-9, NOx-10, NOx-11), tests shall be conducted on one of the representative heaters in that group: within 180 days of the startup of New Coker (#2 Coker).

(c) The emissions units to be tested in order to demonstrate compliance with Prevention of Significant Deterioration (326 IAC 2-2), Emission Offset (326 IAC 2-3) and Nonattainment NSR (326 IAC 2-1.1-5) minor limits shall be grouped as follows:

<table>

(d) Within 180 days of the startup of New Coker (#2 Coker), in order to demonstrate compliance with the PM-10 emission factor limit from the SCR stacks at No. 3 Stanolind Power Station (3 SPS), testing shall be conducted on one (1) of the five (5) stacks for 3 SPS boiler/SCR stacks, utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. PM-10 includes filterable and condensable PM-10. This test shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

(e) Compliance with the emissions limits for each emission unit or test group shall be determined as follows:

\[
T = \frac{1}{n} \sum_{i=1}^{n} T_i
\]

Where:

\[
T = \text{average of IDEM approved stack test results for emission unit or all units within that same group over the previous 12 month period}
\]

\[
T_i = \text{average of multiple runs during Test #i}
\]

\[
n = \text{number of IDEM approved stack tests during previous 12 month period}
\]

### Recordkeeping and Reporting Requirements

**D.0.4 Recordkeeping Requirements**

In order to demonstrate compliance with Condition D.0.1, the Permittee shall maintain the following records each month, upon issuance of the SPM No. 089-25488-00453 and until the startup of the New Coker (#2 Coker) and associated coke handling facilities:
(a) The emissions in tons, including fugitive emissions, of PM, PM-10, VOC, NOx, and SO2, from new emission units installed as part of the CXHO project during that month.

(b) The emissions increases and decreases from CXHO related projects, including modifications, shutdowns, and installation of controls, and emissions increases from existing affected units during the past 12 months.

(c) Emissions increases and decreases from non-CXHO related projects during the past 12 months.

(d) The net emissions increases or decreases as calculated each month in Condition D.0.1(a).

D.0.5 Reporting Requirements

(a) In order to demonstrate compliance with Condition D.0.1, no later than 45 days after the end of the first 12-calender month period following the effective date of SPM No. 089-25488-00453, and every 6 months thereafter, the Permittee shall submit a report to IDEM documenting the net emissions increases or decreases for the CXHO project as calculated each month, as required in Condition D.0.1(e).

(b) The reporting requirements in Condition D.0.5(a) shall no longer be applicable following the startup of the New Coker (#2 Coker). Start-up is defined as when the unit becomes operational only after a reasonable shakedown period, not to exceed 180 days, pursuant to 326 IAC 2-2-1 (jj)(7).
### SECTION D.1 FACILITY OPERATION CONDITIONS - No. 11 Pipe Still

#### Facility Description [326 IAC 2-7-5(15)]

(a) Nos. 11A and 11C Pipe Stills built in 1956, with a rated capacity of 220,800 barrels per day, and identified as Unit ID 120 process crude into various hydrocarbon fractions based on boiling points. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. The following process heaters, all of which are fired by natural gas, refinery gas, or liquified petroleum gas:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>

</tr>
</tbody>
</table>

2. Two (2) vacuum hot wells (D-21, constructed in 1990 and D-26, constructed in 1997) and one (1) sump (D-20, constructed in 1990), with D-20, D-21, and D-26 each venting to S/V 120-07, at No. 11 A Pipe Still.

3. One (1) vacuum hot well (D-300), constructed in 1995 venting to S/V 120-08 at No. 11C Pipe Still.

The vacuum tower overhead system consists of a series of condensers, steam ejectors, and vacuum pumps. The majority of the overhead vapors are condensed and drained to the hotwell, which is pumped back to the front end of the unit for reprocessing. The gas compressors pull the remaining vapor that is not condensed in the overhead system into the wet gas system, where the hydrocarbon is reprocessed by downstream steam units. A thermocouple system (with temperature alarm) is used to monitor the vacuum on the system.

4. Leaks from process equipment, including pumps; compressors (K4 and K4A at No. 11A Pipe Still and K300A and K300-B at the No. 11C Pipe Still); pressure relief devices; sampling connection systems; open-ended lines or valves; and instrumentation systems.

5. One (1) storage tank (identified as Tank 3030) with a maximum storage capacity of 847,000 gallons. This tank was installed in 1957 and is equipped with an external floating roof.

6. One (1) oil water separation system (identified as Tank 8), with a maximum storage capacity of 124,800 gallons.

7. One (1) redundant oil water separation system (identified as Tank 8a), permitted in 2008, with a maximum storage capacity of 124,800 gallons, equipped with a carbon canister for VOC control.

8. As part of the No. 11A PS and No. 11C PS WARP, permitted in 2008, the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C will be shutdown, with the emergency pressure relief discharge that was previously routed to the blowdown stacks being re-routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COV's.
Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.1.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall comply with the following PM$_{10}$ emission limitations for Nos. 11A and 11C Pipe Still process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-1X Heater</td>
<td>0.031</td>
<td>6.867</td>
</tr>
<tr>
<td>H2 Vacuum Heater</td>
<td>0.032</td>
<td>1.440</td>

<tr>
<td>H3 Vacuum Heater</td>
<td>0.031</td>
<td>1.704</td>
</tr>
<tr>
<td>H-200 Crude Charge</td>
<td>0.032</td>
<td>7.866</td>
</tr>
<tr>
<td>H-300 Furnace</td>
<td>0.031</td>
<td>4.931</td>
</tr>
</tbody>
</table>

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) After the startup of the low-NOx burners on heater H-200, the emissions of NOx shall not exceed 0.05 pounds per million BTU of fuel gas fired.

(b) The Permittee shall comply with the following limits following the startup of the new Coker (#2 Coker):

1. Annual firing rate and SO2 emissions limits:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate (10$^4$ mmBTU) per 12 consecutive month period</th>
<th>SO2 emissions (tons per 12 consecutive month period)</th>

H-300 | 0.082 | 0.0054 | 0.137 | 0.0019 | 0.0075

* 0.05 lb/mmBTU after startup of low-NOx burners

(c) After the startup of the New Coker (#2 Coker), the two existing blowdown stacks identified as stacks 11PS-A and 11PS-C will be shutdown, with the emergency pressure relief discharge that was previously routed to the blowdown stacks being re-routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COV's.

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.1.23 Lake County Sulfur Dioxide (SO₂) Emission Limitations [326 IAC 7-4.1-3]
Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following sulfur dioxide emission limitations for the Nos. 11A and 11C Pipe Still process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>SO₂ Limit (lbs/MMBtu)</th>
<th>SO₂ Limit (lbs/hour)</th>

<td>0.357</td>
</tr>
</tbody>
</table>

D.1.45 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]
Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for process heaters: H-1X Heater, H-2 Vacuum Heater, H-3 Vacuum Heater, H-200 Crude Charge, and H-300 Furnace.

D.1.56 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]
(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.
Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at No. 11A Pipe Still.

D.1.67 Volatile Organic Compounds (VOC) [326 IAC 8-4-2]

(a) Pursuant to 326 IAC 8-4-2(1), the Permittee shall control VOC emissions from the vacuum producing systems at the No. 11A Pipe Still vacuum hot wells (D-20, D-21, and D-26) and No. 11C Pipe Still vacuum hot well (D-300) according to the following:

The Permittee shall not emit any noncondensable volatile organic compounds from the condensers, hot wells or accumulators of any vacuum producing systems at a petroleum refinery.

(b) Pursuant to 326 IAC 8-4-2(2), the Permittee shall equip the wastewater (oil/water) separators Tank 8 and Tank 8a, any forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when performing maintenance.

D.1.78 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ] [326 IAC 12]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF:

(1) The Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(2) The Permittee shall operate tank 3030 in accordance with the requirements in Sections E.1 and E.3 by complying with the requirements in Section E.9, except as provided for in 40 CFR 63.640(n)(8) and listed in Section E.1.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply the requirements specified in Section E.20 for process heaters H-1X, H-2, H-3, H-200, H-300, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.1.9 Operating Requirement

(a) Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002, effective June 1, 2003, fuel oil shall not be used as a fuel for the Nos. 11A and 11C Pipe Stills.

(b) In order to demonstrate compliance with Condition D.1.2, following the installation of the low-NOx burners the heater H-200 shall operate using only low-NOx burners.
Compliance with the limits in Condition D.1.2(b)(2) shall be demonstrated as specified in Condition D.0.3.

In order to demonstrate compliance with Condition D.1.2, following the startup of New Coker (#2 Coker), the pressure relief discharge that was previously routed to the blowdown stacks will be routed to the DDU flare, except for T-300 vacuum tower relief discharge and the COV’s. The flare must be operated with a flame present at all times that 11A PS or 11C PS is in operation.

Operating Requirement

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.1.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

Continuous Emissions Monitoring

In order to demonstrate compliance with Condition D.1.2, the Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for H-1X, H-2, H-3, H-200 and H-300 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

Record Keeping Requirements

Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.1.3 and D.1.9, the Permittee shall maintain a daily record of the following for Nos. 11A and 11C Pipe Stills:

1. fuel type,
2. average daily sulfur content for each fuel type,
3. average daily fuel gravity for each fuel type,
4. total daily fuel usage for each type, and
5. heat content of each fuel.

Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.1.1, Permittee shall maintain records for the Nos. 11A and 11C Pipe Still process heaters as specified in the Continuous Compliance Plan.

Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.1.5 D.1.4, the Permittee shall maintain the records specified in Section E.2.
Pursuant to 326 IAC 8-4-8 and to document compliance with Condition **D.1.6(a)** **D.1.5(a)**, the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR Plan.

Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition **D.1.6(b)** **D.1.5(b)**, the Permittee shall keep records as specified in Section E.1 and E.4.

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition **D.1.8(a)(1)** **D.1.7(a)(1)**, the Permittee shall keep records as specified in Sections E.1 and E.3.

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition **D.1.8(a)(2)** **D.1.7(a)(2)**, the Permittee shall keep records as specified in Sections E.1, E.3, and E.9.

Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition **D.1.8(b)** **D.1.7(b)**, the Permittee shall keep records as specified in Section E.6.

In order to demonstrate compliance with Condition D.1.2, the Permittee shall maintain records of monthly firing rates and SO2 emissions for H-1X, H-2, H-3, H-200, and H-300.

Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.1.2, the Permittee shall keep the following records for the continuous emission monitors:

1. One-minute block averages.
2. All documentation relating to:
   A. design, installation, and testing of all elements of the monitoring system, and
   B. required corrective action or compliance plan activities.
3. All maintenance logs, calibration checks, and other required quality assurance activities,
4. All records of corrective and preventive action, and
5. A log of plant operations, including the following:
   A. Date of facility downtime,
   B. Time of commencement and completion of downtime, and
   C. Reason for each downtime.

**D.1.14 Reporting Requirements**

Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions **D.1.3**, **D.1.4** and **D.1.9** **D.1.2**, **D.1.3** and **D.1.9**, the Permittee shall submit a report to the IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour for Nos. 11A and 11C Pipe Still process heaters.

Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition **D.1.5** **D.1.4**, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.
(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.1.6(a) D.1.5(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.1.6(b) D.1.5(b), the Permittee shall submit records as specified in Section E.1 and E.4.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.1.8(a)(1) D.1.7(a)(1), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.1.8(a)(2) D.1.7(a)(2), the Permittee shall submit reports as specified in Sections E.1, E.3, and E.9.

(g) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.1.8(b) D.1.7(b), the Permittee shall submit reports as specified in Section E.6.

(h) In order to demonstrate compliance with Condition D.1.2, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions for heaters H-200, H-300, H-1X, H-2, and H-3 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(i) Pursuant to 326 IAC 3-5-7 and to document compliance with Condition D.1.2 and D.1.11, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:

   A Date of downtime.
   B Time of commencement.
   C Duration of each downtime.
   D Reasons for each downtime.
   E Nature of system repairs and adjustments
Facility Description [326 IAC 2-7-5(15)]

No. 11B Coker, which processes heavy crude fractions into coke, and Coke Pile. These facilities are identified as Unit 120 and are rated at 2,000 tons of coke per day. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. Four (4) process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-101</td>
<td>200 (total)</td>
<td>120-04</td>
<td>None</td>
</tr>
<tr>
<td>H-102</td>

<td></td>
</tr>
<tr>
<td>H-104</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. Storage and handling of the bulk material. Fugitive emissions are controlled by keeping the coke wetted and having a 15’ sheet piling wall surrounding the coke pile. The coke pile height will not exceed 15’.

3. The No. 11B Coker is connected to the DDU flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

4. Leaks from process equipment, including pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges and other connectors.

New Coker (#2 Coker), which processes heavy crude fractions into coke, and new Coke Handling System. These facilities are identified as Unit 800 and are rated at 6,000 tons of coke per day. The New Coker (#2 Coker) heaters H-201, H-202, and H-203 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New Coker (#2 Coker) heater stacks have continuous emissions monitors (CEMS) for NOx and CO. The existing Coker and Coke Pile will be replaced as part of the CXHO Project. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

1. Process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
(2) Storage and handling (including up to 10 transfer points) of the bulk material comprised of a partially enclosed crusher, enclosed conveyors, enclosed storage, day bins, and rail car load out under the main operating scenario. In order to minimize fugitive emissions from the coke handling process, transfer points 1 and 10 will include enclosed conveyors and transfer points 2 through 9 will use enclosed buildings, and water sprays. Coke handling operations will be expected to operate under this main operating scenario for at least 95% of operating hours annually.

There will also be an alternative operating scenario which will consist of three enclosed conveyors with unenclosed transfer points. Coke handling operations are expected to operate under this alternate operating scenario for no more than 5% of operating hours annually.

(3) The Coker is connected to the South flare system (included in Section D.35). The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

(4) One (1) storage tank, identified as TK-6255, with a maximum storage capacity of 14,028,000 gallons storing coker resid at a vapor pressure less than 0.5 psia. Tank TK-6255 is equipped with a fixed roof.

(5) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.2.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Until the shutdown of the No. 11B Coker and Coke Pile and the heaters identified as H-101, H-102, H-103, H-104, pursuant to Commissioner’s Order No. 2007-01 326 IAC 6.8-2-6 (formerly 326 IAC 6-10.1-1(d)), PM10 emissions from the stack serving No. 11 pipe still furnaces H-101, H-102, H-103, and H-104 coke preheaters shall not exceed 0.0075 lb/MMBTU and 1.49 lb/hr (total), 0.004 lbs/MMBtu and 0.741 lbs/hr.

(b) Until the shutdown of the No. 11B Coker and Coke Pile and the heaters identified as H-101, H-102, H-103, H-104, pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

(c) Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from each of the New Coker (#2 Coker) stacks 800-01, 800-02, and 800-03 shall not exceed 0.03 grains per dry standard cubic foot.
In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) After the permanent shutdown of No. 11 B Coker and Coke Pile, the throughput of coke processed at the New Coker (#2 Coker) shall not exceed 2,190,000 tons per twelve (12) consecutive month period, with compliance determined at the end of each month and the coke handling operations shall not operate under the alternative operating scenario for more than 438 hours per twelve (12) consecutive month period.

(b) The No. 11B Coker, Coke Pile, and heaters H-101, H-102, H-103, and H-104 shall be permanently shutdown as part of the CXHO project.

For each of the heaters H-201, H-202, and H-203:

(c) The emissions of NOx from each shall not exceed 18.2 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.

(e) The emissions of SO2 from each shall not exceed 10.1 tons per 12 consecutive month period, with compliance determined at the end of each month.

(f) The emissions of PM and PM-10 each shall not exceed 0.0019 and 0.0081 pounds per million BTU.

(g) The emissions of CO from each shall not exceed 17.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(h) The Permittee shall comply with the following fuel usage limits per twelve (12) consecutive month period, with compliance determined at the end of each month:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate limit (10^3 mmBTU) per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-201</td>
<td>1822.1</td>
</tr>
<tr>
<td>H-202</td>
<td>1822.1</td>
</tr>
<tr>
<td>H-203</td>
<td>1822.1</td>
</tr>
</tbody>
</table>

Compliance with the coker throughput limits and limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.2.3 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

Until the shutdown of the heaters identified as H-101, H-102, H-103, H-104:

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the H-101, H-102, H-103, and H-104 No. 11B Coker process heaters shall each not exceed 0.033 lbs/MMBtu and the total sulfur dioxide emissions from all four process heaters shall not exceed 6.60 lbs per hour.
D.2.4 Volatile Organic Liquid Storage Vessels [326 IAC 8-9-6]

Pursuant to 326 IAC 8-9-6(b), for storage tank TK-6255, which is used to store liquids with vapor pressures less than 0.5 psia, the Permittee shall comply only with the recordkeeping requirements specified in Condition D.2.16(h).

D.2.5 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]

(a) Until the shutdown of the heaters identified as H-101, H-102, H-103, H-104, pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the process heaters H-101, H-102, H-103, and H-104 No. 11B.

(b) Upon startup of New Coker (#2 Coker) heaters H-201, H-202, H-203, Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for process heaters H-201, H-202 and H-203.

D.2.6 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.2.7 Hazardous Air Pollutants (HAP) [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the storage tank TK-6255 shall comply with the requirements under 40 CFR 63.640(l)(3) through l(3), as specified in Section E.1.

D.2.8 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ] [326 IAC 12]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.
The Permittee shall comply with the following for the No. 11B Coker and Coke Pile until it is permanently shutdown, and for the New Coker (#2 Coker) and Coke Handling System upon startup:

Pursuant to 326 IAC 6.8-10-3(3)(A), (3)(B), (5), and (6) (formerly 326 IAC 6-1-11.1(d)(3)(A), (3)(B), (5), (6)(A) and (d)(6)(B)), the Permittee shall comply with the opacity limitations in Condition C.6 (Fugitive Dust Emissions) for batch material transfer, wind erosion from storage piles, and material transfer by front end loader and truck. Opacity from the activities shall be determined as follows:

(a) Batch Transfer - The average instantaneous opacity shall consist of the average of three (3) opacity readings taken five (5) seconds, ten (10) seconds, and fifteen (15) seconds after the end of one (1) batch loading or unloading operation. The three (3) readings shall be taken at the point of maximum opacity. The observer shall stand approximately fifteen (15) feet from the plume and at approximately right angles to the plume.

(b) Wind Erosion from Storage Piles - The opacity shall be determined using 40 CFR 60, Appendix A, Method 9, except that the opacity shall be observed at approximately four (4) feet from the surface at the point of maximum opacity. The observer shall stand approximately fifteen (15) feet from the plume and at approximately right angles to the plume. The limitations may not apply during periods when application of fugitive particulate control measures are either ineffective or unreasonable due to sustained very high wind speeds. During such periods, the company shall continue to implement all reasonable fugitive particulate control measures and maintain records documenting the application of measures and the basis for a claim that meeting the opacity limitation was not reasonable given prevailing wind conditions.

(c) Material Transported by Truck or Rail - Compliance with this limitation shall be determined by 40 CFR 60, Appendix A, Method 22, except that the observation shall be taken at approximately right angles to the prevailing wind from the leeward side of the truck or railroad car. Material transported by truck or rail that is enclosed and covered shall be considered in compliance with the inplant transportation requirement.

(d) Material Transported by Front End Loader or Skip Hoist - Compliance with this limitation shall be determined by the average of three (3) opacity readings taken at five (5) second intervals. The three (3) opacity readings shall be taken as follows:

(1) The first will be taken at the time of emission generation.

(2) The second will be taken five (5) seconds later.

(3) The third will be taken five (5) seconds later or ten (10) seconds after the first.

pursuant to 40 CFR Part 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for process heaters H-101, H-102, H-103, and H-104, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.2.8 D.2.10 Operating Requirement

Until the shutdown of the No. 11B Coker and the associated emissions units:
Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the No. 11B Coker furnaces.

Compliance with the limits in Condition D.2.2(d) and (f) shall be demonstrated as specified in Condition D.0.3.

**D.2.9 Fugitive Dust Control Plan [326 IAC 6.8-10]**

(a) Until the shutdown of the No. 11B Coker and the associated emissions units:

Pursuant to 326 IAC 6.8-10-4 (formerly 326 IAC 6-1-11.1) and in order to comply with Condition D.2.9, the Permittee shall control fugitive particulate matter emissions from No. 11B Coker and Coke Pile according to the Fugitive Dust Control Plan (FDCP), included as Appendix C. If it is determined that the control procedures specified in the FDCP do not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require that the FDCP be revised and submitted for approval.

(b) Pursuant to 326 IAC 6.8-10-4 (formerly 326 IAC 6-1-11.1), the Permittee shall control fugitive particulate matter emissions from the New Coker (#2 Coker) and Coke Pile according to the updated Fugitive Dust Control Plan (FDCP) submitted on January 30, 2008, included as Appendix C. If it is determined that the control procedures specified in the FDCP do not demonstrate compliance with the fugitive emissions limitations, IDEM, OAQ may require that the FDCP be revised and submitted for approval.

**D.2.10 Operating Requirement**

(a) Until the shutdown of the No. 11B Coker and heaters, pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.2.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) In order to demonstrate compliance with Condition D.2.2, the Permittee shall operate the heaters H-201, H-202, and H-203 using only low-NOx burners.

(c) In order to comply with Condition D.2.2, the SCRs shall be operated as necessary to meet the NOx emissions limits for heaters H-201, H-202 and H-203.

**D.2.13 Continuous Emissions Monitoring**

The Total Reduced Sulfur, CO, and NOx continuous emission monitoring systems (CEMS) for H-201, H-202, and H-203 shall be calibrated, maintained, and operated for determining compliance with the SO2, CO and NOx emissions limits in Condition D.2.2 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

**D.2.14 PM and PM-10**

In order to comply with Condition D.2.2, the Permittee shall use wet suppression to control emissions of PM and PM10 from transfer points 1 through 10 at New Coker (#2 Coker) as necessary to ensure that the coke processed has a moisture content greater than eight percent. The suppressant shall be applied in a manner and at a frequency sufficient to ensure compliance with Condition D.2.2.
Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.2.14 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.2.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.2.3 and D.2.11, the Permittee shall maintain a daily record of the following for the No. 11B Coker process heaters:

1. fuel type,
2. average daily sulfur content for each fuel type,
3. average daily fuel gravity for each fuel type,
4. total daily fuel usage for each type, and
5. heat content of each fuel.

The Permittee shall comply with this requirement until the shutdown of the No. 11B Coker and the associated emissions units.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.2.1, Permittee shall maintain records for the No. 11B Coker process heaters as specified in the Continuous Compliance Plan. The Permittee shall comply with this requirement until the shutdown of the No. 11B Coker and the associated emissions units.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.2.5, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.2.6(a) and D.2.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC and to document compliance with Condition D.2.6(b) and D.2.4(b), the Permittee shall keep records as specified in Sections E.1, E.4, and E.13.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.2.8, the Permittee shall keep records as specified in Sections E.1 and E.3.

(g) Pursuant to 326 IAC 6.8-10-4(4) (formerly 326 IAC 6-1-11.1(e)(4)) and to document compliance with Condition D.2.9, for the Coke Pile, the Permittee shall keep the following documentation:

1. A map or diagram showing the location of all fugitive PM emission sources controlled,
2. For application of physical or chemical control agents, the following:
A) The name of the agent

B) Location of application

C) Application rate

D) Total quantity of agent used

E) If diluted, percent of concentration

F) The material data safety sheets for each chemical

(3) A log recording incidents when control measures were not used and a statement of explanation.

(4) Copies of all records required by this section shall be submitted to IDEM, OAQ within twenty (20) working days of a written request by IDEM, OAQ.

(h) Pursuant to 326 IAC 8-9-6(b), the Permittee shall maintain, for the life of the vessel, a record of the following for tank TK-6255 to which 326 IAC 8-9 applies:

1) The vessel identification number,

2) The vessel dimensions,

3) The vessel capacity,

4) A description of the emission control equipment for each vessel described in section 4(a) or 4(b) of 326 IAC 8-9, or a schedule for installation of emission control equipment on vessels described in section 4(a) or 4(b) of 326 IAC 8-9 with a certification that the emission control equipment meets the applicable standards.

(i) In order to demonstrate compliance with Condition D.2.2, the Permittee shall maintain records of monthly firing rates and CO, NOx, and SO2 emissions for heaters H-201, H-202, and H-203.

(j) In order to demonstrate compliance with Condition D.2.2, the Permittee shall maintain records of monthly coke throughput at the New Coker (#2 Coker).

(k) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.2.13 the Permittee shall keep the following records for the continuous emission monitors:

1) One-minute block averages.

2) All documentation relating to:

   A) design, installation, and testing of all elements of the monitoring system, and

   B) required corrective action or compliance plan activities.

3) All maintenance logs, calibration checks, and other required quality assurance activities,

4) All records of corrective and preventive action, and
(5) A log of plant operations, including the following:

(A) Date of facility downtime,

(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

**D.2.13** Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.2.3 and D.2.10 D.2.2, and D.2.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the No. 11B Coker process heaters. The Permittee shall comply with this requirement until the shutdown of the No. 11B Coker and the associated emissions units.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.2.5 D.2.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.2.6(a) D.2.4(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC and to document compliance with Condition D.2.6(a) D.2.4(b), the Permittee shall submit reports as specified in Sections E.1, E.4, and E.13.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.2.8 D.2.5, the Permittee shall submit reports as specified in Sections E.1 and E.3.

(f) Pursuant to 326 IAC 6.8-10-4(4)(G) (formerly 326 IAC 6-1-11.1(e)(4)(G)) and to document compliance with Condition D.2.11 D.2.9, a quarterly report shall be submitted within thirty (30) days of the end of each quarter, stating the following:

1. The dates any required control measures were not implemented
2. A listing of those control measures
3. The reasons that the control measures were not implemented
4. Any corrective action taken

(g) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.2.2 and D.2.13, the Permittee shall submit reports of excess SO2, CO and NOx emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.

(5) A summary itemizing the exceedances by cause.

(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:

(A) Date of downtime.
(B) Time of commencement.
(C) Duration of each downtime.
(D) Reasons for each downtime.
(E) Nature of system repairs and adjustments.

(h) In order to demonstrate compliance with Condition D.2.2, the Permittee shall submit quarterly reports for the monthly firing rates, and CO, NOx, and SO2 emissions at heaters H-201, H-202, and H-203. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).

(i) In order to demonstrate compliance with Condition D.2.2, the Permittee shall submit quarterly reports for the coke throughput at the New Coker (#2 Coker) and the number of hours the coke handling operated under alternative operating scenario. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).
Facility Description [326 IAC 2-7-5(15)]

(c) No. 12 Pipe Still, constructed in 1959, to be modified as part of the CXHO Project, which processes crude into various hydrocarbon fractions based on boiling points, identified as Unit ID 130, and is rated at 336,000 barrels per day. Heaters identified as H-1AN, H-1AS, H-1B, H-2, H-1CN, H-1CS, and H-1CX will be shutdown and replaced by heaters H-101A, H-101B, and H-102 as part of the CXHO project. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following process heaters, all of which are fired by natural gas, refinery gas, or liquified petroleum gas:

* No longer in service -- was rated at 120 MMBtu/hour.
* No longer in service -- was exhausted to stack 130-03.

(2) One (1) vacuum hot well, identified as D-7, constructed in 1995, and venting to S/V 130-05. The vacuum tower overhead system consists of a series of condensers, steam ejectors, and vacuum pumps. The majority of the overhead vapors are condensed and drained to the hotwell, which is pumped back to the front end of the unit for reprocessing. The gas compressors pull the remaining vapor that is not condensed in the overhead system into the wet gas system, where the hydrocarbon is reprocessed by down stream units. A thermocouple system (with temperature alarm) is used to monitor the vacuum on the system.

(3) Leaks from process equipment, including compressors (K-1, K-1A, and K-1B), valves, pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and flanges.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
D.3.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall comply with the following PM$_{10}$ emission limitations for the No. 12 Pipe Still process heaters until these heaters are shutdown as part of the CXHO project:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>

</tr>
<tr>
<td>H-1CX Crude Preheater</td>
<td>0.004</td>
<td>0.924</td>
</tr>
</tbody>
</table>

(b) Until the shutdown of heaters H-1CN and H-1CX, pursuant to Commissioner’s Order No. 2007-01, the PM$_{10}$ emissions from H-1CN and H-1CX shall not exceed 0.0075 lb/MMBTU for both heaters and 0.894 and 3.055 lb/hr for H-1CN and H-1CX, respectively.

(b)(c) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition (until shutdown) in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.3.2 Particulate Matter [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from each of the three (3) heaters H-101A, H-101B and H-102 shall not exceed 0.03 grains per dry standard cubic foot.

D.3.23 Lake County Sulfur Dioxide (SO$_2$) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following sulfur dioxide emission limitations for the No. 12 Pipe Still process heaters until these heaters are shutdown:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>SO$_2$ Limit(lbs/MMBtu)</th>
<th>SO$_2$ Limit(lbs/hour)</th>

D.3.34 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]

(a) Pursuant to SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for following process heaters (until heaters H-1AS and H-1AN Preheaters, H-1B Preheater, H-2 Vacuum Heater, H-1CN Crude Preheater, H-1CS Crude Preheater, and H-1CX Crude Preheater are shutdown): H-1AS and H-1AN Preheaters, H-1B Preheater, H-2 Vacuum Heater, H-1CN Crude Preheater, H-1CS Crude Preheater, and H-1CX Crude Preheater.

(b) Pursuant to 40 CFR 60.140(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the following heaters upon startup: H-101A, H-101B, H-102.

(a) Pursuant to CP 089-2055-00453 issued on March 12, 1992, nitrogen oxide emissions from the 12 Pipe Still H-1CX furnace shall not exceed 0.10 lb/MMBtu. This is equivalent to 180 tons per year. Compliance with this limit renders 326 IAC 2-3 not applicable. The H-1CX furnace shall also be equipped with low NOₓ burners.

In order to render 326 IAC 2-2-8, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable:

(b) The Permittee shall comply with the following limits for the heaters identified as H-101A, H-101B and H-102, with compliance with the annual NOₓ, CO, and SO2 limits determined at the end of each month):

<table>
<thead>
<tr>
<th>Heater ID</th>
<th>NOx tons per 12 consecutive month period</th>
<th>SO2 tons per 12 consecutive month period</th>
<th>CO tons per 12 consecutive month period</th>
<th>VOC (lb/mmBTU)</th>
<th>PM (lb/mmBTU)</th>
<th>PM-10 (lb/mmBTU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-101A</td>
<td>77.7</td>
<td>17.2</td>

<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>H-101B</td>
<td>77.7</td>
<td>17.2</td>
<td>29.5</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>H-102</td>
<td>72.5</td>
<td>16.0</td>
<td>27.5</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
</tbody>
</table>

(c) The Permittee shall comply with the following limits on firing rates:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate limit ($10^7$ mmBTU) per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-101A</td>
<td>3109.8</td>
</tr>
<tr>
<td>H-101B</td>
<td>3109.8</td>
</tr>
<tr>
<td>H-102</td>
<td>2899.6</td>
</tr>
</tbody>
</table>

(d) The heaters H-1AN, H-1AS, H-1B, H-2, H-1CN, and H-1CX shall be permanently shutdown prior to the start-up of the new Coker (#2 Coker).

Compliance with the limits on the annual firing rates and the NOₓ, VOC, SO₂, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOₓ, VOC, SO₂, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.
D.3.56 Equipment Leaks of VOC and Hazardous Air Pollutants (HAPs) [326 IAC 12] [326 IAC 8-4-8] [40 CFR 60, Subpart GGGa] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]  

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.254, and E.2643 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.3.67 Volatile Organic Compounds (VOC) [326 IAC 8-4-2]  
Pursuant to 326 IAC 8-4-2(1), the Permittee shall control VOC emissions from No. 12 Pipe Still vacuum hot well, D-7, according to the following:

No owner or operator of any vacuum producing systems at a petroleum refinery may cause, allow or permit the emission of any noncondensable volatile organic compounds from the condensers, hot wells or accumulators of the system.

D.3.78 Wastewater / Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ] [326 IAC 12]  

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for the process heaters H-1AN, H-1AS, H-1B, H-2, H-1CN and H-1CX, which comprise the affected source for the large gaseous fuel subcategory: process heaters H-1AN, H-1AS, H-1B, H-2, H-1CN, and H-1CX.

D.3.9 Prevention of Significant Deterioration (PSD) Minor Limit [326 IAC 2-2]  
Pursuant to SPM 089-15202-00003, issued April 24, 2002 and SPM 089-18588-00453, issued July 15, 2004, nitrogen oxide emissions from the Heater H-2 (until shutdown) shall be controlled by low-NOx burners having an emission rate of 0.044 pounds per million Btu or less. This limit equates to a potential to emit 33.53 tons of nitrogen per year for Heater H-2. This condition renders the requirements of 326 IAC 2-2 not applicable.

Compliance Determination Requirements

D.3.10 Operating Requirement  

(a) Pursuant to SPM 089-15202-00003, issued April 24, 2002, fuel oil shall not be used as fuel for the No. 12 Pipe Still.
(b) In order to demonstrate compliance with Condition D.3.5(b), the heaters H-101A, H-101B, and H-102 shall operate using ultra-low NOx burners only.

(c) Compliance with the lb/mmBTU limits in Condition D.3.5(b) shall be demonstrated as specified in Condition D.0.3.

D.3.11 Continuous Emissions Monitoring

The Total Reduced Sulfur, NOx, and CO continuous emission monitoring systems (CEMS) for H-101A, H-101B, and H-102 shall be calibrated, maintained, and operated for determining compliance with the SO2, NOx, and CO emissions limits in Condition D.3.5 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

D.3.12 Testing Requirements  [326 IAC 2-7-6(1),(6)] [326 IAC 2-1.1-11]

(a) Within 36 months after the effective date of this permit, in order to demonstrate compliance with Condition D.3.4, the Permittee shall perform NOx testing of the H-1CX heater utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C-Performance Testing.

(b) Within 5 years of last compliant stack test, the Permittee shall perform NOx testing of the H-2 heater utilizing methods approved by the Commissioner, in order to demonstrate compliance with Condition D.3.9. Testing shall be conducted in accordance with Section C- Performance Testing.

D.3.13 Operating Requirement

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.3.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

D.3.14 Continuous Emissions Monitoring

(a) In order to demonstrate compliance with Conditions D.3.5 and D.3.12, the Total Reduced Sulfur, NOx, and CO continuous emission monitoring systems (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2, NOx, and CO emissions limits for H-101A, H-101B, and H-102 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

(b) In order to demonstrate compliance with Condition D.3.12, the CO continuous emission monitoring systems (CEMS) shall be calibrated, maintained, and operated for demonstrating compliance with the CO emissions limits for H-101A, H-101B, and H-102 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements  [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.3.15 Monitoring for Equipment Leaks of VOC  [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.
Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.3.14 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.3.3 D.3.2 and D.3.10, the Permittee shall maintain a daily record of the following for No. 12 Pipe Still:

   1. fuel type,
   2. average daily sulfur content for each fuel type,
   3. average daily fuel gravity for each fuel type,
   4. total daily fuel usage for each fuel type, and
   5. heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.3.1, Permittee shall maintain records for the No. 12 Pipe Still process heaters H-1AS and H-1AN Preheaters, H-1B Preheater, H-2 Vacuum Heater, H-1CN Crude Preheater, H-1CS Crude Preheater, and H-1CX Crude Preheater as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.3.4 D.3.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.3.6(a) D.3.5(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.3.6(b) D.3.5(b), the Permittee shall keep records as specified in Sections E.1, E.4 and E.13.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.3.8 D.3.7, the Permittee shall keep records as specified in Sections E.1 and E.3.

(g) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.3.8(b) D.3.7(b), the Permittee shall keep records as specified in Section E.6.

(h) In order to demonstrate compliance with Condition D.3.5, the Permittee shall maintain records of the monthly firing rates and CO, SO2, and NOx emissions at heaters H-101A, H-101B, and H-102.

(i) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.3.11, the Permittee shall keep the following records for the continuous emission monitors:

   1. One-minute block averages.
   2. All documentation relating to:

      (A) design, installation, and testing of all elements of the monitoring system, and
      (B) required corrective action or compliance plan activities.
(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

(A) Date of facility downtime,

(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

D.3.4517 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.3.3, D.3.2, and D.3.10, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur emission rate, in pounds per hour, for No. 12 Pipe Still process heaters.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.3.4, D.3.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.3.6(a) D.3.5(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC and to document compliance with Condition D.3.6(b) D.3.5(b), the Permittee shall submit reports as specified in Sections E.1, E.4, and E.13.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.3.8(a) D.3.7(a), the Permittee shall submit reports as specified in Sections E.1, and E.3.

(f) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.3.8(b) D.3.7(b), the Permittee shall submit reports as specified in Section E.6.

(g) In order to demonstrate compliance with Condition D.3.5, upon start-up of the H-101A, H-101B and H-102 heaters, the Permittee shall submit a quarterly summary of the monthly firing rates, and CO, NOx, and SO2 emissions for heaters H-101A, H-101B, and H-102 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(h) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.3.5 and D.3.11, the Permittee shall submit reports of excess SO2, NOx and CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,

(2) Date of excess emissions,

(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.

(5) A summary itemizing the exceedances by cause.

(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:

(A) Date of downtime.

(B) Time of commencement.

(C) Duration of each downtime.

(D) Reasons for each downtime.

(E) Nature of system repairs and adjustments
## SECTION D.4 FACILITY OPERATION CONDITIONS - Sulfur Recovery Unit

**Facility Description [326 IAC 2-7-5(15)]**

(d) The Sulfur Recovery Unit (SRU) Facility, identified as Unit ID 162, originally constructed in 1971 and expanded in 1981 and 1995, and rated at 600 long tons per day and will be modified as part of the CXHO Project increasing the capacity to 1,300 long tons per day of sulfur. The facility includes the following and may also include insignificant activities listed in Section A.4 of this permit:

1. Three (3) three-stage Claus sulfur recovery trains, identified as A, B, and C, and two (2) additional three-stage Claus sulfur recovery trains installed after modification, identified as D and E trains.

2. One (1) Beavon-Stretford tail gas unit (B/S TGU), a reduction system with a burner capacity of 24.3 MMBtu per hour, exhausting at stack S/V 162-02. **The B/S TGU will be decommissioned as part of the CXHO project.**

3. One (1) tail gas unit (SBS TGU), an oxidation system with a burner capacity of 40 MMBtu per hour, exhausting at stack 162-04. **The SBS TGU will be decommissioned as part of the CXHO project.**

4. One (1) caustic soda scrubbing tower to control sulfur dioxide emissions from the SBS TGU. **The caustic soda scrubbing tower will be decommissioned as part of the CXHO project.**

5. One (1) cooling tower, identified as the SBS cooling tower, to remove sodium bisulfite from the caustic scrubbing tower exhaust stream, equipped with a high-efficiency mist eliminator, and exhausting at stack 162-05. **The SBS cooling tower will be decommissioned as part of the CXHO project.**

6. Gas quenching and cooling towers other than the SBS cooling tower, to be decommissioned as part of the CXHO project.

7. One (1) quench separator with mist eliminators, to be decommissioned as part of the CXHO project.

8. One (1) gas cooler and water condenser with sulfur dioxide stripper, to be decommissioned as part of the CXHO project.

9. Caustic soda storage tanks and sodium bisulfite storage tanks, and handling equipment to be decommissioned as part of the CXHO project.

10. One (1) standby incinerator, used only in the event of an emergency, exhausting at stack S/V 162-01, **to be decommissioned as part of the CXHO project.**

11. One (1) flare stack exhausting at stack S/V 162-03 which controls H₂S and VOC emissions during emergency situations, unit start-ups/shut-downs, and preparation of equipment for maintenance. Refinery or natural gas is used as a constant purge stream. Pilot gas is natural gas.

12. One (1) modular degassing unit, which removes gases that are emitted during the cooling of molten sulfur. Removed gases are vented to the SBS TGU. **Removed gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.**
(13) Two (2) modular degassing units, to be installed as part of the CXHO project, which remove gases that are emitted during the cooling of molten sulfur. The gases will be vented to the front-end of Claus Trains D and/or E as part of the CXHO project.

(13) One (1) sour water tank, identified as TK-431, with a maximum storage capacity of 845,600 gallons and used to store a material that has a vapor pressure of less than 0.5 psia. The tank was constructed in 1985 and is equipped with an external floating roof.

(14) Three (3) sulfur pits, (Sulfur Pits A, B, and C) used to store molten sulfur with their vent stacks routed to the B/S TGU and/or the SBS. As part of the CXHO project, the vents from the sulfur pits A, B and C will be routed to either COT 1 and/or COT 2.

(15) Two (2) sulfur pits (Sulfur Pits D and E), to be installed as part of the CXHO project, used to store molten sulfur and the vents routed to either COT 1 and/or COT 2.

(16) One (1) sour water tank, identified as TK-431, with a maximum storage capacity of 845,600 gallons and used to store a material that has a vapor pressure of less than 0.5 psia. The tank was constructed in 1985 and is equipped with an external floating roof.

(17) One (1) sour water storage tank, identified as TK-410, permitted in 2008, having a maximum storage capacity of 4,351.200 gallons and equipped with an external floating roof. The maximum true vapor pressure of the material stored in this tank is less than 0.5 psia.

(18) Two (2) Claus Offgas Treaters (COT), identified as COT1 and COT2, to be installed as part of the CXHO project, thermal oxidation systems which combust natural gas, each rated at 72 mmBTU/hr, equipped with SO2 and CO CEMS, exhausting at stacks S/V 162-06 and 162-07.

(19) Two (2) sulfur storage tanks, identified as SH-1 and SH-2, each with a maximum storage capacity of 1,008,000 gallons and used to store molten sulfur exhausting to stacks S/V 163-09 and 162-10. These tanks will be constructed as part of the CXHO Project and are both fixed roof tanks controlled by a caustic scrubber.

Main Operating Scenario Pre-CXHO:
Approximately 80% of tail gases from the three trains are sent to the B/S TGU, with the remainder sent to the SBS TGU.

Alternate Operating Scenario #1 Pre-CXHO:
One train and the B/S TGU are not operate. Tail gases from the other two trains are sent to the SBS TGU.

Alternate Operating Scenario #2 Pre-CXHO:
The B/S TGU is not operated. Tail gases from the three trains are sent to the SBS TGU.

Alternate Operating Scenario #3 Pre-CXHO:
The SBS TGU is not operated. Tailgases from the three trains are sent to the B/S TGU.

Main Operating Scenario Post-CXHO:
The tail gases from the five trains are sent to both of the COTs.

Alternate Operating Scenario #1 Post-CXHO:
One of the COTs is not operated and the tail gases from the five trains are sent to the other COT.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.4.1 Particulate Matter [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from SBS TGU (until shutdown), each of the two (2) offgas treaters/thermal oxidizers identified as COT1 and COT2, and the SBS cooling tower (until shutdown) shall not exceed 0.03 grains per dry standard cubic foot.

D.4.2 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01, until it is shutdown, the PM10 emissions from the B/S TGU shall not exceed 0.0075 lb/MMBTU and 0.182 lb/hr. 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), emissions for the following Sulfur Recovery Unit process units shall comply with the following emission limitations:

<table>
<thead>
<tr>
<th>Emission Unit</th>
<th>PM10 Limit (lbs/MMBTU)</th>
<th>PM10 Limit (lbs/ton of Feed)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulfur Recovery Unit Incinerator</td>
<td>0.004</td>
<td>None</td>
<td>0.090</td>
</tr>
<tr>
<td>Beavon Stretford Tail Gas Unit (B/S TGU)</td>
<td>None</td>
<td>0.110</td>
<td>0.103</td>
</tr>
</tbody>
</table>

(b) Pursuant to Commissioner’s Order No. 2007-01, the PM10 emissions from the Sulfur Recovery Unit Incinerator, until it is shutdown, shall not exceed 0.0075 lb/MMBTU and 0.285 lb/hr.

(c) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP), until the B/S TGU and Sulfur Recovery Unit Incinerator are shutdown. Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.4.3 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

(a) Pursuant to 326 IAC 7-4.1-3(a)(15), (16) and (17), emissions from the following Sulfur Recovery Unit process units shall comply with the following sulfur dioxide emission limitations:

<table>
<thead>
<tr>
<th>Unit Description</th>
<th>SO2 Emission Limitation (lbs/MMBtu)</th>
<th>SO2 Emission Limitation (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulfur Recovery Unit Incinerator (until shutdown)</td>
<td>0.033</td>
<td>1.25</td>
</tr>
<tr>
<td>Beavon Stretford Tail Gas</td>
<td>None</td>
<td>53.10 Total Reduced</td>
</tr>
</tbody>
</table>
### Unit Description

<table>

<td>None</td>
<td>9.0</td>
</tr>
</tbody>
</table>

(b) Pursuant to 326 IAC 7-4.1-1, the offgas treaters/thermal oxidizers identified as COT1 and COT2 shall burn natural gas only as supplemental fuel.

(a) Pursuant to Construction Permit 089-3323-00003, issued December 14, 1994:

1. Emissions of TRS calculated as SO₂ from the B/S TGU (until shutdown) shall not exceed 232.6 tons per twelve (12) consecutive month period.

2. Emissions of TRS calculated as SO₂ from the B/S TGU (until shutdown) shall be limited to 300 parts per million by volume (ppmv).

3. The following emission units shall remain inoperative unless new approval is obtained:
   - (A) Propane Dewaxing Unit
   - (B) #1, #2, and #3 Asphalt Oxidizers
   - (C) The Butamer Unit
   - (D) The F-7 Furnace to the Isomerization Unit
   - (E) The #1 Power Station Boiler #1

(b) Pursuant to SSM 089-13846-00003, issued on June 27, 2001, emissions of SO₂ at 0% excess air from the SBS TGU (until shutdown) shall not exceed 39.4 tons per twelve (12) consecutive month period.

Compliance with these conditions (a) and (b) above shall renders the requirements of 326 IAC 2-3 (Emission Offset) not applicable.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(c) The PM and PM-10 emissions from COT1 and COT2 shall not exceed 0.0019 and 0.0075 pounds per million BTU, respectively.

(d) The VOC emissions from COT1 and COT2 shall not exceed 0.0054 pounds per million BTU.

(e) The combined SO₂ emissions from COT1 and COT2 shall not exceed 194.8 tons per 12 consecutive month period, with compliance determined at the end of each month.
(f) The combined CO emissions from COT1 and COT2 shall not exceed 55.0 tons per 12 consecutive month period, with compliance determined at the end of each month.

(g) The NOx emissions from COT1 and COT2 shall not exceed 0.08 pounds per million BTU.

(h) The Permittee shall comply with the following firing rate limit:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing Rate (10^7 mmBTU) per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>COT1 and COT2 (total)</td>
<td>1261.4</td>
</tr>
</tbody>
</table>

(i) The B/S TGU, SBS TGU, and SBS Cooling tower shall be permanently shutdown prior to the startup of the new Coker (#2 Coker).

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.4.5 New Source Performance Standards [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(2), the Permittee shall comply with the requirements in Section E.2 for the SBS TGU (until shutdown), COT1 and COT2 offgas treaters/thermal oxidizers and B/S TGU (until shutdown).

D.4.6 Equipment Leaks of VOC [326 IAC 8-4-8]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

D.4.7 Wastewater [326 IAC 12] [40 CFR 60, Subpart QQQ]

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

D.4.8 Requirements for 40 CFR Part 63, Subpart UUU

Pursuant to 40 CFR 63, Subpart UUU, the Sulfur Recovery Unit and associated bypass lines shall comply with the requirements of Section E.10.

Compliance Determination Requirements

D.4.9 Operating Requirements

(a) Pursuant to permit SSM 089-13846-00003 issued June 27, 2001 as amended by Administrative Amendment 089-15525-00003 issued April 15, 2002, the Permittee shall re-route all NSPS SRP sulfur pit emissions such that they are treated, monitored, and included as part of the emissions of the SRU subject to the NSPS Subpart J limit for SO2.
(b) Compliance with the limits in Conditions D.4.4(c),(d) and (g) shall be demonstrated as specified in Condition D.0.3.

D.4.10 Testing Requirements [326 IAC 2-7-6(1), (6)] [326 IAC 2-1.1-11]

Within 3 months of the issuance of this permit and in order to demonstrate compliance with Condition D.4.1, the Permittee shall perform testing of the total dissolved solids (TDS) in the SBS cooling tower utilizing methods as approved by the Commissioner. The SBS tower will be deemed in compliance with 326 IAC 6.8-1-2 provided that the total dissolved solids in the cooling tower water do not exceed 3300 ppmv. This test shall be repeated at least once every three months from the date of this valid compliance demonstration.

D.4.11 Operating Requirement

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitation for the SRU incinerator in Condition D.4.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

D.4.12 Continuous Emissions Monitoring

In order to demonstrate compliance with Condition D.4.4, the SO2 and CO continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for COT1 and COT2 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.4.13 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.4.14 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the SRU incinerator for each day that the unit is operated:

1. fuel type,
2. average daily sulfur content for each fuel type,
3. average daily fuel gravity for each fuel type,
4. total daily fuel usage for each type, and
5. heat content of each fuel.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.4.2, the Permittee shall maintain records for the SRU as specified in the Continuous Compliance Plan.

(c) Pursuant to 326 IAC 7-4.1-3(b)(1)(C) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the B/S TGU:

1. total reduced sulfur concentration,
(2) hydrogen sulfide concentration, and
(3) calculated stack gas flow rates.

d) Pursuant to 326 IAC 7-4.1-3(b)(1)(D) and to document compliance with Condition D.4.3, the Permittee shall maintain daily records of the following for the SBS TGU:
(1) sulfur dioxide concentration, and
(2) stack gas flow rate.

e) To document compliance with Condition D.4.4(a), the Permittee shall keep the following records for the B/S TGU:
(1) one-minute block averages from the TRS CEM, and
(2) average TRS emission rates, calculated as $SO_2$, per twelve (12) consecutive month period.

f) To document compliance with Conditions D.4.4(b), the Permittee shall keep the following records for the SBS TGU:
(1) one-minute block averages from the $SO_2$ CEM, and
(2) average $SO_2$ emission rate per twelve (12) consecutive month period.

g) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.4.5, the Permittee shall maintain the records specified in Section E.2.

h) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.4.6, the Permittee shall keep records as specified in the LDAR plan.

i) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.4.7, the Permittee shall keep records as specified in Section E.6.

j) Pursuant to 326 IAC 8-9-6 (Volatile Organic Liquid Storage Vessels), the Permittee shall maintain records of the following information for storage tank TK-431:
(1) The vessel identification number.
(2) The vessel dimensions.
(3) The vessel capacity.

The Permittee shall keep all records as described in (1) through (3) for the life of the vessel.

k) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.4.12, the Permittee shall keep the following records for the continuous emission monitors:
(1) One-minute block averages.
(2) All documentation relating to:
(A) design, installation, and testing of all elements of the monitoring system, and

(B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

(A) Date of facility downtime,

(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

D.4.14 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Condition D.4.3, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the following information:

(1) average daily sulfur emission rate, in pounds per hour, for the SRU incinerator;

(2) the average daily sulfur dioxide emission rate for the incinerator and B/S TGU, in terms of pounds per hour of sulfur dioxide; and

(3) the average daily total reduced sulfur emission rate, calculated as sulfur dioxide, for the SBS TGU in pounds per hour.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.4.5, the Permittee shall submit reports to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.4.6, the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 326 IAC 3-5-4(a), if revisions are made to the standard operating procedures (SOP) submitted to OAQ for the continuous emission monitors, updates shall be submitted biennially.

(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.4.7, the Permittee shall submit reports as specified in Section E.6.

(f) **Until the B/S TGU and SBS are shutdown, a quarterly summary of the information to document compliance with Condition D.4.4 shall be submitted to the address listed in Section C - General Reporting Requirements, using the reporting forms located at the end of this permit, or their equivalent, within thirty (30) days after the end of the quarter being reported.**

(g-f) Pursuant to 40 CFR 63, Subpart UUU and to demonstrate compliance with Condition D.4.8, the Permittee shall submit to IDEM, OAQ the documents specified in Condition E.10.
(g) In order to demonstrate compliance with Condition D.4.4, upon start-up of COT 1 and/or COT 2, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions at COT1 and COT2 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(h) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.4.4 and D.4.12, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments.
SECTION D.5  FACILITY OPERATION CONDITIONS - Vapor Recovery Units 100 and 200

Facility Description [326 IAC 2-7-5(15)]:

(e)  (1) Vapor Recovery Unit 100 (VRU-100) identified as Unit ID 241, and Vapor Recovery Unit 200 (VRU-200) identified as Unit ID 231, permitted for turnaround (TAR) in 2008 to repair or replace tower trays and increase existing pumping and cooling capacities. Gasoline and lighter products from the FCUs are separated in the VRUs using a series of distillation towers. The VRUs are connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes leaks from process equipment including one (1) compressor (identified as J-3E located at VRU-100), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system. The facility may also include insignificant activities listed in Section A.4 of this permit.

(2) As part of the VRU 100/200 Whiting Atmospheric Relief Project (WARP), permitted in 2008, the pressure relief discharges that vented to the existing VRU 100/200 vent stack are being re-routed to the VRU flare.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.5.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

D.5.2 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.
D.5.3 Prevention of Significant Deterioration [326 IAC 2-2], Emission Offset [326 IAC 2-3] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) After the startup of the New Coker (#2 Coker), the vent stack for VRU 100 and VRU 200 shall be permanently shutdown and the pressure relief discharges that were routed to the vent stack will be routed to the VRU flare.

Compliance Determination Requirements

D.5.4 Operating Requirement

In order to demonstrate compliance with Condition D.5.3, following the startup of New Coker (#2 Coker), the pressure relief discharges from VRU 100 and VRU 200 shall be routed to the VRU flare. The flare must be operated with a flame present at all times that VRU 100 or VRU 200 is in operation.

Compliance Monitoring Requirements

D.5.35 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

(b) Prior to start-up of VRU 100 and VRU 200, BP shall make a determination as to whether 40 CFR Part 60, Subpart GGGa has been triggered by the changes made as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.5.46 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.5.1(a), the Permittee shall keep records as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.5.1(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.5.2, the Permittee shall keep records as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.5.2, the Permittee shall keep records as specified in Section E.6.

D.5.57 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.5.1(a), the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.5.1(b), the Permittee shall submit reports as specified in Section E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.5.2, the Permittee shall submit reports as specified in Sections E.1 and E.3.
(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.5.2, the Permittee shall submit reports as specified in Section E.6.
SECTION D.6  FACILITY OPERATION CONDITIONS - Vapor Recovery Units 300 and 400

Facility Description [326 IAC 2-7-5(15)]:

(f) (A) The Vapor Recovery Unit 300 (VRU 300), identified as Unit ID 150. Light ends and naphtha are separated in the VRU using a series of distillation towers. This unit is connected to flare stack S/V 241-01, the VRU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit:

(1) One (1) off-gas knock out drum (D-400) which exhausts to flare stack S/V 241-01.

(2) Leaks from process equipment, including two (2) compressors (identified as K-340 and K-351), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation system.

(B) Vapor Recovery Unit VRU 400 for the New Coker (#2 Coker), permitted in 2008, to be installed as part of the CXHO project.

(Emission Limitations and Standards [326 IAC 2-7-5(1)])

D.6.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC for VRU 300 and VRU 400 from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems for VRU 300 and VRU 400.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, for VRU 400, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.6.2 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.
Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.6.3 Miscellaneous Process Vents [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Section E.1 for the control of miscellaneous process vent emissions from the off gas knock-out drum (D-400).

This miscellaneous process vent is routed to the VRU Flare. Additional requirements for the VRU Flare are included in Section D.35.7.

Compliance Monitoring Requirements

D.6.4 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.6.5 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.6.1(a), the Permittee shall keep records as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.6.1(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.6.3, the Permittee shall keep records as specified in Section E.1.

(d) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.6.2, the Permittee shall keep records as specified in Sections E.1 and E.3.

(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.6.2, the Permittee shall keep records as specified in Section E.6.

D.6.6 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.6.2(a), the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.6.3(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.12.

(c) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.6.3, the Permittee shall submit reports as specified in Section E.1.

(d) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.6.2, the Permittee shall submit reports as specified in Sections E.1 and E.3.
(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.6.2, the Permittee shall submit reports as specified in Section E.6.
SECTION D.8 FACILITY OPERATION CONDITIONS - Propylene Concentration Unit

### Facility Description [326 IAC 2-7-5(15)]:

(h) The Propylene Concentration Unit (PCU), identified as Unit ID 145, purifies propylene for sale to chemical plants and eventual manufacture into polypropylene plastic. This unit also has a treating system, which purifies propane. This unit is connected to flare stack S/V 140-01 (the Alky Flare). The flare controls VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The facility includes a caustic degassing drum (D-100) that is vented to flare stack S/V 140-01 and leaks from process equipment, including one compressor (identified as k-104), pumps, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation system. This facility may include insignificant activities listed in Section A.4 of this permit.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

### Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.8.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [3267 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(c) Prior to start-up of the new coker (#2 Coker), BP shall make a determination as to whether 40 CFR Part 60 GGGa has been triggered by component changes made on the PCU as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

### Compliance Monitoring Requirements

D.8.2 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the plan submitted by the Permittee.

### Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.8.3 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.8.1(a), the Permittee shall keep records as specified in the LDAR plan.
(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.8.1(b), the Permittee shall keep records as specified in Section E.1 and E.4.

D.8.4 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.8.1(a), the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.8.1(b), the Permittee shall submit reports as specified in Section E.1 and E.4.
SECTION D.9 FACILITY OPERATION CONDITIONS - Isomerization Unit

Facility Description [326 IAC 2-7-5(15)]:

(i) The Isomerization Unit (Isom), identified as Unit ID 210, was constructed in 1985 as a conversion of the No.2 Ultraformer. The Isomerization process converts low octane naphtha into high octane gasoline blending components. This unit is connected to flare stack S/V 220-04, the UIU Flare, to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. **As part of the CXHO Project, the ISOM heater H-1 will be modified by replacing several burners with larger burners, with rated capacity remaining at 190 MMBTU/hr.** The facility includes the following emission sources and may include insignificant activities listed in Section A.4 of this permit.

1. One (1) natural gas, refinery gas, or liquified petroleum gas-fired Process Heater H-1, modified as part of CXHO, rated at 190 MMBtu/hr and vented to stack S/V 210-01.
2. One (1) Flare Knock-out Drum (D-18) with emissions vented to vessel D-24, which exhausts to flare stack S/V 220-04.
3. Leaks from process equipment, including one (1) compressor (identified as K1), pumps, valves, process drains and pressure relief devices.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.9.1 Lake County PM{sub 10} Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01, PM{sub 10} emissions from the H-1 Feed Heater Furnace shall not exceed 0.0075 lb/MMBTU and 1.416 lb/hr. 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), PM{sub 10} emissions from the H-1 Feed Heater Furnace shall not exceed 0.004 lb/MMBTU and 0.704 lb/hr.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.9.2 Lake County Sulfur Dioxide (SO{sub 2}) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3(a)(5), sulfur dioxide emissions from the H-1 Feed Heater Furnace shall not exceed 0.034 lb/MMBTu and 6.46 pounds per hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for ISOM heater H-1:

(a) The emissions of NOx shall not exceed 0.275 pounds per million BTU.

(b) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.
(c) The emissions of SO2 shall not exceed 7.4 tons per 12 consecutive month period after the start-up of the new Coker (#2 Coker).

(d) The emissions of PM and PM-10 each shall not exceed 0.0019 and 0.0075 pounds per million BTU, respectively.

(e) The emissions of CO shall not exceed 0.082 pounds per million BTU.

(f) The Permittee shall comply with the following limit on firing rate, following the completion of the CXHO project:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate (10^3 mmBTU) per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISOM H-1</td>
<td>1342.03</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.9.34 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified E.2 for the H-1 Feed Heater Furnace.

D.9.45 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs)[326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [3267 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation system.

(c) Prior to start-up of the new coker (#2 Coker), BP shall make a determination as to whether 40 CFR Part 60 GGGa has been triggered by component changes made on the ISOM as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

D.9.56 Miscellaneous Process Vents [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Section E.1 to control miscellaneous process vent emissions from the off gas knock-out drum (D-18).

This miscellaneous process vent is routed to the UIU Flare. Additional requirements for the UIU Flare are included in Section D.357.
D.9.6a Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF]

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for the H-1 process heater, which comprises the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.9.8 Operating Requirement

Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002, fuel oil shall not be used as fuel for the H-1 Isom Process Heater.

D.9.9 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.9.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with the limits in D.9.3(a), (b), (d) and (e) shall be demonstrated as specified in Condition D.0.3.

D.9.10 Continuous Emissions Monitoring

In order to demonstrate compliance with Condition D.9.3, the Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limit from ISOM H-1 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements

D.9.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.9.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.9.2 and D.9.8, the Permittee shall maintain a daily record of the following for the H-1 Process Heater:

(1) fuel type,

(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.9.1, the Permittee shall maintain records for the H-1 Feed Heater Furnace as specified in the Continuous Compliance Plan.

c) Pursuant to 40 CFR 60, Subpart J and to demonstrate compliance with Condition D.9.4 D.9.3, the Permittee shall maintain the records specified in Section E.2.

d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.9.5(a) D.9.4(a), the Permittee shall comply with equipment leak record keeping requirements as specified in the LDAR plan.

e) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.9.5(b) D.9.4(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

f) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Conditions D.9.6 D.9.5, the Permittee shall keep records as specified in Sections E.1.

g) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.9.7 D.9.6, the Permittee shall keep records as specified in Section E.1 and E.3.

(h) In order to demonstrate compliance with Condition D.9.3, the Permittee shall maintain records of monthly firing rates and SO2 emissions for ISOM H-1.

(i) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.9.10, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.
(2) All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.
(3) All maintenance logs, calibration checks, and other required quality assurance activities,
(4) All records of corrective and preventive action, and
(5) A log of plant operations, including the following:
   (A) Date of facility downtime,
   (B) Time of commencement and completion of downtime, and
   (C) Reason for each downtime.
Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.9.2 and D.9.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the H-1 Process Heater.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.9.4 D.9.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.9.5(a) D.9.4(a), the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.9.5(b) D.9.4(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(e) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.9.6 D.9.5, the Permittee shall submit reports as specified in Section E.1.

(f) In order to demonstrate compliance with Condition D.9.3, the Permittee shall submit a quarterly summary of monthly firing rates and SO2 emissions for ISOM H-1 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(g) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.9.3 and D.9.10, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
(E) Nature of system repairs and adjustments
SECTION D.10 FACILITY OPERATION CONDITIONS - Aromatics Recovery Unit

Facility Description [326 IAC 2-7-5(15)]:

(j) The Aromatic Recovery Unit (ARU), identified as Unit ID 242, consists of the ARU 200 section and the ARU 300 section. The primary function is to remove light ends from naphtha to obtain a more desirable reforming feed. Its secondary function is to separate xylene, a chemical feedstock, from the Ultraformer product. The ARU utilizes a series of distillation towers to purify reformer feed and another set of towers to separate chemical feedstocks. The ARU includes the following process units and may also include insignificant activities listed in Section A.4 of this permit.

1. The following process heaters, which are fired with refinery gas, natural gas or liquified petroleum gas.

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Construction Date</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-200A</td>
<td>1978</td>
<td>249.5</td>
<td>242-01</td>
<td>None</td>
</tr>
<tr>
<td>F-200B</td>
<td>1978</td>
<td>249.5</td>
<td>242-02</td>
<td>None</td>
</tr>
</tbody>
</table>

2. The ARU is connected to the 4UF flare stack, S/V 224-06. The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

3. Leaks from process equipment.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.10.1 Lake County PM\textsubscript{10} Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(d)), PM\textsubscript{10} emissions from the following ARU combustion units shall not exceed the following emission limitations:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM\textsubscript{10} Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-200A</td>
<td>0.0075 0.004</td>
<td>1.86 0.924</td>
</tr>
<tr>
<td>F-200B</td>
<td>0.0075 0.004</td>
<td>1.86 0.924</td>
</tr>
</tbody>
</table>

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.
D.10.2 Lake County Sulfur Dioxide (SO\textsubscript{2}) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3(a)(8), sulfur dioxide emissions from the ARU combustion units, F-200A and F-200B, shall not exceed 0.035 pounds per MMBtu and a total for both F-200A and F200B of 17.47 pounds per hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for heaters F-200A and F-200B:

(a) The emissions of NO\textsubscript{x} shall not exceed 0.275 pounds per million BTU.

(b) The emissions of CO shall not exceed 0.082 pounds per million BTU.

(c) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.

(d) The emissions of PM and PM-10 shall not exceed 0.0019 and 0.0075 pounds per million BTU, respectively.

(e) The Permittee shall comply with the following limits, following the completion of the CXHO project:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing Rate (10\textsuperscript{3} mmBTU) per 12 month period</th>
<th>SO\textsubscript{2} (tons per 12 consecutive month period)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-200A</td>
<td>1264.94</td>
<td>7.0</td>
</tr>
<tr>
<td>F-200B</td>
<td>1264.94</td>
<td>7.0</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NO\textsubscript{x}, VOC, SO\textsubscript{2}, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NO\textsubscript{x}, VOC, SO\textsubscript{2}, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.10.34 Fuel Gas Hydrogen Sulfide (H\textsubscript{2}S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the F-200A and F-200B Process Heaters.

D.10.45 Equipment Leaks of Volatile Organic Compounds and Hazardous Air Pollutants [326 IAC 8-4-8] [36 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart J] [326 IAC 12][40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with Sections E.1 and E.4 for the equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation system.

(c) Pursuant to 40 CFR 61, Subpart J, the Permittee shall control benzene leaks from the pumps, pressure relief devices, sampling connection systems, open-ended valves, open-ended lines, and valves in accordance with requirements in Section E.5.
Pursuant to 40 CFR 63.640(p), equipment that is subject to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart J is required only to comply with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Prior to start-up of the new coker (#2 Coker), BP shall make a determination as to whether 40 CFR Part 60 GGGa has been triggered by component changes made on the ARU as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered.

D.10.56 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF]

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil-water separators, and closed-vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for process heaters F-200A and F-200B, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.10.7 Operating Requirement

Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002 and effective June 1, 2003, fuel oil shall not be used as fuel for the F-200A and F-200B Process Heaters.

D.10.8 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.10.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with the limits in D.10.3(a), (b), (c) and (d) shall be demonstrated as specified in Condition D.0.3.

D.10.9 Continuous Emissions Monitoring

In order to demonstrate compliance with Condition D.10.3(e), the Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for F-200A and F-200B in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements

D.10.810 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan.
Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.10.1011 Recordkeeping Requirements

(a) Pursuant to 326 IAC 7-4-1-3(b)(1) and to document compliance with Conditions D.10.2, and D.10.7, the Permittee shall maintain a daily record of the following for the F-200A and F-200B Process Heaters:

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.10.1, the Permittee shall maintain records for the process heater F-200A and F-200B as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to demonstrate compliance with Condition D.10.4 D.10.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.10.5(a) D.10.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) To demonstrate compliance with the equipment leak standards of 40 CFR 63, Subpart CC and to document compliance with Condition D.10.5(b) D.10.4(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(f) Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition D.10.5(c) D.10.4(c), the Permittee shall keep records as specified in Section E.5.

(g) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.10.6 D.10.5, the Permittee shall keep reports as specified in Sections E.1 and E.3.

(h) In order to demonstrate compliance with Condition D.10.3, the Permittee shall maintain records of the monthly firing rates and SO2 emissions for F-200A and F-200B.

(i) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.10.9, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.
(2) All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.
All maintenance logs, calibration checks, and other required quality assurance activities,

All records of corrective and preventive action, and

A log of plant operations, including the following:

(A) Date of facility downtime,

(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

D.10.11 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.10.2 and D.10.7, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the F-200A and F-200B Process Heaters.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.10.4 D.10.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.10.5(a) D.10.4(a), the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.10.5(b) D.10.4(b), the Permittee shall submit reports as specified in Section E.1 and E.4.

(e) Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition D.10.5(c) D.10.4(c), the Permittee shall keep records as specified in Section E.5.

(f) Pursuant to 40 CFR 63, Subpart CC, 40 CFR 61, Subpart FF and to document compliance with Condition D.10.6 D.10.5, the Permittee shall submit reports as specified in Sections E.1 and E.3.

(g) In order to demonstrate compliance with Condition D.10.3, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions at F-200A and F-200B to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(h) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.10.3 and D.10.9, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,

(2) Date of excess emissions,

(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.

(5) A summary itemizing the exceedances by cause.

(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:

(A) Date of downtime.

(B) Time of commencement.

(C) Duration of each downtime.

(D) Reasons for each downtime.

(E) Nature of system repairs and adjustments
SECTION D.11 FACILITY OPERATION CONDITIONS - Blending Oil Unit

Facility Description [326 IAC 2-7-5(15)]:

(k) The Blending Oil Unit (BOU), identified as Unit ID 250, uses hydrogen to convert sulfur to hydrogen sulfide and remove it from distillate and gas oil streams to meet product specifications. The hydrogen sulfide is sent to the Claus Trains for further processing. As part of the CXHO Project, the BOU heater F-401 will be modified by replacing burners. The facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) process Furnace F-401, constructed in 1972, and modified as part of CXHO, which vents to stack ID SV250-01. The furnace is rated at 35 million Btu and is fired by natural gas, refinery gas or liquid petroleum gas.

(2) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.11.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. the PM10 emissions from the F-401 process furnace shall not exceed 0.0075 lb/MMBTU and 0.261 lb/hr. 326 IAC 6.8-2-6 (formerly 326 IAC 6.1-10.1(d)), PM10 emissions from the F-401 Process Furnace shall not exceed 0.004 lb/MMBtu and 0.130 lb/hr.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6.10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.11.2 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the F-401 Process Furnace shall not exceed 0.034 lb/MMBtu and 1.19 lbs/hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for heater F-401:

(a) The emissions of NOx shall not exceed 0.098 pounds per million BTU.

(b) The emissions of CO shall not exceed 0.082 pounds per million BTU.

(c) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.
(d) The emissions of PM and PM-10 each shall not exceed 0.0019 and 0.0075 pounds per million BTU, respectively.

(e) The Permittee shall comply with the following limits following the completion of the CXHO project:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate ($10^3$ mmBTU) per 12 month period</th>
<th>SO2 tons per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-401</td>
<td>201.48</td>
<td>1.1</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.11.34 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the F-401 Process Furnace.

D.11.45 Equipment Leaks of Volatile Organic Compounds (VOC) [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

D.11.56 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC, and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for drains systems subject to the 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for drain systems subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for Furnace F-401, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.11.7 Operating Requirement

Pursuant to Permit SPM 089-15202-00003, issued April 24, 2003, effective June 1, 2003, fuel oil shall not be used as fuel for the F-401 Process Furnace.
D.11.8 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.11.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with limits in Condition D.11.3(a), (b), (c) and (d) shall be demonstrated as specified in Condition D.0.3.

D.11.9 Continuous Emissions Monitoring

In order to demonstrate compliance with Condition D.10.3, the Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for F-401 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements

D.11.910 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.11.4011 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.11.2, and D.11.7, the Permittee shall maintain a daily record of the following for the F-401 Process Furnace:

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.11.1, the Permittee shall maintain records for the F-401 Process Furnace as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to demonstrate compliance with Condition D.11.4 D.11.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.11.5(a) D.11.4(a), the Permittee shall comply with equipment leak record keeping requirements as specified in the LDAR plan.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.11.6(a) D.11.5(a), the Permittee shall keep records as specified in Conditions E.1 and E.3.
(f) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.11.6(b), the Permittee shall keep records as specified in Section E.6.

(g) In order to demonstrate compliance with Condition D.11.3, the Permittee shall maintain the records of monthly firing rate and SO2 emissions at F-401.

(h) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.11.9, the Permittee shall keep the following records for the continuous emission monitors:

1. One-minute block averages.
2. All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.
3. All maintenance logs, calibration checks, and other required quality assurance activities,
4. All records of corrective and preventive action, and
5. A log of plant operations, including the following:
   (A) Date of facility downtime,
   (B) Time of commencement and completion of downtime, and
   (C) Reason for each downtime.

D.11.11 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.11.2 and D.11.7, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the F-401 Process Furnace.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.11.4, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.11.5, the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC 40 CFR 61, Subpart FF and to document compliance with Condition D.11.6(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.11.6(b), the Permittee shall submit reports as specified in Section E.6.
(f) In order to demonstrate compliance with Condition D.11.3, the Permittee shall submit a quarterly summary of the monthly firing rate and SO2 emissions at F-401 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(g) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.11.3 and D.11.9, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,
(2) Date of excess emissions,
(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
(5) A summary itemizing the exceedances by cause.
(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
Facility Description [326 IAC 2-7-5(15)]:

(m) No. 4 Treatment Plant, identified as unit 602, removes disagreeable odors from various naphtha and distillate streams using a catalytic process. This facility has only fugitive emissions and/or other emissions that are considered insignificant. To be shutdown as part of the CXHO project.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.13.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 326 IAC 8-4-8, until shutdown, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, until shutdown, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

D.13.2 Wastewater/Wastestreams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, until shutdown, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil-water separators, and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, until shutdown, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), until shutdown a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Compliance Monitoring Requirements

D.13.3 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, until shutdown the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.
D.13.4 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.13.1(a), until shutdown the Permittee shall keep records as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.13.1(b), until shutdown the Permittee shall keep records as specified in Sections E.1 and E.4.

(c) Pursuant 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.13.2(a), until shutdown the Permittee shall keep records as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.13.2(b), until shutdown the Permittee shall keep records as specified in Section E.6.

D.13.5 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.13.1(a), until shutdown the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.13.1(b), until shutdown the Permittee shall submit reports as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.13.2(a), until shutdown the Permittee shall submit reports as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.13.2(b), until shutdown the Permittee shall submit reports as specified in Section E.6.
Facility Description [326 IAC 2-7-5(15)]:

(o) The No.3 Ultraformer Unit (No. 3 UF), identified as Unit ID 220, commissioned in 1958. The majority of the unit was shutdown in March 2007, including the H-1, H-2 and F-7 heaters, catalyst filled reactors and the internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process. The unit consists of the C-2 Splitter Tower, the D-18 flare gas separator, D-24 knock-out drum and associated piping.

The No.3 Ultraformer is used to upgrade low-octane naphtha to gasoline blending material and chemical feedstocks. The reforming section consists of a series of process furnaces and catalyst-filled reactors in which the naphtha is heated and converted from straight chain to aromatic compounds. The reactor products are separated by distillation for further processing or blending into gasoline. The No. 3 Ultraformer is connected to flare stack S/V 220-04, the UIU flare, to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance and reactor regenerations. The No.3 Ultraformer includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit.

1. Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBTU/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>H-1 (to be shutdown as part of CXHO)</td>
<td>240</td>
<td>220-04</td>
<td>None</td>
</tr>
<tr>
<td>H-2 (to be shutdown as part of CXHO)</td>
<td>185</td>
<td>220-02</td>
<td>None</td>
</tr>
<tr>
<td>F-7 (to be shutdown as part of CXHO)</td>
<td>23</td>
<td>220-03</td>
<td>None</td>
</tr>
<tr>
<td>Regeneration Furnace</td>
<td>Not in service</td>
<td>Not in service</td>
<td>None</td>
</tr>
</tbody>
</table>

2. One (1) flare gas separator (D-18) with emissions vented to vessel D-24, which exhausts to flare stack S/V 220-04.

3. Five (5) catalyst-filled reactors, which are vented to flare stack S/V 220-04 during the initial catalyst depressurizing and catalyst purging steps of the regeneration process.

4. One (1) internal scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation steps of the regeneration process, which removes HAP emissions.

5. Leaks from process equipment, including one (1) compressor (identified as K-1), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

The No. 3 Ultraformer, consisting of emission units listed in (1) through (5) will be shut down as part of the CXHO project.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.15.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner's Order No. 2007-01, 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall not exceed the following PM$_{10}$ emission limitations for the No. 3 UF process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.004</td>
<td>0.085</td>
</tr>
<tr>
<td>Regeneration Furnace (Not in service)</td>
<td>0.004</td>
<td>1.537</td>
</tr>
</tbody>
</table>

D.15.2 Lake County Sulfur Dioxide (SO$_2$) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following SO$_2$ emission limitations for the No. 3 UF process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>SO$_2$ Limit (lbs/MMBtu)</th>
<th>SO$_2$ Limit (lbs/hour)</th>
</tr>
</thead>
</table>

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

Prior to the start-up of the new Coker (#2 Coker), permanently shutdown No. 3 Ultraformer, including 3UF heaters H-1, H-2, and F-7, and the 3UF Reformer, except for the C-2 splitter tower with associated piping and the D-18 flare gas separator.

Compliance with requirement to shutdown the No. 3 Ultraformer including the heaters H-1, H-2, and F-7 and Reformer, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.15.34 Fuel Gas Hydrogen Sulfide (H$_2$S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements of Section E.2 for the H-1 (until shutdown), H-2 (until shutdown), and F-7 (until shutdown) Process Heaters.

D.15.2 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.
(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

D.15.3 Miscellaneous Process Vents [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Section E.1 to control miscellaneous process vent emissions from the off gas knock-out drum (D-18).

This miscellaneous process vent is routed to the UIU Flare. Additional requirements for the UIU Flare are included in Section D.37.

D.15.4 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.15.7 Requirements for 40 CFR Part 63, Subpart UUU

Pursuant to 40 CFR 63, Subpart UUU, the No. 3 Ultraformer Unit and associated bypass lines shall comply with the requirements of Section E.10.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements of Section E.20 for process heaters H-1, H-2, and F-7, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.15.9 Operating Requirement

Pursuant to Permit SPM 089-25482-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the H-1, H-2, and F-7 Process Heaters.

D.15.10 Operating Requirement

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.15.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

Compliance Monitoring Requirements

D.15.5 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.
D.15.12  Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4-1.3(b)(1)(A) and to document compliance with Conditions D.15.2 and D.15.9, the Permittee shall maintain a daily record of the following for the H-1, H-2, and F-7 Process Heaters (until shutdown):

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8.7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.15.1 the Permittee shall maintain records for the No.3 Ultraformer process heaters as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.15.3, the Permittee shall maintain the records specified Section E.2.

D.15.13  Reporting Requirements

(a) Pursuant to 326 IAC 7-4-1.3(b)(2) and to document compliance with Conditions D.15.2 and D.15.9, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the H-1, H-2, and F-7 Process Heaters.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.15.4, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.15.5(a), the Permittee shall submit reports as specified in the LDAR plan.
(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.15.5(b) D.15.4(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.15.6 D.15.5, the Permittee shall submit reports as specified in Section E.1.

(d) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.15.7(a) D.15.6(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.15.7(b) D.15.6(b), the Permittee shall submit reports as specified in Section E.6.

(h) Pursuant to 40 CFR 63, Subpart UUU and to demonstrate compliance with Condition D.15.8 D.15.7, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.10.
 Facility Description [326 IAC 2-7-5(15)]:

(p) The No. 4 Ultraformer Unit (no. 4 UF), identified as Unit ID 224, built in 1972, upgrades low-octane naphtha to gasoline blending material and chemical feedstocks. The front-end of the unit is a desulfurization section. The reforming section consists of a series of process furnaces and catalyst-filled reactors in which the naphtha is heated and converted from straight chain to aromatic compounds. The reactor products are separated by distillation for further processing or blending into gasoline. A new reactor will be installed as part of the CXHO project. The No. 4 Ultraformer includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:

1. Nine (9) process heaters, all of which burn refinery gas, natural gas, or liquefied petroleum gas:

<table>

</table>

2. One (1) flare (identified as the 4UF flare), exhausting at stack S/V 224-06. The 4UF flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, preparation of equipment for maintenance, and reactor regenerations.

3. Six (6) catalyst-filled reactors, which are vented to flare stack S/V 224-06 during the initial catalyst depressuring and catalyst purging steps of the regeneration process.

4. Leaks from process equipment, including two (2) compressors (identified as K-1 and K-7), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

5. One (1) caustic scrubbing system, controlling the regeneration vent during the coke burn-off and catalyst rejuvenation process, which removes HAP emissions. The scrubber system includes:

   A. One (1) caustic scrubber exhausting to stack 224-07;

   B. One (1) carbon adsorption system used to treat waste scrubber liquor prior to disposal;

   C. Caustic feed unloading, storage, and transfer equipment.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
D.16.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall not exceed the following PM$_{10}$ emission limitations for the No. 4 UF process heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM$_{10}$ Limit (lbs/MMBtu)</th>
<th>PM$_{10}$ Limit (lbs/hour)</th>

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(j)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.16.2 Lake County Sulfur Dioxide (SO$_2$) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following SO$_2$ emission limitations for the No. 4 UF process heaters:

<table>
<thead>
<tr>
<th>Process Heater Identification</th>
<th>SO$_2$ Limit (lbs/MMBtu)</th>
<th>SO$_2$ Limit (lbs/hour)</th>

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.16.34 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements in Section E.2 for the F-1, F-8A, F-8B, F-2, F-3, F-4, F-5, F-6, and F-7 Process Heaters.

D.16.45 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs)[326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.
(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(d) Prior to start-up of 4UF after the installation of the new reactor for the CXHO project, BP shall make a determination as to whether 40 CFR Part 60 GGGa has been triggered by the changes made as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered.

D.16.67 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC, and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual wastewater drains systems and oil-water separators subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for process heaters F-1, F-8A, F-8B, F-2, F-3, F-4R, F-5, F-6, and F-7, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.16.8 Operating Requirement

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the F-1, F-8A, F-8B, F-2, F-3, F-4R, F-5, F-6, and F-7 Process Heaters.

D.16.9 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.16.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with the limits in D.16.3(a) shall be demonstrated as specified in Condition D.0.3.

D.16.10 Continuous Emissions Monitoring
The Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for F-1, F-2, F-3, F-4, F-5, F-6, F-7, F-8A and F-8B in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements

D.16.101 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.16.112 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4-1-3(b)(1)(A) and to document compliance with Conditions D.16.2, and D.16.8, the Permittee shall maintain a daily record of the following for the F-1, F-8A, F-8B, F-2, F-3, F-4, F-5, F-6, and F-7 Process Heaters:

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.16.4 D.16.3, the Permittee shall maintain the records specified in Section E.2.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.16.4 D.16.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.16.5(a) D.16.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.16.5(b) D.16.4(b), the Permittee shall keep records as specified in Section E.1 and E.4.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.16.7(a) D.16.6(a), the Permittee shall keep records as specified in Sections E.1 and E.3.

(g) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.16.7(b) D.16.6(b), the Permittee shall keep records as specified in Section E.6.

(h) Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.16.6 D.16.5, the Permittee shall keep records as specified in Section E.10.
In order to demonstrate compliance with Condition D.16.3, the Permittee shall maintain records of monthly firing rates and SO2 emissions at F-1, F-2, F-3, F-4, F-5, F-6, F-7, F-8A, and F-8B.

Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.16.10, the Permittee shall keep the following records for the continuous emission monitors:

1. One-minute block averages.
2. All documentation relating to:
   A. design, installation, and testing of all elements of the monitoring system, and
   B. required corrective action or compliance plan activities.
3. All maintenance logs, calibration checks, and other required quality assurance activities,
4. All records of corrective and preventive action, and
5. A log of plant operations, including the following:
   A. Date of facility downtime,
   B. Time of commencement and completion of downtime, and
   C. Reason for each downtime.

D.16.12 Reporting Requirements

1. Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.16.2, and D.16.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the F-1, F-8A, F-8B, F-2, F-3, F-4R, F-5, F-6, and F-7 Process Heaters.
2. Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.16.4, the Permittee shall submit to IDEM, OAQ the reports specified in Condition E.2.
3. Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.16.5(a), the Permittee shall submit reports as specified in the LDAR plan.
4. Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.16.5(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.
5. Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.16.7(a) and D.16.8, the Permittee shall submit reports as specified in Sections E.1 and E.3.
6. Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.16.7(b), the Permittee shall submit reports as specified in Section E.6.
7. Pursuant to 40 CFR 63, Subpart UUU and to demonstrate compliance with Condition D.16.5, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.10.
(h) In order to demonstrate compliance with Condition D.16.3, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions at heaters F-1, F-2, F-3, F-4, F-5, F-6, F-7, F-8A, and F-8B to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(i) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.16.3 and D16.10, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments
SECTION D.17 FACILITY OPERATION CONDITIONS - Hydrogen Unit

Facility Description [326 IAC 2-7-5(15)]:

(q) The Hydrogen Unit (HU), identified as Unit ID 698, commissioned in 1993, produces 99+% pure hydrogen needed for the refinery hydrotreating processes. The HU produces high purity hydrogen by reacting steam with methane. The reaction is carried out by heating the mixture in a furnace and reacting it in the presence of a catalyst. The HU includes the following sources of emissions and may also include insignificant activities listed in Section A.4 of this permit:

(1) One (1) natural gas, refinery gas or liquified petroleum gas fired B-501 Process Heater rated at 366.3 MMBTU/hr, which exhausts at stack S/V 698-01. The Process Heater is equipped with low-NOx burners.

(2) One (1) DDU Flare exhausting at stack S/V 698-02, burning natural gas as the pilot gas, used to control VOC emissions during emergency situations, unit startups and shutdowns and depressuring equipment for maintenance.

(3) Leaks from process equipment.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.17.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), PM10 emissions from the B-501 HU Process Heater shall not exceed 0.0075 lb/MMBTU and 2.729 lb/hr 0.009 lb/MMBTU and 3.340 lbs/hour.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.17.2 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the B-501 process heater shall not exceed 0.033 lbs/MMBtu and 12.09 lbs/hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-2 not applicable, the Permittee shall comply with the following:

(a) The emissions from B-501 shall not exceed the following limits:

<table>
<thead>
<tr>
<th>Heater ID</th>
<th>NOx (lb/MMBTU)</th>
<th>CO (lb/MMBTU)</th>
<th>VOC (lb/MMBTU)</th>
<th>PM (lb/MMBTU)</th>
<th>PM-10 (lb/MMBTU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>B-501</td>
<td>0.0675</td>
<td>0.02</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
</tbody>
</table>
(b) After the start-up of the new Coker (#2 Coker), the SO2 emissions from B-501 shall not exceed 15.5 tons per 12 consecutive month period, with compliance determined at the end of each month.

(c) After the start-up of the new Coker (#2 Coker), the firing rate at B-501 shall not exceed 2,809,332 million BTU per 12 consecutive month period, with compliance determined at the end of each month.

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.17.34 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

(a) Pursuant to Permit CP 089-2055-00003, issued March 12, 1992 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements in Section E.2 for the HU Process Heater B-501 and DDU Flare. The requirements for the DDU Flare are included in Section D.35.

(b) To demonstrate compliance with paragraph (a) of this condition and as approved by the U.S. EPA on March 3, 1999, the Permittee shall comply with the following alternative compliance monitoring requirements for the B-501 process heater:

1. The Permittee shall sample the fuel gas at the representative location once every eight hour shift (three times per day) during the unit's operation with no more than ten hours elapsing between each sampling event. H2S concentration shall be determined using three gas detection tubes with a span of 0-5 ppm for each sampling event.

2. The Permittee shall calculate the average of the gas detection tube readings for each sampling event.

3. If the H2S concentrations equal or exceed 5 ppm within one hour, the Permittee shall begin performing H2S sampling and analysis every hour using three gas tubes with a span of 0-200 ppm.

4. When three consecutive hours of sampling with the 0-200 ppm gas detection tubes indicate that the H2S concentration is below 5 ppm, the Permittee may revert to sampling as provided in paragraph (b)(1) of this condition.

5. If the H2S concentration ever exceeds 80 ppm, the Permittee shall install and certify a H2S CEM within 180 days, and in the mean time continue to follow this approved alternative monitoring method.

6. The Permittee shall submit quarterly summary reports indicating all instances when the H2S concentration equals or exceeds 80 ppm, the actual H2S concentration, and the times the unit was not operational.

7. The Permittee shall maintain records of the gas detection tube results used to prepare the quarterly reports on file for at least two (2) years.

8. The Permittee must obtain written approval from the U.S. EPA, Region V prior to using gas detection tubes with a 0-15 ppm span.
Pursuant to Permit CP 089-2055-00003 issued on March 12, 1992, the Permittee shall comply with the following emission limitations and operating conditions:

(a) Nitrogen Oxide (NO\textsubscript{x}) emissions from the B-501 Process Heater shall not exceed 0.078 lb/MMBTU. This is equivalent to NO\textsubscript{x} emissions of 125 tons per year from the B-501 Process Heater.

(b) Carbon Monoxide (CO) emissions from the B-501 Process Heater shall not exceed 0.02 lb/MMBTU. This is equivalent to CO emissions of 32 tons per year from the B-501 Process Heater.

(c) All compressor seals in volatile organic compound (VOC) service shall be purged and vented to the flare header.

(d) The Propane Dewaxing Unit and Asphalt Oxidizer Nos. 2 and 3 shall remain inoperative.

Compliance with these limits makes 326 IAC 2-2 (Prevention of Significant Deterioration (PSD)) and 326 IAC 2-3 (Emission Offset) not applicable.

Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

Pursuant to 40 CFR 63.640(p), equipment that is subject to both 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC are required to comply only with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Pursuant to 40 CFR 60, Subpart QQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQ.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for process heater B-501, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the B-501 Process Heater.
D.17.9 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.17.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with the limits in D.17.3(a) shall be demonstrated as specified in Condition D.0.3.

D.17.10 Testing Requirements [326 IAC 2-7-6(1),(6)] [326 IAC 2-1.1-11]

(a) Within 36 months after the effective date of this permit, in order to demonstrate compliance with Condition D.17.3(a), the Permittee shall perform NO x testing of the B-501 Process Heater. This test shall be repeated at least once every five (5) years from the date of the valid compliance demonstration.

(b) Within 36 months after the effective date of this permit, in order to demonstrate compliance with Condition D.17.4(b), the Permittee shall perform CO testing of the B-501 Process Heater. This test shall be repeated at least once every five (5) years from the date of the valid compliance demonstration.

(c) Testing shall be conducted in accordance with Section C.12 – Performance Testing utilizing methods approved by the Commissioner.

D.17.10 Continuous Emissions Monitoring

The Total Reduced Sulfur continuous emission monitoring system (CEMS) for B-501 shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limit for B-501 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.17.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.17.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.17.2, and D.17.8, the Permittee shall maintain a daily record of the following for the B-501 process heater:

(1) fuel type,

(2) average daily sulfur content for each fuel type,

(3) average daily fuel gravity for each fuel type,

(4) total daily fuel usage for each type, and

(5) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.17.1, the Permittee shall maintain records for Process Heater B-501 as specified in the Continuous Compliance Plan.
(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.17.4 D.17.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.17.6(a) D.17.5(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.17.6(b) D.17.5(b), the Permittee shall keep records as specified in Sections E.1, E.4, and E.13.

(f) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.17.7 D.17.6, the Permittee shall keep records as specified in Section E.6.

(g) In order to demonstrate compliance with Condition D.17.3, the Permittee shall maintain records of monthly firing rate and SO2 emissions at B-501.

(h) Pursuant to 326 IAC 3-5-6 and to demonstrate compliance with D.17.10, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.

(2) All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:
   (A) Date of facility downtime,
   (B) Time of commencement and completion of downtime, and
   (C) Reason for each downtime.

D.17.13 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.17.2, and D.17.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the B-501 process heater.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.17.4 D.17.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.17.6(a) D.17.5(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.
(d) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.17.6(b) D.17.5(b), the Permittee shall submit reports as specified in Sections E.1, E.4, and E.13.

(e) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.17.7 D.17.6, the Permittee shall submit reports as specified in Section E.6.

(f) In order to demonstrate compliance with Condition D.17.3, the Permittee shall submit a quarterly summary of the monthly firing rate and SO2 emissions at heater B-501 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(g) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.17.3 and D.17.10, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
SECTION D.18 FACILITY OPERATION CONDITIONS - Distillate Desulfurizer Unit

Facility Description [326 IAC 2-7-5(15)]:

The Distillate Desulfurizer Unit (DDU), identified as Unit ID 700, commissioned in 1993, removes sulfur from petroleum distillates. Distillate feed is mixed with hydrogen, heated in process furnaces and passed over a catalyst bed to convert sulfur compounds to H2S. The DDU includes the following emissions sources and may also include insignificant activities listed in Section A.4 of this permit:

1. Process Heater WB-301, rated at 64.8 MMBTU/hr and exhausting to stack S/V 700-01. The Process Heater is equipped with low-NOx burners and burns natural gas, refinery gas, or liquified petroleum gas.
2. Process Heater WB-302, rated at 83.7 MMBTU/hr and exhausting to stack S/V 700-02. The Process Heater is equipped with low-NOx burners and burns natural gas, refinery gas, or liquified petroleum gas.
3. Leaks from process equipment.
4. The Distillate Desulfurization Unit is connected to the DDU Flare System. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns and depressuring equipment for maintenance.

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.18.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall not exceed the following PM10 emission limitations for the DDU Process Heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM10 Limit (lbs/MMBTU)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>WB-301</td>
<td>0.004</td>
<td>0.250</td>
</tr>
<tr>
<td>WB-302</td>
<td>0.004</td>
<td>0.240</td>
</tr>
</tbody>
</table>

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.
Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the WB-301 and WB-302 process heaters shall each not exceed 0.033 lbs/MMBtu and the total emissions from both process heaters shall not exceed 4.24 lbs/hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-2 not applicable, the Permittee shall comply with the following:

(a) For heaters WB-301 and WB-302, the emissions shall not exceed the following emissions limits:

<table>
<thead>
<tr>
<th>Heater ID</th>
<th>NOx</th>
<th>CO</th>
<th>VOC</th>
<th>PM</th>
<th>PM-10</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(lb/mmBTU)</td>
<td>(lb/mmBTU)</td>
<td>(lb/mmBTU)</td>
<td>(lb/mmBTU)</td>
<td>(lb/mmBTU)</td>
</tr>
<tr>
<td>WB-301</td>
<td>0.035</td>
<td>0.04</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>WB-302</td>
<td>0.030</td>
<td>0.04</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
</tbody>
</table>

(b) The Permittee shall comply with the following limits, following the start-up of the new coker (#2 Coker):

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate ($10^3$ mmBTU) per 12 consecutive month period</th>
<th>SO2 tons per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>WB-301</td>
<td>620.21</td>
<td>3.4</td>
</tr>
<tr>
<td>WB-302</td>
<td>488.81</td>
<td>2.7</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.18.45 Emission Offset and Prevention of Significant Deterioration (PSD) [326 IAC 2-2] [326 IAC 2-3]

Pursuant to Permit CP 089-2055-00003 issued on March 12, 1992, and amended on February 19, 1999, the Permittee shall comply with the following emission limitations and operating conditions:

(a) Prior to start-up of the new coker (#2 Coker), nitrogen Oxide (NOx) emissions from the WB-301 and WB-302 Process Heaters shall not exceed 0.065 lb/MMBTU. This is equivalent to total NOx emissions of 36.6 tons per year from the WB-301 and WB-302 Process Heaters.

(b) Pursuant to permit CP 089-2055-0003, carbon Monoxide (CO) emissions from the WB-301 and WB-302 Process Heaters shall not exceed 0.04 lb/MMBTU. This is equivalent to total CO emissions of 22.5 tons per year from the WB-301 and WB-302 Process Heaters.
Prior to start-up of the new coker (#2 Coker), the input of natural gas and natural gas equivalents to Process Heaters WB-301 and WB-302 shall be limited to a total of 1089.7 million cubic feet (MMcf) per twelve (12) consecutive month period, with compliance determined at the end of every month. For the purpose of determining compliance with this limit, every one (1.0) MMcf of refinery gas usage shall be considered equivalent to one (1.0) MMcf of natural gas usage.

All compressor seals in volatile organic compound (VOC) service shall be purged and vented to the flare header.

The Propane Dewaxing Unit and Asphalt Oxidizer Nos. 2 and 3 shall remain inoperative.

Compliance with these limits makes 326 IAC 2-2 (Prevention of Significant Deterioration (PSD)) and 326 IAC 2-3 (Emission Offset) not applicable.

Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.4, and E.13 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service. Pursuant to 40 CFR 63.640(p), equipment that is subject to both 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC are required to comply only with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Prior to start-up of the new coker (#2 Coker), BP shall make a determination as to whether 40 CFR Part 60, Subpart GGGa has been triggered by component changes made on the DDU as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.
Compliance Determination Requirements

D.18.8 Operating Requirement

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the WB-301 and WB-302 Process Heaters.

D.18.9 Operating Requirement

(a) Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.18.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

(b) Compliance with limits in condition D.18.3(a) shall be demonstrated as specified in Condition D.0.3.

D.18.10 Testing Requirements [326 IAC 2-7-6(1),(6)] [326 IAC 2-1.1-11]

(a) Within 36 months after the effective date of this permit, in order to demonstrate compliance with Condition D.18.4(a), the Permittee shall perform NO\textsubscript{x} testing of the WB-301 Process Heater.

(b) Within 36 months after the effective date of this permit, in order to demonstrate compliance with Condition D.18.4(b), the Permittee shall perform CO testing of the WB-301 and WB-302 Process Heaters.

(c) Testing shall be conducted in accordance with Section C-12 - Performance Testing utilizing methods approved by the Commissioner.

D.18.10 Continuous Emissions Monitoring

The Total Reduced Sulfur continuous emission monitoring system (CEMS) for WB-301 and WB-302 shall be calibrated, maintained, and operated for determining compliance with SO\textsubscript{2} emissions limits for WB-301 and WB-302 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO\textsubscript{2} emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO\textsubscript{2}.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.18.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.18.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.18.2, and D.18.8, the Permittee shall maintain a daily record of the following for the WB-301 and WB-302 process heaters:
(1) fuel type,

(2) average daily sulfur content for each fuel type,

(3) average daily fuel gravity for each fuel type,

(4) total daily fuel usage for each type, and

(5) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.8.1, the Permittee shall maintain records for the WB-301 and WB-302 as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.18.4 D.18.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 6-4-8 and to document compliance with Condition D.18.6(a) D.18.5(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC and to document compliance with Condition D.18.6(b) D.18.5(b), the Permittee shall keep records as specified in Sections E.1, E.4, and E.13.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.18.7(a) D.18.6(a), the Permittee shall keep records as specified in Sections E.1 and E.3.

(g) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.18.7(b) D.18.6(b), the Permittee shall keep records as specified in Section E.6.

(h) In order to demonstrate compliance with Condition D.18.3, the Permittee shall maintain records of monthly firing rates and SO2 emissions at WB-301 and WB-302.

(i) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.18.10, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.

(2) All documentation relating to:

(A) design, installation, and testing of all elements of the monitoring system, and

(B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

(A) Date of facility downtime,
(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

D.18.13 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.18.2, and D.18.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the WB-301 and WB-302 process heaters.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.18.4 D.18.3, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.18.6(a) D.18.5(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC and to document compliance with Conditions D.18.6(b) D.18.5(b), the Permittee shall submit reports as specified in Sections E.1, E.4, and E.13.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.18.7(a) D.18.6(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(f) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.18.7(b) D.18.6(b), the Permittee shall submit reports as specified in Section E.6.

(g) In order to demonstrate compliance with Condition D.18.3, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions at heaters WB-301 and WB-302 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(h) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.18.3 and D.18.10, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,
(2) Date of excess emissions,
(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
(5) A summary itemizing the exceedances by cause.
(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
(A) Date of downtime.
(B) Time of commencement.
(C) Duration of each downtime.
(D) Reasons for each downtime.
(E) Nature of system repairs and adjustments
SECTION D.19 FACILITY OPERATION CONDITIONS - Cat Feed Hydrotreating Unit

Facility Description [326 IAC 2-7-5(15)]:

(s) The Cat Feed Hydrotreating Unit (CFHU), identified as Unit ID 171, built in 1982, removes sulfur from and improves the quality of gas oil feed to the Fluidized Cracking Units. The No. 4 Ultraformer Flare Stack, S/V 224-06, is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The CFHU is connected to the No. 4 Ultraformer flare stack. The flare is used to control VOC emissions, unit startups and shutdowns, and preparation of equipment for maintenance. The CFHU includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) Three (3) process heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBTU/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-801 A/B</td>
<td>66.5</td>
<td>171-01</td>
<td>low-NOx burners</td>
</tr>
<tr>
<td>F-801C</td>
<td>60.0</td>
<td>171-02</td>
<td>ultra low-NOx burners</td>
</tr>
</tbody>
</table>

(2)Leaks from process equipment.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.19.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to Commissioner’s Order No. 2007-01 the PM10 from the CFHU Process Heaters F-801A, F-801B and F-801C shall not exceed 0.0075 lb/MMBTU and 0.943 lb/hr (total). 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), PM10 emissions from the CFHU Process Heaters F-801A/B shall be limited to 0.004 lbs/MMBTU and 0.246 lbs/hour.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.19.2 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the CFHU Process Heaters shall be limited as follows:

<table>
<thead>
<tr>
<th>Process Heater Identification</th>
<th>SO2 Limit (lbs/MMBtu)</th>
<th>SO2 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-801A/B</td>
<td>0.035</td>
<td>2.33</td>
</tr>
<tr>
<td>F-801C</td>
<td>0.035</td>
<td>2.1</td>
</tr>
</tbody>
</table>

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-2 not applicable, the Permittee shall comply with the following:

(a) For heaters F-801A, F-801B, and F-801C, the emissions shall not exceed the following emissions limits:

<table>
<thead>
<tr>
<th>Heater ID</th>
<th>NOx (lb/mmBTU)</th>
<th>CO (lb/mmBTU)</th>
<th>VOC (lb/mmBTU)</th>
<th>PM (lb/mmBTU)</th>
<th>PM-10 (lb/mmBTU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-801A</td>
<td>0.049</td>
<td>0.082</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>F-801B</td>
<td>0.049</td>
<td>0.082</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>F-801C</td>
<td>0.036</td>
<td>0.0001</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
</tbody>
</table>

(b) The Permittee shall comply with the following limits following the start-up of the new coker (*#2 Coker*):

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate (10^3 mmBTU) per 12 consecutive month period</th>
<th>SO2 tons per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-801A</td>
<td>215.5</td>
<td>1.2</td>
</tr>
<tr>
<td>F-801B</td>
<td>215.5</td>
<td>1.2</td>
</tr>
<tr>
<td>F-801C</td>
<td>215.5</td>
<td>1.2</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.19.34 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to Permit SSM 089-14630-00003, issued on November 30, 2001 and 40 CFR 60.104(1)(a), the Permittee shall comply with the requirements specified in Section E.2 for the F-801 A/B and F-801C process heaters.

D.19.45 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) 326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 12] [40 CFR 60, Subpart GGG]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.4, and E.13 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service. Pursuant to 40 CFR 63.640(p), equipment that is subject to both 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC are required to comply only with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.
Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for the process heaters F-801A/B and F-801C, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

Operating Requirement

(a) Pursuant to Permit SSM 089-14630-00003, issued on November 30, 2001, fuel oil shall not be used as fuel for the CFHU Heaters.

(b) Compliance with the limits in Condition D.19.3(a) shall be demonstrated as specified in Condition D.0.3.

Prevention of Significant Deterioration (PSD) [326 IAC 2-2]

Pursuant to SSM 089-14630-00003, issued on November 30, 2001 and SPM 089-18588-00453, issued July 15, 2004, the Permittee shall comply with the following requirement:

Nitrogen oxide emissions from Furnace F-801C shall be controlled by ultra low-NOx burners having an emission rate of 0.040 pounds per million Btu or less. This limit equates to a potential to emit 10.51 tons of nitrogen oxides per year for Furnace F-801C. This condition renders the requirements of PSD as not applicable for nitrogen oxides.

Testing Requirements [326 IAC 2-7-6(1),(6)] [326 IAC 2-1.1-11]

Within 5 years after the effective date of this permit, in order to demonstrate compliance with Condition D.19.11, the Permittee shall perform NOx testing of the F-801C Process Heater utilizing methods as approved by the Commissioner. This test shall be repeated at least once every five (5) years from the date of the valid compliance demonstration. Testing shall be conducted in accordance with Section C – Performance Testing.

Continuous Emissions Monitoring

The Total Reduced Sulfur continuous emission monitoring system (CEMS) for F-801A, F-801B, and F-801C shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for F-801A, F-801B, and F-801C in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.
Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.19.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

Compliance Monitoring Requirements

D.19.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.19.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.19.2, and D.19.7, the Permittee shall maintain a daily record of the following for the CFHU Process Heaters F-801A/B and F-801C:

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel.

(b) Pursuant to 326 IAC 8-4-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.19.1, the Permittee shall maintain records for the F-801A/B process heater as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.19.4 D.19.3, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.19.5(a) D.19.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.19.5(b) D.19.4(b), the Permittee shall keep records as specified in Sections E.1, E.4, and E.13.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, and to document compliance with Condition D.19.6(a) D.19.5(a), the Permittee shall keep records as specified in Sections E.1 and E.3.11.

(g) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.19.6(b) D.19.5(b), the Permittee shall keep records as specified in Section E.6.

(h) In order to demonstrate compliance with Condition D.19.3, the Permittee shall maintain records of monthly firing rates at F-801A, F-801B, and F-801C, and monthly emissions of SO2 from F-801A, F-801B, and F-801C.

(i) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.19.9, the Permittee shall keep the following records for the continuous emission monitors:
(1) One-minute block averages.

(2) All documentation relating to:

   (A) design, installation, and testing of all elements of the monitoring system, and

   (B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

   (A) Date of facility downtime,

   (B) Time of commencement and completion of downtime, and

   (C) Reason for each downtime.

D.19.13 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.19.2, and D.19.7, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the CFHU Process Heaters F-801A/B and F-801C.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Conditions D.19.4 D.19.3, the Permittee shall submit the records as specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.19.5(a) D.19.4(a), the Permittee shall submit reports as specified in the LDAR plan.5

(d) Pursuant to 40 CFR 63, Subpart CC, 40 CFR 63, Subpart GGG, and to document compliance with Condition D.19.5(b) D.19.4(b), the Permittee shall submit reports as specified in Sections E.1, E.4, and E.13.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.19.6(a) D.19.5(a), the Permittee shall submit records as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.19.6(b) D.19.5(b), the Permittee shall submit records as specified in Section E.6.

(e) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.19.3 and D.19.10, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

   (1) Monitored facility operation time during the reporting period,

   (2) Date of excess emissions,

   (3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.

(5) A summary itemizing the exceedances by cause.

(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
SECTION D.20 FACILITY OPERATION CONDITIONS - Catalytic Refining Unit

Facility Description [326 IAC 2-7-5(15)]:

(t) The Catalytic Refining Unit (CRU), identified as Unit ID 201, which removes sulfur from petroleum naphthas and distillates. Naphtha or distillate feed is mixed with hydrogen, heated in process furnaces and passed over a catalyst bed inside one of two reactor trains, identified as D-114 and D-105, to convert sulfur compounds to hydrogen sulfide. Hydrogen sulfide is subsequently removed from the product by distillation followed by scrubbing with an amine. The CRU includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. Two (2) heaters, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-101</td>
<td>72</td>
<td>201-01</td>
<td>Low-NO&lt;sub&gt;x&lt;/sub&gt; Burners</td>
</tr>
<tr>
<td>F-102A</td>
<td>60</td>
<td>201-02</td>
<td>Low-NO&lt;sub&gt;x&lt;/sub&gt; Burners</td>
</tr>
</tbody>
</table>

2. The CRU is connected to the UIU flare stack, S/V 220-04. The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

3. Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

Main Operating Scenario:
The CRU operates as a naphtha hydrotreater. Maximum production under this scenario is 27,000 barrels per day.

Alternative Operating Scenario:
The CRU operates as a distillate hydrotreater. Maximum production under this scenario is 40,000 barrels per day.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.20.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)) Commissioner’s Order No. 2007-01, the Permittee must comply with the following PM10 emission limitations for the CRU Process Heaters:

<table>
<thead>
<tr>
<th>Process Heater</th>
<th>PM10 Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-101</td>
<td>0.0040.0075</td>
<td>0.2670.536</td>
</tr>
<tr>
<td>F-102A</td>
<td>0.0040.0075</td>
<td>0.2900.447</td>
</tr>
</tbody>
</table>
(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.20.2 Lake County Sulfur Dioxide (SO\textsubscript{2}) Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following SO\textsubscript{2} emission limitations for the CRU Process Heaters:

<table>
<thead>
<tr>
<th>Process Heater Identification</th>
<th>SO\textsubscript{2} Limit (lbs/MMBtu)</th>
<th>SO\textsubscript{2} Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-101</td>
<td>0.04</td>
<td>2.88</td>
</tr>
<tr>
<td>F-102A</td>
<td>0.04</td>
<td>2.40</td>
</tr>
</tbody>
</table>

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-2 not applicable, the Permittee shall comply with the following:

(a) For heaters F-101 and F-102A, the emissions shall not exceed the following emissions limits:

<table>
<thead>
<tr>
<th>Heater ID</th>
<th>NO\textsubscript{x} (lb/mmBTU)</th>
<th>CO (lb/mmBTU)</th>
<th>VOC (lb/mmBTU)</th>
<th>PM (lb/mmBTU)</th>
<th>PM-10 (lb/mmBTU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>F101</td>
<td>0.08</td>
<td>0.082</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
<tr>
<td>F-102A</td>
<td>0.08</td>
<td>0.082</td>
<td>0.0054</td>
<td>0.0019</td>
<td>0.0075</td>
</tr>
</tbody>
</table>

(b) The Permittee shall comply with the following limits, following the completion of the CXHO project:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Firing rate (10\textsuperscript{3} mmBTU) per 12 consecutive month period</th>
<th>SO\textsubscript{2} tons per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-101</td>
<td>208.49</td>
<td>1.2</td>
</tr>
<tr>
<td>F-102A</td>
<td>208.49</td>
<td>1.2</td>
</tr>
</tbody>
</table>

Compliance with the limits on the annual firing rates and the NO\textsubscript{x}, VOC, SO\textsubscript{2}, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NO\textsubscript{x}, VOC, SO\textsubscript{2}, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.20.34 Fuel Gas Hydrogen Sulfide (H\textsubscript{2}S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements in Section E.2 for the F-101 and F-102A process heaters.
D.20.45 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs)  
[326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 12]  
[40 CFR 60, Subpart GGG]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements in Sections E.1, E.4, and E.13 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service. Pursuant to 40 CFR 63.640(p), equipment that is subject to both 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC are required to comply only with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.20.56 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14]  
[40 CFR 61, Subpart FF]

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil-water separators, and closed-vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

D.20.67 Prevention of Significant Deterioration (PSD) [326 IAC 2-2]

Pursuant to SSM 089-15052-00453, issued November 17, 2003:

(a) Nitrogen Oxide emissions from Process Heater F-101 shall be controlled by low-NO\textsubscript{x} burners having an emission rate of 0.080 pounds per million Btu heat input or less. This limit equates to a potential to emit 25.2 tons of nitrogen oxides per year.

(b) Nitrogen Oxide emissions from Process Heater F-102A shall be controlled by low-NO\textsubscript{x} burners having an emission rate of 0.080 pounds per million Btu heat input or less. This limit equates to a potential to emit 21.0 tons of nitrogen oxides per year.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for the process heaters F-101 and F-102A, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.20.8 Operating Requirement

(a) Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the F-101 and F-102A Process Heaters.

(b) Compliance with the limits in Condition D.20.3(a) shall be demonstrated as specified in Condition D.0.3.
D.20.9 Continuous Emissions Monitoring

The Total Reduced Sulfur continuous emission monitoring system (CEMS) for F-101 and F-102A shall be calibrated, maintained, and operated for determining compliance with SO2 emissions limits for F-101 and F-102 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment. The SO2 emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO2.

D.20.10 Operating Requirement

Pursuant to 326 IAC 7-4.1-3(b)(1) and except as specified in 326 IAC 7-4.1-2(d) and 326 IAC 7-2-1(c)(3), compliance with the sulfur dioxide emission limitations in Condition D.20.2 shall be determined based on the daily average sulfur dioxide emission rate, in pounds per hour.

Compliance Monitoring Requirements

D.20.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.20.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.20.2, and D.20.8, the Permittee shall maintain a daily record of the following for the F-101 and F-102A Process Heaters:

(1) fuel type,
(2) average daily sulfur content for each fuel type,
(3) average daily fuel gravity for each fuel type,
(4) total daily fuel usage for each type, and
(5) heat content of each fuel.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.20.4 D.20.3, the Permittee shall maintain the records as specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8, and to document compliance with Condition D.20.5(a) D.20.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.20.6 D.20.5, the Permittee shall keep records as specified in Sections E.1 and E.3.

(e) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.20.5(b) D.20.4(b), the Permittee shall keep records as specified in Sections E.1, E.4., and E.13.

(f) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.20.1, the Permittee shall maintain records for the Process Heaters F-101 and F-102A, as specified in the Continuous Compliance Plan.
(g) In order to demonstrate compliance with Condition D.20.3, the Permittee shall maintain records of monthly firing rates and SO2 emissions at F-101 and F-102A.

(h) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.20.9, the Permittee shall keep the following records for the continuous emission monitors:

   (1) One-minute block averages.

   (2) All documentation relating to:

   (A) design, installation, and testing of all elements of the monitoring system, and

   (B) required corrective action or compliance plan activities.

   (3) All maintenance logs, calibration checks, and other required quality assurance activities,

   (4) All records of corrective and preventive action, and

   (5) A log of plant operations, including the following:

   (A) Date of facility downtime,

   (B) Time of commencement and completion of downtime, and

   (C) Reason for each downtime.

---

D.20.13 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.20.2 and D.20.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour, for the F-101 and F-102A Process Heaters.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.20.4, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.20.5(a), the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC, 40 CFR 63, Subpart GGG and to document compliance with Condition D.20.5(b) and D.20.4(c), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(e) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.20.7 and D.20.6, the Permittee shall submit reports as specified in Sections E.1 and E.3.

(f) In order to demonstrate compliance with Condition D.20.3, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions at heaters F-101 and F-102A to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).
(g) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.20.3 and D20.9, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments.
SECTION D.21 FACILITY OPERATION CONDITIONS - Fluidized Catalytic Cracking Unit 500

Facility Description [326 IAC 2-7-5(15)]:

(u) The Fluidized Catalytic Cracking Unit (FCU) 500, constructed in 1945, identified as Unit ID 230 and rated at 115,000 barrels per day. This facility converts hydrocarbons that boil above 500°F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 500 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. One (1) catalyst regenerator. Flue gas from the regenerator passes through an ammonia injection system, a waste heat recovery unit which generates steam, an Electrostatic Precipitator for particulate matter control, and is exhausted through stack S/V 230-01. The ammonia injection system includes aqueous ammonia injection and handling equipment. Aqueous ammonia is transferred from the FCU 600 SCR system’s storage tanks.

2. Three (3) catalyst storage bins, one each for spent, equilibrium, and fresh catalyst. Particulate emissions from the spent catalyst storage bin, identified as Bin F-52, are controlled by one (1) cyclone, which exhausts to stack S/V 230-03.

3. One (1) flare exhaust at stack S/V 241-01 (VRU Flare). The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

4. Leaks from process equipment, including two (2) compressors (identified as J-3D and J-3G), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system.

5. As part of the FCU 500 WARP, per SSM 089-25484-00453, the existing FCU 500 blowdown stack is being shutdown and the pressure relief discharges that were vented to the blowdown stack will be routed to the VRU flare.

6. The FCU 500 turnaround (TAR) project, per SSM 089-25484-00453, for the repair or replacement of the power recovery turbine, and the air ring for the catalyst regenerator. The increases in emissions from FCU 500 TAR are already accounted for as CXHO project related emissions increases.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.21.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), PM10 emissions from FCU 500 shall not exceed 1.22 pounds per thousand pounds of coke burned and 73.2 pounds per hour.
Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.21.2 Lake County Sulfur Dioxide Emission Limitations [326 IAC 7-4.1-3]
Pursuant to 326 IAC 7-4.1-3 (formerly 326 IAC 7-4-1.1(c)), sulfur dioxide (SO2) emissions from FCU 500 shall not exceed 750 pounds per hour.

D.21.3 State Operation Permit Requirements
Pursuant to Operation Permit 45-08-08-0561, issued on January 12, 1990 and amended on October 28, 1992, April 14, 1993 and October 29, 1993, the FCU 500 shall be limited as follows:

(a) particulate matter (PM) emissions shall not exceed 191.8 pounds per hour.

(b) SO2 emissions shall not exceed 1500 pounds per hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for FCU 500 after the start-up of the new Coker (#2 Coker):

(a) The emissions of NOx shall not exceed 155.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of VOC shall not exceed 3.3 pounds per 1000 barrels of fresh feed used per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of SO2 shall not exceed 200.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of PM and PM-10 shall not exceed 0.465 pounds per 1000 pounds of coke burned at FCU 500 per 12 consecutive month period, with compliance determined at the end of each month.

(e) The emissions of CO shall not exceed 147.2 tons per 12 consecutive month period, with compliance determined at the end of each month.

(f) The fresh feed used at FCU 500 shall not exceed 37.6 million barrels per 12 consecutive month period, with compliance determined at the end of each month.

(g) The coke burned at FCU 500 shall not exceed 669,191,000 pounds per 12 consecutive month period, with compliance determined at the end of each month.

(h) The FCU 500 blowdown stack shall be permanently shutdown and the pressure relief discharges that were routed to the blowdown stack will be routed to the VRU flare.
Compliance with the FCU 500 throughput limits and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, CO, SO2, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.21.4 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 12] [40 CFR 60, Subpart GGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

Prior to start-up of the FCU 500 after the TAR project, BP shall make a determination as to whether 40 CFR 60, Subpart GGa has been triggered by component changes made on the ARU as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGa has been triggered, BP shall comply with the requirements of that rule upon startup.

D.21.5 Requirements for 40 CFR Part 63, Subpart UUU

Pursuant to 40 CFR 63, Subpart UUU, Fluidized Catalytic Cracking Unit 500 shall comply with the requirements specified in Section E.10.

D.21.6 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, Subpart CC and 40 CFR 60, Subpart QQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.21.7 Alternative Opacity Requirements [326 IAC 5-1-3]

(a) Pursuant to 326 IAC 5-1-3(a), when building a new fire in a boiler, or shutting down a boiler, opacity may exceed 20%; however, opacity levels shall not exceed 60% for any six (6) minute averaging period. Opacity in excess of 20% shall not continue for more than two (2) six (6) minute averaging periods in any twenty-four (24) hour period.
(b) Pursuant to 326 IAC 5-1-3(b), when moving ashes from the fuel bed or furnace in the FCU 500 boiler blowing tubes, opacity may exceed 20% in any one (1) six (6) minute averaging period. However, the opacity shall not exceed 60% for any six (6) minute averaging period and opacity in excess of 20% shall not continue for more than one (1) six (6) minute averaging period in a sixty (60) minute period. The averaging period shall not be permitted for more than three (3) six (6) minute averaging periods in a twelve (12) hour period.

Compliance Determination Requirements

D.21.8 Operating Requirement

(a) Pursuant to SPM 089-15202-00003, issued on April 24, 2002 and SPM 089-18588-00453, issued July 15, 2004, carbon monoxide (CO) emissions shall not exceed 500 parts per million by volume, on a dry basis, based on 1-hour averages. The CO limits shall not apply during periods of startup, shutdown, or malfunction.

(b) Compliance with the limits in Condition D.21.3(b) and (d) shall be demonstrated as specified in Condition D.0.3.

In order to demonstrate compliance with Condition D.21.3, after the startup of the New Coker (#2 Coker):

(c) The pressure relief discharges that were routed to the FCU 500 blowdown stack shall be routed to the VRU flare. The flare must be operated with a flame present at all times that FCU 500 is in operation.

D.21.9 Continuous Emissions Monitoring

The NOx, CO, and SO2 continuous emission monitoring systems (CEMS) for FCU 500 shall be calibrated, maintained, and operated for determining compliance with NOx, CO, and SO2 emissions limits for FCU 500 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements

D.21.910 Inspection and Monitoring Requirements for the Electrostatic Precipitator [326 IAC 6.8-8-7]

Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(r)(2)), the Permittee shall maintain a Continuous Compliance Plan (CCP) for the ESP. The CCP shall include recording, inspection, and maintenance procedures in accordance with the requirements provided in 326 IAC 6.8-8-7(2)(A) and (B) (formerly 326 IAC 6-1-10.1(r)(2)(A) and (B)), including operating parameters to be monitored and the inspection and maintenance schedule to be followed. The Permittee shall inspect the ESP according to the schedule and procedures specified in the CCP. Pursuant to 326 IAC 2-7-5(1)(B)(ii), the inspection schedule records shall be available for inspection by IDEM, OAQ for up to five (5) years after the date of inspection.

D.21.4011 Continuous Monitoring [326 IAC 3-5-1(e)] [326 IAC 6.8-8]

(a) Pursuant to SPM 089-15202-00003, issued on April 24, 2002, SPM 089-18588-00453, issued July 15, 2004, and to demonstrate compliance with Conditions D.21.2 and D.21.7, continuous monitoring systems shall be installed, certified, calibrated, maintained, and operated in accordance with the applicable requirements of 40 CFR 60.13 and the CCP, and operated at all times when FCU 500 is in operation to monitor and record the following for the FCU 500 flue gas:
(1) The Permittee shall monitor and record the hourly average CO concentration, on a dry basis. Process analyzers, calibrated in accordance with the manufacturer’s recommendations, may be used for this purpose.

(2) The Permittee shall use a NO\textsubscript{x} CEMS to monitor performance of the FCU 500 during the life of the Consent Decree 2:96 CV 095 RL and to report compliance with the terms and conditions of the Consent Decree.

(3) The Permittee shall use an SO\textsubscript{2} CEMS to monitor performance of the FCU 500 and to report compliance with the terms and conditions of the Consent Decree 2:96 CV 095 RL.

(b) Pursuant to 326 IAC 3-5 and 326 IAC 6.8-8-5(2) (formerly 326 IAC 6-1-10.1(p)(2)), the Permittee shall continuously monitor the opacity of exhaust gases from the catalyst regenerator stack at all times when the catalyst regenerator is in operation. The Permittee shall comply with the performance and operating specifications in 326 IAC 3-5-2, the certification process in 326 IAC 3-5-3, the operation procedures in 326 IAC 3-5-4, and the quality assurance requirements in 326 IAC 3-5-5 for the continuous opacity monitor.

(c) Pursuant to 326 IAC 6.8-8-5(2) (formerly 326 IAC 6-1-10.1(p)(2)), the Permittee shall continuously monitor coke burn off rate, in pounds per hour, as specified in the Continuous Compliance Plan (CCP).

D.21.1112 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.21.4213 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(B) and to document compliance with Conditions D.21.2 and D.21.3(b), the Permittee shall maintain daily records of the following:

1. calculated coke burn off rate for FCU 500, and
2. sulfur content of the coke.

(b) Pursuant to 326 IAC 3-5-6 and to document compliance with Conditions D.21.3, D.21.7, D.21.9 and D.21.11, D.21.11, D.21.17 and D.21.10(b), the Permittee shall keep the following records for the continuous opacity monitor and continuous emission monitors:

1. One-minute block averages.
2. All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.
3. All maintenance logs, calibration checks, and other required quality assurance activities,
4. All records of corrective and preventive action, and
A log of plant operations, including the following:

(A) Date of facility downtime,

(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.21.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.21.4(b), the Permittee shall keep records as specified in Section E.1 and E.4.

(e) Pursuant to SPM 089-15202-00003, issued on April 24, 2002, and SPM 089-18588-00453, issued July 15, 2004, and to document compliance with Condition D.21.8, the Permittee shall maintain records of 1-hour average CO emissions.

(f) Pursuant to 326 IAC 6.8-8-3 and 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5), (q)(1), and (r)(2)) and to demonstrate compliance with Condition D.21.1, the Permittee shall maintain records for the FCU and ESP as specified in the Continuous Compliance Plan.

(g) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.21.6(a), the Permittee shall keep records as specified in Sections E.1 and E.3.

(h) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.21.6(b), the Permittee shall keep records as specified in Section E.6.

(i) Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.21.5, the Permittee shall keep records as specified in Section E.10.

(j) In order to demonstrate compliance with Condition D.21.3, the Permittee shall maintain records of fresh feed usage at FCU 500 and the coke burned at FCU 500 each month.

(k) In order to demonstrate compliance with Condition D.21.3, the Permittee shall maintain records of monthly emissions of SO2, NOx, and CO from FCU 500.

D.21.43 Reporting Requirements

(a) Pursuant to 326 IAC IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.21.2 and D.21.3(b), the Permittee shall submit a report containing the average daily sulfur dioxide emission rate, in pounds per hour, for FCU 500 within thirty (30) days after the end of each calendar quarter.

(b) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.21.7 and D.21.11, D.21.7 and D.21.10(b), the Permittee shall submit reports of excess opacity emissions within thirty (30) days of the end of each quarter in which excess emissions occur. Pursuant to 321 IAC 3-5-7, the reports shall include:

(1) Monitored facility operation time during the reporting period,

(2) Date of excess emissions,

(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. The actual opacity of each averaging period for each period in excess of the opacity limit. If the exceedance occurs continuously beyond one (1) six (6) minute period, the Permittee shall report either the percent opacity for each six (6) minute period or the highest six (6) minute average opacity for the entire period.

(5) A summary itemizing the exceedances by cause.

(c) Pursuant to 326 IAC 3-5-4(a), if revisions are made to the standard operating procedures (SOP) submitted to OAQ for the continuous opacity monitor, updates shall be submitted biennially.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.21.4(a), the Permittee shall submit reports as specified in the LDAR plan.

(e) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.21.4(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(f) To document compliance with Condition D.21.8 and D.21.3, the Permittee shall submit reports of excess CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,

(2) Date of excess emissions,

(3) Time of commencement and completion for each excess emission,

(4) Magnitude of each excess emission, in terms of 1-hr averages, and

(5) A summary itemizing the exceedances by cause.

(g) Pursuant to 40 CFR 63, Subpart UUU and to demonstrate compliance with Condition D.21.5, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.10.

(h) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.21.6(a), the Permittee shall submit reports as specified in Section E.1 and E.3.

(i) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.21.6(b), the Permittee shall submit reports as specified in Section E.6.

(j) In order to demonstrate compliance with Condition D.21.3, the Permittee shall submit quarterly reports for the fresh feed used and coke burned at FCU 500. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).

(k) In order to demonstrate compliance with Condition D.21.3, the Permittee shall submit quarterly reports of monthly emissions of SO2, NOx, and CO from FCU 500. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).
(l) **Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.21.3 and D.21.11**, the Permittee shall submit reports of excess SO₂, NOₓ, and CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
SECTION D.22 FACILITY OPERATION CONDITIONS - Fluidized Catalytic Cracking Unit 600

Facility Description [326 IAC 2-7-5(15)]:

(v) The Fluidized Catalytic Cracking Unit (FCU) 600, constructed in 1946, identified as Unit ID 240 and rated at 80,000 barrels per day. This facility converts hydrocarbons that boil above 500°F into lower molecular weight products, which include gasoline and LPG. The cracking takes place as the gas oil and catalyst stream mix in the reactor. This process results in the catalyst being coated with coke, which is subsequently burned off in a regenerator. The FCU 600 includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. One (1) catalyst regenerator. Flue gas from the regenerator passes through a waste heat recovery unit, which generates steam and an Electrostatic Precipitator for particulate matter control. The flue gas is then directed to a selective catalytic reduction (SCR) system, which chemically reduces nitrogen oxide emissions by reaction with injected ammonia, and is exhausted through stack S/V 240-01.

2. Two catalyst storage bins, one each for equilibrium and fresh catalyst. (Spent catalyst is stored in Bin F-52, which is associated with FCU 500.)

3. One (1) flare exhausting at stack ID S/V 230-02 (FCU Flare). The flare is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

4. Leaks from process equipment, including two (2) wet gas compressors (identified as J-3D and J-3E), pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and an instrumentation system.

5. As part of the FCU 600 WARP, per SSM 089-25484-00453 the existing FCU 600 blowdown stack is being shutdown and the pressure relief discharges that were vented to the blowdown stack are being re-routed to the FCU flare.

6. The FCU 600 turnaround (TAR) project, per SSM 089-25484-00453, for the repair or replacement of the main fractionator overhead condensers, the slurry and pump around system, unit pump replacement, FCU flare tip replacement, and additional controls to reduce plugging on the SCR. The increases in emissions from FCU 600 TAR are already accounted for as CXHO project related emissions increases.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.22.1 Lake County PM$_{10}$ Emission Limitations [326 IAC 6.8-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), PM$_{10}$ emissions from FCU 600 shall not exceed 1.10 pounds per thousand pounds of coke burned and 55.0 pounds per hour.
(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

D.22.2 Lake County Sulfur Dioxide Emission Limitations [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide (SO₂) emissions from FCU 600 shall not exceed 437.50 pounds per hour.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for FCU 600:

After the startup of the New Coker (#2 Coker), the Permittee shall comply with the following:

(a) The emissions of NOₓ shall not exceed 49.7 tons per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of VOC shall not exceed 3.3 pounds per 1000 barrels of fresh feed used per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of SO₂ shall not exceed 190.0 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of PM and PM-10 shall not exceed 0.35 pounds per 1000 pounds of coke burned at FCU 600 per 12 consecutive month period, with compliance determined at the end of each month.

(e) The emissions of CO shall not exceed 92.1 tons per 12 consecutive month period, with compliance determined at the end of each month.

(f) The fresh feed used at FCU 600 shall not exceed 24.09 million barrels per 12 consecutive month period, with compliance determined at the end of each month.

(g) The coke burned at FCU 600 shall not exceed 428,802,000 pounds per 12 consecutive month period, with compliance determined at the end of each month.

(h) The FCU 600 blowdown stack shall be permanently shutdown and with the exhaust routed to the FCU stack.

Compliance with the FCU 600 throughput limits and the NOₓ, VOC, SO₂, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOₓ, VOC, SO₂, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.
Compliance Determination Requirements

D.22.3 State Operation Permit Requirements

Pursuant to Operation Permit 45-08-93-0562, issued on January 12, 1990 and amended on November 13, 1990 and April 14, 1993:

(a) particulate matter (PM) emissions shall not exceed 147.4 pounds per hour.

(b) SO\textsubscript{2} emissions shall not exceed 875 pounds per hour.

D.22.4 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs)

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(c) Prior to start-up of the FCU 600 after the TAR project, BP shall make a determination as to whether 40 CFR 60, Subpart GGGa has been triggered by component changes made on the ARU as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

D.22.5 Requirements for 40 CFR Part 63, Subpart UUU

Pursuant to 40 CFR 63, Subpart UUU, the Fluidized Catalytic Cracking Unit 600 and associated bypass lines shall comply with the requirements of Section E.10.

D.22.6 Wastewater/Waste Streams

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil-water separators, and closed-vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

D.22.7 Operating Requirement

Pursuant to SPM 089-15202-00003, issued on April 24, 2002 and SPM 089-18588-00453, issued July 15, 2004:

(a) The Permittee shall use a selective catalytic reduction (SCR) system to reduce Nitrogen Oxide (NO\textsubscript{x}) emissions.

(b) The carbon monoxide (CO) emissions shall not exceed 500 parts per million by volume, on a dry basis, based on 1-hour averages. The CO limit shall not apply during periods of startup, shutdown, and malfunction.
Compliance with limits in Condition D.22.3(b) and (d) shall be demonstrated as specified in Condition D.0.3.

In order to demonstrate compliance with Condition D.22.3, after the startup of the New Coker (#2 Coker):

(d) The pressure relief discharges that were routed to the FCU 600 blowdown stack shall be routed to the FCU flare. The flare must be operated with a flame present at all times that FCU 600 is in operation.

D.22.8 Alternative Opacity Requirements [326 IAC 5-1-3]

(a) Pursuant to 326 IAC 5-1-3(a), when building a new fire in a boiler, or shutting down a boiler, opacity may exceed 20%; however, opacity levels shall not exceed 60% for any six (6) minute averaging period. Opacity in excess of 20% shall not continue for more than two (2) six (6) minute averaging periods in any twenty-four (24) hour period.

(b) Pursuant to 326 IAC 5-1-3(b), when moving ashes from the fuel bed or furnace in the FCU 500 boiler blowing tubes, opacity may exceed 20% in any one (1) six (6) minute averaging period. However, the opacity shall not exceed 60% for any six (6) minute averaging period and opacity in excess of 20% shall not continue for more than one (1) six (6) minute averaging period in a sixty (60) minute period. The averaging period shall not be permitted for more than three (3) six (6) minute averaging periods in a twelve (12) hour period.

D.22.9 Continuous Emissions Monitoring

The NOx, CO, and SO2 continuous emission monitoring systems (CEMS) for FCU 600 shall be calibrated, maintained, and operated for determining compliance with NOx, CO, and SO2 emissions limits for FCU 600 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements

D.22.910 Inspection and Monitoring Requirements for the Electrostatic Precipitator [326 IAC 6.8-8-7]

Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(r)(2)), the Permittee shall maintain a Continuous Compliance Plan (CCP) for the ESP. The CCP shall include recording, inspection, and maintenance procedures in accordance with the requirements provided in 326 IAC 6.8-8-7(A) and (B) (formerly 326 IAC 6-1-10.1(r)(2)(A) and (B)), including operating parameters to be monitored and the inspection and maintenance schedule to be followed. The Permittee shall inspect the ESP according to the schedule and procedures specified in the CCP. Pursuant to 326 IAC 2-7-5(1)(B)(ii), the inspection schedule records shall be available for inspection by IDEM, OAQ for up to five (5) years after the date of inspection.

D.22.911 Continuous Monitoring [326 IAC 3-5][326 IAC 6.8-8]

(a) Pursuant to SPM 089-15202-00003, issued on April 24, 2002, SPM 089-18588-00453, issued July 15, 2004, and to demonstrate compliance with Condition D.22.79(b), the Permittee shall:

(1) The Permittee shall use NOx CEMS to monitor performance of FCU 600 and to report compliance with the terms and compliance with the terms and conditions of Consent Decree 2:96 CV 095 RL.
(2) The Permittee shall measure and record the hourly average concentration, on a dry basis, of carbon monoxide in the exhaust gas stream. Process analyzers, calibrated in accordance with the manufacturer’s recommendations, may be used for this purpose.

(3) The Permittee shall use a SO2 CEMS to monitor performance of FCU 600 and to report compliance with the terms and conditions of Consent Decree 2:96 CV 095 RL.

(b) Pursuant to 326 IAC 3-5 and 326 IAC 6.8-8-5(2) (formerly 326 IAC 6-1-10.1(p)(2)), the Permittee shall continuously monitor the opacity of exhaust gases from the catalyst regenerator stack at all times when the catalyst regenerator is in operation. The Permittee shall comply with the performance and operating specifications in 326 IAC 3-5-2, the certification process in 326 IAC 3-5-3, the operation procedures in 326 IAC 3-5-4, and the quality assurance requirements in 326 IAC 3-5-5 for the continuous opacity monitor.

(c) Pursuant to 326 IAC 6.8-8-5(2) (formerly 326 IAC 6-1-10.1(p)(2)), the Permittee shall continuously monitor coke burn off rate, in pounds per hour, as specified in the Continuous Compliance Plan (CCP).

D.22.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.22.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(C) and to document compliance with Conditions D.22.2 and D.22.3(b), the Permittee shall maintain daily records of the following:

(1) calculated coke burn off rate for FCU 600, and

(2) sulfur content of the coke.

(b) Pursuant to 326 IAC 3-5-6 and to demonstrate compliance with Conditions D.22.8, D.22.9 and D.22.4011, the Permittee shall keep the following records for the continuous opacity monitor and continuous emission monitors:

(1) One-minute block averages;

(2) All documentation relating to:

(A) design, installation, and testing of all elements of the monitoring system, and

(B) required corrective action or compliance plan activities,

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

(A) Date of facility downtime,
(B) Time of commencement and completion of downtime, and

(C) Reason for each downtime.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.22.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.22.4(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(e) Pursuant to SPM 089-15202-00003, issued April 24, 2002, SPM 089-18588-00453, issued July 15, 2004, and to demonstrate compliance with Conditions D.22.7 and D.22.12, the Permittee shall maintain records of the 1-hour average CO emissions.

(f) Pursuant to 326 IAC 6.8-8-3 and 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5), (q)(1), and (r)(2)) and to document compliance with Condition D.22.1, the Permittee shall maintain records for the FCU and ESP as specified in the Continuous Compliance Plan.

(g) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.22.6, the Permittee shall keep records as specified in Sections E.1 and E.3.

(h) Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.22.5, the Permittee shall maintain records as specified in Section E.10.

(i) In order to demonstrate compliance with Condition D.22.3, the Permittee shall maintain records of daily fresh feed to FCU 600 and the coke burned at FCU 600 each month.

(j) In order to demonstrate compliance with Condition D.22.3, the Permittee shall maintain records of monthly emissions of SO2, NOx, and CO from FCU 600.

D.22.1443 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.22.2 and D.22.3(b), the Permittee shall submit a report containing the average daily sulfur dioxide emission rate in pounds per hour within thirty (30) days after the end of each calendar quarter.

(b) Pursuant to 326 IAC 3-5-7 and to document compliance with Condition D.22.4(b), the Permittee shall submit reports of excess opacity emissions within thirty (30) days of the end of each quarter in which excess emissions occur. Pursuant to 321 IAC 3-5-7, the reports shall include:

1. Monitored facility operation time during the reporting period,

2. Date of excess emissions,

3. Time of commencement and completion for each excess emission,
Magnitude of each excess emission. The actual opacity of each averaging period for each period in excess of the opacity limit. If the exceedance occurs continuously beyond one (1) six (6) minute period, the Permittee shall report either the percent opacity for each six (6) minute period or the highest six (6) minute average opacity for the entire period.

A summary itemizing the exceedances by cause.

Pursuant to 326 IAC 3-5-4(a), if revisions are made to the standard operating procedures (SOP) submitted to OAQ for the continuous opacity monitor, updates shall be submitted biennially.

Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.22.5(a), the Permittee shall submit reports as specified in the LDAR plan.

Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.22.5(b), the Permittee shall submit reports as specified in Section E.4.

Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.22.3 and D.22.9, the Permittee shall submit reports of excess CO, SO2, and NOx emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments

Pursuant to 40 CFR 63, Subpart UUU and to demonstrate compliance with Condition D.22.5, the Permittee shall submit to IDEM, OAQ the reports as specified in Section E.10.

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.22.6, the Permittee shall submit reports as specified in Sections E.1 and E.3.

In order to demonstrate compliance with Condition D.22.3, the Permittee shall submit quarterly reports for the fresh feed used and coke burned at FCU 600 each month. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).
(j) **In order to demonstrate compliance with Condition D.22.3, the Permittee shall submit quarterly reports of monthly emissions of SO2, NOx, and CO from FCU 600. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).**
SECTION D.23 FACILITY OPERATION CONDITIONS - No. 1 Stanolind Power Station

Facility Description [326 IAC 2-7-5(15)]:

(w) A portion of No. 1 Stanolind Power Station (SPS) constructed in 1928 and identified as Unit ID 501. The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas, are NOx budget units:

(1) The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas:

<table>
<thead>
<tr>
<th>Boiler Identification</th>
<th>Maximum Heat Input Capacity (MMBtu/hr)</th>
<th>Stack Exhausted To</th>
<th>Emission Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>#3 Boiler</td>
<td>265</td>
<td>501-01</td>
<td>None</td>
</tr>
<tr>
<td>#4 Boiler</td>
<td>265</td>
<td>501-01</td>

<tr>
<td>#6 Boiler</td>
<td>265</td>
<td>501-02</td>
<td>None</td>
</tr>
<tr>
<td>#7 Boiler</td>
<td>265</td>
<td>501-02</td>
<td>None</td>
</tr>
</tbody>
</table>

Note: The boilers in No. 1 Stanolind Power Station are scheduled to be shut down as part of the CXHO project.

(2) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the boilers #3, 4, 5, 6, and 7 shall be permanently shutdown prior to the start-up of the new Coker (#2 Coker).

D.23.1.2 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

Until the shutdown of boilers #5, 6, and 7:

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1(d)), the Permittee shall comply with the following PM10 emission limitations for the No. 1 SPS Boilers:

<table>
<thead>
<tr>
<th>Boiler</th>
<th>PM10 Limit (lbs/MMBtu)</th>
<th>PM10 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack serving Boilers #3, and #4</td>
<td>0.016</td>
<td>15.809 (Total)</td>
</tr>
<tr>
<td>Stack serving Boilers #5, #6, and #7</td>
<td>0.016</td>
<td>13.244 (Total)</td>
</tr>
</tbody>
</table>

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), until shutdown of boilers, 5, 6 and 7, the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.
D.23.2 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]

Until the shutdown of boilers #5, 6, and 7:

Pursuant to 326 IAC 7-4.1-3, the Permittee shall comply with the following SO2 emission limitations for the No. 1 SPS Boilers:

<table>
<thead>
<tr>
<th>Boiler</th>
<th>SO2 Limit (lbs/MMBtu)</th>
<th>SO2 Limit (lbs/hour)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.033</td>
<td></td>
</tr>
<tr>
<td>#6</td>
<td>0.033</td>
<td>26.24 Total</td>
</tr>
<tr>
<td>#7</td>
<td>0.033</td>
<td></td>
</tr>
</tbody>
</table>

D.23.3 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Until the shutdown of boilers #5, 6, and 7:

Pursuant to SPM 089-15202-00003, issued April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the No. 1 SPS Boilers.

D.23.4 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8]

Until the shutdown of boilers #5, 6, and 7:

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

D.23.5 Nitrogen Oxides Budget Trading Program [326 IAC 10-4]

Until the shutdown of boilers #3, 4, 5, 6, and 7:

Pursuant to 326 IAC 10-4-1(a), the Permittee shall comply with Nitrogen Oxides Budget Trading program for boilers #3 through #7 which are specified in Section E.11.

D.23.6 Wastewater/Waste Streams [40 CFR 60, Subpart QQQ] [326 IAC 12]

Until the shutdown of boilers #5, 6, and 7:

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual wastewater drains systems.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for boilers #3, 4, 5, 6 and 7, which comprise the affected source for the large gaseous fuel subcategory.
Compliance Determination Requirements

D.23.8 Operating Requirement

Until the shutdown of boilers #5, 6, and 7:

Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003, fuel oil shall not be used as fuel for the No. 1SPS Boilers.

Compliance Monitoring Requirements

D.23.9 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Until the shutdown of boilers #5, 6, and 7:

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.23.10 Record Keeping Requirements

Until the shutdown of boilers #5, 6, and 7:

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.23.3 and D.23.9 D.23.2, and D.23.8, the Permittee shall maintain a daily record of the following for the No. 1SPS Boilers:

(1) operational status of each facility,
(2) fuel type,
(3) average daily sulfur content for each fuel type,
(4) average daily fuel gravity for each fuel type,
(5) total daily fuel usage for each type, and
(6) heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(p) and 326 IAC 6-1-10.1(n)(5)) and to document compliance with Condition D.23.1(b), the Permittee shall maintain records for the Boilers #3, #4, #5, #6, and #7 as specified in the Continuous Compliance Plan.

(c) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.23.4(a) D.23.3(a), the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.23.5(a) D.23.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.23.5(b) D.23.4(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(f) Pursuant to 326 IAC 10-4 and to document compliance with Condition D.23.6 D.23.5, the Permittee shall keep records as specified in Section E.11.
Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.23.7, the Permittee shall keep records as specified in Section E.6.

D.23.11 Reporting Requirements

Until the shutdown of boilers #5, 6, and 7:

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.23.3 and D.23.9, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour for the No. 1 SPS Boilers.

(b) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.23.4, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.23.5(a), the Permittee shall submit reports as specified in the LDAR plan.

(d) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.23.5(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(e) Pursuant to 326 IAC 10-4 and to document compliance with Condition D.23.6, the Permittee shall submit reports as specified in Section E.11.

(f) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.23.7, the Permittee shall submit reports as specified in Section E.6.
Facility Description [326 IAC 2-7-5(15)]:

(x) A portion of No. 3 Stanolind Power Station (SPS) constructed as listed below and identified as Unit ID 503. The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas, are NOx budget units:

(1) The following boilers, all of which burn refinery gas, natural gas, or liquified petroleum gas:

</tbody>
</table>

(2) Five (5) direct-fired duct burners, permitted in 2008, rated at 41 mmBTU/hr each, equipped with low NOx burners and controlled by a Selective Catalytic Reduction (SCR) system.

(2.3) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.24.1 Lake County PM10 Emission Limitations [326 IAC 6.8-2-6]

(a) Pursuant to 326 IAC 6.8-2-6 (formerly 326 IAC 6-1-10.1), PM10 emissions from each stack serving Boilers #1, #2, #3, #4 and #6 shall not exceed 0.030 pounds per million Btu heat input and 17.49 pounds per hour for each boiler.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.
D.24.2 Lake County PM10 Emissions Limitations [326 IAC 6.8-1-2]
Pursuant to 326 IAC 6.8-1-2, PM emissions from the five (5) duct burners shall not exceed 0.03 gr/dscf.

D.24.23 Lake County Sulfur Dioxide (SO2) Emission Limitations [326 IAC 7-4.1-3]
Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from Boilers #1, #2, #3, #4 and #6 shall each not exceed 18.98 pounds per hour and 0.033 pounds per million Btu heat input.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for No. 3 Stanolind Power Station:

After the installation of the duct burners and the conventional burners and a Selective Catalytic Reduction (SCR) on boilers 1, 2, 3, 4 and 6, the Permittee shall comply with the following for boilers 1, 2, 3, 4, and 6 at the stack vent:

(a) The emissions of NOx shall not exceed 0.02 pound per million BTU.
(b) The emissions of VOC shall not exceed 0.0054 pound per million BTU.
(c) The emissions of PM shall not exceed 0.0019 pound per million BTU.
(d) The firing rate (total) shall not exceed 24,303,535 mmBTU per 12 consecutive month period, with compliance determined at the end of each month.
(e) The firing rate (total) at the five (5) duct burners shall not exceed 1,732,947 mmBTU per 12 consecutive month period, with compliance determined at the end of each month.
(f) The emissions of CO (total) from boilers 1, 2, 3, 4, and 6 and the five (5) duct burners shall not exceed 260.3 tons per 12 consecutive month period, with compliance determined at the end of each month.
(g) The emissions of PM-10 from each boiler/SCR stack shall not exceed 0.0087 pound per million BTU.

Compliance with the limits on annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.24.35 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]
Pursuant to Permit SPM 089-15202-00003, issued April 24, 2002 and 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the No. 3 SPS Boilers.
D.24.46 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs)

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may request the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements of Sections E.1 and E.2 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

Prior to start-up of the boilers 1, 2, 3, 4 and 6 after installation of the duct burners the conventional burners and a Selective Catalytic Reduction (SCR), BP shall make a determination as to whether 40 CFR 60, Subpart GGGa has been triggered by component changes made on the boilers as a part of the projects authorized by SSM 089-25484-00463. BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

D.24.57 Nitrogen Oxides Budget Trading Program [326 IAC 10-4]

Pursuant to 326 IAC 10-4-1(a), the Permittee shall comply with Nitrogen Oxides Budget Trading program for boilers #1 through #4 and #6, which are specified in Section E.11.

D.24.68 Wastewater/Waste Streams [326 IAC 12] [40 CFR 60, Subpart QQQ]

Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual wastewater drains systems.

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for boilers # 1, 2, 3, 4 and 6, which comprise the affected source for the large gaseous fuel subcategory.

Compliance Determination Requirements

D.24.89 Operating Requirement

(a) Pursuant to Permit SPM 089-15202-00003, issued on April 24, 2002, effective June 1, 2003 and SPM 089-18588-00453, issued July 15, 2004, fuel oil shall not be used as fuel for the No. 3SPS Boilers.

(b) Compliance with the limits in Condition D.24.4(a), (b) and (g) shall be demonstrated as specified in Condition D.0.3.

D.24.10 Continuous Emissions Monitoring

The CO analyzer for the boiler/duct burner stacks shall be calibrated, maintained, and operated for determining compliance with CO emissions limits for the boilers 1, 2, 3, 4, and 6 and the five (5) duct burners in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.
Compliance Monitoring Requirements

D.24.911 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.24.1012 Record Keeping Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(1)(A) and to document compliance with Conditions D.24.3 and D.24.9 D.24.2 and D.24.8, the Permittee shall maintain a daily record of the following for the No. 3 SPS Boilers:

1. operational status of each facility,
2. fuel type,
3. average daily sulfur content for each fuel type,
4. average daily fuel gravity for each fuel type,
5. total daily fuel usage for each type, and
6. heat content of each fuel type.

(b) Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(p) and 326 IAC 6-1-10.1(n)(5)), and to document compliance with Condition D.24.1(b), the Permittee shall maintain records as specified in the Continuous Compliance Plan.

(c) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.24.6(a) D.24.4(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(d) In order to demonstrate compliance with Condition D.24.3, the Permittee shall maintain records of monthly firing rates and CO emissions at No. 3 Stanolind Power Station boilers 1, 2, 3, 4, 6, and the five (5) duct burners.

D.24.1113 Reporting Requirements

(a) Pursuant to 326 IAC 7-4.1-3(b)(2) and to document compliance with Conditions D.24.3 and D.24.9 D.24.2 and D.24.8, the Permittee shall submit a report to IDEM, OAQ within thirty (30) days after the end of each calendar quarter containing the average daily sulfur dioxide emission rate, in pounds per hour for the No. 3 SPS Boilers.

(b) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.24.6(a) D.24.4(a), the Permittee shall submit reports as specified in the LDAR plan.

(c) In order to demonstrate compliance with Condition D.24.4, the Permittee shall submit a quarterly summary of the monthly firing rates and CO emissions at the boilers 1, 2, 3, 4, 6 and five (5) duct burners to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).
Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.24.4, the Permittee shall submit reports of excess CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
Facility Description [326 IAC 2-7-5(15)]:

Hazardous Waste Treatment System:

Fluid Bed Incinerator (FBI), identified as Unit ID 510, equipped with a wet venturi scrubber, wet electrostatic precipitator (WESP) and a carbon bed absorber. This is a refinery pollution control system for hazardous waste materials and regulated under the Resource Conservation and Recovery Act (RCRA) and the Hazardous Waste Combustion MACT Standards. It is designed to treat API separator sludge, DAF skimmings and biological solids from the waste water treatment plant. The WESP and carbon bed absorber were installed in 2003. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

(1) The following incinerator fired by No.2 fuel oil:

Dewatering and thermal desorption system for processing sludge, to be installed as part of CXHO project, including dissolved air flotation skimmings (DAF) and API oil/water separator sludge. The dewatering system will be equipped with a wet scrubber and carbon canister system and the thermal desorption unit will be equipped with a vapor recovery system to optimize absorption of hydrocarbons. The feed rate capacities at the dewatering system and thermal desorption systems are 22,500 tons of feed per year and 9,000 dry tons of solids per year, per year, respectively. This facility includes the following emission sources and may include insignificant activities listed in Section A.4 of the permit:

(1) Two (2) centrifuges;
(2) Two (2) sludge surge tanks;
(3) One (1) oil/water mixture surge tank;
(4) One (1) enclosed auger transfer system;
(5) One (1) vapor recovery system on the thermal desorption unit including: an oil condensing/scrubbing system, a water condensing/scrubbing system, and an oil water separator. Uncondensed vapors from this system are routed to the two (2) diesel fired burners for destruction of VOCs.

Insignificant Activities:

(6) Two (2) diesel fired burners rated at 4 mmBTU/hr each, to supply heat to the thermal desorption system.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.25.1 Particulate Matter [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from each of the two (2) diesel fired burners shall not exceed 0.03 grains per dry standard cubic foot.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for the dewatering and thermal desorption system:

The VOC emissions from the thermal desorption, thermal dewatering system and associated fugitives shall not exceed 2.4 tons per 12 consecutive month period, with compliance at the end of each month.

Compliance with the VOC emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

Compliance Determination Requirements

D.25.3 Petroleum Refineries [326 IAC 8-4-2]

Pursuant to 326 IAC 8-4-2(2), the Permittee shall equip all wastewater (oil/water) separators, forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when in actual use.

D.25.4 Wastewater / Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for all wastewater tanks and waste streams associated with the dewatering and thermal desorption system, individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, subpart CC specified in Section D.1.
D.25.5 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF]
Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil-water separators, and closed-vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

D.25.6 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may request the Permittee to revise the plan.

(d) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements of Sections E.1 and E.2 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.25.7 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]
Pursuant 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for the two (2) thermal desorption burners.

Compliance Monitoring Requirements

D.25.8 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]
Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.25.9 Record Keeping Requirements

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall keep records as specified in Section E.1 and E.3.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall keep records as specified in Section E.6.

(c) Pursuant to 40 CFR 60, Subpart J, the Permittee shall keep records as specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.25.6, the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.
### D.25.10 Reporting Requirements

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall submit reports as specified in Sections E.1 and E.3.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall submit reports as specified in Section E.6.

(c) Pursuant to 40 CFR 60, Subpart J, the Permittee shall submit reports as specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.25.6, the Permittee shall submit reports as specified in the LDAR plan.

### D.25.1 Lake County PM10 Emission Limitations [326 IAC 6.8-1-6]

(a) Pursuant to 326 IAC 6.8-1-6 (formerly 326 IAC 6-1-10.1(d)), PM10 emissions from the FBI shall not exceed 6.84 lbs per hour and 0.173 lbs per ton based on 79,000 lbs per hour fluidizing air flow.

(b) Pursuant to 326 IAC 6.8-8 (formerly 326 IAC 6-1-10.1(l)(3)), the Permittee shall operate the emission units listed in paragraph (a) of this condition in accordance with the Continuous Compliance Plan (CCP). Pursuant to 326 IAC 6.8-8(c) (formerly 326 IAC 6-10.1-1(u)), the Permittee shall update the CCP as needed, retain a copy of any changes and updates to the CCP onsite, and make the revised CCP available for inspection by IDEM, OAQ. The Permittee shall submit the revised CCP to IDEM, OAQ, within thirty (30) days of the update. If IDEM, OAQ determines that the procedures specified in the plan will not demonstrate compliance with 326 IAC 6.8-8, IDEM, OAQ may require the Permittee to revise the plan.

### D.25.2 Sulfur Dioxide (SO$_2$) [326 IAC 7-4.1-3]

Pursuant to 326 IAC 7-4.1-3, sulfur dioxide emissions from the FBI shall not exceed 1.78 pounds per hour.

### D.25.3 Mercury (Hg) Limitations [326 IAC 14-1] [40 CFR 61, Subpart E]

(a) Pursuant to 40 CFR 61, Subpart E, the Permittee shall comply with the requirements specified in Section E.18 for the FBI, except as specified in paragraph (b) of this condition.

(b) As allowed under the waiver approved by the U.S. EPA on May 11, 2006, the Permittee may demonstrate compliance with the performance testing requirements of 40 CFR 61.53 using performance tests for mercury required by 40 CFR 63, Subpart EEE, which are incorporated in Section E.19.

### D.25.4 Standards for Hazardous Air Pollutants from Hazardous Waste Combustion [326 IAC 20-28] [40 CFR 63, Subpart EEE]

Pursuant to 40 CFR 63, Subpart EEE, the Permittee shall comply with the requirements specified in Section E.19 for the Fluid Bed Incinerator (FBI).

### Compliance Determination Requirements

### D.25.5 Testing [326 IAC 2-7-6(1), (6)] [326 IAC 2-1.1-1]

(a) Within 36 months after the effective date of this permit and in order to demonstrate compliance with Condition D.25.2, the Permittee shall perform SO$_2$ testing for the FBI utilizing methods as approved by the Commissioner.
These tests shall be repeated at least once every five (5) years from the date of the valid compliance demonstration. Testing shall be conducted in accordance with Section C: Performance Testing.

D.25.6 Inspection of Scrubber [326 IAC 6.8-8-7(3)]

Pursuant to 326 IAC 6.8-8-7(3) (formerly 326 IAC 6-1-10.1(2)(B)), the Permittee shall inspect the ESP according to the schedule and procedures specified in the Continuous Compliance Plan.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.25.7 Monitoring of Scrubber [326 IAC 6.8-8-7(r)]

Pursuant to 326 IAC 6.8-8-7(2) (formerly 326 IAC 6-1-10.1(2)(A)), the Permittee shall monitor operating parameters of the scrubber according to the procedure specified in the Continuous Compliance Plan.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.25.8 Record Keeping Requirements

Pursuant to 326 IAC 6.8-8-7 (formerly 326 IAC 6-1-10.1(n)(5)), the Permittee shall maintain records for the FBI scrubber as specified in the Continuous Compliance Plan.
Facility Description [326 IAC 2-7-5(15)]

Facility Description (z) Wastewater Treatment Plant (WWTP), identified as Unit ID 544. This facility treats the water used in the refining process that comes into contact with oil or chemicals. In the first step, the heavier solids are removed at the inlet to the WWTP and the floating oil is skimmed from the surface of the wastewater in the API separator boxes. The oil is then recycled back to the refinery. The water is then aerated in the Air Flotation Unit where additional solid impurities are floated and skimmed. Thereafter, it moves to the Activated Sludge Plant where special bacteria digest the remaining contaminants. The water then passes through a clarifier and then eight (8) final filters before being returned to Lake Michigan. This facility includes the following emission sources and may also include insignificant activities listed in section A.4 of this permit:

1. The following units are equipped with closed vent systems: oil sump P-1, oil sump P-2, and Diffused Air Floatation (DAF) Secondary Boxes, which vent to a biofilter and carbon canisters; Tank 569 is equipped with a conservation vent.

2. The following units are equipped with a fixed-roof or floating roof: Interceptor Box, Diversion Box (from Tank 5051 to DAF), DAF Flash Mixer, DAF Influent Channel, DAF Effluent Channel, DAF Primary Boxes, and DAF Sump.

3. One (1) storage tank (identified as Tank 5051) having a maximum storage capacity of 10,000,000 gallons, constructed in 1988 and equipped with an external floating roof.

4. One (1) storage tank (identified as Tank 5050) having a maximum storage capacity of 10,000,000 gallons, constructed in 1988. This tank is used for storm event and upset impoundments.

5. Seven (7) oil-water/solids separator units enclosed with a fixed-roof: Bar Screen, #7 API Separator Fixed Cover, #7 API Separator Primary Inlet, #7 API Separator Secondary Inlet, #7 API Separator Secondary Outlet, #7 API Separator Inlet Channel Section, and #7 API Separator Gear Boxes.

6. One (1) storage tank (identified as Tank 5052) having a maximum storage capacity of 11,676,000 gallons, constructed as part of the CXHO Project. This tank is used as a stormwater equalization tank and is equipped with an external floating roof.

7. A brine treatment system with seven (7) wastewater tanks with vertical fixed roofs, constructed as part of CXHO project, identified as:

   A) TK-105A, with a storage capacity of 867,180 gallons;
   B) TK-105B, with a storage capacity of 867,180 gallons;
   C) TK-101, with a storage capacity of 66,096 gallons;
   D) TK-102, with a storage capacity of 66,096 gallons;
   E) TK-103, with a storage capacity of 66,096 gallons;
   F) TK-104A, with a storage capacity of 89,943 gallons; and
   G) TK-104B, with a storage capacity of 89,943 gallons.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.26.1 Petroleum Refineries [326 IAC 8-4-2]

Pursuant to 326 IAC 8-4-2 (2), the Permittee shall equip all wastewater (oil/water) separators, forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when in actual use.

D.26.2 Wastewater / Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for tank 5051, individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, subpart CC specified in Section D.1.

(d) Pursuant to 40 CFR 63.647 of 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements of 40 CFR 61, Subpart FF, specified in Section E.3, for stormwater equalization tank 5052.

(e) Pursuant to 40 CFR 63.647 of 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements of 40 CFR 61, Subpart FF, specified in Section E.3, for the seven (7) storage tanks in the brine treatment facility.

D.26.3 Volatile Organic Compound (VOC) Emission Offset

Pursuant to OP 45-08-93-0574, issued January 12, 1990, the VOC emissions from the Oil-Water Separator (#7) shall not exceed 602 tons per year.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.26.4 Record Keeping Requirements

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.26.2(a), the Permittee shall keep records as specified in Section E.1 and E.3.

(b) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.26.2(b), the Permittee shall keep records as specified in Section E.6.

D.26.5 Reporting Requirements

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.26.2(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(b) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.26.2(b), the Permittee shall keep records as specified in Section E.6.
Facility Description [326 IAC 2-7-5(15)]

(aa) Oil Movements, identified as Unit 640. This facility is used to store, blend, and ship products. Gasoline blending components are custom blended into various grades of gasoline. Additive and other compounds are blended into the products to give them their unique characteristics. Furnace oil and other distillates are also blended using components from process units or storage. Crude oil and feedstocks for process units and products are also stored at this location. Product loading operations include the pipeline and railcar racks. This facility includes the following emission sources and may also include insignificant activities listed in section A.4 of this permit:

1. One (1) internal floating roof storage tank identified as 3730, storing ethanol, constructed in 1955, with a maximum storage capacity of 1,050,721 gallons.

2. Ten (10) external floating roof storage tanks storing petroleum hydrocarbon with vapor pressure less than 15 psia, comprising the following tanks:

</table>

(5) One (1) oil-water separator identified as the J & L Separator.

(6) Leaks from process equipment, including pumps, pressure relief devices, sampling connection systems, open-ended valves or lines, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

**Emission Limitations and Standards [326 IAC 2-7-5(1)]**

D.27.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) and Benzene [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [326 IAC 14][40 CFR 61, Subpart J]
Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(a) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(b) Pursuant to 40 CFR 61, Subpart J, the Permittee shall comply with the requirements specified in Section E.5 for leaks of benzene from pumps, pressure relief devices, sampling connection systems, open-ended lines or valves, and valves.

(c) Pursuant to 40 CFR 63.640(p), equipment that is subject to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart J is required only to comply with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

(e) Pursuant to 40 CFR 60, Subpart GGG, the Permittee shall comply with the requirements specified in Section E.13 for equipment leaks of VOC from compressors and other process equipment that is located at the J & L Tank Field and was modified after modified January 4, 1983. Pursuant to 40 CFR 63.640(p), equipment that is subject to both 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC are required to comply only with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.27.2 Petroleum Liquid Storage Facilities [326 IAC 8-4-3]

Pursuant to 326 IAC 8-4-3(a), the Permittee shall comply with the requirements in this condition for all petroleum liquid storage vessels with capacities greater than 39,000 gallons containing volatile organic compounds whose true vapor pressure is greater than 1.52 psi. Tanks subject to this condition include: 3474, 3475, 3476, 3477, 3480, 3482, 3483, 3484, 3486, 3487, 3488, 3489, 3493, 3511, 3512, 3513, 3514, 3525, 3526, 3527, 3528, 3531, 3532, 3533, 3549, 3553, 3554, 3558, 3601, 3605, 3629, 3639, 3641, 3701, 3702, 3703, 3704, 3707, 3716, 3728, 3730, 3900, 3904, 3905, 3907, 3909, 3911, 3912, 3914, 3916, 3917, 3918, 3919, 3920, BT-002, 3492, 3529, 3631, 3637, 3706, 3860, and 3901.

Pursuant to 326 IAC 8-4-3(a), the Permittee shall comply with the following requirements for all petroleum liquid storage vessels with capacities greater than 39,000 gallons containing volatile organic compounds whose true vapor pressure is greater than 1.52 psi.

(a) Pursuant to 326 IAC 8-4-3(b), the Permittee shall not permit the use of an affected fixed roof tank unless:

(1) The tank has been retrofitted with an internal floating roof equipped with a closure seal, or seals, to close the space between the roof edge and tank wall unless the source has been retrofitted with equally effective alternate control which has been approved,

(2) The facility is maintained such that there are no visible holes, tears or other opening in the seal or any seal fabric or materials,

(3) All openings, except stub drains, are equipped with covers, lids or seals such that:
(A) the cover, lid or seal is in the closed position at all times except when in actual use;

(B) automatic bleeder vents are closed at all times except when in actual use;

(C) rim vents if provided, are set to open when the roof is being floated off the roof leg supports or at the manufacturer’s recommended setting.

(b) Pursuant to 326 IAC 8-4-3(c)(1), the Permittee shall not store petroleum liquid in an affected open top tank having a cover consisting of a double deck or pontoon single deck which rests upon and is supported by the petroleum liquid being contained and is equipped with a closure seal or seals to close the space between the roof edge and tank wall shall not be used to store volatile organic liquids unless:

(1) The tank has been fitted with:

   (A) a continuous secondary seal extending from the floating roof to the tank wall (rim-mounted secondary seal); or

   (B) a closure or other device approved by the commissioner which is equally effective.

(2) All seal closure devices meet the following requirements:

   (A) there are no visible holes, tears, or other openings in the seal(s) or seal fabric;

   (B) the seal(s) are intact and uniformly in place around the circumference of the floating roof between the floating roof and the tank wall;

   (C) for vapor mounted primary seals, the accumulated gap area around the circumference of the secondary seal where a gap exceeding one-eighth (1/8) inch exists between the secondary seal and the tank wall shall not exceed 1.0 square inch per foot of tank diameter. There shall be no gaps exceeding one-half (½) inch between the secondary seal and the tank wall of welded tanks and no gaps exceeding one (1) inch between the secondary seal and the tank wall of riveted tanks.

(3) All openings in the external floating roof, except for automatic bleeder vents, rim space vents, and leg sleeves, are:

   (A) equipped with covers, seals, or lids in the closed position except when the openings are in actual use; and

   (B) equipped with projections into the tank which remain below the liquid surface at all times.

(4) automatic bleeder vents are closed at all times except when the roof is floated off or landed on the roof leg supports;

(5) rim vents are set to open when the roof is being floated off the leg supports or at the manufacturer’s recommended setting; and

(6) emergency roof drains are provided with slotted membrane fabric covers or equivalent covers which cover at least ninety percent (90%) of the opening.
Pursuant to 326 IAC 8-9, the Permittee shall comply with the following requirements for storage tanks 3529, 3901, 3902, 3912, 3482, 3492, 3510, 3512, 3513, 3532, 3624, 3631, 3633, 3635, 3639, 3641, 3705, 3706, 3709, 3728, 3730, 3905, 3909, 3914, 3511, 3601, 3480, 3486, 3487, 3525, 3526, 3553, 3554, 3605, 3703, 3704, 3533, 3915, 3916, 3917, 3918, 3919, 3920, D-424, F-011, TK-3546, TK-3547, TK-3548, TK-3567, TK-3867, TK-3868, TK-3869, TK-3872, TK-3876, TK-0563, TK-3228, TK-3234, TK-3243, TK-3465, TK-3468, TK-3491, TK-3496, TK-3498, TK-3499, TK-3500, TK-3505, TK-3509, TK-3569, TK-3606, TK-3607, TK-3609, TK-3610, TK-3611, TK-3613, TK-3711, TK-3712, TK-3714, TK-3717, TK-3718, TK-3719, TK-3720, TK-3721, TK-3722, TK-3723, TK-3726, TK-3733, TK-3735, TK-3908, TK-3910, TK-3913, TK-6078, TK-6113, TK-6114, TK-6125, TK-6126, TK-6127, TK-6128, TK-6129, TK-6145, TK-6150, TK-6248, TK-6249, TK-6250, TK-6251, TK-6252, TK-6253, TK-6261, TK-6262, TK-3572, TK-3734, and TK-3906. For storage tanks 3633, TK-3572, TK-3734, and TK-3906, which are used to store liquids with vapor pressures less than 0.5 psia, the Permittee shall comply only with the recordkeeping and reporting requirements specified in Condition D.27.9(e). For storage tanks 3633, 3635, 3710, 3571, TK-3572, TK-3734, and TK-3906, which are used to store liquids with vapor pressures between 0.5 and 0.75 psia, the Permittee shall comply only with the requirements specified in Condition D.27.9(e) and (i).

(a) Pursuant to 326 IAC 8-9-4(a), the Permittee shall comply with the following requirements for each vessel having a capacity greater than or equal to thirty-nine thousand (39,000) gallons, that stores VOL with a maximum true vapor pressure greater than or equal to seventy-five hundredths (0.75) pound per square inch absolute (psia) but less than eleven and one-tenth (11.1) psia:

(1) On or before May 1, 1996, for each vessel having a permanently affixed roof, the Permittee shall install one (1) of the following:

(A) An internal floating roof meeting the standards in section (b) of this Condition.

(B) An equivalent emissions control system resulting in equivalent emissions reductions to that obtained in paragraph (a)(1)(A).

(2) For each vessel having an internal floating roof, install one (1) of the following:

(A) At the time of the next scheduled cleaning, but not later than ten (10) years after May 1, 1996, an internal floating roof meeting the standards in section (b) of this Condition,

(B) On or before May 1, 1996, an equivalent emissions control system resulting in equivalent emissions reductions to that obtained in paragraph (a)(2)(A).

(3) For each vessel having an external floating roof, install one (1) of the following:
(A) At the time of the next scheduled cleaning, but not later than ten (10) years after May 1, 1996, an external floating roof meeting the standards in section (c) of this Condition.

(B) On or before May 1, 1996, an equivalent emissions control system resulting in equivalent emissions reductions to that obtained in paragraph (a)(3)(A) of this condition.

(b) Pursuant to 326 IAC 8-9-4(c), for each internal floating roof, the Permittee shall comply with the following standards:

(1) The internal floating roof shall float on the liquid surface, but not necessarily in complete contact with it, inside a vessel that has a permanently affixed roof.

(2) The internal floating roof shall be floating on the liquid surface at all times, except during initial fill and during those intervals when the vessel is completely emptied or subsequently emptied and refilled.

(3) When the roof is resting on the leg supports, the process of filling, emptying, or refilling shall be continuous and shall be accomplished as rapidly as possible.

(4) Each internal floating roof shall be equipped with one (1) of the following closure devices between the wall of the vessel and the edge of the internal floating roof:

(A) A foam or liquid-filled seal mounted in contact with the liquid (liquid-mount seal).

(B) Two (2) seals mounted one (1) above the other so that each forms a continuous closure that completely covers the space between the wall of the vessel and the edge of the internal floating roof. The lower seal may be vapor mounted, but both shall be continuous.

(C) A mechanical shoe seal that consists of a metal sheet held vertically against the wall of the vessel by springs or weighted levers and that is connected by braces to the floating roof. A flexible coated fabric, or envelope, spans the annular space between the metal sheet and the floating roof.

(5) Each opening in a noncontact internal floating roof except for automatic bleeder vents (vacuum breaker vents) and the rim space vents shall provide a projection below the liquid surface.

(6) Each opening in a noncontact internal floating roof except for leg sleeves, automatic bleeder vents, rim space vents, column wells, ladder wells, sample wells, and stub drains shall be equipped with a cover or lid that shall be maintained in a closed position at all times (with no visible gap) except when the device is in actual use. The cover or lid shall be equipped with a gasket. Covers on each access hatch and automatic gauge float well shall bebolted except when they are in use.

(7) Automatic bleeder vents shall be equipped with a gasket and shall be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports.
(8) Rim space vents shall be equipped with a gasket and shall be set to open only when the internal floating roof is not floating or at the manufacturer’s recommended setting.

(9) Each penetration of the internal floating roof for the purpose of sampling shall be a sample well. The sample well shall have a slit fabric cover that covers at least ninety percent (90%) of the opening.

(10) Each penetration of the internal floating roof that allows for passage of a ladder shall have a gasketed sliding cover.

(c) Pursuant to 326 IAC 8-9-4(e), the Permittee shall comply with the following standards applicable to each external floating roof:

(1) Each external floating roof shall be equipped with a closure device between the wall of the vessel and the roof edge. The closure device shall consist of two (2) seals, one (1) above the other. The lower seal shall be referred to as the primary seal; the upper seal shall be referred to as the secondary seal.

(2) Except as provided in 326 IAC 8-9-5(c)(4), the primary seal shall completely cover the annular space between the edge of the floating roof and vessel wall and shall be either a liquid-mounted seal or a shoe seal.

(3) The secondary seal shall completely cover the annular space between the external floating roof and the wall of the vessel in a continuous fashion except as allowed in 326 IAC 8-9-5(c)(4).

(4) Except for automatic bleeder vents and rim space vents, each opening in a noncontact external floating roof shall provide a projection below the liquid surface.

(5) Except for automatic bleeder vents, rim space vents, roof drains, and leg sleeves, each opening in the roof shall be equipped with a gasketed cover, seal or lid that shall be maintained in a closed position at all times, without visible gap, except when the device is in actual use.

(6) Automatic bleeder vents shall be closed at all times when the roof is floating except when the roof is being floated off or is being landed on the roof leg supports.

(7) Rim vents shall be set to open when the roof is being floated off the roof leg supports or at the manufacturer’s recommended setting. Automatic bleeder vents and rim space vents shall be gasketed.

(8) Each emergency roof drain shall be provided with a slotted membrane fabric cover that covers at least ninety percent (90%) of the area of the opening.

(9) The roof shall be floating on the liquid at all times, for example, off the roof leg supports, except when the vessel is completely emptied and subsequently refilled. The process of filling, emptying, or refilling when the roof is resting on the leg supports shall be continuous and shall be accomplished as rapidly as possible.
D.27.4 VOC and HAP Emissions From Storage Vessels [326 IAC 12] [40 CFR 60, Subpart K] [40 CFR 60, Subpart Ka] [40 CFR 60, Subpart Kb] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 40 CFR 60.110a, storage vessels 3480, 3486, 3487, 3525, 3526, 3553, 3554, 3602, 3604, 3703, 3704, 3915, 3916, 3917, 3918, 3919, and 3920 are affected facilities under 40 CFR 60, Subpart Ka. Unless otherwise specified in paragraph (d) of this condition, the Permittee shall operate these storage tanks in compliance with the requirements specified in Section E.8. For storage tanks 3602 and 3604, the Permittee shall comply only with the record keeping requirements in Section E.8.

(b) Pursuant to 40 CFR 60.110b, storage vessels 3474, 3475, 3476, 3484, 3488, 3489, 3493, 3514, 3527, 3528, 3531, 3558, 3600, 3622, 3629, 3701, 3702, 3715, 3716, 3860, 3900, 3904, 3907, TK-3637, and 3911 are affected facilities under 40 CFR 60, Subpart Kb. Unless otherwise specified in paragraph (d) of this condition, the Permittee shall operate these storage tanks in compliance with the requirements specified in Section E.9.

(c) Pursuant to 40 CFR 60.110, storage vessels 3534, 3601, and 3605 are affected facilities under 40 CFR 60, Subpart K. Unless otherwise specified in paragraph (d) of this condition, the Permittee shall operate these storage tanks in compliance with the requirements specified in Section E.7.

(d) Pursuant to 40 CFR 63, Subpart CC,

(1) The Permittee shall comply with the requirements specified in Section E.1, for the following Group I storage vessels: 3477, 3474, 3475, 3476, 3480, 3482, 3483, 3484, 3486, 3487, 3488, 3489, 3493, 3510, 3511, 3512, 3513, 3514, 3525, 3526, 3527, 3528, 3529, 3531, 3532, 3534, 3537, 3533, 3553, 3554, 3601, 3605, 3624, 3629, 3631, 3633, 3635, 3637, 3639, 3641, 3701, 3702, 3703, 3704, 3705, 3706, 3707, 3710, 3715, 3716, 3728, 3900, 3901, 3902, 3904, 3905, 3907, 3909, 3912, 3914, 3915, 3916, 3917, 3918, 3919, and 3920.

(2) Pursuant to 40 CFR 63.640(n)(5), Group 1 storage vessels that are also subject to the provisions of 40 CFR 60, Subparts K or Ka are required to only comply with the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

(3) Pursuant to 40 CFR 63.640(n)(1), Group 1 and Group 2 storage vessels that are also subject to the provisions of 40 CFR Part 60, Subpart Kb, are required to comply only with the requirements of 40 CFR 60, Subpart Kb, except as provided in 40 CFR 63.640(n)(8).

D.27.5 Wastewater/Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF][40 CFR 60 Subpart QQQ] [326 IAC 12]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements in Sections E.1 and E.3 for individual drain systems, oil-water separators, and closed vent systems and control devices.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems subject to 40 CFR, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, subpart CC specified in Section E.1.
D.27.6 Petroleum Refineries - Separators [326 IAC 8-4-2]

Pursuant to 326 IAC 8-4-2(2), the Permittee shall equip oil-water separators, forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when in actual use.

D.27.7 NESHAP for Organic Liquid Distribution [40 CFR 63, Subpart EEEE]

Pursuant to 40 CFR 63.2338(b), storage tank D-424 and any equipment at this source that meets the definition of an affected source under 40 CFR 63.2334 shall comply with the requirements of 40 CFR 63, Subpart EEEE, as specified in Section E.24.

Compliance Monitoring Requirements

D.27.8 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

D.27.89 Storage Vessel Inspections [326 IAC 8-9]

(a) Pursuant to 326 IAC 8-9-5(a), the Permittee shall meet the requirements of paragraph (b), (c), or (d) for each vessel subject to 326 IAC 8-9-4(a):

(b) On and after May 1, 1996, except as provided in 326 IAC 8-9-4(a)(2), the Permittee shall meet the following requirements for each vessel equipped with an internal floating roof:

(1) Visually inspect the internal floating roof, the primary seal, and the secondary seal, if one is in service, prior to filling the vessel with VOL. If there are holes, tears, or other openings in the primary seal, the secondary seal, or the seal fabric or defects in the internal floating roof, or both, the Permittee shall repair the items before filling the vessel.

(2) For vessels equipped with a liquid-mounted or mechanical shoe primary seal, visually inspect the internal floating roof and the primary seal or the secondary seal, if one is in service, through manholes and roof hatches on the fixed roof at least once every twelve (12) months after initial fill. If the internal floating roof is not resting on the surface of the VOL inside the vessel, or there is liquid accumulated on the roof, or the seal is detached, or there are holes or tears in the seal fabric, the Permittee shall repair the items or empty and remove the vessel from service within forty-five (45) days. If a failure that is detected during inspections required in this section cannot be repaired in forty-five (45) days and if the vessel cannot be emptied within forty-five (45) days, a thirty (30) day extension may be requested from the department in the inspection report required in 326 IAC 8-9-6(c)(3). Such a request for an extension shall document that alternate storage capacity is unavailable and specify a schedule of actions the company will take that will assure that the control equipment will be repaired or the vessel will be emptied as soon as possible.

(3) For vessels equipped with both primary and secondary seals:

(A) visually inspect the vessel as specified in paragraph (b)(4) of this Condition, at least every five (5) years; or

(B) Visually inspect the vessel as specified in paragraph (b)(2) of this Condition.
Visually inspect the internal floating roof, the primary seal, the secondary seal, if one is in service, gaskets, slotted membranes, and sleeve seals each time the vessel is emptied and degassed. If the internal floating roof has defects, the primary seal has holes, tears, or other openings in the seal or the seal fabric, or the secondary seal has holes, tears, or other openings in the seal or the seal fabric, or the gaskets no longer close off the liquid surfaces from the atmosphere, or the slotted membrane has more than ten percent (10%) open area, the Permittee shall repair the items as necessary so that none of the conditions specified in this paragraph exist before refilling the vessel with VOL.

In no event shall the inspections required by this Condition occur at intervals greater than ten (10) years in the case of vessels conducting the annual visual inspection as specified in paragraphs (b)(2) and (b)(3)(B) of this Condition and at intervals no greater than five (5) years in the case of vessels specified in subdivision (b)(3)(A).

On and after May 1, 1996, except as provided in 326 IAC 8-9-4(a)(3), the Permittee shall meet the following requirements for each vessel equipped with an external floating roof:

Determine the gap areas and maximum gap widths between the primary seal and the wall of the vessel and between the secondary seal and the wall of the vessel according to the following frequency:

(A) Measurements of gaps between the vessel wall and the primary seal (seal gaps) shall be performed during the hydrostatic testing of the vessel or within sixty (60) days of the initial fill with VOL and at least once every five (5) years thereafter.

(B) Measurements of gaps between the vessel wall and the secondary seal shall be performed within sixty (60) days of the initial fill with VOL and at least once per year thereafter.

(C) If any source ceases to store VOL for a period of one (1) year or more, subsequent introduction of VOL into the vessel shall be considered an initial fill for purposes of paragraph (c)(1) of this Condition.

Determine gap widths and areas in the primary and secondary seals individually by the following procedures:

(A) Measure seal gaps, if any, at one (1) or more floating roof levels when the roof is floating off the roof leg supports.

(B) Measure seal gaps around the entire circumference of the vessel in each place where a one-eighth (1/8) inch diameter uniform probe passes freely (without forcing or binding against seal) between the seal and the wall of the vessel and measure the circumferential distance of each such location.

(C) The total surface area of each gap described in paragraph (c)(2)(B) of this Condition shall be determined by using probes of various widths to measure accurately the actual distance from the vessel wall to the seal and multiplying each such width by its respective circumferential distance.
Add the gap surface area of each gap location for the primary seal and the secondary seal individually and divide the sum for each by the nominal diameter of the vessel and compare each ratio to the respective standards in paragraph (c)(4) of this Condition.

Make necessary repairs or empty the vessel within forty-five (45) days of identification of seals not meeting the requirements listed in paragraphs (A) and (B) as follows:

(A) The accumulated area of gaps between the vessel wall and the mechanical shoe or liquid-mounted primary seal shall not exceed ten (10) square inches per foot of vessel diameter, and the width of any portion of any gap shall not exceed one and five-tenths (1.5) inches. There shall be no holes, tears, or other openings in the shoe, seal fabric, or seal envelope.

(B) The secondary seal shall meet the following requirements:
   (i) The secondary seal shall be installed above the primary seal so that it completely covers the space between the roof edge and the vessel wall except as provided in paragraph (c)(2)(C) of this Condition.
   (ii) The accumulated area of gaps between the vessel wall and the secondary seal used in combination with a metallic shoe or liquid-mounted primary seal shall not exceed one (1) square inch per foot of vessel diameter, and the width of any portion of any gap shall not exceed five-tenths (0.5) inch. There shall be no gaps between the vessel wall and the secondary seal when used in combination with a vapor-mounted primary seal.
   (iii) There shall be no holes, tears, or other openings in the seal or seal fabric.

(C) If a failure that is detected during inspections required in paragraph (c) of this condition cannot be repaired within forty-five (45) days and if the vessel cannot be emptied within forty-five (45) days, a thirty (30) day extension may be requested from the department in the inspection report required in section 6(d)(3) of 326 IAC 8-9. Such extension request shall include a demonstration of unavailability of alternate storage capacity and a specification of a schedule that will assure that the control equipment will be repaired or the vessel will be emptied as soon as possible.

Visually inspect the external floating roof, the primary seal, secondary seal, and fittings each time the vessel is emptied and degassed. If the external floating roof has defects, the primary seal has holes, tears, or other openings in the seal or the seal fabric, or the secondary seal has holes, tears, or other openings in the seal fabric, the Permittee shall repair the items as necessary so that none of the conditions specified in this paragraph exist before filling or refilling the vessel with VOL.
(d) For each vessel that is equipped with a closed vent system and control device described in 326 IAC 8-9-4(a)(1)(B), (a)(2)(B), or (a)(3)(B) and meeting the requirements of 326 IAC 8-9-4(d), other than a flare, the Permittee shall operate the closed vent system and control device and monitor the parameters of the closed vent system and control device in accordance with the operating plan submitted to the department in accordance with 326 IAC 8-9-5(d)(1).

(e) For each vessel that is equipped with a closed vent system and a flare to meet the requirements in 326 IAC 8-9-4(a)(4) or (d), the Permittee shall meet the requirements specified in the general control device requirements in 40 CFR 60.18(e) and 40 CFR 60.18(f)

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.27.910 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.27.1(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.27.1(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 61, Subpart J, and to document compliance with Condition D.27.1(c), the Permittee shall keep records as specified in Section E.5.

(d) Pursuant to 326 IAC 8-4-3(d) and to document compliance with Condition D.27.2, the Permittee shall maintain the following records for storage vessels subject to 326 IAC 8-4-3:
   (1) type of petroleum liquid stored,
   (2) maximum true vapor pressure to the liquid as stored, and
   (3) results of inspections performed on storage vessels.

(e) Pursuant to 326 IAC 8-9-6(b) and to document compliance with Condition D.27.3, the Permittee shall maintain, for the life of the vessel, a record of the following for each vessel to which 326 IAC 8-9 applies:
   (1) The vessel identification number,
   (2) The vessel dimensions,
   (3) The vessel capacity, and
   (4) A description of the emission control equipment for each vessel described in section 4(a) or 4(b) of 326 IAC 8-9, or a schedule for installation of emission control equipment on vessels described in section 4(a) or 4(b) of 326 IAC 8-9 with a certification that the emission control equipment meets the applicable standards.

(f) Pursuant to 326 IAC 8-9-6(c) and to document compliance with Condition D.27.3(a), the Permittee shall maintain the following records for each vessel equipped with a permanently affixed roof and internal floating roof:
(1) A record of each inspection performed as required by section 5(b)(1) through 5(b)(4) of 326 IAC 8-9. Each record shall identify the following:

(A) The vessel inspected by identification number.

(B) The date the vessel was inspected.

(C) The observed condition of each component of the control equipment, including the following:

(i) Seals

(ii) Internal floating roof.

(iii) Fittings

(2) If any of the conditions described in 326 IAC 8-9-5(b)(2) are detected during the required annual visual inspection, a record that includes the following shall be maintained:

(A) The vessel by identification number.

(B) The nature of the defects.

(C) The date the vessel was emptied or the nature of and date the repair was made.

(3) After each inspection required by 326 IAC 8-9-5(b)(3) that finds holes or tears in the seal or seal fabric, or defects in the internal floating roof, or other control equipment defects listed in 326 IAC 8-9-5(b)(3)(B) a record that includes the following shall be maintained:

(A) The vessel by identification number.

(B) The reason the vessel did not meet the specifications of 326 IAC 8-9-4(a)(1)(A), 8-9-4(a)(2)(A), or 8-9-5(b) and list each repair made.

(g) Pursuant to 326 IAC 8-9-6(d) and to document compliance with Condition D.27.8(c), the Permittee shall comply with the following record keeping requirements for each vessel equipped with an external floating roof:

(1) Keep a record of each gap measurement performed as required by section 5(c) of 326 IAC 8-9. Each record shall identify the vessel in which the measurement was made and shall contain the following:

(A) The date of measurement.

(B) The raw data obtained in the measurement.

(C) The calculations described in section 5(c)(2) and 5(c)(3) of 326 IAC 8-9.

(2) For each seal gap measurement that detects gaps exceeding the limitations specified in section 5(c) of 326 IAC 8-9, the Permittee shall maintain a record of the following:
The date of measurement.

The raw data obtained in the measurement.

The calculations described in section 5(c)(2) and 5(c)(3) of 326 IAC 8-9.

The date the vessel was emptied or the repairs made and date of repair.

Pursuant to 326 IAC 8-9-6(e) and to document compliance with Condition D.27.4(a), the Permittee shall comply with the following record keeping requirements for any vessel with a closed vent system with a control device:

1. The Permittee shall maintain records of the following for any vessel equipped with a control device other than a flare:
   
   A. The operating plan.
   
   B. Measured values of the parameters monitored according to section 5(d)(2) of 326 IAC 8-9.

2. The Permittee shall meet the following requirements for any vessel equipped with a closed vent system and a flare:
   
   A. Keep records of all periods of operation during which the flare pilot flame is absent.
   
   B. Keep records of measurements required by 40 CFR 60.18(f)(1) through 40 CFR 60.18(f)(5) as required by 40 CFR 60.8.

Pursuant to 326 IAC 8-9-6(g) and (h), the Permittee shall maintain the following records for storage tanks 3633, 3635, 3710, 3571, TK-3572, TK-3734, and TK-3906, which have a design capacity greater than or equal to thirty-nine thousand (39,000) gallons and store a VOL with a maximum true vapor pressure greater than or equal to 0.5 but less than 0.75 pound per square inch absolute (psia):

1. The type of VOL stored.
2. The dates of the VOL stored.
3. For each day of VOL storage, the average stored temperature for VOLs stored above or below the ambient temperature or average ambient temperature for VOLs stored at ambient temperature, and the corresponding maximum true vapor pressure.
4. The Permittee shall maintain a record and notify the department within thirty (30) days when the maximum true vapor of the liquid exceeds 0.75 psia.

Pursuant to 40 CFR 60, Subpart Ka and to document compliance with Condition D.27.4(a), the Permittee shall maintain records as specified in Section E.8.

Pursuant to 40 CFR 60, Subpart Kb and to document compliance with Condition D.27.4(b), the Permittee shall maintain records as specified in Section E.9.

Pursuant to 40 CFR 60, Subpart K and to document compliance with Condition D.27.4(c), the Permittee shall maintain records as specified in Section E.7.
(m) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.27.4(d), the Permittee shall maintain records as specified in Section E.1.

(n) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.27.5(a), the Permittee shall keep records as specified in Sections E.1 and E.3.

(o) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.27.5(b), the Permittee shall keep records as specified in Section E.6.

(p) Pursuant to 40 CFR 60, Subpart GGG and to document compliance with Condition D.27.2(e), the Permittee shall keep records as specified in Section E.13.

(q) Pursuant to 40 CFR 63, Subpart EEEE, the Permittee shall keep records as specified in Section E.24.

D.27.4011 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.27.1(a), the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.27.1(b), the Permittee shall submit reports as specified in Section E.1 and E.4.

(c) Pursuant to 40 CFR 61, Subpart J, and to document compliance with Condition D.27.1(c), the Permittee shall submit reports as specified in Section E.5.

(d) Pursuant to 326 IAC 8-9-6(c) and to document compliance with Condition D.27.2(a):

(1) If any of the conditions described in 326 IAC 8-9-5(b)(2) are detected during the required annual visual inspection, the Permittee shall furnish a report to the department within (30) days of the inspection. Each report shall identify the following:

(A) The vessel by identification number.

(B) The nature of the defects.

(C) The date the vessel was emptied or the nature of and date the repair was made.

(2) After each inspection required by 326 IAC 8-9-5(b)(3) that finds holes or tears in the seal or seal fabric, or defects in the internal floating roof, or other control equipment defects listed in 326 IAC 8-9-5(b)(3)(B), the Permittee shall furnish a report to the department within thirty (30) days of the inspection. The report shall identify the following:

(A) The vessel by identification number.

(B) The reason the vessel did not meet the specifications of section 4(a)(1)(A), 4(a)(2)(A), or 5(b) of 326 IAC 8-9 and list each repair made.

(e) Pursuant to 326 IAC 8-9-6(d) and to document compliance with Condition D.27.9(c) D.27.8(e):
(1) Within sixty (60) days of performing the seal gap measurements required by section 5(c)(1) of 326 IAC 8-9, the Permittee shall furnish the department with a report that contains the following:

(A) The date of measurement.

(B) The raw data obtained in the measurement.

(C) The calculations described in section 5(c)(2) and 5(c)(3) of 326 IAC 8-9.

(2) After each seal gap measurement that detects gaps exceeding the limitations specified in section 5(c) of 326 IAC 8-9, the Permittee shall submit a report to the department within thirty (30) days of the inspection. The report shall identify the vessel and contain the following information:

(A) The date of measurement.

(B) The raw data obtained in the measurement.

(C) The calculations described in section 5(c)(2) and 5(c)(3) of 326 IAC 8-9.

(D) The date the vessel was emptied or the repairs made and date of repair.

(f) Pursuant to 326 IAC 8-9-6(e) and to document compliance with Condition D.27.3(a), the Permittee shall meet the following requirements for any vessel equipped with a closed vent system and a flare:

(1) Furnish the department with a report containing the measurements required by 40 CFR 60.18(f)(1) through 40 CFR 60.18(f)(5) as required by 40 CFR 60.8. This report shall be submitted within six (6) months of the initial start-up date.

(2) Furnish the department with a semiannual report of all periods recorded under 40 CFR 60.115 in which the pilot flame was absent.

(g) Pursuant to 326 IAC 8-9-5(b)(5) and 326 IAC 8-9-5(c)(6)(B), the Permittee shall notify the department in writing at least thirty (30) days prior to the filling or refilling of each vessel for which an inspection is required by 326 IAC 8-9-5(b)(1) to afford the department the opportunity to have an observer present. If the inspection required by 326 IAC 8-9-5(b)(4) or (c)(6) is not planned and the Permittee could not have known about the inspection thirty (30) days in advance of refilling the vessel, the Permittee shall notify the department at least seven (7) days prior to the refilling of the vessel. Notification shall be made by telephone immediately followed by written documentation demonstrating why the inspection was unplanned. Alternatively, this notification, including the written documentation, may be made in writing and sent by express mail so that it is received by the department at least seven (7) days prior to the refilling.

(h) The Permittee shall notify the department in writing at least thirty (30) days prior to the filling or refilling of each vessel to afford the department the opportunity to inspect the vessel prior to the filling. If the inspection required by this subdivision is not planned and the Permittee could not have known about the inspection thirty (30) days in advance of refilling the vessel, the Permittee shall notify the department at least seven (7) days prior to the refilling of the vessel. Notification shall be made by telephone immediately followed by written documentation demonstrating why the inspection was unplanned. Alternatively, this notification including the written documentation may be made in writing and sent by express mail so that it is received by the department at least seven (7) days prior to the refilling.
(i) Pursuant to 326 IAC 8-9-5(c)(5), the Permittee shall notify the department thirty (30) days in advance of any gap measurements required by 326 IAC 8-9-5(c)(1) to afford the department the opportunity to have an observer present.

(j) Pursuant to 40 CFR 60, Subpart Ka and to document compliance with Condition D.27.4(a), the Permittee shall submit reports as specified in Section E.8.

(k) Pursuant to 40 CFR 60, Subpart Kb and to document compliance with Condition D.27.4(b), the Permittee shall submit reports as specified in Section E.9.

(l) Pursuant to 40 CFR 60, Subpart K and to document compliance with Condition D.27.4(c), the Permittee shall submit reports as specified in Section E.7.

(m) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.27.4(d), the Permittee shall submit reports as specified in Section E.1.

(n) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.27.5(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(o) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.27.5(b), the Permittee shall submit reports as specified in Section E.6.

(p) To document compliance with Condition D.27.4(d)(2), the Permittee shall submit the following reports:

Pursuant to 40 CFR 63.654(g)(6), the Permittee shall submit Notification of Compliance Status reports no later than 60 days after the end of the 6-month period after an existing Group 1 storage tank was brought into compliance. The Notification of Compliance Status Report may be combined with the periodic report. The notifications shall be submitted to:

Indiana Department of Environmental Management
Compliance Data Section, Office of Air Quality
100 North Senate Avenue
**MC 61-53 IGCN 1003**
Indianapolis, Indiana 46204-2251
and
United States Environmental Protection Agency, Region V
Director, Air and Radiation Division
77 West Jackson Boulevard
Chicago, Illinois 60604-3590

The notifications require the certification by the "responsible official" as defined by 326 IAC 2-7-1(34).

(q) Pursuant to 40 CFR 60, Subpart GGG and to document compliance with Condition D.27.2(e), the Permittee shall submit reports as specified in Section E.13.

(r) Pursuant to 40 CFR 63, Subpart EEEE, the Permittee shall submit reports as specified in Section E.24.
Facility Description [326 IAC 2-7-5(15)]

Cooling Towers constructed after 1995: Cooling Towers, including the following:

1. One (1) cooling tower (identified as Cooling Tower No.6), constructed in 1996, with a maximum capacity of 20,000 gallons of water per minute. Cooling Tower No.6 is located at the No.12 Pipestill.

2. Cooling Towers (constructed prior to 1980) with controls installed as part of the CXHO project:

<table>
<thead>
<tr>
<th>Cooling Tower</th>
<th>Recirculation Rate/Make-up rate (gallons/minute)</th>
<th>Control Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cooling Tower 2*</td>
<td>50,000/1,285</td>
<td>high efficiency liquid drift eliminators</td>

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.31.1 Prevention of Significant Deterioration [326 IAC 2-2], Nonattainment NSR [326 IAC 2-1.1-5] and Emission Offset [326 IAC 2-3]

(a) Pursuant to In order to render 326 IAC 2-3 (Emission Offset) not applicable and pursuant to CP089-4822-00003, issued April 19, 1996, the average concentration of total dissolved solids (TDS) in the water input to Cooling Tower No.6 shall not exceed 3,300 mg/L based on a twelve (12) consecutive month period, with compliance determined at the end of each month. This limit is equivalent to 27.5 tons per year of PM and PM10 emissions.

(b) Pursuant to In order to render 326 IAC 2-3 (Emission Offset) not applicable and pursuant to CP089-4822-00003, issued April 19, 1996, the VOC emissions from Cooling Tower No.6 shall not exceed 0.84 pounds per hour, which is equivalent to 3.7 tons per twelve (12) consecutive month period.

Compliance with these limits shall ensure that 326 IAC 2-3 does not apply to Cooling Tower No. 6.

(c) In order to render 326 IAC 2-2 and 326 IAC 2-1.1-5 not applicable, after the installation of the liquid drift eliminators on cooling towers 2, 3, 4, and the installation of towers 7 and 8, the average concentration of total dissolved solids (TDS) in the water input to Cooling Towers No. 2, 3, 4, 7, and 8 shall not exceed the following:
<table>
<thead>
<tr>
<th>Cooling Tower</th>
<th>TDS (mg/L) per twelve (12) consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1,627</td>
</tr>
<tr>
<td>3</td>
<td>1,147</td>
</tr>
<tr>
<td>4</td>
<td>1,645</td>
</tr>
<tr>
<td>7</td>
<td>1,163</td>
</tr>
<tr>
<td>8</td>
<td>1,163</td>
</tr>
</tbody>
</table>

(d) In order to render 326 IAC 2-3 (Emission Offset) not applicable, the VOC emissions from Cooling Towers No., 7 and 8 shall not exceed the following based on a 12 consecutive month average:

<table>
<thead>
<tr>
<th>Cooling Tower</th>
<th>lb/hr</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>0.9</td>
</tr>
<tr>
<td>8</td>
<td>3.9</td>
</tr>
</tbody>
</table>

Compliance with the VOC, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for VOC, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

Compliance Determination Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.31.2 Operating Requirements

In order to demonstrate compliance with Condition D.31.1(c), the liquid drift eliminators shall be in operation and control PM and PM-10 from Cooling Towers 2, 3, 4, 7 and 8 at all times that these cooling towers are in operation.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.31.23 Compliance Monitoring Requirements [326 IAC 2-3]

(a) To monitor compliance with Condition D.31.1(a) and (c), the Permittee shall take weekly measurements of the total dissolved solids (TDS) in the water input to Cooling Towers No. 2, 3, 4, 6, 7 and 8. If the TDS limitation is exceeded, the Permittee shall perform quantitative water analyses and shall take the remedial action necessary to correct the problem.

(b) To monitor compliance with Condition D.31.1(b) and (d), the Permittee shall visually inspect the water going to Cooling Towers No. 2, 3, 4, 6, 7 and 8 for liquid VOC, including but not limited to the indication of a sheen, at least once per week. If VOC is observed, the Permittee will take the remedial action necessary to correct the problem.

Record Keeping and Reporting Requirement [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.31.34 Record Keeping Requirements [326 IAC 2-3]
(a) To document compliance with Condition D.31.1(a) and (c), and D.31.2(a) 31.3(a), the Permittee shall maintain records of the total dissolved solids (TDS) in the water input to Cooling Towers No. 2, 3, 4, 6, 7 and 8 and any remedial actions taken (including the date remedial actions were initiated).

(b) To document compliance with Condition D.31.1(b) and (d) and D.31.2(b) D.31.3(b), the Permittee shall maintain records of the visual inspect required by D.31.2(b) D.31.3(b) and any remedial actions taken (including the date remedial actions were initiated).
Facility Description [326 IAC 2-7-5(15)]

(ii) One (1) Marine Dock Facility used to store and transfer products. The facility has three dock berths. A process heater is used to keep certain tanks at the proper temperature for shipping. 

As part of the CXHO Project, a vapor recovery/control system will be installed on the Marine Dock Loading operations to control emissions from gasoline loading. This facility includes the following emission sources and may also include insignificant activities listed in Section A.4 of this permit:

1. One (1) natural gas-fired process heater (identified as Marine Dock Heater F-100), having a maximum heat input capacity of 7 MMBtu per hour.

2. One (1) storage tank (identified as BT-1), constructed in 1990, with a maximum storage capacity of 706,000 gallons and used to store petroleum hydrocarbons with a vapor pressure less than 15 psia. The tank is equipped with a fixed roof and an internal floating roof.

3. One storage tank (BT-002), constructed in 1968, permitted for modification per SPM 089-25488-00453, with a maximum storage capacity of 874,944 gallons, used to store petroleum hydrocarbons with a vapor pressure less than 15 psia, with a fixed roof and an internal floating roof.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.34.1 Lake County PM\textsubscript{10} Emission Limitations [326 IAC 6.8-3-6]

Pursuant to 326 IAC 6.8-6-3 (formerly 326 IAC 6-1-10.1(h)), the Permittee shall comply with the following requirements for process heater F-100:

(a) Only natural gas shall be burned as fuel; and

(b) The PM\textsubscript{10} emissions shall not exceed 0.0075 - 0.003 pounds per million Btu heat input and 0.052 - 0.020 pounds per hour.

D.34.2 Emission Offset [326 IAC 2-3] Minor Limit

In order to render 326 IAC 2-3 not applicable, the Permittee shall comply with the following limits for gasoline loading operations at the marine loading dock:

(a) The VRU/VCU shall be installed and operated as part of the CXHO project.

(b) After the installation of the Vapor Recover Unit (VRU) or Vapor Capture Unit (VCU) on the marine loading dock, the emissions of VOC during gasoline loading shall not exceed 10 milligrams per liter (mg/L) of gasoline loaded.

(c) After the installation of the Vapor Recover Unit (VRU) or Vapor Capture Unit (VCU) on the marine loading dock, the gasoline loaded shall not exceed 4,000,000 barrels per 12 consecutive month period, with compliance determined at the end of each month.

(d) The additional NOx and CO emissions from the VRU/VCU shall not exceed 5.6 tons and 2.2 tons per 12 consecutive month period, respectively, with compliance determined at the end of each month,
Compliance with the VOC, NOx and CO emissions limit, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for VOC and CO for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-3 not applicable for these pollutants.

D.34.23 Wastewater/Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF]

Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems and oil-water separators.

D.34.34 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) and Benzene [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAPs from pumps, valves, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

D.34.45 Standards for Marine Tank Loading [326 IAC 20-17] [40 CFR 63, Subpart Y] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC and Y, the Permittee shall comply with the requirements specified in Section E.1 and E.12 for the Marine Dock Facility.

D.34.56 Petroleum Liquid Storage Facilities [326 IAC 8-4-3]

Pursuant to 326 IAC 8-4-3(b), the Permittee shall not permit the storage of a VOC with a true vapor pressure greater than 1.52 psia (10.5 kPa) in a fixed roof tank with a capacity greater than 39,000 gallons unless:

(a) The tank has been retrofitted with an internal floating roof equipped with a closure seal, or seals, to close the space between the roof edge and tank wall unless the source has been retrofitted with equally effective alternate control which has been approved,

(b) The facility is maintained such that there are no visible holes, tears or other opening in the seal or any seal fabric or materials,

(c) All openings, except stub drains, are equipped with covers, lids or seals such that:

(1) the cover, lid or seal is in the closed position at all times except when in actual use;

(2) automatic bleeder vents are closed at all times except when in actual use;

(3) rim vents if provided, are set to open when the roof is being floated off the roof leg supports or at the manufacturer’s recommended setting.
D.34.67 VOC and HAP Emissions From Storage Vessels [326 IAC 12] [40 CFR 60, Subpart Kb] [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

(a) Pursuant to 40 CFR 60, Subpart Kb and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.9 for storage tanks BT-1 and BT-002.

(b) Pursuant to 40 CFR 63.640(n)(1), a Group 1 or Group 2 storage vessel that is subject to 40 CFR 63, Subpart CC and to the provisions of 40 CFR 60, Subpart Kb is required to comply only with the requirements of 40 CFR 60, Subpart Kb except as provided in 40 CFR 63.640(n)(8), which are listed in Section E.1.

D.34.7 National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters [40 CFR Part 63, Subpart DDDDD] Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements specified in Section E.20 for Marine Dock Heater F-100, which comprises the affected source for the small gaseous fuel subcategory.

Compliance Determination Requirements

D.34.8 Operating Requirement Pursuant to SSM 089-14630-00003, issued on November 30, 2001, fuel oil shall not be used as fuel for process heater F-100, effective June 1, 2003.

D.34.9 Testing Requirements [326 IAC 2-7-6(1),(6)] [326 IAC 2-1.1-11]

(a) Within 180 days of the installation of the VRU or VCU at the marine loading dock, in order to demonstrate compliance with Condition D.34.2, the Permittee shall perform VOC testing at the outlet of the VRU/VCU when loading gasoline utilizing methods as approved by the Commissioner. Testing shall be conducted in accordance with Section C - Performance Testing. This test shall be repeated at least once every five years from the date of the previous valid compliance demonstration.

(b) Compliance with the emissions limit for the VRU/VCU shall be determined as follows:

\[ T = \frac{\sum_{i=1}^{n} T_i}{n} \]

Where:

- \( T \) = average of IDEM approved stack test results over the previous 12 month period
- \( T_i \) = average of multiple runs during Test #i
- \( n \) = number of IDEM approved stack tests during previous 12 month period

D.34.10 Operating Requirement After the installation of the VRU/VCU at the marine loading dock, in order to demonstrate compliance with Condition D.34.2, the VRU/VCU shall be in operation and control VOC emissions at all times gasoline loading is being performed at the marine loading dock.
Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.34.911 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirement [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.34.1012 Record Keeping Requirements

(a) To document compliance with Condition D.34.8 the Permittee shall maintain records of the type of fuel burned in Process Heater F-100.

(b) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.34.3(a), the Permittee shall comply with the record keeping requirements in the LDAR Plan.

(c) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.34.4(b) D.34.3(b), the Permittee shall comply with the record keeping requirements in Sections E.1 and E.4.

(d) Pursuant to 326 IAC 8-4-3(d) and to document compliance with Condition D.34.6 D.34.5, the Permittee shall maintain the following records for storage tanks BT-1 and BT-002:

   (1) The type of petroleum liquid stored;
   (2) The maximum true vapor pressure to the liquid as stored; and
   (3) The results of inspections performed on the storage vessel.

(e) Pursuant to 40 CFR 60, Subpart Kb and 40 CFR 63, Subpart CC and to document compliance with Condition D.34.7 D.34.6, the Permittee shall comply with the record keeping requirements in Sections E.1 and E.9.

(f) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.34.3 D.34.2, the Permittee shall keep records as specified in Sections E.1 and E.3.

(g) Pursuant to 40 CFR 63, Subparts CC and Y and to document compliance with Condition D.34.5 D.34.4, the Permittee shall maintain records of as specified in Sections E.1 and E.12.

(d) In order to demonstrate compliance with Condition D.34.2, the Permittee shall maintain records of barrels of gasoline loaded each month at the marine loading dock.

D.34.1413 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.34.4(a) D.34.3(a), the Permittee shall comply with the reporting requirements in the LDAR Plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.34.4(b) D.34.3(b), the Permittee shall comply with the reporting requirements specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 60, Subpart Kb and 40 CFR 63, Subpart CC and to document compliance with Condition D.34.7 D.34.6, the Permittee shall comply with the reporting requirements specified in Sections E.1 and E.9.
(d) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.34.3 - D.34.2, the Permittee shall submit reports as specified in Sections E.1 and E.3.

(e) In order to demonstrate compliance with Condition D.34.2, following the installation of the VRU/VCU at the marine loading dock, the Permittee shall submit quarterly reports of the barrels of gasoline loaded at the marine loading dock. The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).
Facility Description [326 IAC 2-7-5(15)]

(jj) The refinery operates eight ten hydrocarbon flares. The PIB flare is operated by INEOS. The flares are used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance.

The flares are identified as follows:

<table>

* - During emergencies or flare outages, some emission units or streams may be controlled by an alternate flare system that complies with the same applicable requirements as the flare normally used to control the emissions for those units.
** - Owned and operated by INEOS USA, LLC. (Plant I.D. 089-00076).
*** - Flares are equipped with a flare gas recovery system. Under normal operation the recovered gas streams will be sent to vapor recovery/treating area for removal of H2S and heavy components before being utilized in the refinery fuel gas system.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)
Emission Limitations and Standards [326 IAC 2-7-5(1)]

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for the GOHT Flare and the South Flare:

(a) The emissions of NOx shall not exceed 100 pounds per million cubic feet and 0.068 pounds per million BTU of pilot and purge gas burned.

(b) The emissions of VOC shall not exceed 5.5 pounds per million cubic feet and 0.14 pounds per million BTU of pilot and purge gas burned.

(c) The emissions of CO shall not exceed 84 pounds per million cubic feet and 0.37 pounds per million BTU of pilot and purge gas burned.

(d) The emissions of SO2 shall not exceed 0.6 pounds per million cubic feet of pilot gas burned.

(e) The emissions of SO2 shall not exceed 13.3 pounds per million cubic feet of purge gas burned.

(f) The emissions of PM and PM-10 shall not exceed 1.9 and 7.6 pounds per million cubic feet of pilot and purge gas burned.

(g) The Permittee shall comply with the following fuel usage limits:

<table>
<thead>
<tr>
<th>Flare ID</th>
<th>Fuel Usage Limit (10^3 cubic feet per 12 consecutive month period)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOHT-pilot</td>

<td>28,908.0</td>
</tr>
</tbody>
</table>

Compliance with the fuel usage limits and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant thresholds at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.35.2 Standards for Miscellaneous Process Vents [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Section E.1 for the UIU, VRU, GOHT, South and Alky flares relating to the control of process vents.

D.35.23 Equipment Leaks of Benzene [326 IAC 14][40 CFR 61, Subpart J]

Pursuant to 40 CFR 61, Subpart J, the Permittee shall comply with the requirements specified in Section E.5 for control device standards for the 4UF Flare.
D.35.4 Equipment Leaks of VOC [326 IAC 12] [40 CFR 60, Subpart GGG]
Pursuant to 40 CFR 60, Subpart GGG, the Permittee shall comply with the control device standards specified in Section E.13 for the 4UF, UIU, Alky, GOHT, South and DDU flares.

D.35.5 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]
(a) Pursuant to 40 CFR 60, Subpart J, the Permittee shall comply with the requirements specified in Section E.2 for the DDU Flare, GOHT flare, South flare and LPG Flare, except as specified in paragraphs (b).
(b) To demonstrate compliance with paragraph (a) of this condition, the Permittee shall operate the LPG Flare in compliance with the approved alternative monitoring requirements in Condition D.35.57.

D.35.6 Compliance Monitoring Requirements for the LPG Flare [326 IAC 12] [40 CFR 60, Subpart J]
The Permittee shall comply with the following alternative compliance monitoring requirements for the LPG Flare:
(a) The Permittee shall burn only certified commercial grade LPG in the LPG Flare.
(b) On May 13, 2004, the Permittee completed a detection tube sampling and analysis of the gas stored at the LPG storage facilities and determined that the total sulfur content of the gas is 34 ppm. No further testing is required.
(c) If the gas stream composition changes or if the gas stream will no longer be required to meet product or pipeline specifications, then the gas stream must be resubmitted for approval.

D.35.7 Operating Requirements for the Flares
The Permittee may route emissions to an alternate flare during emergencies or flare outages. The alternative flare shall be in compliance with the same requirements applicable to the flare normally used to control the emissions, except in cases of emergencies or malfunctions. Use of a flare as part of normal operation, which is not in compliance with the same applicable requirements as the flare normally used to control emissions, shall require prior approval by IDEM, OAQ.

D.35.8 NESHAP for Petroleum Refineries [40 CFR 63, Subpart UUU]
Pursuant to 40 CFR 63, Subpart UUU, the Permittee shall comply with the requirements specified in Section E.10 for the 4UF and UIU flares.

Record Keeping and Reporting Requirement [326 IAC 2-7-5(3)] [326 IAC 2-7-19]
D.35.9 Record Keeping Requirements
(a) To document compliance with Condition D.35.2-D.35.4, Pursuant to 40 CFR 63, Subpart CC, the Permittee shall maintain the records as specified in Section E.1.
(b) Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition D.35.3 D.35.2, the Permittee shall keep records as specified in Section E.5.
(c) Pursuant to 40 CFR 60, Subpart GGG and to document compliance with Condition D.35.4-D.35.3, the Permittee shall maintain the records as specified in Section E.13.
(d) Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition D.35.5 D.35.4, the Permittee shall keep records as specified in Section E.2.
(e) Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition D.35.8 D.35.7, the Permittee shall keep records as specified in Section E.10.
(f) **In order to demonstrate compliance with Condition D.35.1(e), the Permittee shall maintain records of fuel usages at the GOHT and South flares.**

### D.35.910 Reporting Requirements

- **(a)** Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition [D.35.2](#), the Permittee shall submit reports as specified in Section E.1.

- **(b)** Pursuant to 40 CFR 61, Subpart J and to document compliance with Condition [D.35.3](#), the Permittee shall submit reports as specified in Section E.5.

- **(c)** Pursuant to 40 CFR 60, Subpart GGG and to document compliance with Condition [D.35.4](#) [D.35.3](#), the Permittee shall submit reports as specified in Section E.13.

- **(d)** Pursuant to 40 CFR 60, Subpart J and to document compliance with Condition [D.35.5](#) [D.35.4](#), the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

- **(e)** Pursuant to 40 CFR 63, Subpart UUU and to document compliance with Condition [D.35.8](#) [D.35.7](#), the Permittee shall submit to IDEM, OAQ the reports specified in Section E.10.

- **(f)** **In order to demonstrate compliance with Condition D.35.1, the Permittee shall submit quarterly reports for pilot gas and purge gas usages at the GOHT and South flares.** The report submitted by the Permittee does require the certification by the “Responsible Official” as defined by 326 IAC 2-7-1(34).
Facility Description [326 IAC 2-7-5(15)]

(kk) The OSBL area includes the pipe alleys, laboratory dock and waste transfer pad. The pipe alleys contain pipes that transfer hydrocarbon streams from one process unit to another or to storage. This facility includes leaks from process equipment, including open-ended valves or lines and flanges. This facility also contains area drains and an oil/water separator. This facility may include insignificant activities listed in section A.4 of this permit.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.36.1 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 12] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(c) Prior to start-up of the new coker (#2 Coker), BP shall make a determination as to whether 40 CFR 60, Subpart GGGa has been triggered by component changes made on the OSBL as a part of the projects authorized by SSM 089-25484-00463.
BP shall report the results of that determination to IDEM. If BP determines that Subpart GGGa has been triggered, BP shall comply with the requirements of that rule upon startup.

D.36.2 Wastewater / Waste Streams [326 IAC 20-16-1][40 CFR 63, Subpart CC][326 IAC 14][40 CFR 61, Subpart FF] [326 IAC 12] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and closed vent systems and control devices subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and closed vent systems and control devices subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, subpart CC specified in Section E.1.
Compliance Monitoring Requirements

D.36.3 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.36.4 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.36.1(a), the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.36.1(b), the Permittee shall keep records as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.36.2(a), the Permittee shall keep records as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.36.2(b), the Permittee shall keep records as specified in Section E.6.

D.36.5 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.36.1(a), the Permittee shall submit reports as specified in the LDAR plan.

(b) Pursuant to 40 CFR 63, Subpart CC and to document compliance with Condition D.36.1(b), the Permittee shall submit reports as specified in Sections E.1 and E.4.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.36.2(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.36.2(b), the Permittee shall submit reports as specified in Section E.6.
Facility Description [326 IAC 2-7-5(15)]:

(II) The Distillate Hydrotreating (DHT) Unit, identified as Unit ID 720 and rated at 45,000 barrels per day, which removes sulfur from petroleum distillates. Distillate feed is mixed with hydrogen, heated in a process furnace and passed over a catalyst bed to convert sulfur compounds to \( \text{H}_2\text{S} \). The DHT Unit was constructed in 2005/2006 and includes the following emission units:

(1) DHT Unit Heater B-601, rated at 20 MMBtu per hour and constructed in May 2005. As part of the CXHO Project, DHT Unit Heater B-601 will be replaced with a 41.9 MMBtu per hour natural gas fired heater, identified as B-601A. \( \text{NO}_x \) emissions are controlled by ultra low-\( \text{NO}_x \) burners having an emission rate of 0.04 pounds per million Btu heat input or less. Emissions are exhausted to a stack identified as 720-01.

(2) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, flanges or other connectors, and instrumentation systems.

The DHT Unit shares the DDU Flare, used to control VOC emissions during emergency situations, unit startups and shutdowns.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.37.1 Particulate Matter [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from Heater B-601 (until shutdown) and B-601A shall not exceed 0.03 grains per dry standard cubic foot.

D.37.2 Lake County Sulfur Dioxide Emission Limitations [326 IAC 7-4.1-1]

Pursuant to 326 IAC IAC 7-4.1-1, the Permittee shall burn only natural gas in DHT Heater B-601 (until shutdown) and B-601A.

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for heater B-601A:

(a) The emissions of NO\text{x} shall not exceed 7.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of CO shall not exceed 7.3 tons per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.

(d) The emissions of PM and PM-10 shall not exceed 0.0019 and 0.0075 pounds per million BTU, respectively.

(e) The firing rate shall not exceed 367,044 million BTU per 12 consecutive month period, with compliance determined at the end of each month.
Compliance with the limits on the annual firing rates and the NOx, VOC, SO2, CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NOx, VOC, SO2, CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.37.34 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGG]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 60, Subpart GGG and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.4, and E.13 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.37.45 Wastewater / Waste Streams [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 14] [40 CFR 61, Subpart FF] [40 CFR 60, Subpart QQQ]

(a) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF, the Permittee shall comply with the requirements specified in Sections E.1 and E.3 for individual drain systems, oil water separators, and aggregate facilities subject to 40 CFR 63, Subpart CC wastewater requirements and 40 CFR 61, Subpart FF.

(b) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall comply with the requirements specified in Section E.6 for individual drain systems, oil-water separators, and aggregate facilities subject to 40 CFR 60, Subpart QQQ.

(c) Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream that is managed in a piece of equipment subject to both 40 CFR 63, subpart CC and 40 CFR 60, subpart QQQ is required to comply with only the provisions of 40 CFR 63, Subpart CC specified in Section E.1.

D.37.5 National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters [40 CFR 63 Subpart DDDDD]

Pursuant to 40 CFR 63, Subpart DDDDD, the Permittee shall comply with the requirements in Section E.20 for the DHT Heater B-601, which comprises the affected source for new large natural gas fired process heaters.

D.37.6 Emission Offset [326 IAC 2-3]

(a) Equipment leaks shall comply with the standards in 40 CFR 60 Subpart GGG and 40 CFR 63 Subpart CC, as applicable for components in gas/vapor service and light liquid service, except that a more stringent definition of a leak shall apply to valves and flanges. An instrument reading of 500 parts per million (ppm) or greater shall constitute a leak for valves and flanges.

(b) All emissions from pressure relief devices and compressor seal systems shall be vented to a flare and burned as fuel.
(c) Nitrogen oxide emissions from Process Heater B-601 shall be controlled by ultra low-NOX burners having an emission rate of 0.04 pounds per million Btu heat input or less.

The requirements in paragraphs (a) through (c) of this condition render the requirements of Emission Offset (326 IAC 2-3) not applicable.

Compliance Determination Requirements

D.37.7 Testing Requirements [326 IAC 2-7-6(1),(6)][326 IAC 2-1.1-11]

(a) No later than 180 days after startup of Heater B-601, the Permittee shall conduct performance tests for carbon monoxide according to Table 5 of 40 CFR 63, Subpart DDDDD. Compliance shall be based on a 3-run average. This performance test shall be repeated annually between 10 and 12 months after the date on which previous performance test was performed.

(b) Within 60 days after achieving the maximum production rate at which the DHT Unit will be operated, but no later than 180 days after startup of Heater B-601, the Permittee shall conduct performance tests for nitrogen oxide emissions and furnish the Commissioner a written report of the results of such performance tests.

(e)(a) Compressors in hydrogen service are exempt from the requirements of 40 CFR 60.592 and 40 CFR 63.698(a) and (c) if the Permittee demonstrates that a compressor is in hydrogen service. The Permittee may use engineering judgment to demonstrate that the percent hydrogen content exceeds 50 percent by volume. In the event that OAQ does not agree, OAQ reserves the right to require testing in accordance with 40 CFR 60.593(b)(1) and 40 CFR 63.698(g)(2)(i)(A).

(b) Compliance with the limits in Condition D.37.3(c) and (d) shall be demonstrated as specified in Condition D.0.3.

D.37.8 Continuous Emissions Monitoring

The CO and NOx Continuous Emissions Monitors (CEMs) for heater B-601A shall be calibrated, maintained, and operated for determining compliance with CO and NOx emissions limits for the heater B-601A in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.37.9 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.37.10 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.37.4(a) D.37.3(a), the Permittee shall keep records as specified in the LDAR plan.

(b) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Condition D.37.4(b) D.37.3(b), the Permittee shall keep records as specified in Sections E.1, E.4, and E.13.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.37.5(a) D.37.4(a), the Permittee shall keep records as specified in Sections E.1 and E.3.
(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.37.5(b) D.37.4(b), the Permittee shall keep records as specified in Section E.6.

(e) Pursuant to 40 CFR 63, Subpart DDDDD and to document compliance with Condition D.37.5, the Permittee shall keep records as specified in Section E.20.

(e) In order to demonstrate compliance with Condition D.37.3, the Permittee shall maintain records of the monthly firing rates at B-601A.

(f) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.37.8, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.

(2) All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:
   (A) Date of facility downtime,
   (B) Time of commencement and completion of downtime, and
   (C) Reason for each downtime.

D.37.11 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.37.4(a) D.37.3(a), the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(b) Pursuant to 40 CFR 60, Subpart GGG, 40 CFR 63, Subpart CC, and to document compliance with Conditions D.37.6(b) D.37.5(b), the Permittee shall submit reports as specified in Section E.1, E.4, and E.13.

(c) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 61, Subpart FF and to document compliance with Condition D.37.5(a) D.37.4(a), the Permittee shall submit reports as specified in Sections E.1 and E.3.

(d) Pursuant to 40 CFR 60, Subpart QQQ and to document compliance with Condition D.37.5(b) D.37.4(b), the Permittee shall submit reports as specified in Section E.6.

(e) Pursuant to 40 CFR 63, Subpart DDDDD and to document compliance with Condition D.37.5, the Permittee shall submit reports as specified in Section E.20.
(e) In order to demonstrate compliance with Condition D.37.3, the Permittee shall submit a quarterly summary of the monthly firing rates at heater B-601A to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the "responsible official" as defined by 326 IAC 2-7-1(34).

(f) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.37.3 and D.37.8, the Permittee shall submit reports of excess CO and NOx emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
7. Nature of system repairs and adjustments.
Facility Description [326 IAC 2-7-5(15)]

(n) The Gas Oil Hydrotreater (GOHT) Unit, identified as Unit ID 802 and rated at 120,000 barrels per day. The GOHT reduces the sulfur and nitrogen content of the FCU feed and improves the hydrogen content. Operation of the GOHT will enable the FCU to meet gasoline sulfur specifications and to improve FCU conversion yields. The GOHT Unit will be constructed as part of the CXHO Project and includes the following emission units:

(1) Process heaters comprising of:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (mmBTU/hr)</th>
<th>Stack Exhausted To</th>
<th>Emissions Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-901A</td>
<td>47</td>
<td>802-01</td>
<td>Ultra low-NOx burners</td>
</tr>
<tr>
<td>F-901B</td>
<td>47</td>
<td>802-02</td>
<td>Ultra low-NOx burners</td>
</tr>
</tbody>
</table>

(2) Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open ended lines or valves, flanges or other connectors, and instrumentation systems.

(3) The GOHT Unit vents to the GOHT Flare (included in Section D.35), used to control VOC emissions during emergency situations, unit startups and shutdowns.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.42.1 Particulate Matter [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from each of the stacks 802-01 and 802-02 shall not exceed 0.03 grains per dry standard cubic foot.

D.42.2 Prevention of Significant Deterioration [326 IAC 2-2], Emission Offset [326 IAC 2-3] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following for the heaters identified as F-901A and F-901B:

(a) The emissions of NOx shall not exceed 0.04 pounds per million BTU.
(b) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.
(c) The emissions of SO2 shall not exceed 2.3 tons per 12 consecutive month period for each of the heaters F-901A and F-901B, with compliance determined at the end of each month.
(d) The emissions of PM and PM-10 each shall not exceed 0.0019 and 0.0075 pounds per million BTU of fuel burned, respectively.
(e) The emissions of CO shall not exceed 0.02 pounds per million BTU.
(f) The Permittee shall comply with the following fuel usage limits:
Unit ID | Firing rate limit \( (10^3 \text{ mmBTU}) \) per 12 consecutive month period
---|---
F-901A | 411.72
F-901B | 411.72

Compliance with the limits on the annual firing rates and the NO\(_x\), VOC, SO\(_2\), CO, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions, for NO\(_x\), VOC, SO\(_2\), CO, PM and PM-10 for the CXHO project remain below the significant levels at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.42.3 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart VV] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of VOCs and HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at GOHT unit, identified as Unit ID 802.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.42.4 Fuel Gas Hydrogen Sulfide (H\(_2\)S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for process heaters F-901A and F-901B and the GOHT flare.

Compliance Determination Requirements

D.42.5 Operating Requirement

(a) In order to demonstrate compliance with Condition D.42.3(a), the heaters F-901A and F-901B shall operate using only ultra low-NO\(_x\) burners.

(b) Compliance with the limits in Condition D.42.2(a), (b), (d) and (e) shall be demonstrated as specified in Condition D.0.3.

D.42.6 Continuous Emissions Monitoring

The Total Reduced Sulfur continuous emission monitoring system (CEMS) shall be calibrated, maintained, and operated for determining compliance with SO\(_2\) emissions limits for F-901A and F-901B in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment. The SO\(_2\) emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO\(_2\).
Compliance Monitoring Requirements [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.42.7 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.42.8 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall keep records as specified in the LDAR plan.

(b) In order to demonstrate compliance with Condition D.42.2, the Permittee shall maintain the records of monthly firing rates and SO2 emissions at F-901A and F-901B.

(c) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.42.6, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.
(2) All documentation relating to:
   (A) design, installation, and testing of all elements of the monitoring system, and
   (B) required corrective action or compliance plan activities.
(3) All maintenance logs, calibration checks, and other required quality assurance activities,
(4) All records of corrective and preventive action, and
(5) A log of plant operations, including the following:
   (A) Date of facility downtime,
   (B) Time of commencement and completion of downtime, and
   (C) Reason for each downtime.

D.42.9 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(b) In order to demonstrate compliance with Condition D.42.2, the Permittee shall submit a quarterly summary of the monthly firing rates and SO2 emissions for heaters F-901A and F-901B to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).
Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.42.2 and D.42.6, the Permittee shall submit reports of excess SO2 emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A) Date of downtime.
   B) Time of commencement.
   C) Duration of each downtime.
   D) Reasons for each downtime.
   E) Nature of system repairs and adjustments.
SECTION D.43  FACILITY OPERATION CONDITIONS – New Hydrogen Unit

Facility Description [326 IAC 2-7-5(15)]

The New Hydrogen (New HU) unit, identified as Unit ID 801 commissioned as part of the CXHO Project, produces 99+% pure hydrogen needed for the refinery hydrotreating processes. The New HU produces high purity hydrogen by reacting steam with methane. The reaction is carried out by heating the mixture in a furnace and reacting it in the presence of a catalyst. The New HU heaters HU-1 and HU-2 are equipped with Selective Catalytic Reduction (SCR) for control of NOx. The New HU heater stacks have continuous emissions monitors (CEMS) for NOx and CO. The New HU includes the following sources of emissions and may include insignificant activities listed in Section A.4 of this permit:

1. Process heaters comprising:

<table>
<thead>
<tr>
<th>Heater Identification</th>
<th>Maximum Heat Input Capacity (mmBTU/hr)</th>
<th>Stack Exhausted To</th>
<th>Emissions Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>HU-1</td>
<td>920*</td>
<td>801-01</td>
<td>Low-NOx burners and selective catalytic reduction</td>
</tr>
<tr>
<td>HU-2</td>
<td>920*</td>
<td>801-02</td>
<td>Low-NOx burners and selective catalytic reduction</td>
</tr>
</tbody>
</table>

* HU Heaters HU-1 and HU-2 combust both natural gas and PSA offgas with a fuel ratio of no more than 25% natural gas and the remainder PSA offgas.

2. One cooling tower (HU Cooling Tower) rated at 14,000 gallons per minute recirculation rate controlled by high efficiency drift eliminators.

3. The new Hydrogen Unit is connected to the HU Flare system. The system is used to control VOC emissions during emergency situations, unit startups and shutdowns, and preparation of equipment for maintenance. The HU Flare will be operated with a water seal or nitrogen purge. As such, there will be no purge gas emissions from the HU Flare. The HU Flare exhausts to S/V 801-03.

4. Associated valves, pumps, compressors, pressure relief devices, sampling connection systems, open ended lines or valves, flanges or other connectors, and instrumentation systems.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.43.1 Particulate Matter [326 IAC 6.8.1-1-2]

Pursuant to 326 IAC 6.8-1-2 (formerly 326 IAC 6-1-2), particulate matter emissions from each of the stacks 801-01 and 801-02 shall not exceed 0.03 grains per dry standard cubic foot.

D.43.2 Prevention of Significant Deterioration [326 IAC 2-2], Nonattainment NSR [326 IAC 2-1.1-5] and Emission Offset [326 IAC 2-3]

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-2 not applicable, the Permittee shall comply with the following:

For each of the two (2) heaters HU-1 and HU-2:
(a) The emissions of NOx from each heater shall not exceed 52.4 tons per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of VOC shall not exceed 0.0034 pounds per million BTU.

(d) The emissions of SO2 from each heater shall not exceed 0.0006 pounds per million BTU.

(e) The emissions of PM and PM-10 each shall not exceed 0.0068 pounds per million BTU.

(f) The emissions of CO shall not exceed 60.4 tons per 12 consecutive month period, with compliance determined at the end of each month.

(g) The Permittee shall comply with the following fuel usage limits:

<table>
<thead>
<tr>
<th>Unit ID</th>
<th>Natural gas firing rate limit (10^3 mmBTU) per 12 consecutive month period</th>
<th>Total Gas gas firing rate limit (10^3 mmBTU) per 12 consecutive month period</th>
</tr>
</thead>
<tbody>
<tr>
<td>HU-1</td>
<td>2014.8</td>
<td>8059.2</td>
</tr>
<tr>
<td>HU-2</td>
<td>2014.8</td>
<td>8059.2</td>
</tr>
</tbody>
</table>

For the HU flare pilot gas:

(h) The emissions of NOx shall not exceed 100 pounds per million cubic feet of fuel burned.

(i) The emissions of VOC shall not exceed 5.5 pounds per million cubic feet of fuel burned.

(j) The emissions of SO2 shall not exceed 0.6 pounds per million cubic feet of fuel burned.

(k) The emissions of PM and PM-10 shall not exceed 1.9 and 7.6 pounds per million cubic feet of fuel burned, respectively.

(l) The pilot gas used at the HU flare shall be limited to 2,233,800 cubic feet per 12 consecutive month period.

For the HU cooling tower:

(m) The average concentration of total dissolved solids (TDS) in the water input to HU Cooling Tower shall not exceed an average annual concentration of 6300 mg/L per 12 consecutive month period.

(n) The emissions of PM and PM-10 from HU Cooling tower shall not exceed 0.42 pounds per hour.

Compliance with the firing rate limits and the NOx, VOC, CO, SO2, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions for NOx, VOC, CO, SO2, PM and PM-10 for the CXHO project remain below the significant thresholds at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.
D.43.3 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) [326 IAC 8-4-8] [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of VOCs and HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems located at GOHT unit, identified as Unit ID 802.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.43.4 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for process heaters HU-1 and HU-2 and the HU flare.

D.43.5 Standards for Miscellaneous Process Vents [326 IAC 20-16-1] [40 CFR 63, Subpart CC]

Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Section E.1 for the New HU flare relating to the control of process vents.

D.43.6 Equipment Leaks of VOC [326 IAC 12] [40 CFR 60, Subpart GGGa]

Pursuant to 40 CFR 60, Subpart GGGa, the Permittee shall comply with the control device standards specified in Section E.13 for the New HU flare.

D.43.7 Fuel Gas Hydrogen Sulfide (H2S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60, Subpart J, the Permittee shall comply with the applicable requirements specified in Section E.2 for the New HU Flare.

Compliance Determination Requirements

D.43.8 Operating Requirement

(a) In order to demonstrate compliance with Condition D.43.2, the Permittee shall operate the heaters HU-1 and HU-2 using only low-NOx burners.

(b) In order to comply with Condition D.43.2, the SCRs shall be operated as necessary to meet the NOx emissions limits for heaters HU-1 and HU-2.

(c) In order to comply with Condition D.43.2, the liquid drift eliminator shall be in operation and control PM and PM-10 emissions from the HU Cooling Tower at all times that HU Cooling Tower is in operation.

(d) Compliance with the limits in Condition D.43.2 shall be demonstrated as specified in Condition D.0.3.
D.43.9 Continuous Emissions Monitoring

The CO and NOx continuous emission monitoring systems (CEMS) for HU-1 and HU-2 shall be calibrated, maintained, and operated for determining compliance with CO and NOx emissions limits for HU-1 and HU-2 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13- Maintenance of Emission Monitoring Equipment.

Compliance Monitoring Requirements  [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

D.43.10 Compliance Monitoring Requirements  [326 IAC 2-3]

To monitor compliance with Condition D.43.2 the Permittee shall take weekly measurements of the total dissolved solids (TDS) in the water input to HU Cooling Tower. If the TDS limitation is exceeded, the Permittee shall perform quantitative water analyses and shall take the remedial action necessary to correct the problem.

D.43.11 Monitoring for Equipment Leaks of VOC  [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.43.12 Record Keeping Requirements

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall keep records as specified in the LDAR plan.

(b) In order to demonstrate compliance with Condition D.43.2, the Permittee shall maintain the records of monthly firing rates using natural gas and PSA tailgas and CO, NOx and SO2 emissions at HU-1 and HU-2.

(c) In order to demonstrate compliance with Condition D.43.2, the Permittee shall maintain the records of monthly firing rates using pilot gas at the HU flare.

(d) To document compliance with Condition D.43.2, the Permittee shall maintain records of the total dissolved solids (TDS) in the water input to HU Cooling Tower and any remedial actions taken (including the date remedial actions were initiated).

(e) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.43.9, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.

(2) All documentation relating to:

(A) design, installation, and testing of all elements of the monitoring system, and

(B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

(A) Date of facility downtime,
D.43.13 Reporting Requirements

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall comply with equipment leak reporting requirements specified in the LDAR plan.

(b) In order to demonstrate compliance with Condition D.43.2, the Permittee shall submit a quarterly summary of the fuel usages at heaters HU-1, HU-2 and HU flare and CO, NOx, and SO2 emissions for HU-1 and HU-2 to the address listed in Section C - General Reporting Requirements within thirty (30) days after the end of the quarter being reported. The quarterly report does require the certification by the “responsible official” as defined by 326 IAC 2-7-1(34).

(c) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.43.2 and D.43.9, the Permittee shall submit reports of excess SO2, CO, and NOx emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

1. Monitored facility operation time during the reporting period,
2. Date of excess emissions,
3. Time of commencement and completion for each excess emission,
4. Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
5. A summary itemizing the exceedances by cause.
6. Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   A. Date of downtime.
   B. Time of commencement.
   C. Duration of each downtime.
   D. Reasons for each downtime.
   E. Nature of system repairs and adjustments
SECTION D.44  FACILITY OPERATION CONDITIONS – New Boilers

Facility Description [326 IAC 2-7-5(15)]

(oo) Two (2) new boilers, identified as New Boiler 1 and New Boiler 2, per SPM 089-25488-00453, each rated at 580 million BTU per hour, equipped with low-NOx burners and/or Selective Catalytic Reduction (SCR) for control of NOx, using either blended natural gas and refinery gas or only refinery fuel gas. A separate TRS CEMS shall be installed to measure the sulfur content of the fuel gas or fuel gas-natural gas blend fed to New Boiler 1 and New Boiler 2.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.44.1 Particulate Matter Emissions - Lake County [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2(b)(3), the particulate matter emissions from New Boiler 1 and New Boiler 2 shall be no greater than one-hundredth (0.01) grain per dry standard cubic foot (dscf).

D.44.2 SO2 Emissions Limitation

The SO2 emissions from each of the boilers identified as New Boiler 1 and New Boiler 2 shall be limited to less than 25 tons per 12 consecutive month period.

Compliance with this limit shall render the requirements of 326 IAC 7-4.1-1 (Lake County SO2 Emissions Limitations) not applicable.

D.44.3 Prevention of Significant Deterioration [326 IAC 2-2], Emission Offset [326 IAC 2-3] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) The firing rate (total) at New Boiler 1 and New Boiler 2 shall not exceed 9,907,560 mmBTU per 12 consecutive month period, with compliance determined at the end of each month.

(b) The emissions of NOx (total) from the boilers shall not exceed 322.0 tons per 12 consecutive month period, with compliance determined at the end of each month.

(c) The emissions of SO2 from each of the boilers shall not exceed 24.9 tons per 12 consecutive month period, with compliance determined at the end of each month.

(d) The emissions of CO (total) shall not exceed 118.9 tons per 12 consecutive month period, with compliance determined at the end of each month.

(e) The emissions of PM and PM-10 each shall not exceed 0.002 and 0.007 pounds per million BTU, respectively.

(f) The emissions of VOC shall not exceed 0.0054 pounds per million BTU.
Compliance with the firing rate limits and the NOx, VOC, CO, SO2, PM and PM-10 emissions limits, in conjunction with the emissions limits at other units at this source, shall ensure that the net emissions increases, including fugitive emissions for NOx, VOC, CO, SO2, PM and PM-10 for the CXHO project remain below the significant thresholds at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants.

D.44.4 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60.104(a)(1), the Permittee shall comply with the requirements specified in Section E.2 for New Boiler 1 and New Boiler 2.

D.44.5 Equipment Leaks of Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAPs) [326 IAC 20-16-1] [40 CFR 63, Subpart CC] [326 IAC 8-4-8] [40 CFR 60, Subpart GGGa]

(a) Pursuant to 326 IAC 8-4-8, the Permittee shall control leaks of VOC from pumps, compressors, valves, process drains, and pressure relief devices according to the Leak Detection and Repair (LDAR) Plan submitted by the Permittee. The Permittee shall update the LDAR Plan as necessary and shall submit a copy of the revised LDAR Plan to IDEM OAQ for approval. If IDEM, OAQ determines that the procedures specified in the LDAR Plan will not demonstrate compliance with the fugitive emission limitations, IDEM, OAQ may require the Permittee to revise the plan.

(b) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1 and E.4 for equipment leaks of HAP from pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines or valves, and instrumentation systems.

(c) Pursuant to 40 CFR 60, Subpart GGGa and 40 CFR 63, Subpart CC, the Permittee shall comply with the requirements specified in Sections E.1, E.25, and E.26 for equipment leaks of VOC and HAP from compressors and each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service.

D.44.6 Fuel Gas Hydrogen Sulfide (H₂S) [326 IAC 12] [40 CFR 60, Subpart J]

Pursuant to 40 CFR 60, Subpart J, the Permittee shall comply with the requirements specified in Section E.2 for New Boiler 1 and New Boiler 2.

D.44.7 Standards of Performance for Boilers [40 CFR Part 60, Subpart Db] [326 IAC 12]

Pursuant to 40 CFR 60, Subpart Db, the Permittee shall comply with the requirements of Section E.22 for the New Boiler 1 and New Boiler 2.

Compliance Determination Requirements

D.44.8 Operating Requirement

In order to demonstrate compliance with D.44.3, fuel oil shall not be used as fuel for New Boiler 1 and New Boiler 2.
D.44.9 Continuous Emissions Monitoring

The Total Reduced Sulfur, CO and NOx continuous emission monitoring systems (CEMS) for New Boiler 1 and New Boiler 2 shall be calibrated, maintained, and operated for determining compliance with SO2, CO and NOx emissions limits for New Boiler 1 and New Boiler 2 in accordance with the applicable requirements in Condition C.12 - Maintenance of Continuous Emission Monitoring Equipment and Condition C.13 - Maintenance of Emission Monitoring Equipment.

D.44.10 Requirement to Submit a Significant Permit Modification Application [326 IAC 2-7-12] [326 IAC 2-7-5]

In the event that New Boiler 1 and New Boiler 2 are constructed prior to 2009, the NOx authorized account representative shall submit an application for a significant permit modification to IDEM, OAQ requesting the incorporation of NOx Budget Permit requirements for New Boiler 1 and New Boiler 2 under 326 IAC 10-4 into the Title V permit.

(a) The significant permit modification application shall be consistent with 326 IAC 2-7-12, including information sufficient for IDEM, OAQ to incorporate into the Title V permit the applicable requirements of 326 IAC 10-4, a description of the affected source and activities subject to the requirements, and a description of how the Permittee will meet the applicable requirements.

(b) For any source, with one (1) or more NOx budget units that commences operation on or after January 1, 2001, the NOx authorized account representative shall submit a complete NOx budget permit application covering each NOx budget unit at least two hundred seventy (270) days before the date on which the NOx budget unit commences operation.

(c) The significant permit modification application shall be submitted to:

Indiana Department of Environmental Management
Permits Branch, Office of Air Quality
100 North Senate Avenue
MC 61-53, IGCN 1003
Indianapolis, Indiana 46204-2251

Compliance Monitoring Requirements

D.44.11 Monitoring for Equipment Leaks of VOC [326 IAC 8-4-8]

Pursuant to 326 IAC 8-4-8, the Permittee shall monitor for leaks of VOC according to the LDAR plan submitted by the Permittee.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.44.12 Record Keeping Requirements

(a) In order to document compliance with Conditions D.44.3 and D.44.6, the Permittee shall maintain a daily record of the following for New Boiler 1 and New Boiler 2:

(1) operational status of each facility,
(2) fuel type,
(3) average daily sulfur content for each fuel type,
(4) average daily fuel gravity for each fuel type,
(5) total daily fuel usage for each type, and
(6) heat content of each fuel type.

(c) Pursuant to 40 CFR 60, Subpart J, the Permittee shall maintain the records specified in Section E.2.

(d) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.44.5, the Permittee shall comply with equipment leak record keeping requirements specified in the LDAR plan.

(e) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall keep records as specified in Sections E.1 and E.4.

(f) Pursuant to 40 CFR 60, Subpart Db, the Permittee shall keep records as specified in Section E.22.

(h) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall keep records as specified in Section E.6.

(i) In order to demonstrate compliance with Condition D.44.3, the Permittee shall maintain the records of monthly firing rates and CO, NOx, and SO2 emissions at New Boiler 1 and New Boiler 2.

(j) Pursuant to 326 IAC 3-5-6 and to document compliance with Condition D.44.9, the Permittee shall keep the following records for the continuous emission monitors:

(1) One-minute block averages.

(2) All documentation relating to:
   
   (A) design, installation, and testing of all elements of the monitoring system, and
   
   (B) required corrective action or compliance plan activities.

(3) All maintenance logs, calibration checks, and other required quality assurance activities,

(4) All records of corrective and preventive action, and

(5) A log of plant operations, including the following:

   (A) Date of facility downtime,

   (B) Time of commencement and completion of downtime, and

   (C) Reason for each downtime.

D.44.13 Reporting Requirements

(a) Pursuant to 40 CFR 60, Subpart J, the Permittee shall submit to IDEM, OAQ the reports specified in Section E.2.

(b) Pursuant to 326 IAC 8-4-8 and to document compliance with Condition D.44.5, the Permittee shall submit reports as specified in the LDAR plan.
(c) Pursuant to 40 CFR 63, Subpart CC, the Permittee shall submit reports as specified in Sections E.1 and E.4.

(d) Pursuant to 40 CFR 60, Subpart QQQ, the Permittee shall submit reports as specified in Section E.6.

(e) Pursuant to 40 CFR 60, Subpart Db, the Permittee shall submit reports as specified in Section E.22.

(f) Pursuant to 326 IAC 3-5-7 and to document compliance with Conditions D.44.3 and D44.9, the Permittee shall submit reports of excess SO2, NOx and CO emissions within thirty (30) days of the end of each quarter in which the excess emissions occur. The reports shall include the following:

(1) Monitored facility operation time during the reporting period,
(2) Date of excess emissions,
(3) Time of commencement and completion for each excess emission,
(4) Magnitude of each excess emission. For gaseous emissions, the excess emissions, in units of the applicable standard, must be reported based on the applicable averaging time, for example, one (1) hour block, three (3) hour block, three (3) hour rolling, in addition to any other reporting requirements that may be applicable.
(5) A summary itemizing the exceedances by cause.
(6) Continuous Monitoring system instrument downtime, except for zero (0) and span checks, which shall be reported separately, shall include the following:
   (A) Date of downtime.
   (B) Time of commencement.
   (C) Duration of each downtime.
   (D) Reasons for each downtime.
   (E) Nature of system repairs and adjustments
SECTION D.45 FACILITY OPERATION CONDITIONS – Firepump Engines and Concrete Crusher

Facility Description [326 IAC 2-7-5(15)]

Insignificant Activity:

(ff) Three (3) emergency firepump engines, identified as Firepump 1, 2 and 3, per SPM 089-25488-00453, each rated at 390 HP.

(gg) One (1) concrete crushing process, per SPM 089-25488-00453, with a maximum processing capacity of 120 tons per hour, having two (2) transfer points.

(The information describing the process contained in this facility description box is descriptive information and does not constitute enforceable conditions.)

Emission Limitations and Standards [326 IAC 2-7-5(1)]

D.45.1 Particulate Matter Emissions - Lake County [326 IAC 6.8-1-2]

Pursuant to 326 IAC 6.8-1-2(a), the particulate matter emissions from Firepump 1, Firepump 2, Firepump 3 and the concrete crushing operation shall not exceed 0.03 gr/dscf.

D.45.2 Prevention of Significant Deterioration [326 IAC 2-2], Emission Offset [326 IAC 2-3] and Nonattainment NSR [326 IAC 2-1.1-5] Minor Limits

In order to render 326 IAC 2-2, 326 IAC 2-1.1-5, and 326 IAC 2-3 not applicable, the Permittee shall comply with the following:

(a) The total hours of operation for the three firepump engines shall not exceed 500 hours per year.

(b) The total amount of concrete processed by the concrete crusher shall not exceed 18,000 tons.

Compliance with the emissions limits at the three firepumps and the other units at this source, shall ensure that the net emissions increases, including fugitive emissions for NOx, VOC, CO, SO2, PM and PM-10 for the CXHO project remain below the significant thresholds at each stage of the phased construction of the CXHO project, rendering 326 IAC 2-2, 326 IAC 2-1.1-5 and 326 IAC 2-3 not applicable for these pollutants. Comply with the requirements specified in Section E.2 for New Boiler 1 and New Boiler 2.

D.45.3 Standards of Performance for Stationary Compression Ignition Internal Combustion Engines [40 CFR Part 60, Subpart III[ [326 IAC 12]

Pursuant to 40 CFR 60, Subpart III, the Permittee shall comply with the requirements of Section E.23 for emergency generators and emergency fire pumps.

Record Keeping and Reporting Requirements [326 IAC 2-7-5(3)] [326 IAC 2-7-19]

D.45.4 Record Keeping Requirements

Pursuant to 40 CFR 60, Subpart III, the Permittee shall keep records as specified in Section E.23.

D.45.5 Reporting Requirements

Pursuant to 40 CFR 60, Subpart III, the Permittee shall submit reports as specified in Section E.23.

[E.20.1 General Provisions Relating to NESHAP Subpart DDDDD [40 CFR Part 63, Subpart DDDDD]]

Pursuant to 40 CFR 63.7565, the Permittee shall comply with the provisions of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated by reference as 326 IAC 20-1, as specified in Table 10 of 40 CFR Part 63, Subpart DDDDD in accordance with the schedule in 40 CFR Part 63, Subpart DDDDD.

[E.20.2 NESHAP Subpart DDDDD Requirements [40 CFR Part 63, Subpart DDDDD]]

Pursuant to 40 CFR 63.7485 and 63.7490, the Permittee shall comply with the provisions of 40 CFR Part 63, Subpart DDDDD listed in this condition for the emission units listed in paragraphs (a), (b), and (c):

(a) The following emission units meet the definition of existing units in the large gaseous fuel subcategory:

1. H-1X, H-2, H-3, H-200, and H-300 process heaters located at No.11A and 11C Pipe Stills (Section D.1).
2. H-101, H-102, H-103, and H-104 process heaters located at the No.11B Coker (Section D.2).
3. H-1AN, H-1AS, H-1B, H-1CN, and H-1CX process heaters located at the No.12 Pipe Still (Section D.3).
4. H-1 process heaters located at the Isomerization Unit (Section D.9).
5. F-200A and F-200B process heaters located at the ARU (Section D.10).
6. F-401 process heater located at the Blending Oil Unit (Section D.11).
7. H-1, H-2, and F-7 process heaters located at the No.3 Ultraformer (Section D.15).
8. F-1, F-8A, F-8B, F-2, F-3, F-4R, F-5, F-6, and F-7 process heaters located at the No.4 Ultraformer (Section D.16).
9. B-501 process heater at the Hydrogen Unit (Section D.17).
10. WB-301 and WB-302 process heaters located at the DDU (Section D.18).
11. F-801A/B and F-801C process heaters located at the Cat Feed Hydrotreating Unit (Section D.19).
12. F-101 and F-102A process heaters located at the Catalytic Refining Unit (CRU) (Section D.20).
13. #3, #4, #5, #6, and #7 boilers located at the No.1 Stanolind Power Station (Section D.23).
#1, #2, #3, #4, and #6 boilers located at the No.3 Stanolind Power Station (Section D.24).

F-1 and F-2 process heaters located at the Asphalt Facility (Section D.32).

The following emission units meet the definition of existing units in the small gaseous fuel subcategory:

1. Marine Dock Heater F-100 (Section D.34).
2. Kewanee Boilers #1 and #2 (Section D.40).

The following emission unit meets the definition of a new unit in the large gaseous fuel subcategory: DHT B-601 process heater located at the Distillate Hydrotreating Unit (Section D.37).

Subpart DDDDD–National Emission Standards for Hazardous Air Pollutants for Industrial Commercial, and Institutional Boilers and Process Heaters
§63.7480 What is the purpose of this subpart?
This subpart establishes national emission limits and work practice standards for hazardous air pollutants (HAP) emitted from industrial, commercial, and institutional boilers and process heaters. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limits and work practice standards.

§63.7485 Am I subject to this subpart?
You are subject to this subpart if you own or operate an industrial, commercial, or institutional boiler or process heater as defined in §63.7575 that is located at, or is part of, a major source of HAP as defined in §63.2 or §63.761 (40 CFR Part 63, Subpart HH, National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities), except as specified in §63.7491.

§63.7490 What is the affected source of this subpart?
(a) This subpart applies to new, reconstructed, or existing affected sources as described in paragraphs (a)(1) and (2) of this section.
1. The affected source of this subpart is the collection of all existing industrial, commercial, and institutional boilers and process heaters within a subcategory located at a major source as defined in §63.7575.
2. The affected source of this subpart is each new or reconstructed industrial, commercial, or institutional boiler or process heater located at a major source as defined in §63.7575.
(b) A boiler or process heater is new if you commence construction of the boiler or process heater after January 13, 2003, and you meet the applicability criteria at the time you commence construction.
(c) A boiler or process heater is reconstructed if you meet the reconstruction criteria as defined in §63.2, you commence reconstruction after January 13, 2003, and you meet the applicability criteria at the time you commence reconstruction.
(d) A boiler or process heater is existing if it is not new or reconstructed.

§63.7491 Are any boilers or process heaters not subject to this subpart?
The types of boilers and process heaters listed in paragraphs (a) through (o) of this section are not subject to this subpart:
(a) A hot water heater as defined in this subpart.
(b) Temporary boilers as defined in this subpart.

§63.7495 When do I have to comply with this subpart?
(a) If you have a new or reconstructed boiler or process heater, you must comply with this subpart by November 12, 2004 or upon startup of your boiler or process heater, whichever is later.
(b) If you have an existing boiler or process heater, you must comply with this subpart no later than September 13, 2007.
(d) You must meet the notification requirements in §63.7545 according to the schedule in §63.7545 and in subpart A of this part. Some of the notifications must be submitted before you are required to comply with the emission limits and work practice standards in this subpart.
§63.7499 What are the subcategories of boilers and process heaters?
The subcategories of boilers and process heaters are large solid fuel, limited use solid fuel, small solid fuel, large liquid fuel, limited use liquid fuel, small liquid fuel, large gaseous fuel, limited use gaseous fuel, and small gaseous fuel. Each subcategory is defined in §63.7575.

§63.7500 What emission limits, work practice standards, and operating limits must I meet?
(a) You must meet the requirements in paragraphs (a)(1) and (2) of this section.
(1) You must meet each emission limit and work practice standard in Table 1 to this subpart that applies to your boiler or process heater, except as provided under §63.7507.

§63.7505 What are my general requirements for complying with this subpart?
(a) You must be in compliance with the emission limits (including operating limits) and the work practice standards in this subpart at all times, except during periods of startup, shutdown, and malfunction.
(b) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in §63.6(e)(1). (c) If you have an applicable emission limit or work practice standard, you must develop and implement a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in §63.6(e)(3).

§63.7506 Do any boilers or process heaters have limited requirements?
(b) The affected boilers and process heaters listed in paragraphs (b)(1) through (3) of this section are subject to only the initial notification requirements in §63.9(b) (i.e., they are not subject to the emission limits, work practice standards, performance testing, monitoring, SSMP, site-specific monitoring plans, recordkeeping and reporting requirements of this subpart or any other requirements in subpart A of this part).
(1) Existing large and limited use gaseous fuel units.
(c) The affected boilers and process heaters listed in paragraphs (c)(1) through (4) of this section are not subject to the initial notification requirements in §63.9(b) and are not subject to any requirements in this subpart or in subpart A of this part (i.e., they are not subject to the emission limits, work practice standards, performance testing, monitoring, SSMP plans, site-specific monitoring plans, recordkeeping and reporting requirements of this subpart, or any other requirements in subpart A of this part).
(3) Existing small gaseous fuel boilers and process heaters.

§63.7510 What are my initial compliance requirements and by what date must I conduct them?
(a) For affected sources that elect to demonstrate compliance with any of the emission limits of this subpart through performance testing, your initial compliance requirements include conducting performance tests according to §63.7520 and Table 5 to this subpart, conducting a fuel analysis for each type of fuel burned in your boiler or process heater according to §63.7521 and Table 6 to this subpart, establishing operating limits according to §63.7530 and Table 7 to this subpart, and conducting CMS performance evaluations according to §63.7525.
(c) For affected sources that have an applicable work practice standard, your initial compliance requirements depend on the subcategory and rated capacity of your boiler or process heater. If your boiler or process heater is in any of the limited use subcategories or has a heat input capacity less than 100 MMBtu per hour, your initial compliance demonstration is conducting a performance test for carbon monoxide according to Table 5 to this subpart. If your boiler or process heater is in any of the large subcategories and has a heat input capacity of 100 MMBtu per hour or greater, your initial compliance demonstration is conducting a performance evaluation of your continuous emission monitoring system for carbon monoxide according to §63.7525(a).
(d) For existing affected sources, you must demonstrate initial compliance no later than 180 days after the compliance date that is specified for your source in §63.7495 and according to the applicable provisions in §63.7(a)(2) as cited in Table 10 to this subpart.
(g) If your new or reconstructed affected source commences construction or reconstruction after November 12, 2004, you must demonstrate initial compliance with the promulgated emission limits and work practice standards no later than 180 days after startup of the source.

§63.7515 When must I conduct subsequent performance tests or fuel analyses?
(a) You must conduct all applicable performance tests according to §63.7520 on an annual basis, unless you follow the requirements listed in paragraphs (b) through (d) of this section. Annual performance tests must be completed between 10 and 12 months after the previous performance test, unless you follow the requirements listed in paragraphs (b) through (d) of this section.
(e) If you have an applicable work practice standard for carbon monoxide and your boiler or process heater is in any of the limited use subcategories or has a heat input capacity less than 100 MMBtu per hour, you must conduct annual performance tests for carbon monoxide according to §63.7520. Each annual performance test must be conducted between 10 and 12 months after the previous performance test.

(g) You must report the results of performance tests and fuel analyses within 60 days after the completion of the performance tests or fuel analyses. This report should also verify that the operating limits for your affected source have not changed or provide documentation of revised operating parameters established according to §63.7530 and Table 7 to this subpart, as applicable. The reports for all subsequent performance tests and fuel analyses should include all applicable information required in §63.7550.

§63.7520—What performance tests and procedures must I use?

(a) You must conduct all performance tests according to §63.7(c), (d), (f), and (h). You must also develop a site-specific test plan according to the requirements in §63.7(c) if you elect to demonstrate compliance through performance testing.

(b) You must conduct each performance test according to the requirements in Table 5 to this subpart.

(e) You may not conduct performance tests during periods of startup, shutdown, or malfunction.

(f) You must conduct three separate test runs for each performance test required in this section, as specified in §63.7(e)(3). Each test run must last at least 1 hour.

§63.7530—How do I demonstrate initial compliance with the emission limits and work practice standards?

(a) You must demonstrate initial compliance with each emission limit and work practice standard that applies to you by either conducting initial performance tests and establishing operating limits, as applicable, according to §63.7520, paragraph (c) of this section, and Tables 5 and 7 to this subpart OR conducting initial fuel analyses to determine emission rates and establishing operating limits, as applicable, according to §63.7521, paragraph (d) of this section, and Tables 6 and 8 to this subpart.

(e) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.7545(e).

§63.7540—How do I demonstrate continuous compliance with the emission limits and work practice standards?

(b) You must report each instance in which you did not meet each emission limit, operating limit, and work practice standard in Tables 1 through 4 to this subpart that apply to you. You must also report each instance during a startup, shutdown, or malfunction when you did not meet each applicable emission limit, operating limit, and work practice standard. These instances are deviations from the emission limits and work practice standards in this subpart. These deviations must be reported according to the requirements in §63.7550.

(c) During periods of startup, shutdown, and malfunction, you must operate in accordance with the SSMP as required in §63.7505(e).

(d) Consistent with §§63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the EPA Administrator's satisfaction that you were operating in accordance with your SSMP. The EPA Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in §63.6(e).

§63.7545—What notifications must I submit and when?

(a) You must submit all of the notifications in §§63.7(b) and (c), 63.8 (e), (f)(4) and (6), and 63.9 (b) through (h) that apply to you by the dates specified.

(b) As specified in §63.9(b)(2), if you startup your affected source before November 12, 2004, you must submit an Initial Notification not later than 120 days after November 12, 2004. The Initial Notification must include the information required in paragraphs (b)(1) and (2) of this section, as applicable.

(1) If your affected source has an annual capacity factor of greater than 10 percent, your Initial Notification must include the information required by §63.9(b)(2).

(c) As specified in §63.9(b)(4) and (b)(5), if you startup your new or reconstructed affected source on or after November 12, 2004, you must submit an Initial Notification not later than 15 days after the actual date of startup of the affected source.

(d) If you are required to conduct a performance test you must submit a Notification of Intent to conduct a performance test at least 30 days before the performance test is scheduled to begin.
§63.7530 What reports must I submit and when?

(a) You must submit each report in Table 9 to this subpart that applies to you.

(b) Unless the EPA Administrator has approved a different schedule for submission of reports under §63.10(a), you must submit each report by the date in Table 9 to this subpart and according to the requirements in paragraphs (b)(1) through (5) of this section.

1. The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.7495 and ending on June 30 or December 31, whichever date is the first date that occurs at least 180 days after the compliance date that is specified for your source in §63.7495.

2. The first compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in §63.7495.

3. Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

4. Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

5. For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) The compliance report must contain the information required in paragraphs (c)(1) through (11) of this section.

1. Company name and address.

2. Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

3. Date of report and beginning and ending dates of the reporting period.

4. The total fuel use by each affected source subject to an emission limit, for each calendar month within the semiannual reporting period, including, but not limited to, a description of the fuel and the total fuel usage amount with units of measure.
§63.7555 What records must I keep?  
(a) You must keep records according to paragraphs (a)(1) through (3) of this section.
(b) A summary of the results of the annual performance tests and documentation of any operating limits that were reestablished during this test, if applicable.
(6) A signed statement indicating that you burned no new types of fuel. Or, if you did burn a new type of fuel, you must submit the calculation of chlorine input, using Equation 5 of §63.7530, that demonstrates that your source is still within its maximum chlorine input level established during the previous performance testing (for sources that demonstrate compliance through performance testing), or you must submit the calculation of HCl emission rate using Equation 9 of §63.7530 that demonstrates that your source is still meeting the emission limit for HCl emissions (for boilers or process heaters that demonstrate compliance through fuel analysis). If you burned a new type of fuel, you must submit the calculation of TSM input, using Equation 6 of §63.7530, that demonstrates that your source is still within its maximum TSM input level established during the previous performance testing (for sources that demonstrate compliance through performance testing), or you must submit the calculation of TSM emission rate using Equation 10 of §63.7530 that demonstrates that your source is still meeting the emission limit for TSM emissions (for boilers or process heaters that demonstrate compliance through fuel analysis). If you burned a new type of fuel, you must submit the calculation of mercury input, using Equation 7 of §63.7530, that demonstrates that your source is still within its maximum mercury input level established during the previous performance testing (for sources that demonstrate compliance through performance testing), or you must submit the calculation of mercury emission rate using Equation 11 of §63.7530 that demonstrates that your source is still meeting the emission limit for mercury emissions (for boilers or process heaters that demonstrate compliance through fuel analysis).
(7) If you wish to burn a new type of fuel and you can not demonstrate compliance with the maximum chlorine input operating limit using Equation 5 of §63.7530, the maximum TSM input operating limit using Equation 6 of §63.7530, or the maximum mercury input operating limit using Equation 7 of §63.7530, you must include in the compliance report a statement indicating the intent to conduct a new performance test within 60 days of starting to burn the new fuel.
(8) If you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in §63.10(d)(3)(i).
(9) If you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in §63.10(d)(3)(ii).
(10) If there are no deviations from any emission limits or operating limits in this subpart that apply to you, and there are no deviations from the requirements for work practice standards in this subpart, a statement that there were no deviations from the emission limits, operating limits, or work practice standards during the reporting period.

§63.7560 In what form and how long must I keep my records?  
(a) Your records must be in a form suitable and readily available for expeditious review, according to §63.10(b)(1).
(b) As specified in §63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.
You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1). You can keep the records off site for the remaining 3 years.

§63.7565 What parts of the General Provisions apply to me?
Table 10 to this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you.

Table 10 to Subpart DDDD of Part 63—Emission Limits and Work Practice Standards
As stated in §63.7500, you must comply with the following applicable emission limits and work practice standards:

<table>
<thead>
<tr>
<th>If your boiler or process heater is in this subcategory</th>
<th>For the following pollutants</th>
<th>You must meet the following emission limits and work practice standards</th>
</tr>
</thead>
<tbody>
<tr>
<td>7. New or reconstructed large gaseous fuel.</td>
<td>Carbon Monoxide</td>
<td>400 ppm by volume on a dry basis corrected to 3 percent oxygen (30-rolling average for units 100 MMBtu/hr or greater, 3-run average for units less than 100 MMBtu/hr).</td>
</tr>
</tbody>
</table>

Table 5 to Subpart DDDD of Part 63—Performance Testing Requirements
As stated in §63.7520, you must comply with the following requirements for performance test for existing, new or reconstructed affected sources:

<table>
<thead>
<tr>
<th>To conduct a performance test for the following pollutant</th>
<th>You must</th>
<th>Using</th>
</tr>
</thead>
<tbody>
<tr>
<td>5. Carbon Monoxide</td>
<td>a. Select the sampling ports location and the number of traverse points.</td>
<td>Method 1 in appendix A to part 60 of this chapter.</td>
</tr>
<tr>
<td></td>
<td>b. Determine oxygen and carbon dioxide concentrations of the stack gas.</td>
<td>Method 3A or 3B in appendix A to part 60 of this chapter, or ASTM D6522-00 (IBR, see §63.14(b)), or ASME PTC 19, Part 10 (1981) (IBR, see §63.14(i)).</td>
</tr>
<tr>
<td></td>
<td>c. Measure the moisture content of the stack gas.</td>
<td>Method 4 in appendix A to part 60 of this chapter.</td>
</tr>
<tr>
<td></td>
<td>d. Measure the carbon monoxide emission concentration.</td>
<td>Method 10, 10A, or 10B in appendix A to part 60 of this chapter, or ASTM D6522-00 (IBR, see §63.14(b)) when the fuel is natural gas.</td>
</tr>
</tbody>
</table>
As stated in §63.7550, you must comply with the following requirements for reports:

<table>
<thead>
<tr>
<th>You must submit a(n)</th>
<th>The report must contain</th>
<th>You must submit the report</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Compliance report</strong></td>
<td>a. Information required in §63.7550(c)(1) through (11); and</td>
<td>Semiannually according to the requirements in §63.7550(b).</td>
</tr>
<tr>
<td></td>
<td>b. If there are no deviations from any emission limitation (emission limit and operating limit) that applies to you and there are no deviations from the requirements for work practice standards in Table 8 to this subpart that apply to you, a statement that there were no deviations from the emission limitations and work practice standards during the reporting period. If there were no periods during which the CMSs, including continuous emissions monitoring system, continuous opacity monitoring system, and operating parameter monitoring systems, were out-of-control as specified in §63.8(c)(7), a statement that there were no periods during which the CMSs were out-of-control during the reporting period; and</td>
<td></td>
</tr>
<tr>
<td></td>
<td>c. If you have a deviation from any emission limitation (emission limit and operating limit) or work practice standard during the reporting period, the report must contain the information in §63.7550(d). If there were periods during which the CMSs, including continuous emissions monitoring system, continuous opacity monitoring system, and operating parameter monitoring systems, were out-of-control, as specified in §63.8(c)(7), the report must contain the information in §63.7550(e); and</td>
<td></td>
</tr>
<tr>

Section E.21 40 CFR 63, Subpart GGGGG—National Emission Standards for Hazardous Air Pollutants: Site Remediation

E.21.1 General Provisions Relating to NESHAP Subpart GGGGG [40 CFR Part 63, Subpart GGGGG] [326 IAC 20-1]

Pursuant to 40 CFR 63.7955, the Permittee shall comply with the provisions of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated by reference as 326 IAC 20-1, as specified in Table 3 of 40 CFR Part 63, Subpart GGGGG in accordance with the schedule in 40 CFR Part 63, Subpart GGGGG.

E.21.2 NESHAP Subpart GGGGG Requirements [40 CFR Part 63, Subpart GGGGG] [326 IAC 20-87]

(a) The affected sources for the site remediation activities, including process vents, remediation material management units, and equipment components described in Section D.28 of this permit, are subject to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Site Remediation, (40 CFR 63, Subpart GGGGG), effective October 8, 2003. Pursuant to this rule, the Permittee must comply with the provisions of 40 CFR 63, Subpart GGGGG, which are incorporated by reference in 326 IAC 20-87, on and after October 8, 2006, or accept and meet an enforceable HAP emissions limit below the major source threshold prior to October 8, 2006.

(b) Since the applicable requirements associated with the compliance options are not included and specifically identified in this permit, the permit shield authorized by the B section of this permit in the condition titled Permit Shield, and set out in 326 IAC 2-7-15 does not apply to paragraph (a) of this condition.

(c) The definitions in 40 CFR 63, Subpart GGGGG, CFR 63.7957 are applicable to the Permittee.

E.21.3 National Emissions Standards for Hazardous Air Pollutants for Site Remediation – Notification Requirements [40 CFR 63, Subpart GGGGG] [326 IAC 20-87]

(a) Pursuant to 40 CFR 63.7950, the Permittee shall submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), 63.8(f)(4) and (6), and 63.9(h) through (h) that apply to the affected source and chosen compliance method. These notifications include, but are not limited to, the following:

(1) A Notification of Compliance Status containing the information required by 40 CFR 63.9(h) in accordance with 40 CFR 63.7950(e). The Notification of Compliance Status must be submitted:

(A) Before the close of business on the 30th calendar day following completion of the initial compliance demonstration for each initial compliance demonstration that does not include a performance test; and

(B) Before the close of business on the 60th calendar day following the completion of the performance test according to the requirement specified in 40 CFR 63.10(d)(2) for each initial compliance demonstration that includes a performance test or design evaluation. The Permittee shall submit the complete design evaluation and supporting documentation and the performance test results, as applicable.

(2) If required to conduct a performance test, a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin as required by 40 CFR 63.7(b)(1) and 40 CFR 63.7950(a) and (d); and
If required to use a continuous monitoring system (CMS), notifications, if required, as specified in 40 CFR 63.9(g), by the date of submission of the notification of intent to conduct a performance test, as required by 40 CFR 63.7950(a).

(b) The notifications required by paragraph (a) shall be submitted to:

Indiana Department of Environmental Management
Compliance Data Section, Office of Air Quality
100 North Senate Avenue
Indianapolis, Indiana 46204-2251

E.21.4 Requirement to Submit a Significant Permit Modification Application [326 IAC 2-7-12] [326 IAC 2-7-5]

The Permittee shall submit an application for a significant permit modification to IDEM, OAQ to include information regarding which compliance option or options will be chosen.

(a) The significant permit modification application shall be consistent with 326 IAC 2-7-12, including information sufficient for IDEM, OAQ to incorporate into the Title V permit the applicable requirements of 40 CFR 63, Subpart GGGGG, a description of the affected source and activities subject to the standard, and a description of how the Permittee will meet the applicable requirements of the standard.

(b) The significant permit modification application shall be submitted no later than the 60th day following the completion of the performance test and/or initial compliance demonstrations according to 40 CFR 63.10(d)(2).

(c) The significant permit modification application shall be submitted to:

Indiana Department of Environmental Management
Permits Branch, Office of Air Quality
MC 61-53.IGCN 1003
100 North Senate Avenue,
Indianapolis, Indiana 46204-2251

What This Subpart Covers
§ 63.7880 What is the purpose of this subpart?

This subpart establishes national emissions limitations and work practice standards for hazardous air pollutants (HAP) emitted from site remediation activities. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emissions limitations and work practice standards.

§ 63.7881 Am I subject to this subpart?

(a) This subpart applies to you if you own or operate a facility at which you conduct a site remediation, as defined in §63.7957; and this site remediation, unless exempted under paragraph (b) or (c) of this section, meets all three of the following conditions specified in paragraphs (a)(1) through (3) of this section.

(1) Your site remediation cleans up a remediation material, as defined in §63.7957.

(2) Your site remediation is co-located at your facility with one or more other stationary sources that emit HAP and meet an affected source definition specified for a source category that is regulated by another subpart under 40 CFR part 63. This condition applies regardless whether or not the affected stationary source(s) at your facility is subject to the standards under the applicable subpart(s).
(3) Your facility is a major source of HAP as defined in §63.2, except as specified in paragraph (a)(3)(i) or (ii) of this section. A major source emits or has the potential to emit any single HAP at the rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year.

(i) For production field facilities, as defined in §63.761, only the HAP emissions from the glycol dehydration units and storage vessels with the potential for flash emissions (both as defined in §63.761) shall be aggregated with the HAP emissions from the site remediation activities at the facility for a major source determination.

(ii) For natural gas transmission and storage facilities, HAP emissions shall be aggregated in accordance with the definition of major source in §63.1271 for a major source determination.

(b) You are not subject to this subpart if your site remediation qualifies for any of one of the exemptions listed in paragraphs (b)(1) through (6) of this section.

(1) Your site remediation is not subject to this subpart if the site remediation only cleans up material that does not contain any of the HAP listed in Table 1 of this subpart.

(2) Your site remediation is not subject to this subpart if the site remediation will be performed under the authority of the Comprehensive Environmental Response and Compensation Liability Act (CERCLA) as a remedial action or a non time-critical removal action.

(3) Your site remediation is not subject to this subpart if the site remediation will be performed under a Resource Conservation and Recovery Act (RCRA) corrective action conducted at a treatment, storage and disposal facility (TSDF) that is either required by your permit issued by either the U.S. Environmental Protection Agency (EPA) or a State program authorized by the EPA under RCRA section 3006; required by orders authorized under RCRA; or required by orders authorized under RCRA section 7003.

(4) Your site remediation is not subject to this subpart if the site remediation is conducted at a gasoline service station to clean up remediation material from a leaking underground storage tank.

(5) Your site remediation is not subject to this subpart if the site remediation is conducted at a farm or residential site.

(6) Your site remediation is not subject to this subpart if the site remediation is conducted at a research and development facility that meets the requirements under Clean Air Act (CAA) section 112(c)(7).

(c) Your site remediation activities are not subject to the requirements of this subpart, except for the recordkeeping requirements in this paragraph, provided that you meet the requirements specified in paragraphs (c)(1) through (c)(3) of this section.

(1) You determine that the total quantity of the HAP listed in Table 1 to this subpart that is contained in the remediation material excavated, extracted, pumped, or otherwise removed during all of the site remediations conducted at your facility is less than 1 megagram (Mg) annually. This exemption applies the 1 Mg limit on a facility-wide, annual basis, and there is no restriction to the number of site remediations that can be conducted during this period.

(2) You must prepare and maintain at your facility written documentation to support your determination that the total HAP quantity in your remediation materials for the year is less than 1 Mg. The documentation must include a description of your methodology and data used for determining the total HAP content of the remediation material.

(3) Your Title V permit does not have to be reopened or revised solely to include the recordkeeping requirement specified in paragraph (c)(2) of this section. However, the requirement must be included in your permit the next time the permit is renewed, reopened, or revised for another reason.
(d) Your site remediation is not subject to the requirements of this subpart if all remediation activities at your facility subject to this subpart are completed and you have notified the Administrator in writing that all remediation activities subject to this subpart are completed. You must maintain records of compliance, in accordance with §63.7953, for each remediation activity that was subject to this subpart. All future remediation activity meeting the applicability criteria in this section must comply with the requirements of this subpart.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69016, Nov. 29, 2006]

§ 63.7882 What site remediation sources at my facility does this subpart affect?

(a) This subpart applies to each new, reconstructed, or existing affected source for your site remediation as designated by paragraphs (a)(1) through (3) of this section.

(1) Process vents. The affected source is the entire group of process vents associated with the in-situ and ex-situ remediation processes used at your site to remove, destroy, degrade, transform, or immobilize hazardous substances in the remediation material subject to remediation. Examples of such in-situ remediation processes include, but are not limited to, soil vapor extraction and bioremediation processes. Examples of such ex-situ remediation processes include but are not limited to, thermal desorption, bioremediation, and air stripping processes.

(2) Remediation material management units. Remediation material management unit means a tank, surface impoundment, container, oil-water separator, organic-water separator, or transfer system, as defined in §63.7957, and is used at your site to manage remediation material. The affected source is the entire group of remediation material management units used for the site remediations at your site. For the purpose of this subpart, a tank or container that is also equipped with a vent that serves as a process vent, as defined in §63.7957, is not a remediation material management unit, but instead this unit is considered to be a process vent affected source under paragraph (a)(1) of this section.

(3) Equipment leaks. The affected source is the entire group of equipment components (pumps, valves, etc.) used to manage remediation materials and meeting both of the conditions specified in paragraphs (a)(3)(i) and (ii) of this section. If either of these conditions do not apply to an equipment component, then that component is not part of the affected source for equipment leaks.

(i) The equipment component contains or contacts remediation material having a concentration of total HAP listed in Table 1 of this subpart equal to or greater than 10 percent by weight.

(ii) The equipment component is intended to operate for 300 hours or more during a calendar year in remediation material service, as defined in §63.7957.

(b) Each affected source for your site is existing if you commenced construction or reconstruction of the affected source before July 30, 2002.

(c) Each affected source for your site is new if you commenced construction or reconstruction of the affected source on or after July 30, 2002.

§ 63.7883 When do I have to comply with this subpart?

(a) If you have an existing affected source, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than October 9, 2006.

(b) If you have a new affected source that manages remediation material other than a radioactive mixed waste as defined in §63.7957, then you must meet the compliance date specified in paragraph (b)(1) or (2) of this section, as applicable to your affected source.

(1) If the affected source's initial startup date is on or before October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you by October 8, 2003.

(2) If the affected source's initial startup date is after October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.
(c) If you have a new affected source that manages remediation material that is a radioactive mixed waste as defined in §63.7957, then you must meet the compliance date specified in paragraph (c)(1) or (2) of this section, as applicable to your affected source.

(1) If the affected source's initial startup date is on or before October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than October 9, 2006.

(2) If the affected source's initial startup date is after October 8, 2003, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.

(d) If your facility is an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP as defined in §63.2, then you must meet the compliance dates specified in paragraphs (d)(1) and (2) of this section.

(1) For each source at your facility that is a new affected source subject to this subpart, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup.

(2) For all other affected sources subject to this subpart, you must comply with each emission limitation, work practice standard, and operation and maintenance requirement in this subpart that applies to you no later than 3 years after your facility becomes a major source.

(e) You must meet the notification requirements, according to the schedule applicable to your facility, as specified in §63.7950 and in 40 CFR part 63, subpart A. Some of the notifications must be submitted before you are required to comply with the emissions limitations and work practice standards in this subpart.

General Standards
§ 63.7884 What are the general standards I must meet for each site remediation with affected sources?

(a) For each site remediation with an affected source designated under §63.7882, you must meet the standards specified in §§63.7885 through 63.7955, as applicable to your affected source, unless your site remediation meets the requirements for an exemption under paragraph (b) of this section.

(b) A site remediation that is completed within 30 consecutive calendar days according to the conditions in paragraphs (b)(1) through (3) of this section is not subject to the standards under paragraph (a) of this section. This exemption cannot be used for a site remediation involving the staged or intermittent cleanup of remediation material whereby the remediation activities at the site are started, stopped, and then re-started in a series of intervals, with durations less than 30-days per interval, when the time period from the beginning of the first interval to the end of the last interval exceeds 30 days.

(1) The 30 consecutive calendar day period for a site remediation that qualifies for this exemption is determined according to actions taken by you as defined in paragraphs (b)(1)(i) through (iii) of this section.

(i) The first day of the 30-day period is defined as the day on which you initiate any action that removes, destroys, degrades, transforms, immobilizes, or otherwise manages the remediation materials. The following activities, when completed before beginning this initial action, are not counted as part of the 30-day period: Activities to characterize the type and extent of the contamination by collecting and analyzing samples; activities to obtain permits from Federal, State, or local authorities to conduct the site remediation; activities to schedule workers and necessary equipment; and activities to arrange for contractor or third party assistance in performing the site remediation.

(ii) The last day of the 30-day period is defined as the day on which treatment or disposal of all of the remediation materials generated by the cleanup is completed such that the organic constituents in these materials no longer have a reasonable potential for volatilizing and being released to the atmosphere.
(iii) If treatment or disposal of the remediation materials is conducted at an off-site facility where the final treatment or disposal of the material cannot, or may not, be completed within the 30-day exemption period, then the shipment of all of the remediation material generated from your cleanup that is transferred to another party, or shipped to another facility, within the 30-day period, must be performed according to the applicable requirements specified in §63.7936.

(2) For the purpose of complying with paragraph (b)(1) of this section, if you ship or otherwise transfer the remediation material off-site you must include in the applicable shipping documentation, in addition to any notifications and certifications required under §63.7936, a statement that the shipped material was generated by a site remediation activity subject to the conditions of this exemption. The statement must include the date on which you initiated the site remediation activity generating the shipped remediation materials, as specified in paragraph (b)(1)(i) of this section, and the date 30 calendar days following your initiation date.

(3) You must prepare and maintain at your facility written documentation describing the exempted site remediation, and listing the initiation and completion dates for the site remediation.

[71 FR 69016, Nov. 29, 2006]

§ 63.7885 What are the general standards I must meet for my affected process vents?

(a) For the process vents that comprise the affected source designated under §63.7882, you must select and meet the requirements under one of the options specified in paragraph (b) of this section.

(b) For each affected process vent, except as exempted under paragraph (c) of this section, you must meet one of the options in paragraphs (b)(1) through (3) of this section.

(1) You control HAP emissions from the affected process vents according to the standards specified in §§63.7890 through 63.7893.

(2) You determine for the remediation material treated or managed by the process vented through the affected process vents that the average total volatile organic hazardous air pollutant (VOHAP) concentration, as defined in §63.7957, of this material is less than 10 parts per million by weight (ppmw). Determination of the VOHAP concentration is made using the procedures specified in §63.7943.

(3) If the process vent is also subject to another subpart under 40 CFR part 61 or 40 CFR part 63, you control emissions of the HAP listed in Table 1 of this subpart from the affected process vent in compliance with the standards specified in the applicable subpart. This means you are complying with all applicable emissions limitations and work practice standards under the other subpart (e.g., you install and operate the required air pollution controls or have implemented the required work practice to reduce HAP emissions to levels specified by the applicable subpart). This provision does not apply to any exemption of the affected source from the emissions limitations and work practice standards allowed by the other applicable subpart.

(c) A process vent that meets the exemption requirements in paragraphs (c)(1) and (2) of this section is exempted from the requirements in paragraph (b) of this section.

(1) The process vent stream exiting the process vent meets the conditions in either paragraph (c)(1)(i) or (ii) of this section.

(i) The process vent stream flow rate is less than 0.005 cubic meters per minute (m³/min) at standard conditions (as defined in 40 CFR 63.2); or

(ii) The process vent stream flow rate is less than 6.0 m³/min at standard conditions (as defined in 40 CFR 63.2) and the total concentration of HAP listed in Table 1 of this subpart is less than 20 parts per million by volume (ppmv).
(2) You must demonstrate that the process vent stream meets the applicable exemption conditions in paragraph (c)(1) of this section using the procedures specified in §63.694(m). You must prepare and maintain documentation at your facility to support your determination of the process vent stream flow rate. This documentation must include identification of each process vent exempted under this paragraph and the test results used to determine the process vent stream flow rate and total HAP concentration, as applicable to the exemption conditions for your process vent. You must perform a new determination of the process vent stream flow rate and total HAP concentration, as applicable to the exemption conditions for your process vent, whenever changes to operation of the unit on which the process vent is used could cause the process vent stream conditions to exceed the maximum limits of the exemption.

§ 63.7886 What are the general standards I must meet for my affected remediation material management units?

(a) For each remediation material management unit that is part of an affected source designated by §63.7882, you must select and meet the requirements under one of the options specified in paragraph (b) of this section except for those remediation material management units exempted under paragraph (c) or (d) of this section.

(b) For each affected remediation material management unit, you must meet one of the options in paragraphs (b)(1) through (4) of this section.

(1) You control HAP emissions from the affected remediation material management unit according to the standards specified in paragraphs (b)(1)(i) through (v) of this section, as applicable to the unit.

(i) If the remediation material management unit is a tank, then you control HAP emissions according to the standards specified in §§63.7895 through 63.7898.

(ii) If the remediation material management unit is a container, then you control HAP emissions according to the standards specified in §§63.7900 through 63.7903.

(iii) If the remediation material management unit is a surface impoundment, then you control HAP emissions according to the standards specified in §§63.7905 through 63.7908.

(iv) If the remediation material management unit is an oil-water or organic-water separator, then you control HAP emissions according to the standards specified in §§63.7910 through 63.7913.

(v) If the remediation material management unit is a transfer system, then you control HAP emissions according to the standards specified in §§63.7915 through 63.7918.

(2) You determine that the average total VOHAP concentration, as defined in §63.7957, of the remediation material managed in the remediation material management unit material is less than 500 ppmw. You must follow the requirements in §63.7943 to demonstrate that the VOHAP concentration of the remediation material is less than 500 ppmw. Once the VOHAP concentration for a remediation material has been determined to be less than 500 ppmw, all remediation material management units downstream from the point of determination managing this material meet the requirements of this paragraph unless a remediation process is used that concentrates all, or part of, the remediation material being managed in the unit such that the VOHAP concentration of the material could increase. Any free product returned to the manufacturing process (e.g., recovered oil returned to a storage tank at a refinery) is no longer subject to this subpart.

(3) If the remediation material management unit is also subject to another subpart under 40 CFR part 61 or 40 CFR part 63, you control emissions of the HAP listed in Table 1 of this subpart from the affected remediation material management unit in compliance with the standards specified in the applicable subpart. This means you are complying with all applicable emissions limitations and work practice standards under the other subpart (e.g., you install and operate the required air pollution controls or have implemented the required work practice to reduce HAP emissions to levels specified by the applicable subpart). This provision does not apply to any exemption of the affected source from the emissions limitations and work practice standards allowed by the other applicable subpart.
(4) If the remediation material management unit is an open tank or surface impoundment used for a biological treatment process, you meet the requirements as specified in paragraphs (b)(4)(i) and (ii) of this section.

(i) You demonstrate that the biological treatment process conducted in the open tank or surface impoundment meets the performance levels specified in either §63.684(b)(4)(i) or (ii).

(ii) You monitor the biological treatment process conducted in the open tank or surface impoundment according to the requirements in §63.684(e)(4).

(c) A remediation material management unit is exempted from the requirements in paragraph (b) of this section if this unit is used for cleanup of radioactive mixed waste, as defined in §63.7957, that is subject to applicable regulations, directives, and other requirements under the Atomic Energy Act, the Nuclear Waste Policy Act, or the Waste Isolation Pilot Plant Land Withdrawal Act.

(d) One or a combination of remediation material management units may be exempted at your discretion from the requirements in paragraph (b) of this section provided that the total annual quantity of HAP listed in Table 1 of this subpart contained in the remediation material placed in all of the remediation material management units exempted under this paragraph is less than 1 Mg/yr. For each remediation material management unit you select to be exempted under this provision, you must meet the requirements in paragraphs (d)(1) and (2) of this section.

(1) You must designate each of the remediation material management units you are selecting to be exempted under this paragraph by either submitting to the Administrator a written notification identifying the exempt units or permanently marking the exempt units at the facility site. If you choose to prepare and submit a written notification, this notification must include a site plan, process diagram, or other appropriate documentation identifying each of the exempt units. If you choose to permanently mark the exempt units, each exempt unit must be marked in such a manner that it can be readily identified as an exempt unit from the other remediation material management units located at the site.

(2) You must prepare an initial determination of the total annual HAP quantity in the remediation material placed in the units exempted under this paragraph. This determination is based on the total quantity of the HAP listed in Table 1 of this subpart as determined at the point where the remediation material is placed in each exempted unit. You must perform a new determination whenever the extent of changes to the quantity or composition of the remediation material placed in the exempted units could cause the total annual HAP content in the remediation material to exceed 1 Mg/yr. You must maintain documentation to support the most recent determination of the total annual HAP quantity. This documentation must include the basis and data used for determining the organic HAP content of the remediation material.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69017, Nov. 29, 2006]

§ 63.7887 What are the general standards I must meet for my affected equipment leak sources?

(a) You must control HAP emissions from equipment leaks from each equipment component that is part of the affected source by implementing leak detection and control measures according to the standards specified in §§63.7920 through 63.7922 unless you elect to meet the requirements in paragraph (b) of this section.

(b) If the affected equipment leak source is also subject to another subpart in 40 CFR part 61 or 40 CFR part 63, you may control emissions of the HAP listed in Table 1 to this subpart from the affected equipment leak source in compliance with the standards specified in the other applicable subpart. This means you are complying with all applicable emissions limitations and work practice standards under the other subpart (e.g., you implement leak detection and control measures to reduce HAP emissions as specified by the applicable subpart). This provision does not apply to any exemption of the affected source from the emissions limitations and work practice standards allowed by the other applicable subpart.

[71 FR 69017, Nov. 29, 2006]
§ 63.7888 How do I implement this rule at my facility using the cross-referenced requirements in other subparts?

(a) For the purposes of this subpart, when you read the term “HAP listed in Table 1 of this subpart” in a cross-referenced section under 40 CFR part 63, subpart DD—National Emission Standards for Hazardous Air Pollutants from Off-Site Waste and Recovery Operations, you should refer to Table 1 of this subpart.

(b) For the purposes of this subpart, when you read the term “off-site material” in a cross-referenced section under 40 CFR part 63, subpart DD—National Emission Standards for Hazardous Air Pollutants from Off-Site Waste and Recovery Operations you should substitute the term remediation material, as defined in §63.7957.

(c) For the purposes of this subpart, when you read the term “regulated material” in a cross-referenced section under 40 CFR part 63, subparts OO, PP, QQ, RR, TT, UU, WW, and VV you should substitute the term remediation material, as defined in §63.7957.

§ 63.7890 What emissions limitations and work practice standards must I meet for process vents?

(a) You must control HAP emissions from each new and existing process vent subject to §63.7885(b)(1) according to emissions limitations and work practice standards in this section that apply to your affected process vents.

(b) For your affected process vents, you must meet one of the facility-wide emission limit options specified in paragraphs (b)(1) through (4) of this section. If you have multiple affected process vent streams, you may comply with this paragraph using a combination of controlled and uncontrolled process vent streams that achieve the facility-wide emission limit that applies to you.

(1) Reduce from all affected process vents the total emissions of the HAP listed in Table 1 of this subpart to a level less than 1.4 kilograms per hour (kg/hr) and 2.8 Mg/yr (3.0 pounds per hour (lb/hr) and 3.1 tpy); or

(2) Reduce from all affected process vents the emissions of total organic compounds (TOC) (minus methane and ethane) to a level below 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy); or

(3) Reduce from all affected process vents the total emissions of the HAP listed in Table 1 of this subpart by 95 percent by weight or more; or

(4) Reduce from all affected process vents the emissions of TOC (minus methane and ethane) by 95 percent by weight or more.

(c) For each closed vent system and control device you use to comply with paragraph (b) of this section, you must meet the operating limit requirements and work practice standards in §63.7925(c) through (j) that apply to your closed vent system and control device.

§ 63.7891 How do I demonstrate initial compliance with the emissions limitations and work practice standards for process vents?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7890(b) applicable to your affected process vents by meeting the requirements in paragraphs (b) through (d) of this section.

(b) You have measured or determined using the procedures for performance tests and design evaluations in §63.7941 that emission levels from all of your affected process vents meet the facility-wide emission limits in §63.7890(b) that apply to you, as follows in paragraphs (b)(1) through (4) of this section.

(1) If you elect to meet §63.7890(b)(1), you demonstrate that the total emissions of the HAP listed in Table 1 of this subpart from all affected process vents at your facility are less than 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy).
BP Products North America, Inc.,
-- Whiting Business Unit
Whiting, Indiana
Reviewer: Madhurima D. Moulik

(2) If you elect to meet §63.7890(b)(2), you demonstrate that emissions of TOC (minus methane and ethane) from all affected process vents at your facility are less than 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy).

(3) If you elect to meet §63.7890(b)(3), you demonstrate that the total emissions of the HAP listed in Table 1 of this subpart from all affected process vents are reduced by 95 percent by weight or more.

(4) If you elect to meet §63.7890(b)(4), you demonstrate that the emissions of TOC (minus methane and ethane) from all affected process vents are reduced by 95 percent by weight or more.

(c) For each closed vent system and control device you use to comply with §63.7890(b), you have met each requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.

(d) You have submitted a notification of compliance status according to the requirements in §63.7950.

§ 63.7892 What are my inspection and monitoring requirements for process vents?

For each closed vent system and control device you use to comply with §63.7890(b), you must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.

§ 63.7893 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for process vents?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7890 applicable to your affected process vents by meeting the requirements in paragraphs (b) through (d) of this section.

(b) You must maintain emission levels from all of your affected process vents to meet the facilitywide emission limits in §63.7890(b) that apply to you, as specified in paragraphs (b)(1) through (4) of this section.

(1) If you elect to meet §63.7890(b)(1), you maintain the total emissions of the HAP listed in Table 1 of this subpart from all affected process vents at your facility are less than 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy).

(2) If you elect to meet §63.7890(b)(2), you maintain emissions of TOC (minus methane and ethane) from all affected process vents at your facility are less than 1.4 kg/hr and 2.8 Mg/yr (3.0 lb/hr and 3.1 tpy).

(3) If you elect to meet §63.7890(b)(3), you maintain the total emissions of the HAP listed in Table 1 of this subpart from all affected process vents are reduced by 95 percent by weight or more.

(4) If you elect to meet §63.7890(b)(4), you maintain that the emissions of TOC (minus methane and ethane) from all affected process vents are reduced by 95 percent by weight or more.

(c) For each closed vent system and control device you use to comply with §63.7890(b), you have met each requirement for demonstrating continuous compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7928.

(d) Keeping records to document continuous compliance with the requirements of this subpart according to the requirements in §63.7952.

Tanks

§ 63.7895 What emissions limitations and work practice standards must I meet for tanks?

(a) You must control HAP emissions from each new and existing tank subject to §63.7886(b)(1)(i) according to emissions limitations and work practice standards in this section that apply to your affected tanks.

(b) For each affected tank, you must install and operate air pollution controls that meet the requirements in paragraphs (b)(1) through (4) of this section that apply to your tank.
(1) Unless your tank is used for a waste stabilization process, as defined in §63.7957, you must determine the maximum HAP vapor pressure (expressed in kilopascals (kPa)) of the remediation material placed in your tank using the procedures specified in §63.7944.

(2) If the maximum HAP vapor pressure of the remediation material you place in your tank is less than 76.6 kPa, then you must determine which tank level controls (i.e., Tank Level 1 or Tank Level 2) apply to your tank as shown in Table 2 of this subpart, and based on your tank’s design capacity (expressed in cubic meters (m³)) and the maximum HAP vapor pressure of the remediation material you place in this tank. If your tank is required by Table 2 of this subpart to use Tank Level 1 controls, then you must meet the requirements in paragraph (c) of this section. If your tank is required by Table 2 of this subpart to use Tank Level 2 controls, then you must meet the requirements in paragraph (d) of this section.

(3) If maximum HAP vapor pressure of the remediation material you place in your tank is 76.6 kPa or greater, then the tank must use one of the Tank Level 2 controls specified in paragraphs (d)(3) through (5) of this section. Use of floating roofs under paragraph (d)(1) or (2) of this section is not allowed for tanks managing these remediation materials.

(4) A tank used for a waste stabilization process, as defined in §63.7957, must use one of Tank Level 2 controls, as specified in paragraph (d) of this section, that is appropriate for your waste stabilization process.

(c) If you use Tank Level 1 controls, you must install and operate a fixed roof according to the requirements in §63.902. As an alternative to using this fixed roof, you may choose to use one of Tank Level 2 controls in paragraph (d) of this section.

(d) If you use Tank Level 2 controls, you must meet the requirements of one of the options in paragraphs (d)(1) through (5) of this section.

(1) Install and operate a fixed roof with an internal floating roof according to the requirements in §63.1063(a)(1)(i), (a)(2), and (b); or

(2) Install and operate an external floating roof according to the requirements in §63.1063(a)(1)(ii), (a)(2), and (b); or

(3) Install and operate a fixed roof vented through a closed vent system to a control device according to the requirements in §63.685(g). You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device; or

(4) Install and operate a pressure tank according to the requirements in §63.685(h); or

(5) Locate the tank inside a permanent total enclosure and vent emissions from the enclosure through a closed vent system to a control device that is an enclosed combustion device according to the requirements in §63.685(i). You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(e) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your tanks. If you request for permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7896 How do I demonstrate initial compliance with the emissions limitations and work practice standards for tanks?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7895 that apply to your affected tanks by meeting the requirements in paragraphs (b) through (h) of this section, as applicable to your containers.

(b) You have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) and (2) of this section.

(1) You have determined the applicable tank control levels specified in §63.7895(b) for the tanks to be used for your site remediation.
(2) You have determined, according to the procedures in §63.7944, and recorded the maximum HAP vapor pressure of the remediation material placed in each affected tank subject to §63.7886(b)(1)(i) that does not use Tank Level 2 controls.

(c) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 1 controls if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) through (3) of this section.

(1) Each tank using Tank Level 1 controls is equipped with a fixed roof and closure devices according to the requirements in §63.902(b) and (c) and you have records documenting the design.

(2) You have performed an initial visual inspection of the fixed roof and closure devices for defects according to the requirements in §63.906(a) and you have records documenting the inspection results.

(3) You will operate the fixed roof and closure devices according to the requirements in §63.902.

(d) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 2 controls and using a fixed roof with an internal floating roof according to §63.7895(d)(1) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (d)(1) through (3) of this section.

(1) Each tank is equipped with an internal floating roof that meets the requirements in §63.1063(a) and you have records documenting the design.

(2) You will operate the internal floating roof according to the requirements in §63.1063(b).

(3) You have performed an initial visual inspection according to the requirements in §63.1063(d)(1) and you have a record of the inspection results.

(e) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 2 controls and using an external floating roof according to §63.7895(d)(2) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (e)(1) through (3) of this section.

(1) Each tank is equipped with an external floating roof that meets the requirements in §63.1063(a) and you have records documenting the design.

(2) You will operate the external floating roof according to the requirements in §63.1063(b).

(3) You have performed an initial seal gap measurement inspection according to the requirements in §63.1063(d)(3) and you have records of the measurement results.

(f) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 2 controls and using a fixed roof vented to a control device according to §63.7895(d)(3) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (f)(1) through (4) of this section.

(1) Each tank is equipped with a fixed roof and closure devices according to the requirements in §63.902(b) and (c) and you have records documenting the design.

(2) You have performed an initial visual inspection of fixed roof and closure devices for defects according to the requirements in §63.695(b)(3) and you have records documenting the inspection results.

(3) You will operate the fixed roof and closure devices according to the requirements in §63.685(g).

(4) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.
(g) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 2 controls and operates as a pressure tank according to §63.7895(d)(4) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (g)(1) and (2) of this section.

(1) Each tank is designed to operate as a pressure tank according to the requirements in §63.685(h), and you have records documenting the design.

(2) You will operate the pressure tank and according to the requirements in §63.685(h).

(h) You must demonstrate initial compliance of each tank determined under paragraph (b) of this section to require Tank Level 2 controls and using a permanent total enclosure vented to an enclosed combustion device according to §63.7895(d)(5) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (h)(1) and (2) of this section.

(1) You have submitted as part of your notification of compliance status a signed statement that you have performed the verification procedure according to the requirements in §63.685(i), and you have records of the supporting calculations and measurements.

(2) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69016, Nov. 29, 2006]

§ 63.7897 What are my inspection and monitoring requirements for tanks?

(a) You must visually inspect each of your tanks using Tank Level 1 controls for defects at least annually according to the requirements in §63.906(a).

(b) You must inspect and monitor each of your tanks using Tank Level 2 controls according to the requirements in paragraphs (b)(1) through (5), as applicable to your tanks.

(1) If you use a fixed roof with an internal floating roof according to §63.7895(d)(1), you must visually inspect the fixed roof and internal floating roof according to the requirements in §63.1063(d)(1) and (2).

(2) If you use an external floating roof according to §63.7895(d)(2), you must visually inspect the external floating roof according to the requirements in §63.1063(d)(1) and inspect the seals according to the requirements in §63.1063(d)(2) and (3).

(3) If you use a fixed roof vented to a control device according to §63.7895(d)(3), you must meet requirements in paragraphs (b)(3)(i) and (ii) of this section.

(i) You must visually inspect the fixed roof and closure devices for defects according to the requirements in §63.695(b)(3).

(ii) You must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.

(4) If you use a pressure tank according to §63.7895(d)(4), you must visually inspect the tank and its closure devices for defects at least annually to ensure they are operating according to the design requirements in §63.685(h).

(5) If you use a permanent total enclosure vented to an enclosed combustion device according to §63.7895(d)(5), you must meet requirements in paragraphs (b)(5)(i) and (ii) of this section.

(i) You must perform the verification procedure for the permanent total enclosure at least annually according to the requirements in §63.685(i).

(ii) You must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.
§ 63.7898 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for tanks?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7895 applicable to your affected tanks by meeting the requirements in paragraphs (b) through (d) of this section.

(b) You must demonstrate continuous compliance with the requirement to determine the applicable tank control level specified in §63.7895(b) for each affected tank by meeting the requirements in paragraphs (b)(1) through (3) of this section.

(1) Keeping records of the tank design capacity according to the requirements in §63.1065(a).

(2) For tanks subject to §63.7886(b)(1)(ii) and not using Tank Level 2 controls, meeting the requirements in paragraphs (b)(2)(i) and (ii) of this section.

(i) Keeping records of the maximum HAP vapor pressure determined according to the procedures in §63.7944 for the remediation material placed in each affected tank.

(ii) Performing a new determination of the maximum HAP vapor pressure whenever changes to the remediation material managed in the tank could potentially cause the maximum HAP vapor pressure to increase to a level that is equal to or greater than the maximum HAP vapor pressure for the tank design capacity specified in Table 2. You must keep records of each determination.

(3) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(c) You must demonstrate continuous compliance for each tank determined to require Tank Level 1 controls by meeting the requirements in paragraphs (c)(1) through (5) of this section.

(1) Operating and maintaining the fixed roof and closure devices according to the requirements in §63.902(c).

(2) Visually inspecting the fixed roof and closure devices for defects at least annually according to the requirements in §63.906(a).

(3) Repairing defects according to the requirements in §63.63.906(b).

(4) Recording the information specified in §63.907(a)(3) and (b).

(5) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(d) You must demonstrate continuous compliance for each tank determined to require Tank Level 2 controls and using a fixed roof with an internal floating roof according to §63.7895(d)(1) by meeting the requirements in paragraphs (d)(1) through (5) of this section.

(1) Operating and maintaining the internal floating roof according to the requirements in §63.1063(b).

(2) Visually inspecting the internal floating roof according to the requirements in §63.1063(d)(1) and (2).

(3) Repairing defects according to the requirements in §63.1063(e).

(4) Recording the information specified in §63.1065(b) through (d).

(5) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(e) You must demonstrate continuous compliance for each tank determined to require Tank Level 2 controls and using an external floating roof according to §63.7895(d)(2) by meeting the requirements in paragraphs (e)(1) through (5) of this section.

(1) Operating and maintaining the external floating roof according to the requirements in §63.1063(b).

(2) Visually inspecting the external floating roof according to the requirements in §63.1063(d)(1) and inspecting the seals according to the requirements in §63.1063(d)(2) and (3).
(3) Repairing defects according to the requirements in §63.1063(e).

(4) Recording the information specified in §63.1065(b) through (d).

(5) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(f) You must demonstrate continuous compliance for each tank determined to require Tank Level 2 controls and using a fixed roof vented to a control device according to §63.7895(d)(3) by meeting the requirements in paragraphs (f)(1) through (6) of this section.

(1) Operating and maintaining the fixed roof and closure devices according to the requirements in §63.685(g).

(2) Visually inspecting the fixed roof and closure devices for defects at least annually according to the requirements in §63.695(b)(3)(i).

(3) Repairing defects according to the requirements in §63.695(b)(4).

(4) Recording the information specified in §63.696(e).

(5) Meeting each applicable requirement for demonstrating continuous compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7928.

(6) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(g) You must demonstrate continuous compliance for each tank determined to require Tank Level 2 controls and operated as a pressure tank according to §63.7895(d)(4) by meeting the requirements in paragraphs (g)(1) through (3) of this section.

(1) Operating and maintaining the pressure tank and closure devices according to the requirements in §63.685(h).

(2) Visually inspecting each pressurized tank and closure devices for defects at least annually to ensure they are operating according to the design requirements in §63.685(h), and recording the results of each inspection.

(3) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(h) You must demonstrate continuous compliance for each tank determined to require Tank Level 2 controls and using a permanent total enclosure vented to an enclosed combustion device according to §63.7895(d)(5) by meeting the requirements in paragraphs (h)(1) through (4) of this section.

(1) Performing the verification procedure for the enclosure annually according to the requirements in §63.685(i).

(2) Recording the information specified in §63.696(f).

(3) Meeting each applicable requirement for demonstrating continuous compliance with the emissions limitations and work practice standards for a closed vent system and control device in §63.7928.

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69017, Nov. 29, 2006]

Containers

§ 63.7900 What emissions limitations and work practice standards must I meet for containers?

(a) You must control HAP emissions from each new and existing container subject to §63.7886(b)(1)(ii) according to emissions limitations and work practice standards in this section that apply to your affected containers.
(b) For each container having a design capacity greater than 0.1 m\(^3\) you must meet the requirements in paragraph (b)(1) or (2) of this section that apply to your container except at the times the container is used for treatment of remediation material by a waste stabilization process, as defined in §63.7957. As an alternative for any container subject to this paragraph, you may choose to meet the requirements in paragraph (d) of this section.

(1) If the design capacity of your container is less than or equal to 0.46 m\(^3\), then you must use controls according to the standards for Container Level 1 controls as specified in §63.922. As an alternative, you may choose to use controls according to either of the standards for Container Level 2 controls as specified in §63.923.

(2) If the design capacity of your container is greater than 0.46 m\(^3\), then you must use controls according to the standards for Container Level 2 controls as specified in §63.923 except as provided for in paragraph (b)(3) of this section.

(3) As an alternative to meeting the standards in paragraph (b)(2) of this section for containers with a capacity greater than 0.46 m\(^3\), if you determine that either of the conditions in paragraphs (b)(3)(i) or (ii) apply to the remediation material placed in your container, then you may use controls according to the standards for Container Level 1 controls as specified in §63.922.

(i) Vapor pressure of every organic constituent in the remediation material placed in your container is less than 0.3 kPa at 20 °C; or

(ii) Total concentration of the pure organic constituents having a vapor pressure greater than 0.3 kPa at 20 °C in the remediation material placed in your container is less than 20 percent by weight.

(c) At times when a container having a design capacity greater than 0.1 m\(^3\) is used for treatment of a remediation material by a waste stabilization process as defined in §63.7957, you must control air emissions from the container during the process whenever the remediation material in the container is exposed to the atmosphere according to the standards for Container Level 3 controls as specified in §63.924. You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(d) As an alternative to meeting the requirements in paragraph (b) of this section, you may choose to use controls on your container according to the standards for Container Level 3 controls as specified in §63.924. You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(e) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your containers. If you request for permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7901 How do I demonstrate initial compliance with the emissions limitations and work practice standards for containers?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7990 that apply to your affected containers by meeting the requirements in paragraphs (b) through (e) of this section, as applicable to your containers.

(b) You have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) and (2) of this section.

(1) You have determined the applicable container control levels specified in §63.7990 for the containers to be used for your site remediation.

(2) You have determined and recorded the maximum vapor pressure or total organic concentration for the remediation material placed in containers with a design capacity greater than 0.46 m\(^3\), and do not use Container Level 2 or Level 3 controls.

(c) You must demonstrate initial compliance of each container determined under paragraph (b) of this section to require Container Level 1 controls if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) and (2) of this section.
(1) Each container using Container Level 1 controls will be one of the containers specified in §63.922(b).

(2) You will operate each container cover and closure device according to the requirements in §63.922(d).

(d) You must demonstrate initial compliance of each container determined under paragraph (b) of this section to require Container Level 2 controls if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (d)(1) through (4) of this section.

(1) Each container using Container Level 2 controls will be one of the containers specified in §63.923(b).

(2) You will transfer remediation materials into and out of each container according to the procedures in §63.923(d).

(3) You will operate and maintain the container covers and closure devices according to the requirements in §63.923(d).

(4) You have records that the container meets the applicable U.S. Department of Transportation regulations, or you have conducted an initial test of each container for no detectable organic emissions using the procedures in §63.925(a), and have records documenting the test results, or you have demonstrated within the last 12 months that each container is vapor-tight according to the procedures in §63.925(a) and have records documenting the test results.

(e) You must demonstrate initial compliance of each container determined under paragraph (b) of this section to require Container Level 3 controls if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (e)(1) and (2) of this section.

(1) For each permanent total enclosure you use to comply with §63.7900, you have performed the verification procedure according to the requirements in §63.924(c)(1), and prepare records of the supporting calculations and measurements.

(2) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.

§ 63.7902 What are my inspection and monitoring requirements for containers?

(a) You must inspect each container using Container Level 1 or Container Level 2 controls according to the requirements in §63.926(a).

(b) If you use Container Level 3 controls, you must meet requirements in paragraphs (b)(1) and (2) of this section, as applicable to your site remediation.

(1) You must perform the verification procedure for each permanent total enclosure annually according to the requirements in §63.924(c)(1).

(2) You must monitor and inspect each closed vent system and control device according to the requirements in §63.7927 that apply to you.

§ 63.7903 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for containers?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7990 applicable to your affected containers by meeting the requirements in paragraphs (b) through (e) of this section.

(b) You must demonstrate continuous compliance with the requirement to determine the applicable container control level specified in §63.7990(b) for each affected tank by meeting the requirements in paragraphs (b)(1) through (3) of this section.

(1) Keeping records of the quantity and design capacity for each type of container used for your site remediation and subject to §63.7886(b)(1)(ii).
(2) For containers subject to §63.7886(b)(1)(ii) with a design capacity greater than 0.46 m³ and not using Container Level 2 or Container Level 3 controls, meeting the requirements in paragraphs (b)(2)(i) and (ii) of this section.

(i) Keeping records of the maximum vapor pressure or total organic concentration for the remediation material placed in the containers, as applicable to the conditions in §63.7900(b)(3)(i) or (ii) for which your containers qualify to use Container Level 1 controls.

(ii) Performing a new determination whenever changes to the remediation material placed in the containers could potentially cause the maximum vapor pressure or total organic concentration to increase to a level that is equal to or greater than the conditions specified in §63.7900(b)(3)(i) or (ii), as applicable to your containers. You must keep records of each determination.

(3) Keeping records to document compliance with the requirements according to the requirements in §63.7952.

(c) You must demonstrate continuous compliance for each container determined to require Container Level 1 controls by meeting the requirements in paragraphs (c)(1) through (5) of this section.

(1) Operating and maintaining covers for each container according to the requirements in §63.922(d).

(2) Inspecting each container annually according to the requirements in §63.926(a)(2).

(3) Emptying or repairing each container according to the requirements in §63.926(a)(3).

(4) Keeping records of an inspection that includes the information in paragraphs (a)(4)(i) and (ii) of this section.

(i) Date of each inspection; and

(ii) If a defect is detected during an inspection, the location of the defect, a description of the defect, the date of detection, the corrective action taken to repair the defect, and if repair is delayed, the reason for any delay and the date completion of the repair is expected.

(5) Keeping records to document compliance with the requirements according to the requirements in §63.7952.

(d) You must demonstrate continuous compliance for each container determined to require Container Level 2 controls by meeting the requirements in paragraphs (d)(1) through (6) of this section.

(1) Transferring remediation material in and out of the container according to the requirements in §63.923(c).

(2) Operating and maintaining container covers according to the requirements in §63.923(d).

(3) Inspecting each container annually according to the requirements in §63.926(a)(2).

(4) Emptying or repairing containers according to the requirements in §63.926(a)(3).

(5) Keeping records of each inspection that include the information in paragraphs (d)(5)(i) and (ii) of this section.

(i) Date of each inspection; and

(ii) If a defect is detected during an inspection, the location of the defect, a description of the defect, the date of detection, the corrective action taken to repair the defect, and if repair is delayed, the reason for any delay and the date completion of the repair is expected.

(6) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(e) You must demonstrate continuous compliance for each container determined to require Container Level 3 controls by meeting the requirements in paragraphs (e)(1) through (4) of this section.
(1) Performing the verification procedure for the enclosure annually according to the requirements in §63.685(i).

(2) Recording the information specified in §63.696(f).

(3) Meeting each applicable requirement for demonstrating continuous compliance with the emissions limitations and work practice standards for a closed vent system and control device in §63.7928.

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

**Surface Impoundments**

§ 63.7905 What emissions limitations or work practice standards must I meet for surface impoundments?

(a) You must control HAP emissions from each new and existing surface impoundment subject to §63.7886(b)(1)(iii) according to emissions limitations and work practice standards in this section that apply to your affected surface impoundments.

(b) For each affected surface impoundment, you must install and operate air pollution controls that meet either of the options in paragraphs (b)(1) or (2) of this section.

(1) Install and operate a floating membrane cover according to the requirements in §63.942; or

(2) Install and operate a cover vented through a closed vent system to a control device according to the requirements in §63.943. You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(c) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your surface impoundments. If you request permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7906 How do I demonstrate initial compliance with the emissions limitations or work practice standards for surface impoundments?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7905 that apply to your affected surface impoundments by meeting the requirements in paragraphs (b) and (c) of this section, as applicable to your surface impoundments.

(b) You must demonstrate initial compliance of each surface impoundment using a floating membrane cover according to §63.7905(b)(1) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) through (3) of this section.

(1) You have installed a floating membrane cover and closure devices that meet the requirements in §63.942(b), and you have records documenting the design and installation.

(2) You will operate the cover and closure devices according to the requirements in §63.942(c).

(3) You have performed an initial visual inspection of each surface impoundment and closure devices according to the requirements in §63.946(a), and you have records documenting the inspection results.

(c) You must demonstrate initial compliance of each surface impoundment using a cover vented to a control device according to §63.7905(b)(2) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) through (4) of this section.

(1) You have installed a cover and closure devices that meet the requirements in §63.943(b), and have records documenting the design and installation.

(2) You will operate the cover and closure devices according to the requirements in §63.943(c).

(3) You have performed an initial visual inspection of each cover and closure devices according to the requirements in §63.946(b), and have records documenting the inspection results.
(4) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.

§ 63.7907 What are my inspection and monitoring requirements for surface impoundments?

(a) If you use a floating membrane cover according to §63.7905(b)(1), you must visually inspect the floating membrane cover and its closure devices at least annually according to the requirements in §63.946(a).

(b) If you use a cover vented to a control device according to §63.7905(b)(2), you must meet requirements in paragraphs (b)(1) and (2) of this section.

(1) You must visually inspect the cover and its closure devices for defects according to the requirements in §63.946(b).

(2) You must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.

§ 63.7908 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for surface impoundments?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7905 applicable to your affected surface impoundments by meeting the requirements in paragraphs (b) and (c) of this section as applicable to your surface impoundments.

(b) You must demonstrate continuous compliance for each surface impoundment using a floating membrane cover according to §63.7905(b)(1) by meeting the requirements in paragraphs (b)(1) through (5) of this section.

(1) Operating and maintaining the floating membrane cover and closure devices according to the requirements in §63.942(c).

(2) Visually inspecting the floating membrane cover and closure devices for defects at least annually according to the requirements in §63.946(a).

(3) Repairing defects according to the requirements in §63.946(c).

(4) Recording the information specified in §63.947(a)(2) and (a)(3).

(5) Keeping records to document compliance with the requirements according to the requirements in §63.7952.

(c) You must demonstrate continuous compliance for each surface impoundment using a cover vented to a control device according to §63.7905(b)(2) by meeting the requirements in paragraphs (c)(1) through (6) of this section.

(1) Operating and maintaining the cover and its closure devices according to the requirements in §63.943(c).

(2) Visually inspecting the cover and its closure devices for defects at least annually according to the requirements in §63.946(b).

(3) Repairing defects according to the requirements in §63.946(c).

(4) Recording the information specified in §63.947(a)(2) and (a)(3).

(5) Meeting each applicable requirement for demonstrating continuous compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7928.

(6) Keeping records to document compliance with the requirements according to the requirements in §63.7952.
Separators

§ 63.7910 What emissions limitations and work practice standards must I meet for separators?

(a) You must control HAP emissions from each new and existing oil-water separator and organic-water separator subject to §63.7886(b)(1)(iv) according to emissions limitations and work practice standards in this section that apply to your affected separators.

(b) For each affected separator, you must install and operate air pollution controls that meet one of the options in paragraphs (b)(1) through (3) of this section.

(1) Install and operate a floating roof according to the requirements in §63.1043. For portions of the separator where it is infeasible to install and operate a floating roof, such as over a weir mechanism, you must comply with the requirements specified in paragraph (b)(2) of this section.

(2) Install and operate a fixed roof vented through a closed vent system to a control device according to the requirements in §63.1044. You must meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(3) Install and operate a pressurized separator according to the requirements in §63.1045.

(c) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your separators. If you request for permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7911 How do I demonstrate initial compliance with the emissions limitations and work practice standards for separators?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7910 that apply to your affected separators by meeting the requirements in paragraphs (b) through (d) of this section, as applicable to your separators.

(b) You must demonstrate initial compliance of each separator using a floating roof according to §63.7910(b)(1) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) through (4) of this section.

(1) You have installed a floating roof and closure devices that meet the requirements in §63.1043(b), and you have records documenting the design and installation.

(2) You will operate the floating roof and closure devices according to the requirements in §63.1043(c).

(3) You have performed an initial seal gap measurement inspection using the procedures in §63.1046(b), and you have records documenting the measurement results.

(4) You have performed an initial visual inspection of the floating roof and closure devices for defects according to the requirements in §63.1047(b)(2), and you have records documenting the inspection results.

(5) For any portions of the separator using a fixed roof vented to a control device according to §63.7910(b)(1), you have met the requirements in paragraphs (c)(1) through (4) of this section.

(c) You must demonstrate initial compliance of each separator using a fixed roof vented to a control device according to §63.7910(b)(2) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) through (4) of this section.

(1) You have installed a fixed roof and closure devices that meet the requirements in §63.1042(b), and you have records documenting the design and installation.

(2) You will operate the fixed roof and its closure devices according to the requirements in §63.1042(c).

(3) You have performed an initial visual inspection of the fixed roof and closure devices for defects according to the requirements in §63.1047(a).
(4) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.

(d) You must demonstrate initial compliance of each pressurized separator that operates as a closed system according to §63.7910(b)(3) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (d)(1) and (2) of this section.

(1) You have installed a pressurized separator that operates as a closed system according to the requirements in §63.1045(b)(1) and (b)(2), and you have records of the design and installation.

(2) You will operate the pressurized separator as a closed system according to the requirements in §63.1045(b)(3).

§ 63.7912 What are my inspection and monitoring requirements for separators?

(a) If you use a floating roof according to §63.7910(b)(1), you must meet requirements in paragraphs (a)(1) and (2) of this section.

(1) Measure the seal gaps at least annually according to the requirements in §63.1047(b)(1).

(2) Visually inspect the floating roof at least annually according to the requirements in §63.1047(b)(2).

(b) If you use a cover vented to a control device according to §63.7910(b)(1) or (2), you must meet requirements in paragraphs (b)(1) and (2) of this section.

(1) You must visually inspect the cover and its closure devices for defects according to the requirements in §63.1047(c).

(2) You must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.

(c) If you use a pressurized separator that operates as a closed system according to §63.7910(b)(3), you must visually inspect each pressurized separator and closure devices for defects at least annually to ensure they are operating according to the design requirements in §63.1045(b).

§ 63.7913 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for separators?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7910 applicable to your affected separators by meeting the requirements in paragraphs (b) through (d) of this section as applicable to your surface impoundments.

(b) You must demonstrate continuous compliance for each separator using a floating roof according to §63.7910(b)(1) by meeting the requirements in paragraphs (b)(1) through (6) of this section.

(1) Operating and maintaining the floating roof according to the requirements in §63.1043(b).

(2) Performing seal gap measurement inspections at least annually according to the requirements in §63.1047(b)(1).

(3) Visually inspecting the floating roof at least annually according to the requirements in §63.1047(b)(2).

(4) Repairing defects according to the requirements in §63.1047(d).

(5) Recording the information specified in §63.1048(a) and (b).

(6) Keeping records to document compliance with the requirements according to the requirements in §63.7952.

(c) You must demonstrate continuous compliance for each separator using a fixed roof vented through a closed vent system to a control device according to §63.7910(b)(2) by meeting the requirements in paragraphs (c)(1) through (6) of this section.
(1) Operating and maintaining the fixed roof and its closure devices according to the requirements in §63.1042.

(2) Performing visual inspections of the fixed roof and its closure devices for defects at least annually according to the requirements in §63.1047(a).

(3) Repairing defects according to the requirements in §63.1047(d).

(4) Recording the information specified in §63.1048(a).

(5) Meeting each applicable requirement for demonstrating continuous compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7928.

(6) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(d) You must demonstrate continuous compliance for each pressurized separator operated as a closed system according to §63.7910(b)(3) by meeting the requirements in paragraphs (d)(1) and (2) of this section.

(1) Operating the pressurized separator at all times according to the requirements in §63.1045.

(2) Visually inspecting each pressurized tank and closure devices for defects at least annually to ensure they are operating according to the design requirements in §63.1045(b), and recording the results of each inspection.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69017, Nov. 29, 2006]

Transfer Systems
§ 63.7915 What emissions limitations and work practice standards must I meet for transfer systems?

(a) You must control HAP emissions from each new and existing transfer system subject to §63.7886(b)(1)(v) according to emissions limitations and work practice standards in this section that apply to your affected transfer systems.

(b) For each affected transfer system that is an individual drain system as defined in §63.7957, you must install and operate controls according to the requirements in §63.962.

(c) For each affected transfer system that is not an individual drain system as defined in §63.7957, you must use one of the transfer systems specified in paragraphs (c)(1) through (3) of this section.

(1) A transfer system that uses covers according to the requirements in §63.689(d).

(2) A transfer system that consists of continuous hard piping. All joints or seams between the pipe sections must be permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed flange).

(3) A transfer system that is enclosed and vented through a closed vent system to a control device according to the requirements specified in paragraphs (c)(3)(1) and (ii) of this section.

(i) The transfer system is designed and operated such that an internal pressure in the vapor headspace in the enclosure is maintained at a level less than atmospheric pressure when the control device is operating, and

(ii) The closed vent system and control device are designed and operated to meet the emissions limitations and work practice standards in §63.7925 that apply to your closed vent system and control device.

(d) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your transfer systems. If you request permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]
§ 63.7916  How do I demonstrate initial compliance with the emissions limitations and work practice standards for transfer systems?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7915 that apply to your affected transfer systems by meeting the requirements in paragraphs (b) through (e) of this section, as applicable to your transfer systems.

(b) You must demonstrate initial compliance of each individual drain system using controls according to §63.7915(b) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) through (3) of this section.

(1) You have installed air emission controls for each individual drain system and junction box according to the requirements in §63.962(a) and (b), and you have records documenting the installation and design.

(2) You will operate the air emission controls according to the requirements in §63.962(b)(5).

(3) You have performed an initial visual inspection of each individual drain system according to the requirements in §63.964(a), and you have records documenting the inspection results.

(c) You must demonstrate initial compliance of each transfer system using covers according to §63.7915(c)(1) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) through (3) of this section.

(1) Each transfer system is equipped with covers and closure devices according to the requirements in §63.689(d)(1) through (4), and you have records documenting the design and installation.

(2) You have performed an initial inspection of each cover and its closure devices for defects according to the requirements in §63.695(d)(1) through (5), and you have records documenting the inspection results.

(3) You will operate each cover and its closure devices according to the requirements in §63.689(5).

(d) You must demonstrate initial compliance of each transfer system that consists of hard piping according to §63.7915(c)(2) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (d)(1) and (2) of this section.

(1) You have installed a transfer system that consists entirely of hard piping and meets the requirements in §63.7915(c)(2), and you have records documenting the design and installation.

(2) You have performed an initial inspection of the entire transfer system to verify that all joints or seams between the pipe sections are permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed flange), and you have records documenting the inspection results.

(e) You must demonstrate initial compliance of each transfer system that is enclosed and vented to a control device according to §63.7915(e)(3) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (e)(1) and (2) of this section.

(1) You have installed a transfer system that is designed and operated such that an internal pressure in the vapor headspace in the enclosure is maintained at a level less than atmospheric pressure when the control device is operating, and you have records documenting the design and installation.

(2) You have met each applicable requirement for demonstrating initial compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7926.
§ 63.7917 What are my inspection and monitoring requirements for transfer systems?

(a) If you operate an individual drain system as a transfer system according to §63.7915(b), you must visually inspect each individual drain system at least annually according to the requirements in §63.964(a).

(b) If you operate a transfer system using covers according to §63.7915(c)(1), you must inspect each cover and its closure devices for defects according to the requirements in §63.695(d)(1) through (5).

(c) If you operate a transfer system consisting of hard piping according to §63.7915(c)(2), you must annually inspect the unburied portion of pipeline and all joints for leaks and other defects. In the event that a defect is detected, you must repair the leak or defect according to the requirements of paragraph (e) of this section.

(d) If you operate a transfer system that is enclosed and vented to a control device according to §63.7915(c)(3), you must meet requirements in paragraphs (d)(1) and (2) of this section.

1) You must annually inspect all enclosure components (e.g., enclosure sections, closure devices, fans) for defects that would prevent an internal pressure in the vapor headspace in the enclosure from continuously being maintained at a level less than atmospheric pressure when the control device is operating. In the event that a defect is detected, you must repair the defect according to the requirements of paragraph (e) of this section.

2) You must monitor and inspect the closed vent system and control device according to the requirements in §63.7927 that apply to you.

(e) If you are subject to paragraph (c) or (d) of this section, you must repair all detected defects as specified in paragraphs (e)(1) through (3) of this section.

1) You must make first efforts at repair of the defect no later than 5 calendar days after detection and repair shall be completed as soon as possible but no later than 45 calendar days after detection except as provided in paragraph (e)(2) of this section.

2) Repair of a defect may be delayed beyond 45 calendar days if you determine that repair of the defect requires emptying or temporary removal from service of the transfer system and no alternative transfer system is available at the site to accept the material normally handled by the system. In this case, you must repair the defect the next time the process or unit that is generating the material handled by the transfer system stops operation. Repair of the defect must be completed before the process or unit resumes operation.

3) You must maintain a record of the defect repair according to the requirements specified in §63.7952.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]

§ 63.7918 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for transfer systems?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7915 applicable to your affected transfer system by meeting the requirements in paragraphs (b) through (e) of this section as applicable to your transfer systems.

(b) You must demonstrate continuous compliance for each individual drain system using controls according to §63.7915(b) by meeting the requirements in paragraphs (b)(1) through (5) of this section.

1) Operating and maintaining the air emission controls for individual drain systems according to the requirements in §63.962.

2) Visually inspecting each individual drain system at least annually according to the requirements in §63.964(a).

3) Repairing defects according to the requirements in §63.964(b).

4) Recording the information specified in §63.965(a).
(5) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(c) You must demonstrate continuous compliance for each transfer system using covers according to §63.7915(c)(1) by meeting the requirements in paragraphs (c)(1) through (4) of this section.

(1) Operating and maintaining each cover and its closure devices according to the requirements in §63.689(d)(1) through (5).

(2) Performing inspections of each cover and its closure devices for defects at least annually according to the requirements in §63.695(d)(1) through (5).

(3) Repairing defects according to the requirements in §63.695(5)

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(d) You must demonstrate continuous compliance for each transfer system that consists of hard piping according to §63.7915(c)(2) by meeting the requirements in paragraphs (d)(1) through (4) of this section.

(1) Operating and maintaining the pipeline to ensure that all joints or seams between the pipe sections remain permanently or semi-permanently sealed (e.g., a welded joint between two sections of metal pipe or a bolted and gasketed flange).

(2) Inspecting the pipeline for defects at least annually according to the requirements in §63.7917(c).

(3) Repairing defects according to the requirements in §63.7917(e).

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(e) You must demonstrate continuous compliance for each transfer system that is enclosed and vented to a control device according to §63.7915(c)(3) by meeting the requirements in paragraphs (e)(1) through (5) of this section.

(1) Operating and maintaining the enclosure to ensure that the internal pressure in the vapor headspace in the enclosure is maintained continuously at a level less than atmospheric pressure when the control device is operating.

(2) Inspecting the enclosure and its closure devices for defects at least annually according to the requirements in §63.7918(d).

(3) Repairing defects according to the requirements in §63.7918(e).

(4) Meeting each applicable requirement for demonstrating continuous compliance with the emission limitations and work practice standards for a closed vent system and control device in §63.7928.

(5) Keeping records to document compliance with the requirements according to the requirements in §63.7952.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]

Equipment Leaks

§ 63.7920 What emissions limitations and work practice standards must I meet for equipment leaks?

(a) You must control HAP emissions from each new and existing equipment subject to §63.7887 according to emissions limitations and work practice standards in this section that apply to your affected equipment.

(b) For your affected equipment, you must meet the requirements in either paragraph (b)(1) or (2) of this section.

(1) Control equipment leaks according to all applicable requirements under 40 CFR part 63, subpart TT—National Emission Standards for Equipment Leaks—Control Level 1; or
Control equipment leaks according to all applicable requirements under 40 CFR part 63, subpart UU—National Emission Standards for Equipment Leaks—Control Level 2.

(c) If you use a closed vent system and control device to comply with this section, as an alternative to meeting the standards in §63.1015 or §63.1034 for closed vent systems and control devices, you may elect to meet the requirements in §§63.7925 through 63.7928 that apply to your closed vent system and control device.

(d) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your equipment. If you request for permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7921 How do I demonstrate initial compliance with the emissions limitations and work practice standards for equipment leaks?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in §63.7920 that apply to your affected equipment by meeting the requirements in paragraphs (b) and (c) of this section, as applicable to your affected sources.

(b) If you control equipment leaks according to the requirements under §63.7920(b)(1), you must demonstrate initial compliance if you have met the requirements in paragraphs (b)(1) and (2) of this section.

(1) You include the information required in §63.1018(a)(1) in your notification of compliance status report.

(2) You have submitted as part of your notification of compliance status a signed statement that:

(i) You will meet the requirements in §§63.1002 through 63.1016 that apply to your affected equipment.

(ii) You have identified the equipment subject to control according to the requirements in §63.1003, including equipment designated as unsafe to monitor, and have records supporting the determinations with a written plan for monitoring the equipment according to the requirements in §63.1003(c)(4).

(c) If you control equipment leaks according to the requirements under §63.7920(b)(2), you must demonstrate initial compliance if you have met the requirements in paragraphs (c)(1) and (2) of this section.

(1) You have included the information required in §63.1039(a) in your notification of compliance status report.

(2) You have submitted as part of your notification of compliance status a signed statement that:

(i) You will meet the requirements in §§63.1021 through 63.1037 that apply to your affected equipment.

(ii) You have identified the equipment subject to control according to the requirements in §63.1022, including equipment designated as unsafe to monitor, and have records supporting the determinations with a written plan for monitoring the equipment according to the requirements in §63.1022(c)(4).

§ 63.7922 How do I demonstrate continuous compliance with the work practice standards for equipment leaks?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in §63.7920 applicable to your affected equipment by meeting the requirements in paragraphs (b) through (d) of this section that apply to you.

(b) If you control equipment leaks according to the requirements under §63.7920(b)(1), you must demonstrate continuous compliance by inspecting, monitoring, repairing, and maintaining records according to the requirements in §§63.1002 through 63.1018 that apply to your affected equipment.
(c) If you control equipment leaks according to the requirements under §63.7920(b)(2), you must demonstrate continuous compliance by inspecting, monitoring, repairing, and maintaining records according to the requirements in §§63.1021 through 63.1039 that apply to your affected equipment.

(d) You must keep records to demonstrate compliance with the requirements according to the requirements in §63.7952.

Closed Vent Systems and Control Devices

§ 63.7925 What emissions limitations and work practice standards must I meet for closed vent systems and control devices?

(a) For each closed-vent system and control device you use to comply with requirements in §§63.7890 through 63.7922, as applicable to your affected sources, you must meet the emissions limitations and work practice standards in this section.

(b) Whenever gases or vapors containing HAP are vented through the closed-vent system to the control device, the control device must be operating except at those times listed in either paragraph (b)(1) or (2) of this section.

(1) The control device may be bypassed for the purpose of performing planned routine maintenance of the closed-vent system or control device in situations when the routine maintenance cannot be performed during periods that the emission point vented to the control device is shutdown. On an annual basis, the total time that the closed-vent system or control device is bypassed to perform routine maintenance must not exceed 240 hours per each calendar year.

(2) The control device may be bypassed for the purpose of correcting a malfunction of the closed-vent system or control device. You must perform the adjustments or repairs necessary to correct the malfunction as soon as practicable after the malfunction is detected.

(c) For each closed vent system, you must meet the work practice standards in §63.693(c).

(d) For each control device other than a flare or a control device used to comply with the facility-wide process vent emission limits in §63.7890(b), you must control HAP emissions to meet either of the emissions limits in paragraphs (d)(1) or (2) of this section except as provided for in paragraph (f) of this section.

(1) Reduce emissions of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from each control device by 95 percent by weight; or

(2) Limit the concentration of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from each combustion control device (a thermal incinerator, catalytic incinerator, boiler, or process heater) to 20 ppmv or less on a dry basis corrected to 3 percent oxygen.

(e) If you use a flare for your control device, then you must meet the requirements for flares in §63.11(b).

(f) If you use a process heater or boiler for your control device, then as alternative to meeting the emissions limits in paragraph (d) of this section you may choose to comply with one of the work practice standards in paragraphs (f)(1) through (3) of this section.

(1) Introduce the vent stream into the flame zone of the boiler or process heater and maintain the conditions in the combustion chamber at a residence time of 0.5 seconds or longer and at a temperature of 760 °C or higher; or

(2) Introduce the vent stream with the fuel that provides the predominate heat input to the boiler or process heater (i.e., the primary fuel); or

(3) Introduce the vent stream to a boiler or process heater for which you either have been issued a final permit under 40 CFR part 270 and complies with the requirements of 40 CFR part 266, subpart H—Hazardous Waste Burned in Boilers and Industrial Furnaces; or has certified compliance with the interim status requirements of 40 CFR part 266, subpart H.

(g) For each control device other than a flare, you must meet each operating limit in paragraphs (g)(1) through (6) of this section that applies to your control device.
(1) If you use a regenerable carbon adsorption system, you must:
   (i) Maintain the hourly average total regeneration stream mass flow during the adsorption bed regeneration cycle greater than or equal to the stream mass flow established in the design evaluation or performance test.
   (ii) Maintain the hourly average temperature of the adsorption bed during regeneration (except during the cooling cycle) greater than or equal to the temperature established during the design evaluation or performance test.
   (iii) Maintain the hourly average temperature of the adsorption bed after regeneration (and within 15 minutes after completing any cooling cycle) less than or equal to the temperature established during the design evaluation.
   (iv) Maintain the frequency of regeneration greater than or equal to the frequency established during the design evaluation.
(2) If you use a nonregenerable carbon adsorption system, you must maintain the hourly average temperature of the adsorption bed less than or equal to the temperature established during the design evaluation or performance test.
(3) If you use a condenser, you must maintain the daily average condenser exit temperature less than or equal to the temperature established during the design evaluation or performance test.
(4) If you use a thermal incinerator, you must maintain the daily average firebox temperature greater than or equal to the temperature established in the design evaluation or during the performance test.
(5) If you use a catalytic incinerator, you must maintain the daily average temperature difference across the catalyst bed greater than or equal to the minimum temperature difference established during the performance test or design evaluation.
(6) If you use a boiler or process heater to comply with an emission limit in paragraph (d) of this section, you must maintain the daily average firebox temperature within the operating level established during the design evaluation or performance test.
(h) If you use a carbon adsorption system as your control, you must meet each work practice standard in paragraphs (h)(1) through (3) of this section that applies to your control device.
   (1) If you use a regenerable carbon adsorption system, you must:
      (i) Replace the existing adsorbent in each segment of the bed with an adsorbent that meets the replacement specifications established during the design evaluation before the age of the adsorbent exceeds the maximum allowable age established during the design evaluation.
      (ii) Follow the disposal requirements for spent carbon in §63.693(d)(4).
   (2) If you use a nonregenerable carbon adsorption system, you must:
      (i) Replace the existing adsorbent in each segment of the bed with an adsorbent that meets the replacement specifications established during the design evaluation before the age of the adsorbent exceeds the maximum allowable age established during the design evaluation.
      (ii) Meet the disposal requirements for spent carbon in §63.693(d)(4)(ii).
   (3) If you use a nonregenerative carbon adsorption system, you may choose to comply with the requirements in paragraphs (h)(3)(i) and (ii) of this section as an alternative to the requirements in paragraph (h)(2) of this section. You must:
      (i) Immediately replace the carbon canister or carbon in the control device when the monitoring device indicates breakthrough has occurred according to the requirements in §63.693(d)(4)(iii)(A), or replace the carbon canister or carbon in the control device at regular intervals according to the requirements in §63.693(d)(4)(iii)(B).
      (ii) Follow the disposal requirements for spent carbon in §63.693(d)(4)(ii).
(i) If you use a catalytic incinerator, you must replace the existing catalyst bed with a bed that meets the replacement specifications before the age of the bed exceeds the maximum allowable age established in the design evaluation or during the performance test.

(j) As provided in §63.6(g), you may request approval from the EPA to use an alternative to the work practice standards in this section that apply to your closed vent systems and control devices. If you request for permission to use an alternative to the work practice standards, you must submit the information described in §63.6(g)(2).

§ 63.7926 How do I demonstrate initial compliance with the emission limitations and work practice standards for closed vent systems and control devices?

(a) You must demonstrate initial compliance with the emissions limitations and work practice standards in this subpart applicable to your closed vent system and control device by meeting the requirements in paragraphs (b) through (h) of this section that apply to your closed vent system and control device.

(b) You must demonstrate initial compliance with the closed vent system work practice standards in §63.7925(c) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(1) and (2) of this section.

(1) You have installed a closed vent system that meets the requirements in §63.695(c)(1) and (2), and you have records documenting the equipment design and installation.

(2) You have performed the initial inspection of the closed vent system according to the requirements in §63.695(c)(1)(i) or (ii), and you have records documenting the inspection results.

(c) You must demonstrate initial compliance of each control device subject to the emissions limits in §63.7925(d) with the applicable emissions limit in §63.7925(d) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(1) and (2) of this section.

(1) For the emissions limit in §63.7925(d)(1), the emissions of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from the control device, measured or determined according to the procedures for performance tests and design evaluations in §63.7941, are reduced by at least 95 percent by weight.

(2) For the emissions limit in §63.7925(d)(2), the concentration of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from the combustion control device, measured by a performance test or determined by a design evaluation according to the procedures in §63.7941, do not exceed 20 ppmv on a dry basis corrected to 3 percent oxygen.

(d) You must demonstrate initial compliance of each control device subject to operating limits in §63.7925(g) with the applicable limits if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (d)(1) and (2) of this section.

(1) You have established an appropriate operating limit(s) for each of the operating parameter applicable to your control device as specified in §63.7925(g)(1) through (6).

(2) You have a record of the applicable operating parameter data during the performance test or design evaluation during which the emissions met the applicable limit.

(e) You must demonstrate initial compliance with the spent carbon replacement and disposal work practice standards for carbon adsorption systems in §63.7925(h) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you will comply with each work practice standard that applies to your carbon adsorption system.

(f) You must demonstrate initial compliance with the catalyst replacement work practice standards for catalytic incinerators in §63.7925(i) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you will comply with the specified work practice standard.
(g) You must demonstrate initial compliance of each flare with the work practice standards in §63.7925(e) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (g)(1) through (3) of this section.

(1) Each flare meets the requirements in §63.11(b).

(2) You have performed a visible emissions test, determined the net heating value of gas being combusted, and determined the flare exit velocity as required in §63.693(h)(2).

(3) You will operate each flare according to the requirements in §63.11(b).

(h) You must demonstrate initial compliance of each boiler or process heater with the work practice standards in §63.7925(f) if you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (h)(1) through (3) of this section.

(1) For the work practice standards in §63.7925(f)(1), you have records documenting that the boiler or process heater is designed to operate at a residence time of 0.5 seconds or greater and maintain the combustion zone temperature at 760 °C or greater.

(2) For the work practice standard in §63.7925(f)(2), you have records documenting that the vent stream is introduced with the fuel according to the requirements in §63.693(g)(1)(iv), or that the vent stream is introduced to a boiler or process heater that meets the requirements in §63.693(g)(1)(v).

(3) For the work practice standard in §63.7925(f)(3), you have records documenting you either have been issued a final permit under 40 CFR part 270 and your boiler or process heater complies with the requirements of 40 CFR part 266, subpart H—Hazardous Waste Burned in Boilers and Industrial Furnaces; or has been certified in compliance with the interim status requirements of 40 CFR part 266, subpart H.

§ 63.7927 What are my inspection and monitoring requirements for closed vent systems and control devices?

(a) You must comply with the requirements in paragraphs (a)(1) and (2) of this section for each closed vent system.

(1) You must monitor and inspect each closed vent system according to the requirements in either paragraph (a)(1)(i) or (ii) of this section.

(i) You must monitor, inspect, and repair defects according to the requirements in §63.695(c)(1)(ii) through (c)(3); or

(ii) You must monitor and inspect the closed vent system according to the requirements in §63.172(f) through (j) and record the information in §63.181.

(2) If your closed vent system includes a bypass device, you must meet the requirements in either paragraph (a)(2)(i) or (ii) of this section.

(i) Use a flow indicator to determine if the presence of flow according to the requirements in §63.693(c)(2)(i); or

(ii) Use a seal or locking device and make monthly inspections as required by §63.693(c)(2)(iii).

(b) If you use a regenerable carbon adsorption system, you must meet the requirements in paragraphs (b)(1) through (3) of this section.

(1) Use a continuous parameter monitoring system (CPMS) to measure and record the hourly average total regeneration stream mass flow during each carbon adsorption cycle.

(2) Use a CPMS to measure and record the hourly average temperature of the adsorption bed during regeneration (except during the cooling cycle).

(3) Use a CPMS to measure and record the hourly average temperature of the adsorption bed after regeneration (and within 15 minutes after completing any cooling cycle).
(c) If you use a nonregenerable carbon adsorption system, you must use a CPMS to measure and record the hourly average temperature of the adsorption bed or you must monitor the concentration of organic compounds in the exhaust vent stream according to the requirements in §63.693(d)(4)(iii)(A).

(d) If you use a condenser, you must use a CPMS to measure and record the hourly average condenser exit temperature and determine and record the daily average condenser exit temperature.

(e) If you use a thermal incinerator, you must use a CPMS to measure and record the hourly average firebox temperature and determine and record the daily average firebox temperature.

(f) If you use a catalytic incinerator, you must use a CPMS with two temperature sensors to measure and record the hourly average temperature at the inlet of the catalyst bed, the hourly average temperature at the outlet of the catalyst bed, the hourly average temperature difference across the catalyst bed, and to determine and record the daily average temperature difference across the catalyst bed.

(g) If you use a boiler or process heater to meet an emission limitation, you must use a CPMS to measure and record the hourly average firebox temperature and determine and record the daily average firebox temperature.

(h) If you use a flare, you must monitor the operation of the flare using a heat sensing monitoring device according to the requirements in §63.693(h)(3).

(i) If you introduce the vent stream into the flame zone of a boiler or process heater according to the requirements in §63.7925(f)(1), you must use a CPMS to measure and record the combustion zone temperature.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]

§ 63.7928 How do I demonstrate continuous compliance with the emissions limitations and work practice standards for closed vent systems and control devices?

(a) You must demonstrate continuous compliance with the emissions limitations and work practice standards in this subpart applicable to your closed vent system and control device by meeting the requirements in paragraphs (b) through (j) of this section as applicable to your closed vent system and control device.

(b) You must demonstrate continuous compliance with the closed vent system work practice standards in §63.7925(c) by meeting the requirements in paragraphs (b)(1) through (7) of this section.

(1) For a closed vent system designed to operate with no detectable organic emissions, visually inspecting the closed vent system at least annually, monitoring after a repair or replacement using the procedures in §63.694(k), and monitoring at least annually according to the requirements in §63.695(c)(1)(iii).

(2) For a closed vent system designed to operate below atmospheric pressure, visually inspecting the closed vent system at least annually according to the requirements in §63.695(c)(2)(iii).

(3) Repairing defects according to the requirements in §63.695(c)(3).

(4) Keeping records of each inspection that include the information in paragraphs (b)(4)(i) through (iii) of this section:

(i) A closed vent system identification number (or other unique identification description you select).

(ii) Date of each inspection.

(iii) If a defect is detected during an inspection, the location of the defect, a description of the defect, the date of detection, the corrective action taken to repair the defect, and if repair is delayed, the reason for any delay and the date completion of the repair is expected.

(5) If you elect to monitor the closed vent system according to the requirements in §63.172(f) through (j), recording the information in §63.181.
(6) If the closed vent system is equipped with a flow indicator, recording the information in §63.693(c)(2)(i).

(7) If the closed vent system is equipped with a seal or locking device, visually inspecting the seal or closure mechanism at least monthly according to the requirements in §63.693(c)(2)(ii), and recording the results of each inspection.

(c) You must demonstrate continuous compliance of each control device subject to the emissions limits in §63.7925(d) with the applicable emissions limit in §63.7925(d) by meeting the requirements in paragraph (c)(1) or (2) of this section.

(1) For the emission limit in §63.7925(d)(1), maintaining the reduction in emissions of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from the control device at 95 percent by weight or greater.

(2) For the emission limit in §63.7925(d)(2), maintaining the concentration of total HAP listed in Table 1 of this subpart or TOC (minus methane and ethane) from the control device at 20 ppmv or less.

(d) You must demonstrate continuous compliance of each control device subject to operating limits in §63.7925(g) with the applicable limits by meeting the requirements in paragraphs (d)(1) through (4) of this section.

(1) Maintaining each operating limit according to the requirements in §63.7925(g) as applicable to the control device.

(2) Monitoring and inspecting each control device according to the requirements in §63.7927(b) through (i) as applicable to the control device.

(3) Operating and maintaining each continuous monitoring system according to the requirements in §63.7945, and collecting and reducing data according to the requirements in §63.7946.

(4) Keeping records to document compliance with the requirements of this subpart according to the requirements in §63.7952.

(e) You must demonstrate continuous compliance with the spent carbon replacement and disposal work practice standards for regenerable carbon adsorption systems in §63.7925(h)(1) by meeting the requirements in paragraphs (e)(1) through (3) of this section.

(1) Replacing the adsorbent as required by §63.7925(h)(1)(i).

(2) Following the disposal requirements for spent carbon in §63.693(d)(4)(ii).

(3) Keeping records to document compliance with the requirements of the work practice standards.

(f) You must demonstrate continuous compliance with the spent carbon replacement and disposal work practice standards for nonregenerable carbon adsorption systems in §63.7925(h)(2) by meeting the requirements in paragraphs (f)(1) through (3) of this section.

(1) Replacing the adsorbent as required by the work practice standard in §63.7925(h)(2)(i).

(2) Following the disposal requirements for spent carbon in §63.693(d)(4)(ii).

(3) Keeping records to document compliance with the requirements of the work practice standards.

(g) You must demonstrate continuous compliance with the spent carbon replacement and disposal work practice standards for nonregenerable carbon adsorption systems in §63.7925(h)(3) by meeting the requirements in paragraphs (g)(1) through (3) of this section.

(1) Monitoring the concentration level of the organic compounds in the exhaust vent for the carbon adsorption system as required in §63.7927(c), immediately replacing the carbon canister or carbon in the control device when breakthrough is indicated by the monitoring device, and recording the date of breakthrough and carbon replacement. Or, you must replace the carbon canister or carbon in the control device at regular intervals and record the date of carbon replacement.
(2) Following the disposal requirements for spent carbon in §63.693(d)(4)(ii).

(3) Keeping records to document compliance with the requirements of the work practice standards.

(h) You must demonstrate continuous compliance with the catalyst replacement work practice standards for catalytic incinerators in §63.7925(i) by meeting the requirements in paragraphs (h)(1) and (2) of this section.

(1) Replacing the existing catalyst bed as required in §63.7925(i).

(2) Keeping records to document compliance with the requirements of the work practice standards.

(i) You must demonstrate continuous compliance of each flare with the work practice standards in §63.7925(e) by meeting the requirements in paragraphs (i)(1) through (5) of this section.

(1) Operating the flare with no visible emissions except for up to 5 minutes in any 2 consecutive hours according to the requirements in §63.11(b)(4).

(2) Monitoring the presence of a pilot flare according to the requirements in §63.7927(h) and maintaining a pilot flame and flare flame at all times that emissions are not vented to the flare according to the requirements in §63.11(b)(5).

(3) Operating the flare with an exit velocity according to the requirements in §63.11(b)(6) through (8).

(4) Operating the flare with a net heating value of the gas being combusted according to the requirements in §63.11(b)(6)(ii).

(5) Keeping records to document compliance with the requirements of the work practice standards.

(j) You must demonstrate continuous compliance of each boiler or process heater with the work practice standards in §63.7925(f) by meeting the requirements in paragraphs (j)(1) through (3) of this section.

(1) For the work practice standards in §63.7925(f)(1), you must demonstrate continuous compliance by meeting the requirements in paragraphs (j)(1)(i) through (iv).

(i) Maintaining conditions in the combustion chamber at a residence time of 0.5 seconds or longer and at a combustion zone temperature at 760 °C or greater whenever the vent stream is introduced to the flame zone of the boiler or process heater.

(ii) Monitoring each boiler or process heater according to the requirements in §63.7927(i).

(iii) Operating and maintaining each continuous monitoring system according to the requirements in §63.7945, and collecting and reducing data according to the requirements in §63.7946.

(iv) Keeping records to document compliance with residence time design requirement.

(2) For the work practice standards in §63.7925(f)(2), you maintain the boiler or process heater operations such that the vent stream is introduced with the fuel according to the requirements in §63.693(g)(1)(iv), or that the vent stream is introduced to a boiler or process heater that meets the requirements in §63.693(g)(1)(v).

(3) For the work practice standard in §63.7925(f)(3), you remain in compliance with all terms and conditions of the final permit under 40 CFR part 270 and your boiler or process heater complies with the requirements of 40 CFR part 266, subpart H—Hazardous Waste Burned in Boilers and Industrial Furnaces; or in compliance with the interim status requirements of 40 CFR part 266, subpart H, as applicable to your boiler or process heater.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]
General Compliance Requirements
§ 63.7935  What are my general requirements for complying with this subpart?

(a) You must be in compliance with the emissions limitations (including operating limits) and the work practice standards in this subpart at all times, except during periods of startup, shutdown, and malfunction.

(b) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in §63.6(e)(1)(i).

(c) You must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in §63.6(e)(3).

(d) [Reserved]

(e) You must report each instance in which you did not meet each emissions limitation and each operating limit that applies to you. This includes periods of startup, shutdown, and malfunction. You must also report each instance in which you did not meet the requirements for work practice standards that apply to you. These instances are deviations from the emissions limitations and work practice standards in this subpart. These deviations must be reported according to the requirements in §63.7951.

(f) Consistent with §§63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with §63.6(e)(1). We will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in §63.6(e).

(g) For each monitoring system required in this section, you must develop and make available for inspection by the permitting authority, upon request, a site-specific monitoring plan that addresses the following:

1. Installation of the continuous monitoring system sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (e.g., on or downstream of the last control device).

2. Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system.

3. Performance evaluation procedures and acceptance criteria (e.g., calibrations).

(h) In your site-specific monitoring plan, you must also address the following:

1. Ongoing operation and maintenance procedures according to the general requirements of §63.8(c)(1), (3), (4)(ii), (7), and (8).

2. Ongoing data quality assurance procedures according to the general requirements of §63.8(d).

3. Ongoing recordkeeping and reporting procedures according to the general requirements of §63.10(c), (e)(1), and (e)(2)(i).

(i) You must operate and maintain the continuous monitoring system according to the site-specific monitoring plan.

(j) You must conduct a performance evaluation of each continuous monitoring according to your site-specific monitoring plan.

§ 63.7936  What requirements must I meet if I transfer remediation material off-site to another facility?

(a) If you transfer to another facility a remediation material generated by your remediation activities and having an average total VOHAP concentration equal to or greater than 10 ppmw (as determined using the procedures specified in §63.7943), then you must transfer the remediation material to a facility that meets the requirements in paragraph (b) of this section. You must record the name, street address, and telephone number of the facility where you send this remediation material.

(b) You may elect to transfer the remediation material to one of the following facilities:

(1) A facility where your remediation material will be directly disposed in a landfill or other land disposal unit according to all applicable Federal and State requirements.

(2) A facility subject to 40 CFR part 63, subpart DD where the exemption under §63.680(b)(2)(iii) is waived and air emissions from the management of your remediation material at the facility are controlled according to all applicable requirements in the subpart for an off-site material. Prior to sending your remediation material, you must obtain a written statement from the owner or operator of the facility to which you send your remediation material acknowledging that the exemption under §63.680(b)(2)(iii) will be waived for all remediation material received at the facility from you and your material will be managed as an off-site material at the facility according to all applicable requirements. This statement must be signed by the responsible official of the receiving facility, provide the name and address of the receiving facility, and a copy sent to the appropriate EPA Regional Office at the addresses listed in 40 CFR 63.13.

(3) A facility where your remediation material will be managed according to all applicable requirements under this Subpart.

(i) You must prepare and include a notice with each shipment or transport of remediation material from your site. This notice must state that the remediation material contains organic HAP that are to be treated according to the provisions of this subpart. When the transport is continuous or ongoing (for example, discharge to a publicly owned treatment works), the notice must be submitted to the receiving facility owner or operator initially and whenever there is a change in the required treatment.

(ii) You may not transfer the remediation material unless the owner or operator of the facility receiving your remediation material has submitted to the EPA a written certification that he or she will manage remediation material received from you according to the requirements of §§63.7885 through 63.7957. The receiving facility owner or operator may revoke the written certification by sending a written statement to the EPA and to you providing at least 90 days notice that they rescind acceptance of responsibility for compliance with the regulatory provisions listed in this section. Upon expiration of the notice period, you may not transfer your remediation material to the facility.

(iii) By providing the written certification to the EPA, the receiving facility owner or operator accepts responsibility for compliance with the regulatory provisions listed in paragraph (b)(3) of this section with respect to any shipment of remediation material covered by the written certification. Failure to abide by any of those provisions with respect to such shipments may result in enforcement action by the EPA against the certifying entity according to the enforcement provisions applicable to violations of these provisions by owners or operators of sources.

(iv) Written certifications and revocation statements to the EPA from the receiving facility owner or operator must be signed by the responsible official of the receiving facility, provide the name and address of the receiving facility, and a copy sent to the appropriate EPA Regional Office at the addresses listed in 40 CFR 63.13. Such written certifications are not transferable.

(c) Acceptance by a facility owner or operator of remediation material from a site remediation subject to this Subpart does not, by itself, require the facility owner or operator to obtain a title V permit under 40 CFR 70.3 or 40 CFR 71.3.
§ 63.7937 How do I demonstrate initial compliance with the general standards?

(a) You must demonstrate initial compliance with the general standards in §§63.7884 through 63.7887 that apply to your affected sources by meeting the requirements in paragraphs (b) through (d) of this section, as applicable to you.

(b) You must demonstrate initial compliance with the general standards in §63.7885 that apply to your affected process vents by meeting the requirements in paragraphs (b)(1) through (4) of this section, as applicable to your process vents.

(1) If HAP emissions are controlled from the affected process vents according to the emission limitations and work practice standards specified in §63.7885(b)(1), you have met the initial compliance requirements in §63.7891.

(2) If the remediation material treated or managed by the process vented through the affected process vents has an average total VOHAP less than 10 ppmw according to §63.7885(b)(2), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have determined, according to the procedures §63.7943, and recorded the average VOHAP concentration of the remediation material placed in the affected remediation material management unit.

(3) If HAP emissions are controlled from the affected process vents to meet standards in another subpart under 40 CFR part 61 or 40 CFR part 63 according to §63.7885(b)(3), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(3)(i) and (ii) of this section.

(i) You include in your statement the citations for the specific emission limitations and work practice standards that apply to the process vents under the subpart in 40 CFR part 61 or 40 CFR part 63 that the vents are also subject.

(ii) You are complying with all applicable emissions limitations and work practice standards specified by the applicable subpart.

(4) For each process vent exempted according to §63.7885(c), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (b)(4)(i) and (ii) of this section.

(i) You identify in your statement each process vent that qualifies for an exemption and the exemption conditions in §63.7885(c)(1)(i) or (ii) that apply to each exempted process vent.

(ii) You have performed the measurements and prepared the documentation required in §63.7885(c)(2) that demonstrates that each exempted process vent stream meets the applicable exemption conditions in §63.7885(c)(1).

(c) You must demonstrate initial compliance with the general standards in §63.7886 that apply to your affected remediation material management units by meeting the requirements in paragraphs (c)(1) through (6) of this section, as applicable to your remediation material management units.

(1) If the remediation material management unit uses air pollution controls according to the standards specified in §63.7886(b)(1), you have met the initial compliance requirements applicable to the remediation material management unit in §§63.7896, 63.7901, 63.7906, 63.7911, or 63.7816.

(2) If the remediation material managed in the affected remediation material management unit has an average total VOHAP concentration less than 500 ppmw according to §63.7886(b)(2), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have determined, according to the procedures in §63.7943, and recorded the average VOHAP concentration of the remediation material placed in the affected remediation material management unit.

(3) If HAP emissions are controlled from the affected remediation material management units to meet standards in another subpart under 40 CFR part 61 or 40 CFR part 63 according to §63.7886(b)(3), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(3)(i) and (ii) of this section.
(i) You include in your statement the citations for the specific emission limitations and work practice standards that apply to the remediation material management units under the subpart in 40 CFR part 61 or 40 CFR part 63 that the units are also subject.

(ii) You are complying with all applicable emissions limitations and work practice standards specified by the applicable subpart.

(4) If HAP emissions are controlled from the affected remediation material management unit that is an open tank or surface impoundment used for a biological treatment process according to §63.7886(b)(4), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(4)(i) and (ii) of this section.

(i) You have performed the measurements and prepared the documentation required in §63.7886(b)(4)(i) that demonstrates that each unit meets the applicable performance levels.

(ii) You will monitor the biological treatment process conducted in each unit according to the requirements in §63.684(e)(4).

(5) For each remediation material management unit used for cleanup of radioactive mixed waste and exempted according to §63.7886(c), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(5)(i) and (ii) of this section.

(i) You include in your statement the citations for the specific requirements that apply to the remediation material management units under regulations, directives, and other requirements under the Atomic Energy Act, the Nuclear Waste Policy Act, or the Waste Isolation Pilot Plant Land Withdrawal Act.

(ii) You are complying with all requirements that apply to the remediation material management units under the applicable regulations or directives.

(6) For each remediation material management unit exempted according to §63.7886(d), you have submitted as part of your notification of compliance status, specified in §63.7950, a signed statement that you have met the requirements in paragraphs (c)(6)(i) and (ii) of this section.

(i) You have designated according to the requirements in §63.7886(d)(1) each of the remediation material management units you are selecting to be exempted.

(ii) You have performed an initial determination and prepared the documentation required in §63.7886(d)(2) that demonstrates that the total annual HAP quantity (based on the HAP listed in Table 1 of this subpart) in the remediation material placed in all of the designated exempted remediation material management units will be less than 1 Mg/yr.

(d) You must demonstrate initial compliance with the general standards in §63.7887 that apply to your affected equipment leak sources by meeting the requirements in §63.7921.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]

§ 63.7938 How do I demonstrate continuous compliance with the general standards?

(a) You must demonstrate continuous compliance with the general standards in §§63.7884 through 63.7887 that apply to your affected sources by meeting the requirements in paragraphs (b) through (d) of this section, as applicable to you.

(b) You have demonstrated continuous compliance with the general standards in §63.7885 that apply to your affected process vents by meeting the requirements in paragraphs (b)(1) through (4) of this section, as applicable to your process vents.

(1) If HAP emissions are controlled from the affected process vents according to the emission limitations and work practice standards specified in §63.7885(b)(1), you must demonstrate continuous compliance by meeting the requirements in §63.7893.
(2) If the remediation material treated or managed by the process vented through the affected process vents has an average total VOHAP less than 10 ppmw according to §63.7885(c)(1), you must demonstrate continuous compliance by performing a new determination and preparing new documentation as required in §63.7885(c)(2) to show that the total VOHAP concentration of the remediation material remains less than 10 ppmw.

(3) If HAP emissions are controlled from the affected process vents to meet standards in another subpart under 40 CFR part 61 or 40 CFR part 63 according to §63.7885(b)(3), you must demonstrate continuous compliance by complying with all applicable emissions limitations and work practice standards specified by the applicable subpart.

(4) For each process vent exempted according to §63.7885(c), you must demonstrate continuous compliance by performing new measurements and preparing new documentation as required in §63.7885(c)(2) that demonstrates that each exempted process vent stream meets the applicable exemption conditions in §63.7885(c)(1).

(c) You must demonstrate continuous compliance with the general standards in §63.7886 that apply to your affected remediation material management units by meeting the requirements in paragraphs (c)(1) through (6) of this section, as applicable to your remediation material management units.

(1) If the remediation material management unit uses air pollution controls according to the standards specified in §63.7886(b)(1), you must demonstrate continuous compliance by meeting the requirements applicable to the remediation material management unit in §§63.7898, 63.7903, 63.7908, 63.7913, or 63.7818.

(2) If the remediation material managed in the affected remediation material management has an average total VOHAP concentration less than 500 ppmw according to §63.7886(b)(2), you must demonstrate continuous compliance by performing a new determination and preparing new documentation as required in §63.7886(c)(2) to show that the total VOHAP concentration of the remediation material remains less than 500 ppmw.

(3) If HAP emissions are controlled from the affected remediation material management units to meet standards in another subpart under 40 CFR part 61 or 40 CFR part 63 according to §63.7886(b)(3), you must demonstrate continuous compliance by meeting all applicable emissions limitations and work practice standards specified by the applicable subpart.

(4) If HAP emissions are controlled from the affected remediation material management unit that is an open tank or surface impoundment used for a biological treatment process according to §63.7886(b)(4), you must demonstrate continuous compliance by meeting the requirements in paragraphs (c)(4)(i) and (ii) of this section.

(i) Performing new measurements and preparing new documentation as required in §63.7886(4)(i) that demonstrates that each unit meets the applicable performance levels.

(ii) Monitoring the biological treatment process conducted in each unit according to the requirements in §63.7886(4)(i).

(5) For each remediation material management unit used for cleanup of radioactive mixed waste and exempted according to §63.7886(c), you must demonstrate continuous compliance by meeting all requirements that apply to the remediation material management units under the applicable regulations or directives.

(6) For each remediation material management unit exempted according to §63.7886(d), you must demonstrate continuous compliance by performing new measurements and preparing new documentation as required in §63.7886(d)(2) to show that the total annual HAP quantity (based on the HAP listed in Table 1 of this subpart) in the remediation material placed in all of the designated exempted remediation material management units remains less than 1 Mg/yr.

(d) You have demonstrated continuous compliance with the general standards in §63.7887 that apply to your affected equipment leak sources by meeting the requirements in §63.7923.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69018, Nov. 29, 2006]
Performance Tests

§ 63.7940  By what date must I conduct performance tests or other initial compliance demonstrations?

(a) You must conduct a performance test or design evaluation for each existing affected source within 180 calendar days after the compliance date that is specified in §63.7883.

(b) For each work practice standard that applies to you where initial compliance is not demonstrated using a performance test or design evaluation, you must demonstrate initial compliance within 30 calendar days after the compliance date that is specified in §63.7883 for your affected source.

(c) For new sources, you must conduct initial performance tests and other initial compliance demonstrations according to the provisions in §63.7(a)(2).

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69019, Nov. 29, 2006]

§ 63.7941  How do I conduct a performance test, design evaluation, or other type of initial compliance demonstration?

(a) You must conduct a performance test or design evaluation to demonstrate initial compliance for each new or existing affected source that is subject to an emission limit in this subpart. You must report the results of the performance test or design evaluation according to the requirements in §63.7950(e)(1).

(b) If you choose to conduct a performance test to demonstrate initial compliance, you must conduct the test according to the requirements in §63.7(e)(1) and paragraphs (b) (1) through (5) of this section.

(1) You must conduct three separate test runs for each performance test required in this section, as specified in §63.7(e)(3). Each test run must last at least 1 hour.

(2) You may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in §63.7(e)(1).

(3) You must conduct each performance test using the test methods and procedures in §63.694(l).

(4) Follow the procedures in paragraphs (b)(4)(i) through (iii) of this section to determine compliance with the facility-wide total organic mass emissions rate in §63.7890(a)(1)(i).

(i) Determine compliance with the total organic mass flow rate using Equation 1 of this section as follows:

\[ E_h = \left( 0.0416 \times 10^{-6} \right) Q_{sd} \sum_{i=1}^{n} \left( C_i \times MW_i \right) \]  (Eq. 1)

Where:

- \( E_h \) = Total organic mass flow rate, kg/h;
- \( Q_{sd} \) = Volumetric flow rate of gases entering or exiting control device (or exiting the process vent if no control device is used), as determined by Method 2 of 40 CFR part 60, appendix A, dscm/h;
- \( n \) = Number of organic compounds in the vent gas;
- \( C_i \) = Organic concentration in ppm, dry basis, of compound i in the vent gas, as determined by Method 18 of 40 CFR part 60, appendix A;
- \( MW_i \) = Molecular weight of organic compound i in the vent gas, kg/kg-mol;

(ii) Determine compliance with the annual total organic emissions rate using Equation 2 of this section as follows:

\[ E_A = E_h \times H \]  (Eq. 2)

Where:

- \( E_A \) = Total organic mass emissions rate, kilograms per year;
- \( E_h \) = Total organic mass flow rate for the process vent, kg/h;
H = Total annual hours of operation for the affected unit, h.

(iii) Determine compliance with the total organic emissions limit from all affected process vents at the facility by summing the total hourly organic mass emissions rates ($E_i$, as determined in Equation 1 of this section) and summing the total annual organic mass emissions rates ($E_A$, as determined in Equation 2 of this section) for all affected process vents at the facility.

(5) Determine compliance with the 95 percent reduction limit in §63.7890(a)(2)(i) for the combination of all affected process vents at the facility using Equations 3 and 4 of this section to calculate control device inlet and outlet concentrations and Equation 5 of this section to calculate control device emission reductions for process vents as follows:

$$E_i = K_2 \left( \sum_{j=1}^{n} C_{ij} M_{ij} \right) Q_i \quad (Eq. \ 3)$$

$$E_o = K_2 \left( \sum_{j=1}^{n} C_{oj} M_{oj} \right) Q_o \quad (Eq. \ 4)$$

Where:

$C_{ij}, C_{oj}$ = Concentration of sample component j of the gas stream at the inlet and outlet of the control device, dry basis, parts per million by volume. For uncontrolled vents, $C_{ij} = C_{oj}$ and equal the concentration exiting the vent;

$E_i, E_o$ = Mass rate of total organic compounds (TOC) (minus methane and ethane) or total HAP, from Table 1 of this subpart, at the inlet and outlet of the control device, respectively, dry basis, kilogram per hour. For uncontrolled vents, $E_i = E_o$ and equal the concentration exiting the vent;

$M_{ij}, M_{oj}$ = Molecular weight of sample component j of the gas stream at the inlet and outlet of the control device, respectively, gram/gram-mole. For uncontrolled vents, $M_{ij} = M_{oj}$ and equal the gas stream molecular weight exiting the vent;

$Q_i, Q_o$ = Flowrate of gas stream at the inlet and outlet of the control device, respectively, dry standard cubic meters per minute (dscm/min). For uncontrolled vents, $Q_i = Q_o$ and equals the flowrate exiting the vent;

$K_2$ = Constant, $2.494 \times 10^{-6}$ (parts per million)$^{-1}$ (gram-mole per standard cubic meter)(kilogram/gram)(minute/hour, where standard temperature (gram-mole per standard cubic meter) is 20 °C);

$n$ = the number of components in the sample.

$$R_v = \sum_{j=1}^{n} \frac{E_i - E_o}{E_i} \times 100 \quad (Eq. \ 5)$$

Where:

$R_v$ = Overall emissions reduction for all affected process vents, percent

$E_i$ = Mass rate of TOC (minus methane and ethane) or total HAP, from Table 1 of this subpart, at the inlet to the control device, or exiting the vent for uncontrolled vents, as calculated in this section, kilograms TOC per hour or kilograms HAP per hour;

$E_o$ = Mass rate of TOC (minus methane and ethane) or total HAP, from Table 1 of this subpart, at the outlet to the control device, or exiting the vent for uncontrolled vents, as calculated in this section, kilograms TOC per hour or kilograms HAP per hour. For vents without a control device, $E_o = E_i$;

$n$ = number of affected source process vents.
(c) If you use a carbon adsorption system, condenser, vapor incinerator, boiler, or process heater to meet an emission limit in this subpart, you may choose to perform a design evaluation to demonstrate initial compliance instead of a performance test. You must perform a design evaluation according to the general requirements in §63.693(b)(8) and the specific requirements in §63.693(d)(2)(ii) for a carbon adsorption system (including establishing carbon replacement schedules and associated requirements), §63.693(e)(2)(ii) for a condenser, §63.693(f)(2)(ii) for a vapor incinerator, or §63.693(g)(2)(i)(B) for a boiler or process heater.

(d) During the performance test or design evaluation, you must collect the appropriate operating parameter monitoring system data, average the operating parameter data over each test run, and set operating limits, whether a minimum or maximum value, based on the average of values for each of the three test runs. If you use a control device design analysis to demonstrate control device performance, then the minimum or maximum operating parameter value must be established based on the control device design analysis and supplemented, as necessary, by the control device manufacturer recommendations or other applicable information.

(e) If you control air emissions from an affected source by introducing the vent stream into the flame zone of a boiler or process heater according to the requirements in §63.693(g)(1)(iii), you must conduct a performance test or design evaluation to demonstrate that the boiler or process heater meets the applicable emission limit while operating at a residence time of 0.5 seconds or greater and at a combustion zone temperature of 760 °C or higher.

(f) You must conduct a performance evaluation for each continuous monitoring system according to the requirements in §63.8(e).

(g) If you are required to conduct a visual inspection of an affected source, you must conduct the inspection according to the procedures in §63.906(a)(1) for Tank Level 1 controls, §63.1063(d) for Tank Level 2 controls, §63.926(a) for Container Level 1 controls, §63.946(a) for a surface impoundment equipped with a floating membrane cover, §63.946(b) for a surface impoundment equipped with a cover and vented to a control device, §63.1047(a) for a separator with a fixed roof, §63.1047(c) for a separator equipped with a fixed roof and vented to a control device, §63.695(c)(1)(i) or (c)(2)(i) for a closed vent system, and §63.964(a) for individual drain systems.

(h) [Reserved]

(i) If you use Container Level 2 controls, you must conduct a test to demonstrate that the container operates with no detectable organic emissions or that the container is vapor-tight. You must conduct the test using Method 21 (40 CFR part 60, appendix A) and the procedures in §63.925(a) to demonstrate that the container operates with no detectable organic emissions or Method 27 (40 CFR part 60, appendix A) and the procedures in §63.925(b) to demonstrate that the container is vapor-tight.

(j) If you locate an affected source inside a permanent total enclosure that is vented to a control device, you must demonstrate that the enclosure meets the verification criteria in section 5 of Procedure T in 40 CFR 52.741, appendix B.

(k) If you use a fixed roof or a floating roof to control air emissions from a separator, you must conduct a test to demonstrate that the roof operates with no detectable organic emissions using Method 21 (40 CFR part 60, appendix A) and the procedures in §63.1046(a). If you use a floating roof, you also must measure the seal gaps according to the procedures in §63.1046(b).

(l) If you use a flare to control air emissions, you must conduct a visible emissions test using Method 22 in 40 CFR part 60, appendix A, and the procedures in §63.11(b)(4).

(m) For each initial compliance demonstration that requires a performance test or design evaluation, you must report the results in your notification of compliance status according to the requirements in §63.7950(e)(1). For each initial compliance demonstration that does not require a performance test or design evaluation, you must submit a notification of compliance status according to the requirements in §63.7950(e)(2).

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69019, Nov. 29, 2006]
§ 63.7942 When must I conduct subsequent performance tests?

For non-flare control devices, you must conduct performance tests at any time the EPA requires you to according to §63.7(3).

§ 63.7943 How do I determine the average VOHAP concentration of my remediation material?

(a) General requirements. You must determine the average total VOHAP concentration of a remediation material using either direct measurement as specified in paragraph (b) of this section or by knowledge as specified in paragraph (c) of this section. These methods may be used to determine the average VOHAP concentration of any material listed in (a)(1) through (3) of this section.

1. A single remediation material stream; or
2. Two or more remediation material streams that are combined prior to, or within, a remediation material management unit or treatment process; or
3. Remediation material that is combined with one or more non-remediation material streams prior to, or within, a remediation material management unit or treatment process.

(b) Direct measurement. To determine the average total VOHAP concentration of a remediation material using direct measurement, you must use the procedures in paragraphs (b)(1) through (3) of this section.

1. Sampling. Samples of each material stream must be collected from the container, pipeline, or other device used to deliver each material stream prior to entering the remediation material management unit or treatment process in a manner such that volatilization of organics contained in the sample is minimized and an adequately representative sample is collected and maintained for analysis by the selected method.

   (i) The averaging period to be used for determining the average total VOHAP concentration for the material stream on a mass-weighted average basis must be designated and recorded. The averaging period can represent any time interval that you determine is appropriate for the material stream but must not exceed 1 year. For streams that are combined, an averaging period representative for all streams must be selected.

   (ii) No less than four samples must be collected to represent the complete range of HAP compositions and HAP quantities that occur in each material stream during the entire averaging period due to normal variations in the material stream(s). Examples of such normal variations are variation of the HAP concentration within a contamination area.

   (iii) All samples must be collected and handled according to written procedures you prepare and document in a site sampling plan. This plan must describe the procedure by which representative samples of the material stream(s) are collected such that a minimum loss of organics occurs throughout the sample collection and handling process and by which sample integrity is maintained. A copy of the written sampling plan must be maintained on site in the facility operating records. An example of an acceptable sampling plan includes a plan incorporating sample collection and handling procedures according to the guidance found in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,” EPA Publication No. SW–846 or Method 25D in 40 CFR part 60, appendix A.

2. Analysis. Each collected sample must be prepared and analyzed according to either one of the methods listed in §63.694(b)(2)(ii), or any current EPA Contracts Lab Program method (or future revisions) capable of identifying all the HAP in Table 1 of this subpart.

3. Calculations. The average total VOHAP concentration (C) on a mass-weighted basis must be calculated by using the results for all samples analyzed according to paragraph (b)(2) of this section and Equation 1 of this section as follows:

   \[
   \bar{C} = \frac{1}{Q_T} \sum_{i=1}^{n} (Q_i \times C_i) \quad \text{[Eq. 1]}
   \]

Where:
C= Average VOHAP concentration of the material on a mass-weighted basis, ppmw.

i = Individual sample “i” of the material.

n = Total number of samples of the material collected (at least 4 per stream) for the averaging period (not to exceed 1 year).

Q_i = Mass quantity of material stream represented by C_i, kilograms per hour (kg/hr).

Q_T = Total mass quantity of all material during the averaging period, kg/hr.

C_i = Measured VOHAP concentration of sample “i” as determined according to the requirements of paragraph (b)(2) of this section, ppmw.

(c) Knowledge of the material. To determine the average total VOHAP concentration of a remediation material using knowledge, you must use the procedures in paragraphs (c)(1) through (3) of this section.

(1) Documentation must be prepared that presents the information used as the basis for your knowledge of the material stream's average VOHAP concentration. Examples of information that may be used as the basis for knowledge include: material balances for the source(s) generating each material stream; species-specific chemical test data for the material stream from previous testing that are still applicable to the current material stream; test data for material from the contamination area(s) being remediated.

(2) If test data are used as the basis for knowledge, then you must document the test method, sampling protocol, and the means by which sampling variability and analytical variability are accounted for in the determination of the average VOHAP concentration. For example, you may use HAP concentration test data for the material stream that are validated according to Method 301 in 40 CFR part 63, appendix A as the basis for knowledge of the material. This information must be provided for each material stream where streams are combined.

(3) If you use species-specific chemical concentration test data as the basis for knowledge of the material, you may adjust the test data to the corresponding average VOHAP concentration value which would be obtained had the material samples been analyzed using Method 305. To adjust these data, the measured concentration for each individual HAP chemical species contained in the material is multiplied by the appropriate species-specific adjustment factor (f_m305) listed in Table 1 of this subpart.

(d) In the event that you and us disagree on a determination using knowledge of the average total VOHAP concentration for a remediation material, then the results from a determination of VOHAP concentration using direct measurement by Method 305 in 40 CFR part 60 appendix A, as specified in paragraph (b) of this section, will be used to determine compliance with the applicable requirements of this subpart. We may perform or request that you perform this determination using direct measurement.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69019, Nov. 29, 2006]

§ 63.7944 How do I determine the maximum HAP vapor pressure of my remediation material?

(a) You must determine the maximum HAP vapor pressure of your remediation material using either direct measurement as specified in paragraph (b) of this section or by knowledge as specified in paragraph (c) of this section.

(b) Direct measurement to determine the maximum HAP vapor pressure.
(1) **Sampling.** A sufficient number of samples must be collected to be representative of the remediation material contained in the tank. All samples must be collected and handled according to written procedures prepared by you and documented in a site sampling plan. This plan must describe the procedure by which representative samples of the remediation material are collected such that a minimum loss of organics occurs throughout the sample collection and handling process and by which sample integrity is maintained. A copy of the written sampling plan must be maintained on site in the facility site operating records. An example of an acceptable sampling plan includes a plan incorporating sample collection and handling procedures according to the guidance found in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,” EPA Publication No. SW–846 or Method 25D in 40 CFR part 60, appendix A.

(2) Analysis. Any one of the following methods may be used to analyze the samples and compute the maximum HAP vapor pressure of the remediation material:

(i) Method 25E in 40 CFR part 60 appendix A;

(ii) Methods described in American Petroleum Institute Bulletin 2517, “Evaporation Loss from External Floating Roof Tanks,”;

(iii) Methods obtained from standard reference texts;

(iv) ASTM Method 2879–83; or

(v) Any other method approved by the Administrator.

(c) Use of knowledge to determine the maximum HAP vapor pressure. Documentation must be prepared and recorded that presents the information used as the basis for your knowledge that the maximum HAP vapor pressure of the remediation material is less than the maximum vapor pressure limit listed in Table 2 of this subpart for the applicable tank design capacity category.

(d) In the event that you and us disagree on a determination using knowledge of the maximum HAP vapor pressure of the remediation material, then the results from a determination of maximum HAP vapor pressure using direct measurement by Method 25E in 40 CFR part 60 appendix A, as specified in paragraph (b) of this section, will be used to determine compliance with the applicable requirements of this subpart. We may perform or request that you perform this determination using direct measurement.

Continuous Monitoring Systems

§ 63.7945 What are my monitoring installation, operation, and maintenance requirements?

(a) Each CPMS must meet the requirements in paragraphs (a)(1) through (4) of this section.

(1) Complete a minimum of one cycle of operation for each successive 15-minute period.

(2) To calculate a valid hourly value, you must have at least three of four equally spaced data values (or at least two, if that condition is included to allow for periodic calibration checks) for that hour from a CPMS that is not out of control according to the monitoring plan referenced in §63.7935.

(3) To calculate the average emissions for each averaging period, you must have at least 75 percent of the hourly averages for that period using only block hourly average values that are based on valid data (i.e., not from out-of-control periods).

(4) Unless otherwise specified, each CPMS must determine the hourly average of all recorded readings and daily average, if required.

(b) You must record the results of each inspection, calibration, and validation check.

(c) You must conduct a performance evaluation for each CPMS according to the requirements in §63.8(e) and your site-specific monitoring plan.

§ 63.7946 How do I monitor and collect data to demonstrate continuous compliance?

(a) You must monitor and collect data according to this section and your site-specific monitoring plan required in §63.7935.
§ 63.7947 What are my monitoring alternatives?

(a) As an alternative to the parametric monitoring required in this subpart, you may install, calibrate, and operate a continuous emission monitoring system (CEMS) to measure the control device outlet total organic emissions or organic HAP emissions concentration.

(1) The CEMS used on combustion control devices must include a diluent gas monitoring system (for O₂ or CO₂) with the pollutant monitoring system in order to correct for dilution (e.g., to 0 percent excess air).

(2) Each CEMS must complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period. Data must be reduced as specified in §63.8(g)(2).

(3) You must conduct a performance evaluation of the CEMS according to the requirements in §63.8 and Performance Specification 8 (for a total organic emissions CEMS) or Performance Specification 9 (for a HAP emissions CEMS) and Performance Specification 3 (for an O₂ or CO₂ CEMS) of 40 CFR part 60, appendix B. The relative accuracy provision of Performance Specification 8, sections 2.4 and 3 need not be conducted.

(4) You must prepare a site-specific monitoring plan for operating, calibrating, and verifying the operation of your CEMS according to the requirements in §§63.8(c), (d), and (e).

(5) You must establish the emissions concentration operating limit according to paragraphs (a)(5)(i) and (ii) of this section.

(i) During the performance test, you must monitor and record the total organic or HAP emissions concentration at least once every 15 minutes during each of the three test runs.

(ii) Use the data collected during the performance test to calculate and record the average total organic or HAP emissions concentration maintained during the performance test. The average total organic or HAP emissions concentration, corrected for dilution as appropriate, is the maximum operating limit for your control device.

(b) You must maintain the daily (24-hour) average total organic or HAP emissions concentration in the exhaust vent stream of the control device outlet less than or equal to the site-specific operating limit established during the performance test.

Notification, Reports, and Records

§ 63.7950 What notifications must I submit and when?

(a) You must submit all of the notifications in §§63.7(b) and (c), 63.8(e), 63.8(f)(4) and (6), and 63.9(b) through (h) that apply to you.

(b) As specified in §63.9(b)(2), if you start up your affected source before October 8, 2003, you must submit an Initial Notification not later than 120 calendar days after October 8, 2003.

(c) As specified in §63.9(b)(3), if you start up your new or reconstructed affected source on or after the effective date, you must submit an Initial Notification no later than 120 calendar days after initial startup.

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin as required in §63.7(b)(1).
(e) If you are required to conduct a performance test, design evaluation, or other initial compliance demonstration, you must submit a Notification of Compliance Status according to §63.9(h)(2)(ii).

(1) For each initial compliance demonstration that includes a performance test or design evaluation, you must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test according to §63.10(d)(2). You must submit the complete design evaluation and supporting documentation.

(2) For each initial compliance demonstration that does not include a performance test, you must submit the Notification of Compliance Status before the close of business on the 30th calendar day following the completion of the initial compliance demonstration.

(f) You must provide written notification to the Administrator of the alternative standard selected under §63.1006(b)(5) or (6) before implementing either of the provisions.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69019, Nov. 29, 2006]

§ 63.7951 What reports must I submit and when?

(a) Compliance report due dates. Unless the Administrator has approved a different schedule, you must submit a semiannual compliance report to your permitting authority according to the requirements specified in paragraphs (a)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.7883 and ending on June 30 or December 31, whichever date comes first after the compliance date that is specified for your affected source.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after your first compliance report is due.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of the dates specified in paragraphs (a)(1) through (4) of this section.

(b) Compliance report contents. Each compliance report must include the information specified in paragraphs (b)(1) through (3) of this section and, as applicable, paragraphs (b)(4) through (9) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a startup, shutdown, or malfunction during the reporting period and you took action consistent with your startup, shutdown, and malfunction plan, the compliance report must include the information in §63.10(d)(5)(i).

(5) If there were no deviations from any emissions limitations (including operating limit), work practice standards, or operation and maintenance requirements, a statement that there were no deviations from the emissions limitations, work practice standards, or operation and maintenance requirements during the reporting period.

(6) If there were no periods during which a continuous monitoring system (including a CPMS or CEMS) was out-of-control as specified by §63.8(c)(7), a statement that there were no periods during which the CPMS was out-of-control during the reporting period.
(7) For each deviation from an emissions limitation (including an operating limit) that occurs at an affected source for which you are not using a continuous monitoring system (including a CPMS or CEMS) to comply with an emissions limitation or work practice standard required in this subpart, the compliance report must contain the information specified in paragraphs (b)(1) through (4) and (b)(7)(i) and (ii) of this section. This requirement includes periods of startup, shutdown, and malfunction.

(i) The total operating time of each affected source during the reporting period.

(ii) Information on the number, duration, and cause of deviations (including unknown cause) as applicable and the corrective action taken.

(8) For each deviation from an emissions limitation (including an operating limit) or work practice standard occurring at an affected source where you are using a continuous monitoring system (including a CPMS or CEMS) to comply with the emissions limitations or work practice standard in this subpart, you must include the information specified in paragraphs (b)(1) through (4) and (b)(8)(i) through (xi) of this section. This requirement includes periods of startup, shutdown, and malfunction.

(i) The date and time that each malfunction started and stopped.

(ii) The date and time that each continuous monitoring system was inoperative, except for zero (low-level) and high-level checks.

(iii) The date, time, and duration that each continuous monitoring system was out-of-control, including the information in §63.8(c)(8).

(iv) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

(v) A summary of the total duration of the deviations during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

(vi) A breakdown of the total duration of the deviations during the reporting period into those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and unknown causes.

(vii) A summary of the total duration of continuous monitoring system downtime during the reporting period and the total duration of continuous monitoring system downtime as a percent of the total source operating time during the reporting period.

(viii) A brief description of the process units.

(ix) A brief description of the continuous monitoring system.

(x) The date of the latest continuous monitoring system certification or audit.

(xi) A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

(9) You must include the information on equipment leaks required in periodic reports by §63.1018(a) or §63.1039(b).

(c) Immediate startup, shutdown, and malfunction report. If you had a startup, shutdown, or malfunction during the semiannual reporting period that was not consistent with your startup, shutdown, and malfunction plan, you must submit an immediate startup, shutdown, and malfunction report according to the requirements of §63.10(d)(5)(ii).
Part 70 monitoring report. If you have obtained a title V operating permit for an affected source pursuant to 40 CFR part 70 or 40 CFR part 71, you must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If you submit a compliance report for an affected source along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report includes all the required information concerning deviations from any emissions limitation or operation and maintenance requirement in this subpart, submission of the compliance report satisfies any obligation to report the same deviations in the semiannual monitoring report. However, submission of a compliance report does not otherwise affect any obligation you may have to report deviations from permit requirements for an affected source to your permitting authority.

§ 63.7952 What records must I keep?

(a) You must keep the records specified in paragraphs (a)(1) through (4) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirements in §63.10(b)(1) and (b)(2)(xiv).

(2) The records in §63.6(e)(3)(iii) through (v) related to startups, shutdowns, and malfunctions.

(3) Results of performance tests and performance evaluations as required by §63.10(b)(2)(viii).

(4) The records of initial and ongoing determinations for affected sources that are exempt from control requirements under this subpart.

(b) For each continuous monitoring system, you must keep the records as described in paragraphs (b)(1) and (2) of this section.

(1) Records described in §63.10(b)(2)(vi) through (xi) that apply to your continuous monitoring system.

(2) Performance evaluation plans, including previous (i.e., superseded) versions of the plan as required in §63.8(d)(3).

(c) You must keep the records required by this subpart to show continuous compliance with each emissions limitation, work practice standard, and operation and maintenance requirement that applies to you.

(d) You must record, on a semiannual basis, the information in §63.696(g) for planned routine maintenance of a control device for emissions from process vents.

§ 63.7953 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious review, according to §63.10(b)(1).

(b) As specified in §63.10(b)(1), you must keep your files of all information (including all reports and notifications) for 5 years following the date of each occurrence, measurement, maintenance, action taken to correct the cause of a deviation, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1). You can keep the records off-site for the remaining 3 years.

(d) If, after the remediation activity is completed, there is no other remediation activity at the facility, and you are no longer the owner of the facility, you may keep all records for the completed remediation activity at an off-site location provided you notify the Administrator in writing of the name, address and contact person for the off-site location.

Other Requirements and Information

§ 63.7955 What parts of the General Provisions apply to me?

Table 3 of this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you.
§ 63.7956 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the EPA, or a delegated authority such as your State, local, or tribal agency. If the EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency, in addition to the EPA, has the authority to implement and enforce this subpart. You should contact your EPA Regional Office (see list in §63.13) to find out if this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under section 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that cannot be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the non-opacity emissions limitations and work practice standards in this subpart under §63.6(g).

(2) Approval of major changes to test methods under §63.7(e)(2)(ii) and (f) and as defined in §63.90.

(3) Approval of major changes to monitoring under §63.8(f) and as defined in §63.90.

(4) Approval of major changes to recordkeeping and reporting under §63.10(f) and as defined in §63.90.

[68 FR 58190, Oct. 8, 2003, as amended at 71 FR 69019, Nov. 29, 2006]

§ 63.7957 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in §63.2, and in this section. If a term is defined both in this section and in another subpart cross-referenced by this subpart, then the term will have the meaning given in this section for purposes of this subpart.

**Boiler** means an enclosed combustion device that extracts useful energy in the form of steam and is not an incinerator or a process heater.

**Closed vent system** means a system that is not open to the atmosphere and is composed of hard-piping, ductwork, connections, and, if necessary, fans, blowers, or other flow-inducing device that conveys gas or vapor from an emissions point to a control device.

**Closure device** means a cap, hatch, lid, plug, seal, valve, or other type of fitting that prevents or reduces air pollutant emissions to the atmosphere by blocking an opening in a cover when the device is secured in the closed position. Closure devices include devices that are detachable from the cover (e.g., a sampling port cap), manually operated (e.g., a hinged access lid or hatch), or automatically operated (e.g., a spring-loaded pressure relief valve).

**Container** means a portable unit used to hold material. Examples of containers include, but are not limited to drums, dumpsters, roll-off boxes, bulk cargo containers commonly known as portable tanks or totes, cargo tank trucks, dump trucks, and rail cars. For the purpose of this subpart, a front-end loader, excavator, backhoe, or other type of self-propelled excavation equipment is not a container.

**Continuous record** means documentation of data values measured at least once every 15 minutes and recorded at the frequency specified in this subpart.

**Continuous recorder** means a data recording device that either records an instantaneous data value at least once every 15 minutes or records 15-minutes or more frequent block averages.

**Control device** means equipment used recovering, removing, oxidizing, or destroying organic vapors. Examples of such equipment include but are not limited to carbon adsorbers, condensers, vapor incinerators, flares, boilers, and process heaters.
Cover means a device that prevents or reduces air pollutant emissions to the atmosphere by forming a continuous barrier over the remediation material managed in a unit. A cover may have openings (such as access hatches, sampling ports, gauge wells) that are necessary for operation, inspection, maintenance, and repair of the unit on which the cover is used. A cover may be a separate piece of equipment which can be detached and removed from the unit (such as a tarp) or a cover may be formed by structural features permanently integrated into the design of the unit.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emissions limitation (including any operating limit), or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emissions limitation, (including any operating limit), or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Emissions limitation means any emissions limit, opacity limit, operating limit, or visible emissions limit.

Emissions point means an individual tank, surface impoundment, container, oil-water, organic-water separator, transfer system, vent, or enclosure.

Enclosure means a structure that surrounds a tank or container, captures organic vapors emitted from the tank or container, and vents the captured vapor through a closed vent system to a control device.

Equipment means each pump, pressure relief device, sampling connection system, valve, and connector used in remediation material service at a facility.

External floating roof means a pontoon-type or double-deck type cover that rests on the liquid surface in a tank with no fixed roof.

Facility means all contiguous or adjoining property that is under common control including properties that are separated only by a road or other public right-of-way. Common control includes properties that are owned, leased, or operated by the same entity, parent entity, subsidiary, or any combination thereof. A unit or group of units within a contiguous property that are not under common control (e.g., a wastewater treatment unit located at the facility but is owned by a different company) is a different facility.

Fixed roof means a cover that is mounted on a unit in a stationary position and does not move with fluctuations in the level of the liquid managed in the unit.

Flame zone means the portion of the combustion chamber in a boiler or process heater occupied by the flame envelope.

Floating roof means a cover consisting of a double deck, pontoon single deck, or internal floating cover which rests upon and is supported by the liquid being contained, and is equipped with a continuous seal.

Flow indicator means a device that indicates whether gas is flowing, or whether the valve position would allow gas to flow in a bypass line.

Hard-piping means pipe or tubing that is manufactured and properly installed according to relevant standards and good engineering practices.
**Individual drain system** means a stationary system used to convey wastewater streams or residuals to a remediation material management unit or to discharge or disposal. The term includes hard-piping, all drains and junction boxes, together with their associated sewer lines and other junction boxes (e.g., manholes, sumps, and lift stations) conveying wastewater streams or residuals. For the purpose of this subpart, an individual drain system is not a drain and collection system that is designed and operated for the sole purpose of collecting rainfall runoff (e.g., stormwater sewer system) and is segregated from all other individual drain systems.

**Internal floating roof** means a cover that rests or floats on the liquid surface (but not necessarily in complete contact with it inside a tank that has a fixed roof).

**Maximum HAP vapor pressure** means the sum of the individual HAP equilibrium partial pressure exerted by remediation material at the temperature equal to either: the monthly average temperature as reported by the National Weather Service when the remediation material is stored or treated at ambient temperature; or the highest calendar-month average temperature of the remediation material when the remediation material is stored at temperatures above the ambient temperature or when the remediation material is stored or treated at temperatures below the ambient temperature. For the purpose of this subpart, maximum HAP vapor pressure is determined using the procedures specified in §63.7944.

**No detectable organic emissions** means no escape of organics to the atmosphere as determined using the procedure specified in §63.694(k).

**Oil-water separator** means a separator as defined for this subpart that is used to separate oil from water.

**Operating parameter value** means a minimum or maximum value established for a control device or treatment process parameter which, if achieved by itself or in combination with one or more other operating parameter values, determines that an owner or operator has complied with an applicable emissions limitation or standard.

**Organic-water separator** means a separator as defined for this subpart that is used to separate organics from water.

**Process heater** means an enclosed combustion device that transfers heat released by burning fuel directly to process streams or to heat transfer liquids other than water.

**Process vent** means any open-ended pipe, stack, duct, or other opening intended to allow the passage of gases, vapors, or fumes to the atmosphere and this passage is caused by mechanical means (such as compressors, vacuum-producing systems or fans) or by process-related means (such as volatilization produced by heating). For the purposes of this subpart, a process vent is neither a safety device (as defined in this section) nor a stack, duct or other opening used to exhaust combustion products from a boiler, furnace, heater, incinerator, or other combustion device.

**Radioactive mixed waste** means a material that contains both hazardous waste subject to RCRA and source, special nuclear, or by-product material subject to the Atomic Energy Act of 1954.

**Remediation material** means a material that contains one or more of the HAP listed in Table 1 of this subpart, and this material is one of the following:

1. A material found in naturally occurring media such as soil, groundwater, surface water, sediments, or a mixture of such materials with liquids, sludges, or solids which is inseparable by simple mechanical removal processes and is made up primarily of media. This material does not include debris as defined in 40 CFR 268.2.
(2) A material found in intact or substantially intact containers, tanks, storage piles, or other storage units that requires clean up because this material poses a reasonable potential threat to contaminating media. Examples of these materials include, but are not limited to, solvents, oils, paints, and other volatile or semi-volatile organic liquids found in buried drums, cans, or other containers; gasoline, fuel oil, or other fuels in leaking underground storage tanks; and solid materials containing volatile or semi-volatile organics in unused or abandoned piles. Remediation material is not a waste or residue generated by routine equipment maintenance activities performed at a facility such as, but not limited to, tank bottoms and sludges removed during tank cleanouts; sludges and sediments removed from active wastewater treatment tanks, surface impoundments, or lagoons; spent catalyst removed from process equipment; residues removed from air pollution control equipment; and debris removed during heat exchanger and pipeline cleanouts.

Remediation material management unit means a tank, container, surface impoundment, oil-water separator, organic-water separator, or transfer system used to remove, destroy, degrade, transform, immobilize, or otherwise manage remediation material.

Remediation material service means any time when a pump, compressor, agitator, pressure relief device, sampling connection system, open-ended valve or line, valve, connector, or instrumentation system contains or contacts remediation material.

Responsible official means responsible official as defined in 40 CFR 70.2.

Safety device means a closure device such as a pressure relief valve, frangible disc, fusible plug, or any other type of device which functions to prevent physical damage or permanent deformation to equipment by venting gases or vapors during unsafe conditions resulting from an unplanned, accidental, or emergency event. For the purpose of this Subpart, a safety device is not used for routine venting of gases or vapors from the vapor headspace underneath a cover such as during filling of the unit or to adjust the pressure in this vapor headspace in response to normal daily diurnal ambient temperature fluctuations. A safety device is designed to remain in a closed position during normal operations and open only when the internal pressure, or another relevant parameter, exceeds the device threshold setting applicable to the equipment as determined by the owner or operator based on manufacturer recommendations, applicable regulations, fire protection and prevention codes, standard engineering codes and practices, or other requirements for the safe handling of flammable, combustible, explosive, reactive, or hazardous materials.

Separator means a remediation material management unit, generally a tank, used to separate oil or organics from water. A separator consists of not only the separation unit but also the forebay and other separator basins, skimmers, weirs, grit chambers, sludge hoppers, and bar screens that are located directly after the individual drain system and prior to any additional treatment units such as an air flotation unit clarifier or biological treatment unit. Examples of a separator include, but are not limited to, an API separator, parallel-plate interceptor, and corrugated-plate interceptor with the associated ancillary equipment.

Site remediation means one or more activities or processes used to remove, destroy, degrade, transform, immobilize, or otherwise manage remediation material. The monitoring or measuring of contamination levels in environmental media using wells or by sampling is not considered to be a site remediation.

Sludge means sludge as defined in §260.10 of this chapter.

Soil means unconsolidated earth material composing the superficial geologic strata (material overlying bedrock), consisting of clay, silt, sand, or gravel size particles (sizes as classified by the U.S. Soil Conservation Service), or a mixture of such materials with liquids, sludges, or solids which is inseparable by simple mechanical removal processes and is made up primarily of soil.
Stabilization process means any physical or chemical process used to either reduce the mobility of contaminants in media or eliminate free liquids as determined by Test Method 9095—Paint Filter Liquids Test in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,” EPA Publication No. SW–846, Third Edition, September 1986, as amended by Update I, November 15, 1992. (As an alternative, you may use any more recent, updated version of Method 9095 approved by the EPA). A stabilization process includes mixing remediation material with binders or other materials, and curing the resulting remediation material and binder mixture. Other synonymous terms used to refer to this process are fixation or solidification. A stabilization process does not include the adding of absorbent materials to the surface of remediation material, without mixing, agitation, or subsequent curing, to absorb free liquid.

Surface impoundment means a unit that is a natural topographical depression, man-made excavation, or diked area formed primarily of earthen materials (although it may be lined with man-made materials), which is designed to hold an accumulation of liquids. Examples of surface impoundments include holding, storage, settling, and aeration pits, ponds, and lagoons.

Tank means a stationary unit that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support and is designed to hold an accumulation of liquids or other materials.

Temperature monitoring device means a piece of equipment used to monitor temperature and having an accuracy of ±1 percent of the temperature being monitored expressed in degrees Celsius (°C) or ±1.2 degrees °C, whichever value is greater.

Transfer system means a stationary system for which the predominant function is to convey liquids or solid materials from one point to another point within a waste management operation or recovery operation. For the purpose of this subpart, the conveyance of material using a container (as defined for this subpart) or a self-propelled vehicle (e.g., a front-end loader) is not a transfer system. Examples of a transfer system include but are not limited to a pipeline, an individual drain system, a gravity-operated conveyor (such as a chute), and a mechanically-powered conveyor (such as a belt or screw conveyor).

Treatment process means a process in which remediation material is physically, chemically, thermally, or biologically treated to destroy, degrade, or remove hazardous air pollutants contained in the material. A treatment process can be composed of a single unit (e.g., a steam stripper) or a series of units (e.g., a wastewater treatment system). A treatment process can be used to treat one or more remediation material streams at the same time.

Volatile organic hazardous air pollutant (VOHAP) concentration means the fraction by weight of the HAP listed in Table 1 of this subpart that are contained in the remediation material as measured using Method 305, 40 CFR part 63, appendix A and expressed in terms of parts per million (ppm). As an alternative to using Method 305, 40 CFR part 63, appendix A, you may determine the HAP concentration of the remediation material using any one of the other test methods specified in §63.694(b)(2)(ii). When a test method specified in §63.694(b)(2)(ii) other than Method 305 in 40 CFR part 63, appendix A is used to determine the speciated HAP concentration of the contaminated material, the individual compound concentration may be adjusted by the corresponding $f_{\text{m305}}$ listed in Table 1 of this subpart to determine a VOHAP concentration.

Work practice standard means any design, equipment, work practice, or operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the CAA.

Notes:

- **Fm305**: Fraction measure factor in Method 305, 40 CFR 305 part 63, appendix A.
- **a**: CAS numbers refer to the Chemical Abstracts Services registry number assigned to specific compounds, isomers, or mixtures of compounds.
- **b**: Denotes a HAP that hydrolyzes quickly in water, but the hydrolysis products are also HAP chemicals.
- **c**: Denotes a HAP that may react violently with water.
Denotes a HAP that hydrolyzes slowly in water.

The $F_{\text{m305}}$ factors for some of the more common glycol 305 ethers can be obtained by contacting the Waste and Chemical Processes Group, Office of Air Quality Planning and Standards, Research Triangle Park, NC 27711.

</table>

(a) The affected facility to which this subpart applies is each steam generating unit that commences construction, modification, or reconstruction after June 19, 1984, and that has a heat input capacity from fuels combusted in the steam generating unit of greater than 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/hr)).

(b) Any affected facility meeting the applicability requirements under paragraph (a) of this section and commencing construction, modification, or reconstruction after June 19, 1984, but on or before June 19, 1986, is subject to the following standards:

(1) Coal-fired affected facilities having a heat input capacity between 29 and 73 MW (100 and 250 MMBtu/hr), inclusive, are subject to the particulate matter (PM) and nitrogen oxides (NOX) standards under this subpart.

(2) Coal-fired affected facilities having a heat input capacity greater than 73 MW (250 MMBtu/hr) and meeting the applicability requirements under subpart D (Standards of performance for fossil-fuel-fired steam generators; §60.40) are subject to the PM and NOx standards under this subpart and to the sulfur dioxide (SO2) standards under subpart D (§60.43).

(3) Oil-fired affected facilities having a heat input capacity between 29 and 73 MW (100 and 250 MMBtu/hr), inclusive, are subject to the NOX standards under this subpart.

(4) Oil-fired affected facilities having a heat input capacity greater than 73 MW (250 MMBtu/hr) and meeting the applicability requirements under subpart D (Standards of performance for fossil-fuel-fired steam generators; §60.40) are also subject to the NOX standards under this subpart and the PM and SO2 standards under subpart D (§60.42 and §60.43).

(c) Affected facilities that also meet the applicability requirements under subpart J (Standards of performance for petroleum refineries; §60.104) are subject to the PM and NOX standards under this subpart and the SO2 standards under subpart J (§60.104).

(d) Affected facilities that also meet the applicability requirements under subpart E (Standards of performance for incinerators; §60.50) are subject to the NOX and PM standards under this subpart.

(e) Steam generating units meeting the applicability requirements under subpart Da (Standards of performance for electric utility steam generating units; §60.40Da) are not subject to this subpart.

(f) Any change to an existing steam generating unit for the sole purpose of combusting gases containing total reduced sulfur (TRS) as defined under §60.281 is not considered a modification under §60.14 and the steam generating unit is not subject to this subpart.

(g) In delegating implementation and enforcement authority to a State under section 111(c) of the Clean Air Act, the following authorities shall be retained by the Administrator and not transferred to a State.

(1) Section 60.44b(f).
(2) Section 60.44b(g).
(3) Section 60.49b(a)(4).

(h) Any affected facility that meets the applicability requirements and is subject to subpart Ea, subpart Eb, or subpart AAAA of this part is not covered by this subpart.
(i) Heat recovery steam generators that are associated with combined cycle gas turbines and that meet the applicability requirements of subpart GG or KKKK of this part are not subject to this subpart. This subpart will continue to apply to all other heat recovery steam generators that are capable of combusting more than 29 MW (100 MMBtu/hr) heat input of fossil fuel. If the heat recovery steam generator is subject to this subpart, only emissions resulting from combustion of fuels in the steam generating unit are subject to this subpart. (The gas turbine emissions are subject to subpart GG or KKKK, as applicable, of this part.)

(j) Any affected facility meeting the applicability requirements under paragraph (a) of this section and commencing construction, modification, or reconstruction after June 19, 1986 is not subject to subpart D (Standards of Performance for Fossil-Fuel-Fired Steam Generators, §60.40).

(k) Any affected facility that meets the applicability requirements and is subject to an EPA approved State or Federal section 111(d)/129 plan implementing subpart Cb or subpart BBBB of this part is not covered by this subpart.

§ 60.41b Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act and in subpart A of this part.

Annual capacity factor means the ratio between the actual heat input to a steam generating unit from the fuels listed in §60.42b(a), §60.43b(a), or §60.44b(a), as applicable, during a calendar year and the potential heat input to the steam generating unit had it been operated for 8,760 hours during a calendar year at the maximum steady state design heat input capacity. In the case of steam generating units that are rented or leased, the actual heat input shall be determined based on the combined heat input from all operations of the affected facility in a calendar year.

Byproduct/waste means any liquid or gaseous substance produced at chemical manufacturing plants, petroleum refineries, or pulp and paper mills (except natural gas, distillate oil, or residual oil) and combusted in a steam generating unit for heat recovery or for disposal. Gaseous substances with carbon dioxide (CO2) levels greater than 50 percent or carbon monoxide levels greater than 10 percent are not byproduct/waste for the purpose of this subpart.

Chemical manufacturing plants mean industrial plants that are classified by the Department of Commerce under Standard Industrial Classification (SIC) Code 28.

Coal means all solid fuels classified as anthracite, bituminous, subbituminous, or lignite by the American Society of Testing and Materials in ASTM D388 (incorporated by reference, see §60.17), coal refuse, and petroleum coke. Coal-derived synthetic fuels, including but not limited to solvent refined coal, gasified coal, coal-oil mixtures, coke oven gas, and coal-water mixtures, are also included in this definition for the purposes of this subpart.

Coal refuse means any byproduct of coal mining or coal cleaning operations with an ash content greater than 50 percent, by weight, and a heating value less than 13,900 kJ/kg (6,000 Btu/lb) on a dry basis.

Cogeneration, also known as combined heat and power, means a facility that simultaneously produces both electric (or mechanical) and useful thermal energy from the same primary energy source.

Coke oven gas means the volatile constituents generated in the gaseous exhaust during the carbonization of bituminous coal to form coke.

Combined cycle system means a system in which a separate source, such as a gas turbine, internal combustion engine, kiln, etc., provides exhaust gas to a steam generating unit.
Conventional technology means wet flue gas desulfurization (FGD) technology, dry FGD technology, atmospheric fluidized bed combustion technology, and oil hydrodesulfurization technology.

Distillate oil means fuel oils that contain 0.05 weight percent nitrogen or less and comply with the specifications for fuel oil numbers 1 and 2, as defined by the American Society of Testing and Materials in ASTM D396 (incorporated by reference, see §60.17).

Dry flue gas desulfurization technology means a SO2control system that is located downstream of the steam generating unit and removes sulfur oxides from the combustion gases of the steam generating unit by contacting the combustion gases with an alkaline reagent and water, whether introduced separately or as a premixed slurry or solution and forming a dry powder material. This definition includes devices where the dry powder material is subsequently converted to another form. Alkaline slurries or solutions used in dry flue gas desulfurization technology include but are not limited to lime and sodium.

Duct burner means a device that combusts fuel and that is placed in the exhaust duct from another source, such as a stationary gas turbine, internal combustion engine, kiln, etc., to allow the firing of additional fuel to heat the exhaust gases before the exhaust gases enter a steam generating unit.

Emerging technology means any SO2control system that is not defined as a conventional technology under this section, and for which the owner or operator of the facility has applied to the Administrator and received approval to operate as an emerging technology under §60.49b(a)(4).

Federally enforceable means all limitations and conditions that are enforceable by the Administrator, including the requirements of 40 CFR parts 60 and 61, requirements within any applicable State Implementation Plan, and any permit requirements established under 40 CFR 52.21 or under 40 CFR 51.18 and 51.24.

Fluidized bed combustion technology means combustion of fuel in a bed or series of beds (including but not limited to bubbling bed units and circulating bed units) of limestone aggregate (or other sorbent materials) in which these materials are forced upward by the flow of combustion air and the gaseous products of combustion.

Fuel pretreatment means a process that removes a portion of the sulfur in a fuel before combustion of the fuel in a steam generating unit.

Full capacity means operation of the steam generating unit at 90 percent or more of the maximum steady-state design heat input capacity.

Gaseous fuel means any fuel that is present as a gas at ISO conditions.

Gross output means the gross useful work performed by the steam generated. For units generating only electricity, the gross useful work performed is the gross electrical output from the turbine/generator set. For cogeneration units, the gross useful work performed is the gross electrical or mechanical output plus 75 percent of the useful thermal output measured relative to ISO conditions that is not used to generate additional electrical or mechanical output (i.e., steam delivered to an industrial process).

Heat input means heat derived from combustion of fuel in a steam generating unit and does not include the heat derived from preheated combustion air, recirculated flue gases, or exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.
Heat release rate means the steam generating unit design heat input capacity (in MW or Btu/hr) divided by the furnace volume (in cubic meters or cubic feet); the furnace volume is that volume bounded by the front furnace wall where the burner is located, the furnace side waterwall, and extending to the level just below or in front of the first row of convection pass tubes.

Heat transfer medium means any material that is used to transfer heat from one point to another point.

High heat release rate means a heat release rate greater than 730,000 J/sec-m³ (70,000 Btu/hr-ft³).

ISO Conditions means a temperature of 288 Kelvin, a relative humidity of 60 percent, and a pressure of 101.3 kilopascals.

Lignite means a type of coal classified as lignite A or lignite B by the American Society of Testing and Materials in ASTM D388 (incorporated by reference, see §60.17).

Low heat release rate means a heat release rate of 730,000 J/sec-m³ (70,000 Btu/hr-ft³) or less.

Mass-feed stoker steam generating unit means a steam generating unit where solid fuel is introduced directly into a retort or is fed directly onto a grate where it is combusted.

Maximum heat input capacity means the ability of a steam generating unit to combust a stated maximum amount of fuel on a steady state basis, as determined by the physical design and characteristics of the steam generating unit.

Municipal-type solid waste means refuse, more than 50 percent of which is waste consisting of a mixture of paper, wood, yard wastes, food wastes, plastics, leather, rubber, and other combustible materials, and noncombustible materials such as glass and rock.

Natural gas means: (1) A naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in geologic formations beneath the earth's surface, of which the principal constituent is methane; or (2) liquefied petroleum gas, as defined by the American Society for Testing and Materials in ASTM D1835 (incorporated by reference, see §60.17).

Noncontinental area means the State of Hawaii, the Virgin Islands, Guam, American Samoa, the Commonwealth of Puerto Rico, or the Northern Mariana Islands.

Oil means crude oil or petroleum or a liquid fuel derived from crude oil or petroleum, including distillate and residual oil.

Petroleum refinery means industrial plants as classified by the Department of Commerce under Standard Industrial Classification (SIC) Code 29.

Potential sulfur dioxide emission rate means the theoretical SO2 emissions (nanograms per joule (ng/J) or lb/MBtu heat input) that would result from combusting fuel in an uncleaned state and without using emission control systems.

Process heater means a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst.

Pulp and paper mills means industrial plants that are classified by the Department of Commerce under North American Industry Classification System (NAICS) Code 322 or Standard Industrial Classification (SIC) Code 26.
Pulverized coal-fired steam generating unit means a steam generating unit in which pulverized coal is introduced into an air stream that carries the coal to the combustion chamber of the steam generating unit where it is fired in suspension. This includes both conventional pulverized coal-fired and micropulverized coal-fired steam generating units. Residual oil means crude oil, fuel oil numbers 1 and 2 that have a nitrogen content greater than 0.05 weight percent, and all fuel oil numbers 4, 5 and 6, as defined by the American Society of Testing and Materials in ASTM D396 (incorporated by reference, see §60.17).

Spreader stoker steam generating unit means a steam generating unit in which solid fuel is introduced to the combustion zone by a mechanism that throws the fuel onto a grate from above. Combustion takes place both in suspension and on the grate.

Steam generating unit means a device that combusts any fuel or byproduct/waste and produces steam or heats water or any other heat transfer medium. This term includes any municipal-type solid waste incinerator with a heat recovery steam generating unit or any steam generating unit that combusts fuel and is part of a cogeneration system or a combined cycle system. This term does not include process heaters as they are defined in this subpart.

Steam generating unit operating day means a 24-hour period between 12:00 midnight and the following midnight during which any fuel is combusted at any time in the steam generating unit. It is not necessary for fuel to be combusted continuously for the entire 24-hour period.

Very low sulfur oil means for units constructed, reconstructed, or modified on or before February 28, 2005, an oil that contains no more than 0.5 weight percent sulfur or that, when combusted without SO2emission control, has a SO2emission rate equal to or less than 215 ng/J (0.5 lb/MMBtu) heat input. For units constructed, reconstructed, or modified after February 28, 2005, very low sulfur oil means an oil that contains no more than 0.3 weight percent sulfur or that, when combusted without SO2emission control, has a SO2emission rate equal to or less than 140 ng/J (0.32 lb/MMBtu) heat input.

Wet flue gas desulfurization technology means a SO2control system that is located downstream of the steam generating unit and removes sulfur oxides from the combustion gases of the steam generating unit by contacting the combustion gas with an alkaline slurry or solution and forming a liquid material. This definition applies to devices where the aqueous liquid material product of this contact is subsequently converted to other forms. Alkaline reagents used in wet flue gas desulfurization technology include, but are not limited to, lime, limestone, and sodium.

Wet scrubber system means any emission control device that mixes an aqueous stream or slurry with the exhaust gases from a steam generating unit to control emissions of PM or SO2.

Wood means wood, wood residue, bark, or any derivative fuel or residue thereof, in any form, including, but not limited to, sawdust, sanderdust, wood chips, scraps, slabs, millings, shavings, and processed pellets made from wood or other forest residues.

§ 60.42b Standard for sulfur dioxide (SO2).

(a) Except as provided in paragraphs (b), (c), (d), or (k) of this section, on and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, that combusts coal or oil shall cause to be discharged into the atmosphere any gases that contain SO2in excess of 87 ng/J (0.20 lb/MMBtu) or 10 percent (0.10) of the potential SO2 emission rate (90 percent reduction) and the emission limit determined according to the following formula:

\[ E_r = \frac{(K_1H_a + K_2H_b)}{(H_a + H_b)} \]
Where:
\[ E_s = \text{SO}_2\text{emission limit, in ng/J or lb/MMBtu heat input}; \]
\[ K_a = 520 \text{ ng/J (or 1.2 lb/MMBtu)}; \]
\[ K_b = 340 \text{ ng/J (or 0.80 lb/MMBtu)}; \]
\[ H_a = \text{Heat input from the combustion of coal, in J (MMBtu)}; \]
\[ H_b = \text{Heat input from the combustion of oil, in J (MMBtu)}. \]

Only the heat input supplied to the affected facility from the combustion of coal and oil is counted under this section. No credit is provided for the heat input to the affected facility from the combustion of natural gas, wood, municipal-type solid waste, or other fuels or heat derived from exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.

(b) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, that combusts coal refuse alone in a fluidized bed combustion steam generating unit shall cause to be discharged into the atmosphere any gases that contain \( \text{SO}_2\) in excess of 87 ng/J (0.20 lb/MMBtu) or 20 percent (0.20) of the potential \( \text{SO}_2\) emission rate (80 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input. If coal or oil is fired with coal refuse, the affected facility is subject to paragraph (a) or (d) of this section, as applicable.

(c) On and after the date on which the performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that combusts coal or oil, either alone or in combination with any other fuel, and that uses an emerging technology for the control of \( \text{SO}_2\) emissions, shall cause to be discharged into the atmosphere any gases that contain \( \text{SO}_2\) in excess of 50 percent of the potential \( \text{SO}_2\) emission rate (50 percent reduction) and that contain \( \text{SO}_2\) in excess of the emission limit determined according to the following formula:

\[
E_s = \frac{(K_cH_a + K_dH_d)}{(H_a + H_d)}
\]

Where:
\[ E_s = \text{SO}_2\text{emission limit, in ng/J or lb/MM Btu heat input}; \]
\[ K_c = 260 \text{ ng/J (or 0.60 lb/MMBtu)}; \]
\[ K_d = 170 \text{ ng/J (or 0.40 lb/MMBtu)}; \]
\[ H_c = \text{Heat input from the combustion of coal, in J (MMBtu)}; \]
\[ H_d = \text{Heat input from the combustion of oil, in J (MMBtu)}. \]

Only the heat input supplied to the affected facility from the combustion of coal and oil is counted under this section. No credit is provided for the heat input to the affected facility from the combustion of natural gas, wood, municipal-type solid waste, or other fuels, or from the heat input derived from exhaust gases from other sources, such as gas turbines, internal combustion engines, kilns, etc.

(d) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005 and listed in paragraphs (d)(1), (2), (3), or (4) of this section shall cause to be discharged into the atmosphere any gases that contain \( \text{SO}_2\) in excess of 520 ng/J (1.2 lb/MMBtu) heat input if the affected facility combusts coal, or 215 ng/J (0.5 lb/MMBtu) heat input if the affected facility combusts oil other than very low sulfur oil. Percent reduction requirements are not applicable to affected facilities under paragraphs (d)(1), (2), (3) or (4) of this section.

(1) Affected facilities that have an annual capacity factor for coal and oil of 30 percent (0.30) or less and are subject to a federally enforceable permit limiting the operation of the affected facility to an annual capacity factor for coal and oil of 30 percent (0.30) or less;

(2) Affected facilities located in a noncontinental area; or
(3) Affected facilities combusting coal or oil, alone or in combination with any fuel, in a duct burner as part of a combined cycle system where 30 percent (0.30) or less of the heat entering the steam generating unit is from combustion of coal and oil in the duct burner and 70 percent (0.70) or more of the heat entering the steam generating unit is from the exhaust gases entering the duct burner; or

(4) The affected facility burns coke oven gas alone or in combination with natural gas or very low sulfur distillate oil.

(e) Except as provided in paragraph (f) of this section, compliance with the emission limits, fuel oil sulfur limits, and/or percent reduction requirements under this section are determined on a 30-day rolling average basis.

(f) Except as provided in paragraph (j)(2) of this section, compliance with the emission limits or fuel oil sulfur limits under this section is determined on a 24-hour average basis for affected facilities that (1) have a federally enforceable permit limiting the annual capacity factor for oil to 10 percent or less, (2) combust only very low sulfur oil, and (3) do not combust any other fuel.

(g) Except as provided in paragraph (i) of this section and §60.45b(a), the SO2 emission limits and percent reduction requirements under this section apply at all times, including periods of startup, shutdown, and malfunction.

(h) Reductions in the potential SO2 emission rate through fuel pretreatment are not credited toward the percent reduction requirement under paragraph (c) of this section unless:

(1) Fuel pretreatment results in a 50 percent or greater reduction in potential SO2 emissions and
(2) Emissions from the pretreated fuel (without combustion or post-combustion SO2 control) are equal to or less than the emission limits specified in paragraph (c) of this section.

(i) An affected facility subject to paragraph (a), (b), or (c) of this section may combust very low sulfur oil or natural gas when the SO2 control system is not being operated because of malfunction or maintenance of the SO2 control system.

(j) Percent reduction requirements are not applicable to affected facilities combusting only very low sulfur oil. The owner or operator of an affected facility combusting very low sulfur oil shall demonstrate that the oil meets the definition of very low sulfur oil by: (1) Following the performance testing procedures as described in §60.45b(c) or §60.45b(d), and following the monitoring procedures as described in §60.47b(a) or §60.47b(b) to determine SO2 emission rate or fuel oil sulfur content; or (2) maintaining fuel records as described in §60.49b(r).

(k)(1) Except as provided in paragraphs (k)(2), (k)(3), and (k)(4) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences construction, reconstruction, or modification after February 28, 2005, and that combusts coal, oil, natural gas, a mixture of these fuels, or a mixture of these fuels with any other fuels shall cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) heat input or 8 percent (0.08) of the potential SO2 emission rate (92 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input.

(2) Units firing only very low sulfur oil and/or a mixture of gaseous fuels with a potential SO2 emission rate of 140 ng/J (0.32 lb/MMBtu) heat input or less are exempt from the SO2 emissions limit in paragraph 60.42b(k)(1).

(3) Units that are located in a noncontinental area and that combust coal or oil shall not discharge any gases that contain SO2 in excess of 520 ng/J (1.2 lb/MMBtu) heat input if the affected facility combusts coal, or 215 ng/J (0.50 lb/MMBtu) heat input if the affected facility combusts oil.
(4) As an alternative to meeting the requirements under paragraph (k)(1) of this section, modified facilities that combust coal or a mixture of coal with other fuels shall not cause to be discharged into the atmosphere any gases that contain SO2 in excess of 87 ng/J (0.20 lb/MMBtu) heat input or 10 percent (0.10) of the potential SO2 emission rate (90 percent reduction) and 520 ng/J (1.2 lb/MMBtu) heat input.

§ 60.43b Standard for particulate matter (PM).

(a) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005 that combusts coal or combusts mixtures of coal with other fuels, shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 22 ng/J (0.051 lb/MMBtu) heat input, (i) If the affected facility combusts only coal, or (ii) If the affected facility combusts coal and other fuels and has an annual capacity factor for the other fuels of 10 percent (0.10) or less.

(2) 43 ng/J (0.10 lb/MMBtu) heat input if the affected facility combusts coal and other fuels and has an annual capacity factor for the other fuels greater than 10 percent (0.10) and is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor greater than 10 percent (0.10) for fuels other than coal.

(3) 86 ng/J (0.20 lb/MMBtu) heat input if the affected facility combusts coal or coal and other fuels and

(i) Has an annual capacity factor for coal or coal and other fuels of 30 percent (0.30) or less,
(ii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less,
(iii) Has a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for coal or coal and other solid fuels, and

(4) An affected facility burning coke oven gas alone or in combination with other fuels not subject to a PM standard under §60.43b and not using a post-combustion technology (except a wet scrubber) for reducing PM or SO2 emissions is not subject to the PM limits under §60.43b(a).

(b) On and after the date on which the performance test is completed or required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, and that combusts oil (or mixtures of oil with other fuels) and uses a conventional or emerging technology to reduce SO2 emissions shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 43 ng/J (0.10 lb/MMBtu) heat input.

(c) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification on or before February 28, 2005, and that combusts wood, or wood with other fuels, except coal, shall cause to be discharged from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 43 ng/J (0.10 lb/MMBtu) heat input if the affected facility has an annual capacity factor greater than 30 percent (0.30) for wood.

(2) 86 ng/J (0.20 lb/MMBtu) heat input if (i) The affected facility has an annual capacity factor of 30 percent (0.30) or less for wood;
(ii) Is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for wood; and

(iii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less.

(d) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts municipal-type solid waste or mixtures of municipal-type solid waste with other fuels, shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of the following emission limits:

(1) 43 ng/J (0.10 lb/MMBtu) heat input;

(i) If the affected facility combusts only municipal-type solid waste; or

(ii) If the affected facility combusts municipal-type solid waste and other fuels and has an annual capacity factor for the other fuels of 10 percent (0.10) or less.

(2) 86 ng/J (0.20 lb/MMBtu) heat input if the affected facility combusts municipal-type solid waste or municipal-type solid waste and other fuels; and

(i) Has an annual capacity factor for municipal-type solid waste and other fuels of 30 percent (0.30) or less;

(ii) Has a maximum heat input capacity of 73 MW (250 MMBtu/hr) or less;

(iii) Has a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor of 30 percent (0.30) or less for municipal-type solid waste, or municipal-type solid waste and other fuels; and

(iv) Construction of the affected facility commenced after June 19, 1984, but on or before November 25, 1986.

(e) For the purposes of this section, the annual capacity factor is determined by dividing the actual heat input to the steam generating unit during the calendar year from the combustion of coal, wood, or municipal-type solid waste, and other fuels, as applicable, by the potential heat input to the steam generating unit if the steam generating unit had been operated for 8,760 hours at the maximum heat input capacity.

(f) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts coal, oil, wood, or mixtures of these fuels with any other fuels shall cause to be discharged into the atmosphere any gases that exhibit greater than 20 percent opacity (6-minute average), except for one 6-minute period per hour of not more than 27 percent opacity.

(g) The PM and opacity standards apply at all times, except during periods of startup, shutdown or malfunction.

(h)(1) Except as provided in paragraphs (h)(2), (h)(3), (h)(4), and (h)(5) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commenced construction, reconstruction, or modification after February 28, 2005, and that combusts coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 13 ng/J (0.030 lb/MMBtu) heat input,
(2) As an alternative to meeting the requirements of paragraph (h)(1) of this section, the owner or operator of an affected facility for which modification commenced after February 28, 2005, may elect to meet the requirements of this paragraph. On and after the date on which the initial performance test is completed or required to be completed under §60.8, no owner or operator of an affected facility that commences modification after February 28, 2005 shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of both:

(i) 22 ng/J (0.051 lb/MMBtu) heat input derived from the combustion of coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels; and
(ii) 0.2 percent of the combustion concentration (99.8 percent reduction) when combusting coal, oil, wood, a mixture of these fuels, or a mixture of these fuels with any other fuels.

(3) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences modification after February 28, 2005, and that combusts over 30 percent wood (by heat input) on an annual basis and has a maximum heat input capacity of 73 MW (250 MMBtu/h) or less shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 43 ng/J (0.10 lb/MMBtu) heat input.

(4) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commences modification after February 28, 2005, and that combusts over 30 percent wood (by heat input) on an annual basis and has a maximum heat input capacity greater than 73 MW (250 MMBtu/h) shall cause to be discharged into the atmosphere from that affected facility any gases that contain PM in excess of 37 ng/J (0.085 lb/MMBtu) heat input.

(5) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, an owner or operator of an affected facility that combusts only oil that contains no more than 0.3 weight percent sulfur, coke oven gas, a mixture of these fuels, or either fuel (or a mixture of these fuels) in combination with other fuels not subject to a PM standard under §60.43b and not using a post-combustion technology (except a wet scrubber) to reduce SO2 or PM emissions is not subject to the PM limits under §60.43b(h)(1).

§ 60.44b  Standard for nitrogen oxides (NOX).

(a) Except as provided under paragraphs (k) and (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that combusts only coal, oil, or natural gas shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX (expressed as NO2) in excess of the following emission limits:

<table>
<thead>
<tr>
<th>Fuel/steam generating unit type</th>
<th>Nitrogen oxide emission limits (expressed as NO2) heat input</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ng/J</td>
</tr>
<tr>
<td>(1) Natural gas and distillate oil, except (4):</td>
<td></td>
</tr>
<tr>
<td>(i) Low heat release rate</td>
<td>43</td>
</tr>
<tr>
<td>(ii) High heat release rate</td>
<td>86</td>
</tr>
<tr>
<td>(2) Residual oil:</td>
<td></td>
</tr>
</tbody>
</table>
(i) Low heat release rate 130 0.30
(ii) High heat release rate 170 0.40

(3) Coal:

(i) Mass-feed stoker 210 0.50
(ii) Spreader stoker and fluidized bed combustion 260 0.60
(iii) Pulverized coal 300 0.70
(iv) Lignite, except (v) 260 0.60
(v) Lignite mined in North Dakota, South Dakota, or Montana and combusted in a slag tap furnace 340 0.80
(vi) Coal-derived synthetic fuels 210 0.50

(4) Duct burner used in a combined cycle system:

(i) Natural gas and distillate oil 86 0.20
(ii) Residual oil 170 0.40

(b) Except as provided under paragraphs (k) and (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that simultaneously combusts mixtures of coal, oil, or natural gas shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX in excess of a limit determined by the use of the following formula:

\[
E_n = \frac{EL_{go}H_{go}}{H_{go}} + \frac{EL_{ro}H_{ro}}{H_{ro}} + \frac{EL_{c}H_{c}}{H_{c}}
\]

Where:
- \(E_n\) = NOX emission limit (expressed as NO2), ng/J (lb/MMBtu);
- \(EL_{go}\) = Appropriate emission limit from paragraph (a)(1) for combustion of natural gas or distillate oil, ng/J (lb/MMBtu);
- \(H_{go}\) = Heat input from combustion of natural gas or distillate oil, J (MMBtu);
- \(EL_{ro}\) = Appropriate emission limit from paragraph (a)(2) for combustion of residual oil, ng/J (lb/MMBtu);
- \(H_{ro}\) = Heat input from combustion of residual oil, J (MMBtu);
- \(EL_{c}\) = Appropriate emission limit from paragraph (a)(3) for combustion of coal, ng/J (lb/MMBtu);
- \(H_{c}\) = Heat input from combustion of coal, J (MMBtu);

and

(c) Except as provided under paragraph (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that simultaneously combusts coal or oil, or a mixture of these fuels with natural gas, and wood, municipal-type solid waste, or any other fuel shall cause to be discharged into the atmosphere any gases that contain NOX in excess of the emission limit for the coal or oil, or mixtures of these fuels with natural gas combusted in the affected facility, as determined pursuant to paragraph (a) or (b) of this section, unless the affected facility has an annual capacity factor for coal or oil, or mixture of these fuels with natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less for coal, oil, or a mixture of these fuels with natural gas.
(d) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that simultaneously combusts natural gas with wood, municipal-type solid waste, or other solid fuel, except coal, shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX in excess of 130 ng/J (0.30 lb/MMBtu) heat input unless the affected facility has an annual capacity factor for natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less for natural gas.

(e) Except as provided under paragraph (l) of this section, on and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that simultaneously combusts coal, oil, or natural gas with byproduct/waste shall cause to be discharged into the atmosphere any gases that contain NOX in excess of the emission limit determined by the following formula unless the affected facility has an annual capacity factor for coal, oil, and natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the affected facility to an annual capacity factor of 10 percent (0.10) or less:

\[ E_n = \frac{EL_{go}H_{go} + EL_oh_0 + EL_{ro}H_{ro}}{H_{go} + H_{oo} + H_{ro}} \]

Where:
- \( E_n \) = NOX emission limit (expressed as NO2), ng/J (lb/MMBtu);
- \( EL_{go} \) = Appropriate emission limit from paragraph (a)(1) for combustion of natural gas or distillate oil, ng/J (lb/MMBtu);
- \( H_{go} \) = Heat input from combustion of natural gas, distillate oil and gaseous byproduct/waste, J (MMBtu);
- \( EL_{ro} \) = Appropriate emission limit from paragraph (a)(2) for combustion of residual oil and/or byproduct/waste, ng/J (lb/MMBtu);
- \( H_{ro} \) = Heat input from combustion of residual oil, J (MMBtu);
- \( EL_c \) = Appropriate emission limit from paragraph (a)(3) for combustion of coal, ng/J (lb/MMBtu);
- \( H_c \) = Heat input from combustion of coal, J (MMBtu).

(f) Any owner or operator of an affected facility that combusts byproduct/waste with either natural gas or oil may petition the Administrator within 180 days of the initial startup of the affected facility to establish a NOX emission limit that shall apply specifically to that affected facility when the byproduct/waste is combusted. The petition shall include sufficient and appropriate data, as determined by the Administrator, such as NOX emissions from the affected facility, waste composition (including nitrogen content), and combustion conditions to allow the Administrator to confirm that the affected facility is unable to comply with the emission limits in paragraph (e) of this section and to determine the appropriate emission limit for the affected facility.

(1) Any owner or operator of an affected facility petitioning for a facility-specific NOX emission limit under this section shall:

(i) Demonstrate compliance with the emission limits for natural gas and distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, by conducting a 30-day performance test as provided in §60.46b(e). During the performance test only natural gas, distillate oil, or residual oil shall be combusted in the affected facility; and

(ii) Demonstrate that the affected facility is unable to comply with the emission limits for natural gas and distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, when gaseous or liquid byproduct/waste is combusted in the affected facility under the same conditions and using the same technological system of emission reduction applied when demonstrating compliance under paragraph (f)(1)(i) of this section.
(2) The NOX emission limits for natural gas or distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, shall be applicable to the affected facility until and unless the petition is approved by the Administrator. If the petition is approved by the Administrator, a facility-specific NOX emission limit will be established at the NOX emission level achievable when the affected facility is combusting oil or natural gas and byproduct/waste in a manner that the Administrator determines to be consistent with minimizing NOX emissions. In lieu of amending this subpart, a letter will be sent to the facility describing the facility-specific NOX limit. The facility shall use the compliance procedures detailed in the letter and make the letter available to the public. If the Administrator determines it is appropriate, the conditions and requirements of the letter can be reviewed and changed at any point.

(g) Any owner or operator of an affected facility that combusts hazardous waste (as defined by 40 CFR part 261 or 40 CFR part 761) with natural gas or oil may petition the Administrator within 180 days of the initial startup of the affected facility for a waiver from compliance with the NOX emission limit that applies specifically to that affected facility. The petition must include sufficient and appropriate data, as determined by the Administrator, on NOX emissions from the affected facility, waste destruction efficiencies, waste composition (including nitrogen content), the quantity of specific wastes to be combusted and combustion conditions to allow the Administrator to determine if the affected facility is able to comply with the NOX emission limits required by this section. The owner or operator of the affected facility shall demonstrate that when hazardous waste is combusted in the affected facility, thermal destruction efficiency requirements for hazardous waste specified in an applicable federally enforceable requirement preclude compliance with the NOX emission limits of this section. The NOX emission limits for natural gas or distillate oil in paragraph (a)(1) of this section or for residual oil in paragraph (a)(2) or (l)(1) of this section, as appropriate, are applicable to the affected facility until and unless the petition is approved by the Administrator. (See 40 CFR 761.70 for regulations applicable to the incineration of materials containing polychlorinated biphenyls (PCB’s).) In lieu of amending this subpart, a letter will be sent to the facility describing the facility-specific NOX limit. The facility shall use the compliance procedures detailed in the letter and make the letter available to the public. If the Administrator determines it is appropriate, the conditions and requirements of the letter can be reviewed and changed at any point.

(h) For purposes of paragraph (i) of this section, the NOX standards under this section apply at all times including periods of startup, shutdown, or malfunction.

(i) Except as provided under paragraph (j) of this section, compliance with the emission limits under this section is determined on a 30-day rolling average basis.

(j) Compliance with the emission limits under this section is determined on a 24-hour average basis for the initial performance test and on a 3-hour average basis for subsequent performance tests for any affected facilities that:

(1) Combust, alone or in combination, only natural gas, distillate oil, or residual oil with a nitrogen content of 0.30 weight percent or less;

(2) Have a combined annual capacity factor of 10 percent or less for natural gas, distillate oil, and residual oil with a nitrogen content of 0.30 weight percent or less; and

(3) Are subject to a federally enforceable requirement limiting operation of the affected facility to the firing of natural gas, distillate oil, and/or residual oil with a nitrogen content of 0.30 weight percent or less and limiting operation of the affected facility to a combined annual capacity factor of 10 percent or less for natural gas, distillate oil, and residual oil with a nitrogen content of 0.30 weight percent or less.
(k) Affected facilities that meet the criteria described in paragraphs (j)(1), (2), and (3) of this section, and that have a heat input capacity of 73 MW (250 MMBtu/hr) or less, are not subject to the NOX emission limits under this section.

(l) On and after the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, no owner or operator of an affected facility that commenced construction or reconstruction after July 9, 1997 shall cause to be discharged into the atmosphere from that affected facility any gases that contain NOX (expressed as NO2) in excess of the following limits:

(1) If the affected facility combusts coal, oil, or natural gas, or a mixture of these fuels, or with any other fuels: A limit of 86 ng/J (0.20 lb/MMBtu) heat input unless the affected facility has an annual capacity factor for coal, oil, and natural gas of 10 percent (0.10) or less and is subject to a federally enforceable requirement that limits operation of the facility to an annual capacity factor of 10 percent (0.10) or less for coal, oil, and natural gas; or

(2) If the affected facility has a low heat release rate and combusts natural gas or distillate oil in excess of 30 percent of the heat input on a 30-day rolling average from the combustion of all fuels, a limit determined by use of the following formula:

\[ E_n = \frac{(0.10 \times H_{go}) + (0.20 \times H_r)}{H_{go} + H_r} \]

Where:
- \( E_n \) = NOX emission limit, (lb/MMBtu);
- \( H_{go} \) = 30-day heat input from combustion of natural gas or distillate oil; and
- \( H_r \) = 30-day heat input from combustion of any other fuel.

(3) After February 27, 2006, units where more than 10 percent of total annual output is electrical or mechanical may comply with an optional limit of 270 ng/J (2.1 lb/MWh) gross energy output, based on a 30-day rolling average. Units complying with this output-based limit must demonstrate compliance according to the procedures of §60.48Da(i) of subpart Da of this part, and must monitor emissions according to §60.49Da(c), (k), through (n) of subpart Da of this part.

§ 60.45b Compliance and performance test methods and procedures for sulfur dioxide.

(a) The SO2 emission standards under §60.42b apply at all times. Facilities burning coke oven gas alone or in combination with any other gaseous fuels or distillate oil and complying with the fuel based limit under §60.42b(d) or §60.42b(k)(2) are allowed to exceed the limit 30 operating days per calendar year for by-product plant maintenance.

(b) In conducting the performance tests required under §60.8, the owner or operator shall use the methods and procedures in appendix A (including fuel certification and sampling) of this part or the methods and procedures as specified in this section, except as provided in §60.8(b). Section 60.8(f) does not apply to this section. The 30-day notice required in §60.8(d) applies only to the initial performance test unless otherwise specified by the Administrator.

(c) The owner or operator of an affected facility shall conduct performance tests to determine compliance with the percent of potential SO2 emission rate (% Ps) and the SO2 emission rate (Es) pursuant to §60.42b following the procedures listed below, except as provided under paragraph (d) and (k) of this section.

(1) The initial performance test shall be conducted over 30 consecutive operating days of the steam generating unit. Compliance with the SO2 standards shall be determined using a 30-day average. The first operating day included in the initial performance test shall be scheduled within 30 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of the facility.
(2) If only coal, only oil, or a mixture of coal and oil is combusted, the following procedures are used:

(i) The procedures in Method 19 of appendix A of this part are used to determine the hourly SO2 emission rate (Eho) and the 30-day average emission rate (Eao). The hourly averages used to compute the 30-day averages are obtained from the continuous emission monitoring system (CEMS) of §60.47b (a) or (b).

(ii) The percent of potential SO2 emission rate (%Ps) emitted to the atmosphere is computed using the following formula:

$$\%Ps = 100 \left( 1 - \frac{\%R_g}{100} \right) \left( 1 - \frac{\%R_f}{100} \right)$$

Where:
\%Ps = Potential SO2 emission rate, percent;
\%Rg = SO2 removal efficiency of the control device as determined by Method 19 of appendix A of this part, in percent; and
\%Rf = SO2 removal efficiency of fuel pretreatment as determined by Method 19 of appendix A of this part, in percent.

(3) If coal or oil is combusted with other fuels, the same procedures required in paragraph (c)(2) of this section are used, except as provided in the following:

(i) An adjusted hourly SO2 emission rate (Ehoo) is used in Equation 19–19 of Method 19 of appendix A of this part to compute an adjusted 30-day average emission rate (Eaoo). The Eh° is computed using the following formula:

$$E_{h°} = E_{h} - E_{w} (1 - X_k)$$

Where:
Ehoo = Adjusted hourly SO2 emission rate, ng/J (lb/MMBtu);
Eho = Hourly SO2 emission rate, ng/J (lb/MMBtu);
Ew = SO2 concentration in fuels other than coal and oil combusted in the affected facility, as determined by the fuel sampling and analysis procedures in Method 19 of appendix A of this part, ng/J (lb/MMBtu). The value Ew for each fuel lot is used for each hourly average during the time that the lot is being combusted; and
Xk = Fraction of total heat input from fuel combustion derived from coal, oil, or coal and oil, as determined by applicable procedures in Method 19 of appendix A of this part.

(ii) To compute the percent of potential SO2 emission rate (%Ps), an adjusted %Rg(%Rgo) is computed from the adjusted Eaoo from paragraph (b)(3)(i) of this section and an adjusted average SO2 inlet rate (Eaio) using the following formula:

To compute Eaio, an adjusted hourly SO2 inlet rate (Ehio) is used. The Ehio is computed using the following formula:

$$E_{h°} = E_{hi} - E_{w} (1 - X_k)$$

Where:
Ehio = Adjusted hourly SO2 inlet rate, ng/J (lb/MMBtu); and
Ehi = Hourly SO2 inlet rate, ng/J (lb/MMBtu).

(4) The owner or operator of an affected facility subject to paragraph (b)(3) of this section does not have to measure parameters Ewo or Xk if the owner or operator elects to assume that Xk = 1.0. Owners or operators of affected facilities who assume Xk = 1.0 shall:
(i) Determine %Psfollowing the procedures in paragraph (c)(2) of this section; and

(ii) Sulfur dioxide emissions (Es) are considered to be in compliance with SO2emission limits under §60.42b.

(5) The owner or operator of an affected facility that qualifies under the provisions of §60.42b(d) does not have to measure parameters Ewor Xkunder paragraph (b)(3) of this section if the owner or operator of the affected facility elects to measure SO2emission rates of the coal or oil following the fuel sampling and analysis procedures under Method 19 of appendix A of this part.

(d) Except as provided in paragraph (j) of this section, the owner or operator of an affected facility that combusts only very low sulfur oil, has an annual capacity factor for oil of 10 percent (0.10) or less, and is subject to a federally enforceable requirement limiting operation of the affected facility to an annual capacity factor for oil of 10 percent (0.10) or less shall:

(1) Conduct the initial performance test over 24 consecutive steam generating unit operating hours at full load;

(2) Determine compliance with the standards after the initial performance test based on the arithmetic average of the hourly emissions data during each steam generating unit operating day if a CEMS is used, or based on a daily average if Method 6B of appendix A of this part or fuel sampling and analysis procedures under Method 19 of appendix A of this part are used.

(e) The owner or operator of an affected facility subject to §60.42b(d)(1) shall demonstrate the maximum design capacity of the steam generating unit by operating the facility at maximum capacity for 24 hours. This demonstration will be made during the initial performance test and a subsequent demonstration may be requested at any other time. If the 24-hour average firing rate for the affected facility is less than the maximum design capacity provided by the manufacturer of the affected facility, the 24-hour average firing rate shall be used to determine the capacity utilization rate for the affected facility, otherwise the maximum design capacity provided by the manufacturer is used.

(f) For the initial performance test required under §60.8, compliance with the SO2emission limits and percent reduction requirements under §60.42b is based on the average emission rates and the average percent reduction for SO2for the first 30 consecutive steam generating unit operating days, except as provided under paragraph (d) of this section. The initial performance test is the only test for which at least 30 days prior notice is required unless otherwise specified by the Administrator. The initial performance test is to be scheduled so that the first steam generating unit operating day of the 30 successive steam generating unit operating days is completed within 30 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of the facility. The boiler load during the 30-day period does not have to be the maximum design load, but must be representative of future operating conditions and include at least one 24-hour period at full load.

(g) After the initial performance test required under §60.8, compliance with the SO2emission limits and percent reduction requirements under §60.42b is based on the average emission rates and the average percent reduction for SO2for 30 successive steam generating unit operating days, except as provided under paragraph (d). A separate performance test is completed at the end of each steam generating unit operating day after the initial performance test, and a new 30-day average emission rate and percent reduction for SO2are calculated to show compliance with the standard.
(h) Except as provided under paragraph (i) of this section, the owner or operator of an affected facility shall use all valid \( \text{SO}_2 \) emissions data in calculating \%Ps\ and \( \text{Eh} \) under paragraph (c), of this section whether or not the minimum emissions data requirements under §60.46b are achieved. All valid emissions data, including valid \( \text{SO}_2 \) emission data collected during periods of startup, shutdown and malfunction, shall be used in calculating \%Ps\ and \( \text{Eh} \) pursuant to paragraph (c) of this section.

(i) During periods of malfunction or maintenance of the \( \text{SO}_2 \) control systems when oil is combusted as provided under §60.42b(i), emission data are not used to calculate \%Ps\ or \( \text{Eh} \) under §60.42b(a), (b) or (c); however, the emissions data are used to determine compliance with the emission limit under §60.42b(i).

(j) The owner or operator of an affected facility thatcombusts very low sulfur oil is not subject to the compliance and performance testing requirements of this section if the owner or operator obtains fuel receipts as described in §60.49b(r).

(k) The owner or operator of an affected facility seeking to demonstrate compliance under §§60.42b(d)(4), 60.42b(j), and 60.42b(k)(2) shall follow the applicable procedures under §60.49b(r).

§ 60.46b Compliance and performance test methods and procedures for particulate matter and nitrogen oxides.

(a) The PM emission standards and opacity limits under §60.43b apply at all times except during periods of startup, shutdown, or malfunction. The NOX emission standards under §60.44b apply at all times.

(b) Compliance with the PM emission standards under §60.43b shall be determined through performance testing as described in paragraph (d) of this section, except as provided in paragraph (i) of this section.

(c) Compliance with the NOX emission standards under §60.44b shall be determined through performance testing under paragraph (e) or (f), or under paragraphs (g) and (h) of this section, as applicable.

(d) To determine compliance with the PM emission limits and opacity limits under §60.43b, the owner or operator of an affected facility shall conduct an initial performance test as required under §60.8, and shall conduct subsequent performance tests as requested by the Administrator, using the following procedures and reference methods:

(1) Method 3B of appendix A of this part is used for gas analysis when applying Method 5 or 17 of appendix A of this part.

(2) Method 5, 5B, or 17 of appendix A of this part shall be used to measure the concentration of PM as follows:

(i) Method 5 of appendix A of this part shall be used at affected facilities without wet flue gas desulfurization (FGD) systems; and

(ii) Method 17 of appendix A of this part may be used at facilities with or without wet scrubber systems provided the stack gas temperature does not exceed a temperature of 160 °C (32 °F). The procedures of sections 2.1 and 2.3 of Method 5B of appendix A of this part may be used in Method 17 of appendix A of this part only if it is used after a wet FGD system. Do not use Method 17 of appendix A of this part after wet FGD systems if the effluent is saturated or laden with water droplets.

(iii) Method 5B of appendix A of this part is to be used only after wet FGD systems.
(3) Method 1 of appendix A of this part is used to select the sampling site and the number of traverse sampling points. The sampling time for each run is at least 120 minutes and the minimum sampling volume is 1.7 dscm (60 dscf) except that smaller sampling times or volumes may be approved by the Administrator when necessitated by process variables or other factors.

(4) For Method 5 of appendix A of this part, the temperature of the sample gas in the probe and filter holder is monitored and is maintained at 160\pm14 ^\circ C (320\pm25 ^\circ F).

(5) For determination of PM emissions, the oxygen (O2) or CO2sample is obtained simultaneously with each run of Method 5, 5B, or 17 of appendix A of this part by traversing the duct at the same sampling location.

(6) For each run using Method 5, 5B, or 17 of appendix A of this part, the emission rate expressed in ng/J heat input is determined using:

(i) The O2or CO2measurements and PM measurements obtained under this section;

(ii) The dry basis F factor; and

(iii) The dry basis emission rate calculation procedure contained in Method 19 of appendix A of this part.

(7) Method 9 of appendix A of this part is used for determining the opacity of stack emissions.

(e) To determine compliance with the emission limits for NOXrequired under §60.44b, the owner or operator of an affected facility shall conduct the performance test as required under §60.8 using the continuous system for monitoring NOXunder §60.48(b).

(1) For the initial compliance test, NOXfrom the steam generating unit are monitored for 30 successive steam generating unit operating days and the 30-day average emission rate is used to determine compliance with the NOXemission standards under §60.44b. The 30-day average emission rate is calculated as the average of all hourly emissions data recorded by the monitoring system during the 30-day test period.

(2) Following the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility which combusts coal or which combusts residual oil having a nitrogen content greater than 0.30 weight percent shall determine compliance with the NOXemission standards under §60.44b on a continuous basis through the use of a 30-day rolling average emission rate. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOXemission data for the preceding 30 steam generating unit operating days.

(3) Following the date on which the initial performance test is completed or is required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility that has a heat input capacity greater than 73 MW (250 MMBtu/hr) and that combusts natural gas, distillate oil, or residual oil having a nitrogen content of 0.30 weight percent or less shall determine compliance with the NOXstandards under §60.44b on a continuous basis through the use of a 30-day rolling average emission rate. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOXemission data for the preceding 30 steam generating unit operating days.
(4) Following the date on which the initial performance test is completed or required to be completed under §60.8, whichever date comes first, the owner or operator of an affected facility that has a heat input capacity of 73 MW (250 MMBtu/hr) or less and that combusts natural gas, distillate oil, or residual oil having a nitrogen content of 0.30 weight percent or less shall upon request determine compliance with the NOX standards under §60.44b through the use of a 30-day performance test. During periods when performance tests are not requested, NOX emissions data collected pursuant to §60.48b(g)(1) or §60.48b(g)(2) are used to calculate a 30-day rolling average emission rate on a daily basis and used to prepare excess emission reports, but will not be used to determine compliance with the NOX emission standards. A new 30-day rolling average emission rate is calculated each steam generating unit operating day as the average of all of the hourly NOX emissions data for the preceding 30 steam generating unit operating days.

(5) If the owner or operator of an affected facility that combusts residual oil does not sample and analyze the residual oil for nitrogen content, as specified in §60.49b(e), the requirements of §60.48b(g)(1) apply and the provisions of §60.48b(g)(2) are inapplicable.

(f) To determine compliance with the emissions limits for NOX required by §60.44b(a)(4) or §60.44b(l) for duct burners used in combined cycle systems, either of the procedures described in paragraph (f)(1) or (2) of this section may be used:

(1) The owner or operator of an affected facility shall conduct the performance test required under §60.8 as follows:

(i) The emissions rate (E) of NOX shall be computed using Equation 1 in this section:

\[ E = E_{s\xi} + \left( \frac{H_{\xi}}{H_b} \right) \left( E_{s\xi} - E_g \right) \]  

(\text{Eq.1})

Where:

- \( E \) = Emissions rate of NOX from the duct burner, ng/J (lb/MMBtu) heat input;
- \( E_{s\xi} \) = Combined effluent emissions rate, in ng/J (lb/MMBtu) heat input using appropriate F factor as described in Method 19 of appendix A of this part;
- \( H_{\xi} \) = Heat input rate to the combustion turbine, in J/hr (MMBtu/hr);
- \( H_b \) = Heat input rate to the duct burner, in J/hr (MMBtu/hr); and
- \( E_g \) = Emissions rate from the combustion turbine, in ng/J (lb/MMBtu) heat input calculated using appropriate F factor as described in Method 19 of appendix A of this part.

(ii) Method 7E of appendix A of this part shall be used to determine the NOX concentrations. Method 3A or 3B of appendix A of this part shall be used to determine O2 concentration.

(iii) The owner or operator shall identify and demonstrate to the Administrator’s satisfaction suitable methods to determine the average hourly heat input rate to the combustion turbine and the average hourly heat input rate to the affected duct burner.

(iv) Compliance with the emissions limits under §60.44b(a)(4) or §60.44b(l) is determined by the three-run average (nominal 1-hour runs) for the initial and subsequent performance tests; or

(2) The owner or operator of an affected facility may elect to determine compliance on a 30-day rolling average basis by using the CEMS specified under §60.48b for measuring NOX and O2 and meet the requirements of §60.48b. The sampling site shall be located at the outlet from the steam generating unit. The NOX emissions rate at the outlet from the steam generating unit shall constitute the NOX emissions rate from the duct burner of the combined cycle system.
(g) The owner or operator of an affected facility described in §60.44b(j) or §60.44b(k) shall demonstrate the maximum heat input capacity of the steam generating unit by operating the facility at maximum capacity for 24 hours. The owner or operator of an affected facility shall determine the maximum heat input capacity using the heat loss method described in sections 5 and 7.3 of the ASME Power Test Codes 4.1 (incorporated by reference, see §60.17). This demonstration of maximum heat input capacity shall be made during the initial performance test for affected facilities that meet the criteria of §60.44b(j). It shall be made within 60 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial start-up of each facility, for affected facilities meeting the criteria of §60.44b(k). Subsequent demonstrations may be required by the Administrator at any other time. If this demonstration indicates that the maximum heat input capacity of the affected facility is less than that stated by the manufacturer of the affected facility, the maximum heat input capacity determined during this demonstration shall be used to determine the capacity utilization rate for the affected facility. Otherwise, the maximum heat input capacity provided by the manufacturer is used.

(h) The owner or operator of an affected facility described in §60.44b(j) that has a heat input capacity greater than 73 MW (250 MMBtu/hr) shall:

1. Conduct an initial performance test as required under §60.8 over a minimum of 24 consecutive steam generating unit operating hours at maximum heat input capacity to demonstrate compliance with the NOx emission standards under §60.44b using Method 7, 7A, 7E of appendix A of this part, or other approved reference methods; and

2. Conduct subsequent performance tests once per calendar year or every 400 hours of operation (whichever comes first) to demonstrate compliance with the NOx emission standards under §60.44b over a minimum of 3 consecutive steam generating unit operating hours at maximum heat input capacity using Method 7, 7A, 7E of appendix A of this part, or other approved reference methods.

(i) The owner or operator of an affected facility seeking to demonstrate compliance under paragraph §60.43b(h)(5) shall follow the applicable procedures under §60.49b(r).

(j) In place of PM testing with EPA Reference Method 5, 5B, or 17 of appendix A of this part, an owner or operator may elect to install, calibrate, maintain, and operate a CEMS for monitoring PM emissions discharged to the atmosphere and record the output of the system. The owner or operator of an affected facility who elects to continuously monitor PM emissions instead of conducting performance testing using EPA Method 5, 5B, or 17 of appendix A of this part shall comply with the requirements specified in paragraphs (j)(1) through (j)(13) of this section.

1. Notify the Administrator one month before starting use of the system.

2. Notify the Administrator one month before stopping use of the system.

3. The monitor shall be installed, evaluated, and operated in accordance with §60.13 of subpart A of this part.

4. The initial performance evaluation shall be completed no later than 180 days after the date of initial startup of the affected facility, as specified under §60.8 of subpart A of this part or within 180 days of notification to the Administrator of use of the CEMS if the owner or operator was previously determining compliance by Method 5, 5B, or 17 of appendix A of this part performance tests, whichever is later.
(5) The owner or operator of an affected facility shall conduct an initial performance test for PM emissions as required under §60.8 of subpart A of this part. Compliance with the PM emission limit shall be determined by using the CEMS specified in paragraph (j) of this section to measure PM and calculating a 24-hour block arithmetic average emission concentration using EPA Reference Method 19 of appendix A of this part, section 4.1.

(6) Compliance with the PM emission limit shall be determined based on the 24-hour daily (block) average of the hourly arithmetic average emission concentrations using CEMS outlet data.

(7) At a minimum, valid CEMS hourly averages shall be obtained as specified in paragraphs (j)(7)(i) of this section for 75 percent of the total operating hours per 30-day rolling average.

(i) At least two data points per hour shall be used to calculate each 1-hour arithmetic average.

(ii) [Reserved]

(8) The 1-hour arithmetic averages required under paragraph (j)(7) of this section shall be expressed in ng/J or lb/MMBtu heat input and shall be used to calculate the boiler operating day daily arithmetic average emission concentrations. The 1-hour arithmetic averages shall be calculated using the data points required under §60.13(e)(2) of subpart A of this part.

(9) All valid CEMS data shall be used in calculating average emission concentrations even if the minimum CEMS data requirements of paragraph (j)(7) of this section are not met.

(10) The CEMS shall be operated according to Performance Specification 11 in appendix B of this part.

(11) During the correlation testing runs of the CEMS required by Performance Specification 11 in appendix B of this part, PM and O2(or CO2) data shall be collected concurrently (or within a 30-to 60-minute period) by both the continuous emission monitors and the test methods specified in paragraphs (j)(7)(i) of this section.

(i) For PM, EPA Reference Method 5, 5B, or 17 of appendix A of this part shall be used.

(ii) For O2(or CO2), EPA reference Method 3, 3A, or 3B of appendix A of this part, as applicable shall be used.

(12) Quarterly accuracy determinations and daily calibration drift tests shall be performed in accordance with procedure 2 in appendix F of this part. Relative Response Audit's must be performed annually and Response Correlation Audits must be performed every 3 years.

(13) When PM emissions data are not obtained because of CEMS breakdowns, repairs, calibration checks, and zero and span adjustments, emissions data shall be obtained by using other monitoring systems as approved by the Administrator or EPA Reference Method 19 of appendix A of this part to provide, as necessary, valid emissions data for a minimum of 75 percent of total operating hours per 30-day rolling average.

§ 60.47b   Emission monitoring for sulfur dioxide.
(a) Except as provided in paragraphs (b), (f), and (h) of this section, the owner or operator of an affected facility subject to the SO2 standards under §60.42b shall install, calibrate, maintain, and operate CEMS for measuring SO2 concentrations and either O2 or CO2 concentrations and shall record the output of the systems. For units complying with the percent reduction standard, the SO2 and either O2 or CO2 concentrations shall both be monitored at the inlet and outlet of the SO2 control device. If the owner or operator has installed and certified SO2 and O2 or CO2 CEMS according to the requirements of §75.20(c)(1) of this chapter and appendix A to part 75 of this chapter, and is continuing to meet the ongoing quality assurance requirements of §75.21 of this chapter and appendix B to part 75 of this chapter, those CEMS may be used to meet the requirements of this section, provided that:

1. When relative accuracy testing is conducted, SO2 concentration data and CO2 (or O2) data are collected simultaneously; and

2. In addition to meeting the applicable SO2 and CO2 (or O2) relative accuracy specifications in Figure 2 of appendix B to part 75 of this chapter, the relative accuracy (RA) standard in section 13.2 of Performance Specification 2 in appendix B to this part is met when the RA is calculated on a lb/MMBtu basis; and

3. The reporting requirements of §60.49b are met. SO2 and CO2 (or O2) data used to meet the requirements of §60.49b shall not include substitute data values derived from the missing data procedures in subpart D of part 75 of this chapter, nor shall the SO2 data have been bias adjusted according to the procedures of part 75 of this chapter.

(b) As an alternative to operating CEMS as required under paragraph (a) of this section, an owner or operator may elect to determine the average SO2 emissions and percent reduction by:

1. Collecting coal or oil samples in an as-fired condition at the inlet to the steam generating unit and analyzing them for sulfur and heat content according to Method 19 of appendix A of this part. Method 19 of appendix A of this part provides procedures for converting these measurements into the format to be used in calculating the average SO2 input rate, or

2. Measuring SO2 according to Method 6B of appendix A of this part at the inlet or outlet to the SO2 control system. An initial stratification test is required to verify the adequacy of the Method 6B of appendix A of this part sampling location. The stratification test shall consist of three paired runs of a suitable SO2 and CO2 measurement train operated at the candidate location and a second similar train operated according to the procedures in section 3.2 and the applicable procedures in section 7 of Performance Specification 2. Method 6B of appendix A of this part, Method 6A of appendix A of this part, or a combination of Methods 6 and 3 or 3B of appendix A of this part or Methods 6C and 3A of appendix A of this part are suitable measurement techniques. If Method 6B of appendix A of this part is used for the second train, sampling time and timer operation may be adjusted for the stratification test as long as an adequate sample volume is collected; however, both sampling trains are to be operated similarly. For the location to be adequate for Method 6B of appendix A of this part 24-hour tests, the mean of the absolute difference between the three paired runs must be less than 10 percent.

3. A daily SO2 emission rate, ED, shall be determined using the procedure described in Method 6A of appendix A of this part, section 7.6.2 (Equation 6A–8) and stated in ng/J (lb/MMBtu) heat input.

4. The mean 30-day emission rate is calculated using the daily measured values in ng/J (lb/MMBtu) for 30 successive steam generating unit operating days using equation 19–20 of Method 19 of appendix A of this part.
(c) The owner or operator of an affected facility shall obtain emission data for at least 75 percent of the operating hours in at least 22 out of 30 successive boiler operating days. If this minimum data requirement is not met with a single monitoring system, the owner or operator of the affected facility shall supplement the emission data with data collected with other monitoring systems as approved by the Administrator or the reference methods and procedures as described in paragraph (b) of this section.

(d) The 1-hour average SO2 emission rates measured by the CEMS required by paragraph (a) of this section and required under §60.13(h) is expressed in ng/J or lb/MBtu heat input and is used to calculate the average emission rates under §60.42(b). Each 1-hour average SO2 emission rate must be based on 30 or more minutes of steam generating unit operation. The hourly averages shall be calculated according to §60.13(h)(2). Hourly SO2 emission rates are not calculated if the affected facility is operated less than 30 minutes in a given clock hour and are not counted toward determination of a steam generating unit operating day.

(e) The procedures under §60.13 shall be followed for installation, evaluation, and operation of the CEMS.

(1) Except as provided for in paragraph (e)(4) of this section, all CEMS shall be operated in accordance with the applicable procedures under Performance Specifications 1, 2, and 3 of appendix B of this part.

(2) Except as provided for in paragraph (e)(4) of this section, quarterly accuracy determinations and daily calibration drift tests shall be performed in accordance with Procedure 1 of appendix F of this part.

(3) For affected facilities combusting coal or oil, alone or in combination with other fuels, the span value of the SO2 CEMS at the inlet to the SO2 control device is 125 percent of the maximum estimated hourly potential SO2 emissions of the fuel combusted, and the span value of the CEMS at the outlet to the SO2 control device is 50 percent of the maximum estimated hourly potential SO2 emissions of the fuel combusted. Alternatively, SO2 span values determined according to section 2.1.1 in appendix A to part 75 of this chapter may be used.

(4) As an alternative to meeting the requirements of requirements of paragraphs (e)(1) and (e)(2) of this section, the owner or operator may elect to implement the following alternative data accuracy assessment procedures:

(i) For all required CO2 and O2 monitors and for SO2 and NOX monitors with span values less than 100 ppm, the daily calibration error test and calibration adjustment procedures described in sections 2.1.1 and 2.1.3 of appendix B to part 75 of this chapter may be followed instead of the CD assessment procedures in Procedure 1, section 4.1 of appendix F to this part. If this option is selected, the data validation and out-of-control provisions in sections 2.1.4 and 2.1.5 of appendix B to part 75 of this chapter shall be followed instead of the excessive CD and out-of-control criteria in Procedure 1, section 4.3 of appendix F to this part. For the purposes of data validation under this subpart, the excessive CD and out-of-control criteria in Procedure 1, section 4.3 of appendix F to this part shall apply to SO2 and NOX span values less than 100 ppm;
(ii) For all required CO2 and O2 monitors and for SO2 and NOX monitors with span values greater than 30 ppm, quarterly linearity checks may be performed in accordance with section 2.2.1 of appendix B to part 75 of this chapter, instead of performing the cylinder gas audits (CGAs) described in Procedure 1, section 5.1.2 of appendix F to this part. If this option is selected: The frequency of the linearity checks shall be as specified in section 2.2.1 of appendix B to part 75 of this chapter; the applicable linearity specifications in section 3.2 of appendix A to part 75 of this chapter shall be met; the data validation and out-of-control criteria in section 2.2.3 of appendix B to part 75 of this chapter shall be followed instead of the excessive audit inaccuracy and out-of-control criteria in Procedure 1, section 5.2 of appendix F to this part; and the grace period provisions in section 2.2.4 of appendix B to part 75 of this chapter shall apply. For the purposes of data validation under this subpart, the cylinder gas audits described in Procedure 1, section 5.1.2 of appendix F to this part shall be performed for SO2 and NOX span values less than or equal to 30 ppm; and

(iii) For SO2, CO2, and O2 monitoring systems and for NOX emission rate monitoring systems, RATAs may be performed in accordance with section 2.3 of appendix B to part 75 of this chapter instead of following the procedures described in Procedure 1, section 5.1.1 of appendix F to this part. If this option is selected: The frequency of each RATA shall be as specified in section 2.3.1 of appendix B to part 75 of this chapter; the applicable relative accuracy specifications shown in Figure 2 in appendix B to part 75 of this chapter shall be met; the data validation and out-of-control criteria in section 2.3.2 of appendix B to part 75 of this chapter shall be followed instead of the excessive audit inaccuracy and out-of-control criteria in Procedure 1, section 5.2 of appendix B to part 75 of this chapter shall apply. For the purposes of data validation under this subpart, the relative accuracy specification in section 13.2 of Performance Specification 2 in appendix B to this part shall be met on a lb/MMBtu basis for SO2 (regardless of the SO2 emission level during the RATA), and for NOX when the average NOX emission rate measured by the reference method during the RATA is less than 0.100 lb/MMBtu.

(f) The owner or operator of an affected facility that combusts very low sulfur oil or is demonstrating compliance under §60.45b(k) is not subject to the emission monitoring requirements under paragraph (a) of this section if the owner or operator maintains fuel records as described in §60.49b(r).

§ 60.48b Emission monitoring for particulate matter and nitrogen oxides.

(a) Except as provided in paragraph (j) of this section, the owner or operator of an affected facility subject to the opacity standard under §60.43b shall install, calibrate, maintain, and operate a CEMS for measuring the opacity of emissions discharged to the atmosphere and record the output of the system.

(b) Except as provided under paragraphs (g), (h), and (i) of this section, the owner or operator of an affected facility subject to a NOX standard under §60.44b shall comply with either paragraphs (b)(1) or (b)(2) of this section.

(1) Install, calibrate, maintain, and operate CEMS for measuring NOX and O2 (or CO2) emissions discharged to the atmosphere, and shall record the output of the system; or

(2) If the owner or operator has installed a NOX emission rate CEMS to meet the requirements of part 75 of this chapter and is continuing to meet the ongoing requirements of part 75 of this chapter, that CEMS may be used to meet the requirements of this section, except that the owner or operator shall also meet the requirements of §60.49b. Data reported to meet the requirements of §60.49b shall not include data substituted using the missing data procedures in subpart D of part 75 of this chapter, nor shall the data have been bias adjusted according to the procedures of part 75 of this chapter.

(c) The CEMS required under paragraph (b) of this section shall be operated and data recorded during all periods of operation of the affected facility except for CEMS breakdowns and repairs. Data is recorded during calibration checks, and zero and span adjustments.
(d) The 1-hour average NOX emission rates measured by the continuous NOX monitor required by paragraph (b) of this section and required under §60.13(h) shall be expressed in ng/J or lb/MMBtu heat input and shall be used to calculate the average emission rates under §60.44b. The 1-hour averages shall be calculated using the data points required under §60.13(h)(2).

(e) The procedures under §60.13 shall be followed for installation, evaluation, and operation of the continuous monitoring systems.

(1) For affected facilities combusting coal, wood or municipal-type solid waste, the span value for a continuous monitoring system for measuring opacity shall be between 60 and 80 percent.

(2) For affected facilities combusting coal, oil, or natural gas, the span value for NOX is determined using one of the following procedures:

(i) Except as provided under paragraph (e)(2)(ii) of this section, NOX span values shall be determined as follows:

<table>
<thead>
<tr>
<th>Fuel</th>
<th>Span values for NOX (ppm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural gas</td>
<td>500.</td>
</tr>
<tr>
<td>Oil</td>
<td>500.</td>
</tr>
<tr>
<td>Coal</td>
<td>1,000.</td>
</tr>
<tr>
<td>Mixtures</td>
<td>500 (x + y) + 1,000z.</td>
</tr>
</tbody>
</table>

Where:
- x = Fraction of total heat input derived from natural gas;
- y = Fraction of total heat input derived from oil; and
- z = Fraction of total heat input derived from coal.

(ii) As an alternative to meeting the requirements of paragraph (e)(2)(i) of this section, the owner or operator of an affected facility may elect to use the NOX span values determined according to section 2.1.2 in appendix A to part 75 of this chapter.

(3) All span values computed under paragraph (e)(2)(i) of this section for combusting mixtures of regulated fuels are rounded to the nearest 500 ppm. Span values computed under paragraph (e)(2)(ii) of this section shall be rounded off according to section 2.1.2 in appendix A to part 75 of this chapter.

(f) When NOX emission data are not obtained because of CEMS breakdowns, repairs, calibration checks and zero and span adjustments, emission data will be obtained by using standby monitoring systems, Method 7 of appendix A of this part, Method 7A of appendix A of this part, or other approved reference methods to provide emission data for a minimum of 75 percent of the operating hours in each steam generating unit operating day, in at least 22 out of 30 successive steam generating unit operating days.

(g) The owner or operator of an affected facility that has a heat input capacity of 73 MW (250 MMBtu/hr) or less, and that has an annual capacity factor for residual oil having a nitrogen content of 0.30 weight percent or less, natural gas, distillate oil, or any mixture of these fuels, greater than 10 percent (0.10) shall:

(1) Comply with the provisions of paragraphs (b), (c), (d), (e)(2), (e)(3), and (f) of this section; or

(2) Monitor steam generating unit operating conditions and predict NOX emission rates as specified in a plan submitted pursuant to §60.49b(c).
(h) The owner or operator of a duct burner, as described in §60.41b, that is subject to the NOX standards of §60.44b(a)(4) or §60.44b(l) is not required to install or operate a continuous emissions monitoring system to measure NOX emissions.

(i) The owner or operator of an affected facility described in §60.44b(j) or §60.44b(k) is not required to install or operate a CEMS for measuring NOX emissions.

(j) The owner or operator of an affected facility that meets the conditions in either paragraph (j)(1), (2), (3), (4), or (5) of this section is not required to install or operate a COMS for measuring opacity if:

(1) The affected facility uses a PM CEMS to monitor PM emissions; or

(2) The affected facility burns only liquid (excluding residual oil) or gaseous fuels with potential SO2 emissions rates of 26 ng/J (0.060 lb/MMBtu) or less and does not use a post-combustion technology to reduce SO2 or PM emissions. The owner or operator must maintain fuel records of the sulfur content of the fuels burned, as described under §60.49b(r); or

(3) The affected facility burns coke oven gas alone or in combination with fuels meeting the criteria in paragraph (j)(2) of this section and does not use a post-combustion technology to reduce SO2 or PM emissions; or

(4) The affected facility does not use post-combustion technology (except a wet scrubber) for reducing PM, SO2, or carbon monoxide (CO) emissions, burns only gaseous fuels or fuel oils that contain less than or equal to 0.30 weight percent sulfur, and is operated such that emissions of CO to the atmosphere from the affected facility are maintained at levels less than or equal to 0.15 lb/MMBtu on a steam generating unit operating day average basis. Owners and operators of affected facilities electing to comply with this paragraph must demonstrate compliance according to the procedures specified in paragraphs (j)(4)(i) through (iv) of this section.

(i) You must monitor CO emissions using a CEMS according to the procedures specified in paragraphs (j)(4)(i)(A) through (D) of this section.

(A) The CO CEMS must be installed, certified, maintained, and operated according to the provisions in §60.58b(i)(3) of subpart Eb of this part.

(B) Each 1-hour CO emissions average is calculated using the data points generated by the CO CEMS expressed in parts per million by volume corrected to 3 percent oxygen (dry basis).

(C) At a minimum, valid 1-hour CO emissions averages must be obtained for at least 90 percent of the operating hours on a 30-day rolling average basis. At least two data points per hour must be used to calculate each 1-hour average.

(D) Quarterly accuracy determinations and daily calibration drift tests for the CO CEMS must be performed in accordance with procedure 1 in appendix F of this part.

(ii) You must calculate the 1-hour average CO emissions levels for each steam generating unit operating day by multiplying the average hourly CO output concentration measured by the CO CEMS times the corresponding average hourly flue gas flow rate and divided by the corresponding average hourly heat input to the affected source. The 24-hour average CO emission level is determined by calculating the arithmetic average of the hourly CO emission levels computed for each steam generating unit operating day.
(iii) You must evaluate the preceding 24-hour average CO emission level each steam generating unit operating day excluding periods of affected source startup, shutdown, or malfunction. If the 24-hour average CO emission level is greater than 0.15 lb/MMBtu, you must initiate investigation of the relevant equipment and control systems within 24 hours of the first discovery of the high emission incident and, take the appropriate corrective action as soon as practicable to adjust control settings or repair equipment to reduce the 24-hour average CO emission level to 0.15 lb/MMBtu or less.

(iv) You must record the CO measurements and calculations performed according to paragraph (j)(4) of this section and any corrective actions taken. The record of corrective action taken must include the date and time during which the 24-hour average CO emission level was greater than 0.15 lb/MMBtu, and the date, time, and description of the corrective action.

(5) The affected facility burns only gaseous fuels or fuel oils that contain less than or equal to 0.30 weight percent sulfur and operates according to a written site-specific monitoring plan approved by the appropriate delegated permitting authority. This monitoring plan must include procedures and criteria for establishing and monitoring specific parameters for the affected facility indicative of compliance with the opacity standard.

(k) Owners or operators complying with the PM emission limit by using a PM CEMS monitor instead of monitoring opacity must calibrate, maintain, and operate a CEMS, and record the output of the system, for PM emissions discharged to the atmosphere as specified in §60.46b(j). The CEMS specified in paragraph §60.46b(j) shall be operated and data recorded during all periods of operation of the affected facility except for CEMS breakdowns and repairs. Data is recorded during calibration checks, and zero and span adjustments.

§ 60.49b Reporting and recordkeeping requirements.

(a) The owner or operator of each affected facility shall submit notification of the date of initial startup, as provided by §60.7. This notification shall include:

(1) The design heat input capacity of the affected facility and identification of the fuels to be combusted in the affected facility;

(2) If applicable, a copy of any federally enforceable requirement that limits the annual capacity factor for any fuel or mixture of fuels under §§60.42b(d)(1), 60.43b(a)(2), (a)(3)(iii), (c)(2)(i), (d)(2)(iii), 60.44b(c), (d), (e), (l), (j), (k), 60.45b(d), (g), 60.46b(h), or 60.48b(i);

(3) The annual capacity factor at which the owner or operator anticipates operating the facility based on all fuels fired and based on each individual fuel fired; and

(4) Notification that an emerging technology will be used for controlling emissions of SO2. The Administrator will examine the description of the emerging technology and will determine whether the technology qualifies as an emerging technology. In making this determination, the Administrator may require the owner or operator of the affected facility to submit additional information concerning the control device. The affected facility is subject to the provisions of §60.42b(a) unless and until this determination is made by the Administrator.

(b) The owner or operator of each affected facility subject to the SO2, PM, and/or NOXemission limits under §§60.42b, 60.43b, and 60.44b shall submit to the Administrator the performance test data from the initial performance test and the performance evaluation of the CEMS using the applicable performance specifications in appendix B of this part. The owner or operator of each affected facility described in §60.44b(j) or §60.44b(k) shall submit to the Administrator the maximum heat input capacity data from the demonstration of the maximum heat input capacity of the affected facility.
(c) The owner or operator of each affected facility subject to the NOX standard of §60.44b who seeks to demonstrate compliance with those standards through the monitoring of steam generating unit operating conditions under the provisions of §60.48b(g)(2) shall submit to the Administrator for approval a plan that identifies the operating conditions to be monitored under §60.48b(g)(2) and the records to be maintained under §60.49b(j). This plan shall be submitted to the Administrator for approval within 360 days of the initial startup of the affected facility. If the plan is approved, the owner or operator shall maintain records of predicted nitrogen oxide emission rates and the monitored operating conditions, including steam generating unit load, identified in the plan. The plan shall:

(1) Identify the specific operating conditions to be monitored and the relationship between these operating conditions and NOX emission rates (i.e., ng/J or lbs/MMBtu heat input). Steam generating unit operating conditions include, but are not limited to, the degree of staged combustion (i.e., the ratio of primary air to secondary and/or tertiary air) and the level of excess air (i.e., flue gas O2 level);

(2) Include the data and information that the owner or operator used to identify the relationship between NOX emission rates and these operating conditions; and

(3) Identify how these operating conditions, including steam generating unit load, will be monitored under §60.48b(g) on an hourly basis by the owner or operator during the period of operation of the affected facility; the quality assurance procedures or practices that will be employed to ensure that the data generated by monitoring these operating conditions will be representative and accurate; and the type and format of the records of these operating conditions, including steam generating unit load, that will be maintained by the owner or operator under §60.49b(j).

(d) The owner or operator of an affected facility shall record and maintain records of the amounts of each fuel combusted during each day and calculate the annual capacity factor individually for coal, distillate oil, residual oil, natural gas, wood, and municipal-type solid waste for the reporting period. The annual capacity factor is determined on a 12-month rolling average basis with a new annual capacity factor calculated at the end of each calendar month.

(e) For an affected facility that combuts residual oil and meets the criteria under §§60.46b(e)(4), 60.44b(j), or (k), the owner or operator shall maintain records of the nitrogen content of the residual oil combusted in the affected facility and calculate the average fuel nitrogen content for the reporting period. The nitrogen content shall be determined using ASTM Method D4629 (incorporated by reference, see §60.17), or fuel suppliers. If residual oil blends are being combusted, fuel nitrogen specifications may be prorated based on the ratio of residual oils of different nitrogen content in the fuel blend.

(f) For facilities subject to the opacity standard under §60.43b, the owner or operator shall maintain records of opacity.

(g) Except as provided under paragraph (p) of this section, the owner or operator of an affected facility subject to the NOX standards under §60.44b shall maintain records of the following information for each steam generating unit operating day:

(1) Calendar date;

(2) The average hourly NOX emission rates (expressed as NO2) (ng/J or lb/MMBtu heat input) measured or predicted;

(3) The 30-day average NOX emission rates (ng/J or lb/MMBtu heat input) calculated at the end of each steam generating unit operating day from the measured or predicted hourly nitrogen oxide emission rates for the preceding 30 steam generating unit operating days;
(4) Identification of the steam generating unit operating days when the calculated 30-day average NOX emission rates are in excess of the NOX emissions standards under §60.44b, with the reasons for such excess emissions as well as a description of corrective actions taken;

(5) Identification of the steam generating unit operating days for which pollutant data have not been obtained, including reasons for not obtaining sufficient data and a description of corrective actions taken;

(6) Identification of the times when emission data have been excluded from the calculation of average emission rates and the reasons for excluding data;

(7) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(8) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(9) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3; and

(10) Results of daily CEMS drift tests and quarterly accuracy assessments as required under appendix F, Procedure 1 of this part.

(h) The owner or operator of any affected facility in any category listed in paragraphs (h)(1) or (2) of this section is required to submit excess emission reports for any excess emissions that occurred during the reporting period.

(1) Any affected facility subject to the opacity standards under §60.43b(e) or to the operating parameter monitoring requirements under §60.13(i)(1).

(2) Any affected facility that is subject to the NOX standard of §60.44b, and that:

(i) Combusts natural gas, distillate oil, or residual oil with a nitrogen content of 0.3 weight percent or less; or

(ii) Has a heat input capacity of 73 MW (250 MMBtu/hr) or less and is required to monitor NOX emissions on a continuous basis under §60.48b(g)(1) or steam generating unit operating conditions under §60.48b(g)(2).

(3) For the purpose of §60.43b, excess emissions are defined as all 6-minute periods during which the average opacity exceeds the opacity standards under §60.43b(f).

(4) For purposes of §60.48b(g)(1), excess emissions are defined as any calculated 30-day rolling average NOX emission rate, as determined under §60.46b(e), that exceeds the applicable emission limits in §60.44b.

(i) The owner or operator of any affected facility subject to the continuous monitoring requirements for NOX under §60.48(b) shall submit reports containing the information recorded under paragraph (g) of this section.

(j) The owner or operator of any affected facility subject to the SO2 standards under §60.42b shall submit reports.

(k) For each affected facility subject to the compliance and performance testing requirements of §60.45b and the reporting requirement in paragraph (j) of this section, the following information shall be reported to the Administrator:
(1) Calendar dates covered in the reporting period;

(2) Each 30-day average SO2 emission rate (ng/J or lb/MMBtu heat input) measured during the reporting period, ending with the last 30-day period; reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(3) Each 30-day average percent reduction in SO2 emissions calculated during the reporting period, ending with the last 30-day period; reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(4) Identification of the steam generating unit operating days that coal or oil was combusted and for which SO2 or diluent (O2 or CO2) data have not been obtained by an approved method for at least 75 percent of the operating hours in the steam generating unit operating day; justification for not obtaining sufficient data; and description of corrective action taken;

(5) Identification of the times when emissions data have been excluded from the calculation of average emission rates; justification for excluding data; and description of corrective action taken if data have been excluded for periods other than those during which coal or oil were not combusted in the steam generating unit;

(6) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(7) Identification of times when hourly averages have been obtained based on manual sampling methods;

(8) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(9) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3;

(10) Results of daily CEMS drift tests and quarterly accuracy assessments as required under appendix F, Procedure 1 of this part; and

(11) The annual capacity factor of each fired as provided under paragraph (d) of this section.

(1) For each affected facility subject to the compliance and performance testing requirements of §60.45b(d) and the reporting requirements of paragraph (j) of this section, the following information shall be reported to the Administrator:

(1) Calendar dates when the facility was in operation during the reporting period;

(2) The 24-hour average SO2 emission rate measured for each steam generating unit operating day during the reporting period that coal or oil was combusted, ending in the last 24-hour period in the quarter; reasons for noncompliance with the emission standards; and a description of corrective actions taken;

(3) Identification of the steam generating unit operating days that coal or oil was combusted for which SO2 or diluent (O2 or CO2) data have not been obtained by an approved method for at least 75 percent of the operating hours; justification for not obtaining sufficient data; and description of corrective action taken;

(4) Identification of the times when emissions data have been excluded from the calculation of average emission rates; justification for excluding data; and description of corrective action taken if data have been excluded for periods other than those during which coal or oil were not combusted in the steam generating unit;
(5) Identification of “F” factor used for calculations, method of determination, and type of fuel combusted;

(6) Identification of times when hourly averages have been obtained based on manual sampling methods;

(7) Identification of the times when the pollutant concentration exceeded full span of the CEMS;

(8) Description of any modifications to the CEMS that could affect the ability of the CEMS to comply with Performance Specification 2 or 3; and

(9) Results of daily CEMS drift tests and quarterly accuracy assessments as required under Procedure 1 of appendix F 1 of this part. If the owner or operator elects to implement the alternative data assessment procedures described in §§60.47b(e)(4)(i) through (e)(4)(iii), each data assessment report shall include a summary of the results of all of the RATAs, linearity checks, CGAs, and calibration error or drift assessments required by §§60.47b(e)(4)(i) through (e)(4)(iii).

(m) For each affected facility subject to the SO2 standards under §60.42(b) for which the minimum amount of data required under §60.47b(f) were not obtained during the reporting period, the following information is reported to the Administrator in addition to that required under paragraph (k) of this section:

(1) The number of hourly averages available for outlet emission rates and inlet emission rates;

(2) The standard deviation of hourly averages for outlet emission rates and inlet emission rates, as determined in Method 19 of appendix A of this part, section 7;

(3) The lower confidence limit for the mean outlet emission rate and the upper confidence limit for the mean inlet emission rate, as calculated in Method 19 of appendix A of this part, section 7; and

(4) The ratio of the lower confidence limit for the mean outlet emission rate and the allowable emission rate, as determined in Method 19 of appendix A of this part, section 7.

(n) If a percent removal efficiency by fuel pretreatment (i.e., %Rf) is used to determine the overall percent reduction (i.e., %Ro) under §60.45b, the owner or operator of the affected facility shall submit a signed statement with the report.

(1) Indicating what removal efficiency by fuel pretreatment (i.e., %Rf) was credited during the reporting period;

(2) Listing the quantity, heat content, and date each pre-treated fuel shipment was received during the reporting period, the name and location of the fuel pretreatment facility, and the total quantity and total heat content of all fuels received at the affected facility during the reporting period;

(3) Documenting the transport of the fuel from the fuel pretreatment facility to the steam generating unit; and

(4) Including a signed statement from the owner or operator of the fuel pretreatment facility certifying that the percent removal efficiency achieved by fuel pretreatment was determined in accordance with the provisions of Method 19 of appendix A of this part and listing the heat content and sulfur content of each fuel before and after fuel pretreatment.

(o) All records required under this section shall be maintained by the owner or operator of the affected facility for a period of 2 years following the date of such record.
(p) The owner or operator of an affected facility described in §60.44b(j) or (k) shall maintain records of the following information for each steam generating unit operating day:

(1) Calendar date;

(2) The number of hours of operation; and

(3) A record of the hourly steam load.

(q) The owner or operator of an affected facility described in §60.44b(j) or §60.44b(k) shall submit to the Administrator a report containing:

(1) The annual capacity factor over the previous 12 months;

(2) The average fuel nitrogen content during the reporting period, if residual oil was fired; and

(3) If the affected facility meets the criteria described in §60.44b(j), the results of any NOXemission tests required during the reporting period, the hours of operation during the reporting period, and the hours of operation since the last NOXemission test.

(r) The owner or operator of an affected facility who elects to use the fuel based compliance alternatives in §60.42b or §60.43b shall either:

(1) The owner or operator of an affected facility who elects to demonstrate that the affected facility combuts only very low sulfur oil under §60.42b(j)(2) or §60.42b(k)(2) shall obtain and maintain at the affected facility fuel receipts from the fuel supplier that certify that the oil meets the definition of distillate oil as defined in §60.41b and the applicable sulfur limit. For the purposes of this section, the distillate oil need not meet the fuel nitrogen content specification in the definition of distillate oil. Reports shall be submitted to the Administrator certifying that only very low sulfur oil meeting this definition and/or pipeline quality natural gas was combusted in the affected facility during the reporting period; or

(2) The owner or operator of an affected facility who elects to demonstrate compliance based on fuel analysis in §60.42b or §60.43b shall develop and submit a site-specific fuel analysis plan to the Administrator for review and approval no later than 60 days before the date you intend to demonstrate compliance. Each fuel analysis plan shall include a minimum initial requirement of weekly testing and each analysis report shall contain, at a minimum, the following information:

(i) The potential sulfur emissions rate of the representative fuel mixture in ng/J heat input;

(ii) The method used to determine the potential sulfur emissions rate of each constituent of the mixture. For distillate oil and natural gas a fuel receipt or tariff sheet is acceptable;

(iii) The ratio of different fuels in the mixture; and

(iv) The owner or operator can petition the Administrator to approve monthly or quarterly sampling in place of weekly sampling.

(s) Facility specific NOXstandard for Cytec Industries Fortier Plant's C.AOG incinerator located in Westwego, Louisiana:

(1) Definitions . Oxidation zone is defined as the portion of the C.AOG incinerator that extends from the inlet of the oxidizing zone combustion air to the outlet gas stack.
Reducing zone is defined as the portion of the C.AOG incinerator that extends from the burner section to the inlet of the oxidizing zone combustion air. Total inlet air is defined as the total amount of air introduced into the C.AOG incinerator for combustion of natural gas and chemical by-product waste and is equal to the sum of the air flow into the reducing zone and the air flow into the oxidation zone.

2) Standard for nitrogen oxides. (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When natural gas and chemical by-product waste are simultaneously combusted, the NOX emission limit is 289 ng/J (0.67 lb/MMBtu) and a maximum of 81 percent of the total inlet air provided for combustion shall be provided to the reducing zone of the C.AOG incinerator.

3) Emission monitoring. (i) The percent of total inlet air provided to the reducing zone shall be determined at least every 15 minutes by measuring the air flow of all the air entering the reducing zone and the air flow of all the air entering the oxidation zone, and compliance with the percentage of total inlet air that is provided to the reducing zone shall be determined on a 3-hour average basis.

(ii) The NOX emission limit shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b(i).

(iii) The monitoring of the NOX emission limit shall be performed in accordance with §60.48b.

4) Reporting and recordkeeping requirements. (i) The owner or operator of the C.AOG incinerator shall submit a report on any excursions from the limits required by paragraph (a)(2) of this section to the Administrator with the quarterly report required by paragraph (i) of this section.

(ii) The owner or operator of the C.AOG incinerator shall keep records of the monitoring required by paragraph (a)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner of operator of the C.AOG incinerator shall perform all the applicable reporting and recordkeeping requirements of this section.

1) Facility-specific NOX standard for Rohm and Haas Kentucky Incorporated’s Boiler No. 100 located in Louisville, Kentucky:

1) Definitions.
Air ratio control damper is defined as the part of the low NOX burner that is adjusted to control the split of total combustion air delivered to the reducing and oxidation portions of the combustion flame.
Flue gas recirculation line is defined as the part of Boiler No. 100 that recirculates a portion of the boiler flue gas back into the combustion air.

2) Standard for nitrogen oxides. (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical by-product waste are simultaneously combusted, the NOX emission limit is 473 ng/J (1.1 lb/MMBtu), and the air ratio control damper tee handle shall be at a minimum of 5 inches (12.7 centimeters) out of the boiler, and the flue gas recirculation line shall be operated at a minimum of 10 percent open as indicated by its valve opening position indicator.

3) Emission monitoring for nitrogen oxides. (i) The air ratio control damper tee handle setting and the flue gas recirculation line valve opening position indicator setting shall be recorded during each 8-hour operating shift.
(ii) The NOX emission limit shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b.

(iii) The monitoring of the NOX emission limit shall be performed in accordance with §60.48b.

(4) Reporting and recordkeeping requirements. (i) The owner or operator of Boiler No. 100 shall submit a report on any excursions from the limits required by paragraph (b)(2) of this section to the Administrator with the quarterly report required by §60.49b(i).

(ii) The owner or operator of Boiler No. 100 shall keep records of the monitoring required by paragraph (b)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner of operator of Boiler No. 100 shall perform all the applicable reporting and recordkeeping requirements of §60.49b.

(u) Site-specific standard for Merck & Co., Inc.'s Stonewall Plant in Elkton, Virginia. (1) This paragraph (u) applies only to the pharmaceutical manufacturing facility, commonly referred to as the Stonewall Plant, located at Route 340 South, in Elkton, Virginia ("site") and only to the natural gas-fired boilers installed as part of the powerhouse conversion required pursuant to 40 CFR 52.2454(g). The requirements of this paragraph shall apply, and the requirements of §§60.40b through 60.49b(t) shall not apply, to the natural gas-fired boilers installed pursuant to 40 CFR 52.2454(g).

(i) The site shall equip the natural gas-fired boilers with low NOX technology.

(ii) The site shall install, calibrate, maintain, and operate a continuous monitoring and recording system for measuring NOX emissions discharged to the atmosphere and opacity using a continuous emissions monitoring system or a predictive emissions monitoring system.

(iii) Within 180 days of the completion of the powerhouse conversion, as required by 40 CFR 52.2454, the site shall perform a performance test to quantify criteria pollutant emissions.

(2) [Reserved]

(v) The owner or operator of an affected facility may submit electronic quarterly reports for SO2 and/or NOX and/or opacity in lieu of submitting the written reports required under paragraphs (h), (i), (j), (k) or (l) of this section. The format of each quarterly electronic report shall be coordinated with the permitting authority. The electronic report(s) shall be submitted no later than 30 days after the end of the calendar quarter and shall be accompanied by a certification statement from the owner or operator, indicating whether compliance with the applicable emission standards and minimum data requirements of this subpart was achieved during the reporting period. Before submitting reports in the electronic format, the owner or operator shall coordinate with the permitting authority to obtain their agreement to submit reports in this alternative format.

(w) The reporting period for the reports required under this subpart is each 6 month period. All reports shall be submitted to the Administrator and shall be postmarked by the 30th day following the end of the reporting period.

(x) Facility-specific NOX standard for Weyerhaeuser Company's No. 2 Power Boiler located in New Bern, North Carolina:

(1) Standard for nitrogen oxides. (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical by-product waste are simultaneously combusted, the NOX emission limit is 215 ng/J (0.5 lb/MMBtu).
(2) Emission monitoring for nitrogen oxides. (i) The NOX emissions shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b.

(ii) The monitoring of the NOX emissions shall be performed in accordance with §60.48b.

(3) Reporting and recordkeeping requirements. (i) The owner or operator of the No. 2 Power Boiler shall submit a report on any excursions from the limits required by paragraph (x)(2) of this section to the Administrator with the quarterly report required by §60.49b(i).

(ii) The owner or operator of the No. 2 Power Boiler shall keep records of the monitoring required by paragraph (x)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner or operator of the No. 2 Power Boiler shall perform all the applicable reporting and recordkeeping requirements of §60.49b.

(y) Facility-specific NOX standard for INEOS USA’s AOGI located in Lima, Ohio:

(1) Standard for NOX. (i) When fossil fuel alone is combusted, the NOX emission limit for fossil fuel in §60.44b(a) applies.

(ii) When fossil fuel and chemical byproduct/waste are simultaneously combusted, the NOX emission limit is 645 ng/J (1.5 lb/MMBtu).

(2) Emission monitoring for NOX. (i) The NOX emissions shall be determined by the compliance and performance test methods and procedures for NOX in §60.46b.

(ii) The monitoring of the NOX emissions shall be performed in accordance with §60.48b.

(3) Reporting and recordkeeping requirements. (i) The owner or operator of the AOGI shall submit a report on any excursions from the limits required by paragraph (y)(2) of this section to the Administrator with the quarterly report required by paragraph (i) of this section.

(ii) The owner or operator of the AOGI shall keep records of the monitoring required by paragraph (y)(3) of this section for a period of 2 years following the date of such record.

(iii) The owner or operator of the AOGI shall perform all the applicable reporting and recordkeeping requirements of this section.
Section E.23 40 CFR 60, Subpart III—Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

E.23.1 General Provisions Relating to New Source Performance Standards [326 IAC 12-1] [40 CFR Part 60, Subpart A]

Pursuant to 40 CFR 60.1, the Permittee shall comply with the provisions of 40 CFR Part 60 Subpart A—General Provisions, which are incorporated by reference as 326 IAC 12-1, except as otherwise specified in 40 CFR Part 60, Subpart III.

E.23.2 Standards of Performance for Stationary Compression Ignition Internal Combustion Engines [40 CFR Part 60, Subpart III] [326 IAC 12]

Pursuant to 40 CFR Part 60, Subpart III, the Permittee shall comply with the provisions of Standards of Performance for Stationary Compression Ignition Internal Combustion Engines, which are incorporated by reference as 326 IAC 12, as specified as follows:

What This Subpart Covers

§ 60.4200 Am I subject to this subpart?

(a) The provisions of this subpart are applicable to manufacturers, owners, and operators of stationary compression ignition (CI) internal combustion engines (ICE) as specified in paragraphs (a)(1) through (3) of this section. For the purposes of this subpart, the date that construction commences is the date the engine is ordered by the owner or operator.

(2) Owners and operators of stationary CI ICE that commence construction after July 11, 2005 where the stationary CI ICE are:

(i) Manufactured after April 1, 2006 and are not fire pump engines, or
(ii) Manufactured as a certified National Fire Protection Association (NFPA) fire pump engine after July 1, 2006.

§ 60.4205 What emission standards must I meet for emergency engines if I am an owner or operator of a stationary CI internal combustion engine?

(c) Owners and operators of fire pump engines with a displacement of less than 30 liters per cylinder must comply with the emission standards in table 4 to this subpart, for all pollutants.

§ 60.4206 How long must I meet the emission standards if I am an owner or operator of a stationary CI internal combustion engine?

Owners and operators of stationary CI ICE must operate and maintain stationary CI ICE that achieve the emission standards as required in §§60.4204 and 60.4205 according to the manufacturer's written instructions or procedures developed by the owner or operator that are approved by the engine manufacturer, over the entire life of the engine.

Fuel Requirements for Owners and Operators

§ 60.4207 What fuel requirements must I meet if I am an owner or operator of a stationary CI internal combustion engine subject to this subpart?

(a) Beginning October 1, 2007, owners and operators of stationary CI ICE subject to this subpart that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(a).

(b) Beginning October 1, 2010, owners and operators of stationary CI ICE subject to this subpart with a displacement of less than 30 liters per cylinder that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(b) for nonroad diesel fuel.
(c) Owners and operators of pre-2011 model year stationary CI ICE subject to this subpart may petition the Administrator for approval to use remaining non-compliant fuel that does not meet the fuel requirements of paragraphs (a) and (b) of this section beyond the dates required for the purpose of using up existing fuel inventories. If approved, the petition will be valid for a period of up to 6 months. If additional time is needed, the owner or operator is required to submit a new petition to the Administrator.

(d) Owners and operators of pre-2011 model year stationary CI ICE subject to this subpart that are located in areas of Alaska not accessible by the Federal Aid Highway System may petition the Administrator for approval to use any fuels mixed with used lubricating oil that do not meet the fuel requirements of paragraphs (a) and (b) of this section. Owners and operators must demonstrate in their petition to the Administrator that there is no other place to use the lubricating oil. If approved, the petition will be valid for a period of up to 6 months. If additional time is needed, the owner or operator is required to submit a new petition to the Administrator.

(e) Stationary CI ICE that have a national security exemption under §60.4200(d) are also exempt from the fuel requirements in this section.

§ 60.4209 What are the monitoring requirements if I am an owner or operator of a stationary CI internal combustion engine?

If you are an owner or operator, you must meet the monitoring requirements of this section. In addition, you must also meet the monitoring requirements specified in §60.4211.

(a) If you are an owner or operator of an emergency stationary CI internal combustion engine, you must install a non-resettable hour meter prior to startup of the engine.

(b) If you are an owner or operator of a stationary CI internal combustion engine equipped with a diesel particulate filter to comply with the emission standards in §60.4204, the diesel particulate filter must be installed with a backpressure monitor that notifies the owner or operator when the high backpressure limit of the engine is approached.

Compliance Requirements
§ 60.4211 What are my compliance requirements if I am an owner or operator of a stationary CI internal combustion engine?

(a) If you are an owner or operator and must comply with the emission standards specified in this subpart, you must operate and maintain the stationary CI internal combustion engine and control device according to the manufacturer's written instructions or procedures developed by the owner or operator that are approved by the engine manufacturer. In addition, owners and operators may only change those settings that are permitted by the manufacturer. You must also meet the requirements of 40 CFR parts 89, 94 and/or 1068, as they apply to you.

(b) If you are an owner or operator of a pre-2007 model year stationary CI internal combustion engine and must comply with the emission standards specified in §§60.4204(a) or 60.4205(a), or if you are an owner or operator of a CI fire pump engine that is manufactured prior to the model years in table 3 to this subpart and must comply with the emission standards specified in §60.4205(c), you must demonstrate compliance according to one of the methods specified in paragraphs (b)(1) through (5) of this section.

1. Purchasing an engine certified according to 40 CFR part 89 or 40 CFR part 94, as applicable, for the same model year and maximum engine power. The engine must be installed and configured according to the manufacturer's specifications.

2. Keeping records of performance test results for each pollutant for a test conducted on a similar engine. The test must have been conducted using the same methods specified in this subpart and these methods must have been followed correctly.

3. Keeping records of engine manufacturer data indicating compliance with the standards.

4. Keeping records of control device vendor data indicating compliance with the standards.

5. Conducting an initial performance test to demonstrate compliance with the emission standards according to the requirements specified in §60.4212, as applicable.
(c) If you are an owner or operator of a 2007 model year and later stationary CI internal combustion engine and must comply with the emission standards specified in §60.4204(b) or §60.4205(b), or if you are an owner or operator of a CI fire pump engine that is manufactured during or after the model year that applies to your fire pump engine power rating in table 3 to this subpart and must comply with the emission standards specified in §60.4205(c), you must comply by purchasing an engine certified to the emission standards in §60.4204(b), or §60.4205(b) or (c), as applicable, for the same model year and maximum (or in the case of fire pumps, NFPA nameplate) engine power. The engine must be installed and configured according to the manufacturer’s specifications.

(e) Emergency stationary ICE may be operated for the purpose of maintenance checks and readiness testing, provided that the tests are recommended by Federal, State, or local government, the manufacturer, the vendor, or the insurance company associated with the engine. Maintenance checks and readiness testing of such units is limited to 100 hours per year. There is no time limit on the use of emergency stationary ICE in emergency situations. Anyone may petition the Administrator for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency ICE beyond 100 hours per year. For owners and operators of emergency engines meeting standards under §60.4205 but not §60.4204, any operation other than emergency operation, and maintenance and testing as permitted in this section, is prohibited.

Testing Requirements for Owners and Operators

§ 60.4212 What test methods and other procedures must I use if I am an owner or operator of a stationary CI internal combustion engine with a displacement of less than 30 liters per cylinder?

Owners and operators of stationary CI ICE with a displacement of less than 30 liters per cylinder who conduct performance tests pursuant to this subpart must do so according to paragraphs (a) through (d) of this section.

(a) The performance test must be conducted according to the in-use testing procedures in 40 CFR part 1039, subpart F.

(b) Exhaust emissions from stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR part 1039 must not exceed the not-to-exceed (NTE) standards for the same model year and maximum engine power as required in 40 CFR 1039.101(e) and 40 CFR 1039.102(g)(1), except as specified in 40 CFR 1039.104(d). This requirement starts when NTE requirements take effect for nonroad diesel engines under 40 CFR part 1039.

(c) Exhaust emissions from stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR 89.112 or 40 CFR 94.8, as applicable, must not exceed the NTE numerical requirements, rounded to the same number of decimal places as the applicable standard in 40 CFR 89.112 or 40 CFR 94.8, as applicable, determined from the following equation:

\[ \text{NTE requirement for each pollutant} = (1.25) \times (\text{STD}) \]  

(Eq. 1)

Where:

\[ \text{STD} = \text{The standard specified for that pollutant in 40 CFR 89.112 or 40 CFR 94.8, as applicable.} \]

Alternatively, stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR 89.112 or 40 CFR 94.8 may follow the testing procedures specified in §60.4213 of this subpart, as appropriate.
§ 60.4214 What are my notification, reporting, and recordkeeping requirements if I am an owner or operator of a stationary CI internal combustion engine?

(b) If the stationary CI internal combustion engine is an emergency stationary internal combustion engine, the owner or operator is not required to submit an initial notification. Starting with the model years in table 5 to this subpart, if the emergency engine does not meet the standards applicable to non-emergency engines in the applicable model year, the owner or operator must keep records of the operation of the engine in emergency and non-emergency service that are recorded through the non-resettable hour meter. The owner must record the time of operation of the engine and the reason the engine was in operation during that time.

(c) If the stationary CI internal combustion engine is equipped with a diesel particulate filter, the owner or operator must keep records of any corrective action taken after the backpressure monitor has notified the owner or operator that the high backpressure limit of the engine is approached.

Special Requirements

40 CFR 60.4217 What emission standards must I meet if I am an owner or operator of a stationary internal combustion engine using special fuels?

(a) Owners and operators of stationary CI ICE that do not use diesel fuel, or who have been given authority by the Administrator under §60.4207(d) of this subpart to use fuels that do not meet the fuel requirements of paragraphs (a) and (b) of §60.4207, may petition the Administrator for approval of alternative emission standards, if they can demonstrate that they use a fuel that is not the fuel on which the manufacturer of the engine certified the engine and that the engine cannot meet the applicable standards required in §60.4202 or §60.4203 using such fuels.

(b) [Reserved]

General Provisions

§ 60.4218 What parts of the General Provisions apply to me?

Table 8 to this subpart shows which parts of the General Provisions in §§60.1 through 60.19 apply to you.

Definitions

§ 60.4219 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the CAA and in subpart A of this part.

Combustion turbine means all equipment, including but not limited to the turbine, the fuel, air, lubrication and exhaust gas systems, control systems (except emissions control equipment), and any ancillary components and sub-components comprising any simple cycle combustion turbine, any regenerative/recuperative cycle combustion turbine, the combustion turbine portion of any cogeneration cycle combustion system, or the combustion turbine portion of any combined cycle steam/electric generating system.

Compression ignition means relating to a type of stationary internal combustion engine that is not a spark ignition engine.

Diesel fuel means any liquid obtained from the distillation of petroleum with a boiling point of approximately 150 to 360 degrees Celsius. One commonly used form is number 2 distillate oil.

Diesel particulate filter means an emission control technology that reduces PM emissions by trapping the particles in a flow filter substrate and periodically removes the collected particles by either physical action or by oxidizing (burning off) the particles in a process called regeneration.
**Emergency stationary internal combustion engine** means any stationary internal combustion engine whose operation is limited to emergency situations and required testing and maintenance. Examples include stationary ICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary ICE used to pump water in the case of fire or flood, etc. Stationary CI ICE used to supply power to an electric grid or that supply power as part of a financial arrangement with another entity are not considered to be emergency engines.

**Engine manufacturer** means the manufacturer of the engine. See the definition of “manufacturer” in this section.

**Fire pump engine** means an emergency stationary internal combustion engine certified to NFPA requirements that is used to provide power to pump water for fire suppression or protection.

**Manufacturer** has the meaning given in section 216(1) of the Act. In general, this term includes any person who manufactures a stationary engine for sale in the United States or otherwise introduces a new stationary engine into commerce in the United States. This includes importers who import stationary engines for sale or resale.

**Maximum engine power** means maximum engine power as defined in 40 CFR 1039.801.

**Model year** means either:

(1) The calendar year in which the engine was originally produced, or

(2) The annual new model production period of the engine manufacturer if it is different than the calendar year. This must include January 1 of the calendar year for which the model year is named. It may not begin before January 2 of the previous calendar year and it must end by December 31 of the named calendar year. For an engine that is converted to a stationary engine after being placed into service as a nonroad or other non-stationary engine, model year means the calendar year or new model production period in which the engine was originally produced.

**Other internal combustion engine** means any internal combustion engine, except combustion turbines, which is not a reciprocating internal combustion engine or rotary internal combustion engine.

**Reciprocating internal combustion engine** means any internal combustion engine which uses reciprocating motion to convert heat energy into mechanical work.

**Rotary internal combustion engine** means any internal combustion engine which uses rotary motion to convert heat energy into mechanical work.

**Spark ignition** means relating to a gasoline, natural gas, or liquefied petroleum gas fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Dual-fuel engines in which a liquid fuel (typically diesel fuel) is used for CI and gaseous fuel (typically natural gas) is used as the primary fuel at an annual average ratio of less than 2 parts diesel fuel to 100 parts total fuel on an energy equivalent basis are spark ignition engines.

**Stationary internal combustion engine** means any internal combustion engine, except combustion turbines, that converts heat energy into mechanical work and is not mobile. Stationary ICE differ from mobile ICE in that a stationary internal combustion engine is not a nonroad engine as defined at 40 CFR 1068.30 (excluding paragraph (2)(ii) of that definition), and is not used to propel a motor vehicle or a vehicle used solely for competition. Stationary ICE include reciprocating ICE, rotary ICE, and other ICE, except combustion turbines.

**Subpart** means 40 CFR part 60, subpart III.
Useful life means the period during which the engine is designed to properly function in terms of reliability and fuel consumption, without being remanufactured, specified as a number of hours of operation or calendar years, whichever comes first. The values for useful life for stationary CI ICE with a displacement of less than 10 liters per cylinder are given in 40 CFR 1039.101(g). The values for useful life for stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder are given in 40 CFR 94.9(a).

E.24.1 General Provisions Relating to NESHAP Subpart EEEE [326 IAC 20-83-1] [40 CFR Part 63, Subpart EEEE]

Pursuant to 40 CFR 63.2330 the Permittee shall comply with the provisions of 40 CFR Part 63 Subpart A – General Provisions, which are incorporated by reference as 326 IAC 20-1, except as otherwise specified in 40 CFR Part 63, Subpart EEEE.

E.24.2 NESHAP Subpart EEEE Requirements [40 CFR 63, Subpart EEEE] [326 IAC 20-83-1]

Pursuant to 40 CFR 63.2330, the Permittee shall comply with the provisions of 40 CFR 63, Subpart EEEE, which are incorporated by reference in 326 IAC 20-83-1, for the storage tank D-424 and other affected emissions units at this source, specified as follows:

What This Subpart Covers
§ 63.2330 What is the purpose of this subpart?

This subpart establishes national emission limitations, operating limits, and work practice standards for organic hazardous air pollutants (HAP) emitted from organic liquids distribution (OLD) (non-gasoline) operations at major sources of HAP emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations, operating limits, and work practice standards.

§ 63.2334 Am I subject to this subpart?

(a) Except as provided for in paragraphs (b) and (c) of this section, you are subject to this subpart if you own or operate an OLD operation that is located at, or is part of, a major source of HAP emissions. An OLD operation may occupy an entire plant site or be collocated with other industrial (e.g., manufacturing) operations at the same plant site.

(b) Organic liquid distribution operations located at research and development facilities, consistent with section 112(c)(7) of the Clean Air Act (CAA), are not subject to this subpart.

(c) Organic liquid distribution operations do not include the activities and equipment, including product loading racks, used to process, store, or transfer organic liquids at facilities listed in paragraph (c) (1) and (2) of this section.

(1) Oil and natural gas production field facilities, as the term “facility” is defined in §63.761 of subpart HH.

(2) Natural gas transmission and storage facilities, as the term “facility” is defined in §63.1271 of subpart HHH.

§ 63.2338 What parts of my plant does this subpart cover?

(a) This subpart applies to each new, reconstructed, or existing OLD operation affected source.

(b) Except as provided in paragraph (c) of this section, the affected source is the collection of activities and equipment used to distribute organic liquids into, out of, or within a facility that is a major source of HAP. The affected source is composed of:

(1) All storage tanks storing organic liquids.

(2) All transfer racks at which organic liquids are loaded into or unloaded out of transport vehicles and/or containers.

(3) All equipment leak components in organic liquids service that are associated with:

(i) Storage tanks storing organic liquids;

(ii) Transfer racks loading or unloading organic liquids;

(iii) Pipelines that transfer organic liquids directly between two storage tanks that are subject to this subpart;

(iv) Pipelines that transfer organic liquids directly between a storage tank subject to this subpart and a transfer rack subject to this subpart; and...
(v) Pipelines that transfer organic liquids directly between two transfer racks that are subject to this subpart.

(4) All transport vehicles while they are loading or unloading organic liquids at transfer racks subject to this subpart.

(5) All containers while they are loading or unloading organic liquids at transfer racks subject to this subpart.

(c) The equipment listed in paragraphs (c)(1) through (4) of this section and used in the identified operations is excluded from the affected source.

(1) Storage tanks, transfer racks, transport vehicles, containers, and equipment leak components that are part of an affected source under another 40 CFR part 63 national emission standards for hazardous air pollutants (NESHAP).

(2) Non-permanent storage tanks, transfer racks, transport vehicles, containers, and equipment leak components when used in special situation distribution loading and unloading operations (such as maintenance or upset liquids management).

(3) Storage tanks, transfer racks, transport vehicles, containers, and equipment leak components when used to conduct maintenance activities, such as stormwater management, liquid removal from tanks for inspections and maintenance, or changeovers to a different liquid stored in a storage tank.

(d) An affected source is a new affected source if you commenced construction of the affected source after April 2, 2002, and you meet the applicability criteria in §63.2334 at the time you commenced operation.

(e) An affected source is reconstructed if you meet the criteria for reconstruction as defined in §63.2.

(f) An affected source is existing if it is not new or reconstructed.

§ 63.2342 When do I have to comply with this subpart?

(a) If you have a new or reconstructed affected source, you must comply with this subpart according to the schedule identified in paragraph (a)(1), (a)(2), or (a)(3) of this section, as applicable.

(1)(i) Except as provided in paragraph (a)(1)(ii) of this section, if you startup your new affected source on or before February 3, 2004 or if you reconstruct your affected source on or before February 3, 2004, you must comply with the emission limitations, operating limits, and work practice standards for new and reconstructed sources in this subpart no later than February 3, 2004.

(ii) For any emission source listed in paragraph §63.2338(b) at an affected source that commenced construction or reconstruction after April 2, 2002, you must comply with the emission limitations, operating limits, and work practice standards for new and reconstructed sources in this subpart no later than February 3, 2004.

(ii) For any emission source listed in paragraph §63.2338(b) at an affected source that commenced construction or reconstruction after April 2, 2002, that is required to be controlled based on the applicability criteria in this subpart, but:

(A) Would not have been required to be controlled based on the applicability criteria as proposed for this subpart, you must comply with the emission limitations, operating limits, and work practice standards for each such emission source based on the schedule found in paragraph (b) of this section or at startup, whichever is later; or

(B) Would have been subject to a less stringent degree of control requirement as proposed for this subpart, you must comply with the emission limitations, operating limits, and work practice standards in this subpart for each such emission source based on the schedule found in paragraph (b) of this section or at startup, whichever is later, and if you start up your affected new or reconstructed source before February 5, 2007, you must comply with the emission limitations, operating limits, and work practice standards for each such emission source as proposed for this subpart, until you are required to comply with the emission limitations, operating limits, and work practice standards in this subpart for each such emission source based on the schedule found in paragraph (b) of this section.
(2) If you commence construction of or reconstruct your affected source after February 3, 2004, you must comply with the emission limitations, operating limits, and work practice standards for new and reconstructed sources in this subpart upon startup of your affected source.

(3) If, after startup of a new affected source, the total actual annual facility-level organic liquid loading volume at that source exceeds the criteria for control in Table 2 to this subpart, items 9 and 10, the owner or operator must comply with the transfer rack requirements specified in §63.2346(b) immediately; that is, be in compliance the first day of the period following the end of the 3-year period triggering the control criteria.

(b)(1) If you have an existing affected source, you must comply with the emission limitations, operating limits, and work practice standards for existing affected sources no later than February 5, 2007, except as provided in paragraphs (b)(2) and (3) of this section.

(2) Floating roof storage tanks at existing affected sources must be in compliance with the work practice standards in Table 4 to this subpart, item 1, at all times after the next degassing and cleaning activity or within 10 years after February 3, 2004, whichever occurs first. If the first degassing and cleaning activity occurs during the 3 years following February 3, 2004, the compliance date is February 5, 2007.

(3)(i) If an addition or change other than reconstruction as defined in §63.2 is made to an existing affected facility that causes the total actual annual facility-level organic liquid loading volume to exceed the criteria for control in Table 2 to this subpart, items 7 and 8, the owner or operator must comply with the transfer rack requirements specified in §63.2346(b) immediately; that is, be in compliance the first day of the period following the end of the 3-year period triggering the control criteria.

(ii) If the owner or operator believes that compliance with the transfer rack emission limits cannot be achieved immediately, as specified in paragraph (b)(3)(i) of this section, the owner or operator may submit a request for a compliance extension, as specified in paragraphs (b)(3)(ii)(A) through (I) of this section. Subject to paragraph (b)(3)(ii)(B) of this section, until an extension of compliance has been granted by the Administrator (or a State with an approved permit program) under this paragraph (b)(3)(ii), the owner or operator of the transfer rack subject to the requirements of this section shall comply with all applicable requirements of this subpart. Advice on requesting an extension of compliance may be obtained from the Administrator (or the State with an approved permit program).

(A) Submittal. The owner or operator shall submit a request for a compliance extension to the Administrator (or a State, when the State has an approved 40 CFR part 70 permit program and the source is required to obtain a 40 CFR part 70 permit under that program, or a State, when the State has been delegated the authority to implement and enforce the emission standard for that source) seeking an extension allowing the source up to 1 additional year to comply with the transfer rack standard, if such additional period is necessary for the installation of controls. The owner or operator of the affected source who has requested an extension of compliance under this paragraph (b)(3)(ii)(A) and who is otherwise required to obtain a title V permit shall apply for such permit, or apply to have the source's title V permit revised to incorporate the conditions of the extension of compliance. The conditions of an extension of compliance granted under this paragraph (b)(3)(ii)(A) will be incorporated into the affected source's title V permit according to the provisions of 40 CFR part 70 or Federal title V regulations in this chapter (42 U.S.C. 7661), whichever are applicable.

(B) When to submit. (1) Any request submitted under paragraph (b)(3)(ii)(A) of this section must be submitted in writing to the appropriate authority no later than 120 days prior to the affected source's compliance date (as specified in paragraph (b)(3)(i) of this section), except as provided for in paragraph (b)(3)(ii)(B)(2) of this section. Nonfrivolous requests submitted under this paragraph (b)(3)(ii)(B)(1) will stay the applicability of the rule as to the emission points in question until such time as the request is granted or denied. A denial will be effective as of the date of denial.
An owner or operator may submit a compliance extension request after the date specified in paragraph (b)(3)(ii)(B)(1) of this section provided the need for the compliance extension arose after that date, and before the otherwise applicable compliance date and the need arose due to circumstances beyond reasonable control of the owner or operator. This request must include, in addition to the information required in paragraph (b)(3)(ii)(C) of this section, a statement of the reasons additional time is needed and the date when the owner or operator first learned of the problems. Nonfrivolous requests submitted under this paragraph (b)(3)(ii)(B)(2) will stay the applicability of the rule as to the emission points in question until such time as the request is granted or denied. A denial will be effective as of the original compliance date.

(C) Information required. The request for a compliance extension under paragraph (b)(3)(ii)(A) of this section shall include the following information:

(1) The name and address of the owner or operator and the address of the existing source if it differs from the address of the owner or operator;

(2) The name, address, and telephone number of a contact person for further information;

(3) An identification of the organic liquid distribution operation and of the specific equipment for which additional compliance time is required;

(4) A description of the controls to be installed to comply with the standard;

(5) Justification for the length of time being requested; and

(6) A compliance schedule, including the date by which each step toward compliance will be reached. At a minimum, the list of dates shall include:

(i) The date by which on-site construction, installation of emission control equipment, or a process change is planned to be initiated;

(ii) The date by which on-site construction, installation of emission control equipment, or a process change is to be completed; and

(iii) The date by which final compliance is to be achieved.

(D) Approval of request for extension of compliance. Based on the information provided in any request made under paragraph (b)(3)(ii)(C) of this section, or other information, the Administrator (or the State with an approved permit program) may grant an extension of compliance with the transfer rack emission standard, as specified in paragraph (b)(3)(ii) of this section. The extension will be in writing and will—

(1) Identify each affected source covered by the extension;

(2) Specify the termination date of the extension;

(3) Specify the dates by which steps toward compliance are to be taken, if appropriate;

(4) Specify other applicable requirements to which the compliance extension applies (e.g., performance tests);

(5) Specify the contents of the progress reports to be submitted and the dates by which such reports are to be submitted, if required pursuant to paragraph (b)(3)(ii)(E) of this section.

(6) Under paragraph (b)(3)(ii) of this section, specify any additional conditions that the Administrator (or the State) deems necessary to assure installation of the necessary controls and protection of the health of persons during the extension period.

(E) Progress reports. The owner or operator of an existing source that has been granted an extension of compliance under paragraph (b)(3)(ii)(D) of this section may be required to submit to the Administrator (or the State with an approved permit program) progress reports indicating whether the steps toward compliance outlined in the compliance schedule have been reached.
(F) Notification of approval or intention to deny.  (1) The Administrator (or the State with an approved permit program) will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (b)(3)(ii) of this section.  The Administrator (or the State) will notify the owner or operator in writing of the status of his/her application; that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted.  The 30-day approval or denial period will begin after the owner or operator has been notified in writing that his/her application is complete.  Failure by the Administrator to act within 30 calendar days to approve or disapprove a request submitted under paragraph (b)(3)(ii) of this section does not constitute automatic approval of the request.

(2) When notifying the owner or operator that his/her application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after he/she is notified of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(3) Before denying any request for an extension of compliance, the Administrator (or the State with an approved permit program) will notify the owner or operator in writing of the Administrator’s (or the State’s) intention to issue the denial, together with:

(i) Notice of the information and findings on which the intended denial is based; and

(ii) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after he/she is notified of the intended denial, additional information or arguments to the Administrator (or the State) before further action on the request.

(4) The Administrator’s final determination to deny any request for an extension will be in writing and will set forth the specific grounds on which the denial is based.  The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(G) Termination of extension of compliance.  The Administrator (or the State with an approved permit program) may terminate an extension of compliance at an earlier date than specified if any specification under paragraph (b)(3)(ii)(D)(3) or paragraph (b)(3)(ii)(D)(4) of this section is not met.  Upon a determination to terminate, the Administrator will notify, in writing, the owner or operator of the Administrator’s determination to terminate, together with:

(1) Notice of the reason for termination; and

(2) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after he/she is notified of the determination to terminate, additional information or arguments to the Administrator before further action on the termination.

(3) A final determination to terminate an extension of compliance will be in writing and will set forth the specific grounds on which the termination is based.  The final determination will be made within 30 calendar days after presentation of additional information or arguments, or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(H) The granting of an extension under this section shall not abrogate the Administrator’s authority under section 114 of the CAA.

(I) Limitation on use of compliance extension.  The owner or operator may request an extension of compliance under the provisions specified in paragraph (b)(3)(ii) of this section only once for each facility.

(c) If you have an area source that does not commence reconstruction but increases its emissions or its potential to emit such that it becomes a major source of HAP emissions and an existing affected source subject to this subpart, you must be in compliance by 3 years after the area source becomes a major source.
You must meet the notification requirements in §§63.2343 and 63.2382(a), as applicable, according to the schedules in §63.2382(a) and (b)(1) through (3) and in subpart A of this part. Some of these notifications must be submitted before the compliance dates for the emission limitations, operating limits, and work practice standards in this subpart.

Testing and Initial Compliance Requirements
§ 63.2354 What performance tests, design evaluations, and performance evaluations must I conduct?

(a) For each performance test that you conduct, you must use the procedures specified in subpart SS of this part and the provisions specified in paragraph (b) of this section.

(b) For nonflare control devices, you must conduct each performance test according to the requirements in §63.7(e)(1), and either §63.988(b), §63.990(b), or §63.995(b), using the procedures specified in §63.997(e).

(b)(1) For nonflare control devices, you must conduct each performance test according to the requirements in §63.7(e)(1), and either §63.988(b), §63.990(b), or §63.995(b), using the procedures specified in §63.997(e).

(b)(2) You must conduct three separate test runs for each performance test on a nonflare control device as specified in §§63.7(e)(3) and 63.997(e)(1)(v). Each test run must last at least 1 hour, except as provided in §63.997(e)(1)(v)(A) and (B).

(b)(3)(i) In addition to EPA Method 25 or 25A of 40 CFR part 60, appendix A, to determine compliance with the organic HAP or TOC emission limit, you may use EPA Method 18 of 40 CFR part 60, appendix A, as specified in paragraph (b)(3)(i) of this section. As an alternative to EPA Method 18, you may use ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see §63.14), under the conditions specified in paragraph (b)(3)(ii) of this section.

(A) If you use EPA Method 18 to measure compliance with the percentage efficiency limit, you must first determine which organic HAP are present in the inlet gas stream (i.e., uncontrolled emissions) using knowledge of the organic liquids or the screening procedure described in EPA Method 18. In conducting the performance test, you must analyze samples collected as specified in EPA Method 18, simultaneously at the inlet and outlet of the control device. Quantify the emissions for the same organic HAP identified as present in the inlet gas stream for both the inlet and outlet gas streams of the control device.

(B) If you use EPA Method 18 of 40 CFR part 60, appendix A, to measure compliance with the emission concentration limit, you must first determine which organic HAP are present in the inlet gas stream using knowledge of the organic liquids or the screening procedure described in EPA Method 18. In conducting the performance test, analyze samples collected as specified in EPA Method 18 at the outlet of the control device. Quantify the control device outlet emission concentration for the same organic HAP identified as present in the inlet or uncontrolled gas stream.

(ii) You may use ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see §63.14), as an alternative to EPA Method 18 if the target concentration is between 150 parts per billion by volume and 100 ppmv and either of the conditions specified in paragraph (b)(2)(iii)(A) or (B) of this section exists. For target compounds not listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004) and not amenable to detection by mass spectrometry, you may not use ASTM D6420–99 (Reapproved 2004).

(A) The target compounds are those listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see §63.14),; or
(B) For target compounds not listed in Section 1.1 of ASTM D6420–99 (Reapproved 2004), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry (incorporated by reference, see §63.14), but potentially detected by mass spectrometry, the additional system continuing calibration check after each run, as detailed in ASTM D6420–99 (Reapproved 2004), Section 10.5.3, must be followed, met, documented, and submitted with the data report, even if there is no moisture condenser used or the compound is not considered water-soluble.

(4) If a principal component of the uncontrolled or inlet gas stream to the control device is formaldehyde, you may use EPA Method 316 of appendix A of this part instead of EPA Method 18 of 40 CFR part 60, appendix A, for measuring the formaldehyde. If formaldehyde is the predominant organic HAP in the inlet gas stream, you may use EPA Method 316 alone to measure formaldehyde either at the inlet and outlet of the control device using the formaldehyde control efficiency as a surrogate for total organic HAP or TOC efficiency, or at the outlet of a combustion device for determining compliance with the emission concentration limit.

(5) You may not conduct performance tests during periods of SSM, as specified in §63.7(e)(1).

(c) To determine the HAP content of the organic liquid, you may use EPA Method 311 of 40 CFR part 63, appendix A, or other method approved by the Administrator. In addition, you may use other means, such as voluntary consensus standards, material safety data sheets (MSDS), or certified product data sheets, to determine the HAP content of the organic liquid. If the method you select to determine the HAP content provides HAP content ranges, you must use the upper end of each HAP content range in determining the total HAP content of the organic liquid. The EPA may require you to test the HAP content of an organic liquid using EPA Method 311 or other method approved by the Administrator. If the results of the EPA Method 311 (or any other approved method) are different from the HAP content determined by another means, the EPA Method 311 (or approved method) results will govern.

Notifications, Reports, and Records

§ 63.2382 What notifications must I submit and when and what information should be submitted?

(a) You must submit each notification in subpart SS of this part, Table 12 to this subpart, and paragraphs (b) through (d) of this section that applies to you. You must submit these notifications according to the schedule in Table 12 to this subpart and as specified in paragraphs (b) through (d) of this section.

(b)(1) Initial Notification. If you startup your affected source before February 3, 2004, you must submit the Initial Notification no later than 120 calendar days after February 3, 2004.

(2) If you startup your new or reconstructed affected source on or after February 3, 2004, you must submit the Initial Notification no later than 120 days after initial startup.

(c) If you are required to conduct a performance test, you must submit the Notification of Intent to conduct the test at least 60 calendar days before it is initially scheduled to begin as required in §63.7(b)(1).

(d)(1) Notification of Compliance Status. If you are required to conduct a performance test, design evaluation, or other initial compliance demonstration as specified in Table 5, 6, or 7 to this subpart, you must submit a Notification of Compliance Status.

(2) The Notification of Compliance Status must include the information required in §63.999(b) and in paragraphs (d)(2)(i) through (viii) of this section.

(i) The results of any applicability determinations, emission calculations, or analyses used to identify and quantify organic HAP emissions from the affected source.

(ii) The results of emissions profiles, performance tests, engineering analyses, design evaluations, flare compliance assessments, inspections and repairs, and calculations used to demonstrate initial compliance according to Tables 6 and 7 to this subpart. For performance tests, results must include descriptions of sampling and analysis procedures and quality assurance procedures.
(iii) Descriptions of monitoring devices, monitoring frequencies, and the operating limits established during the initial compliance demonstrations, including data and calculations to support the levels you establish.

(iv) Descriptions of worst-case operating and/or testing conditions for the control device(s).

(v) Identification of emission sources subject to overlapping requirements described in §63.2396 and the authority under which you will comply.

(vi) The applicable information specified in §63.1039(a)(1) through (3) for all pumps and valves subject to the work practice standards for equipment leak components in Table 4 to this subpart, item 4.

(vii) If you are complying with the vapor balancing work practice standard for transfer racks according to Table 4 to this subpart, item 3.a, include a statement to that effect and a statement that the pressure vent settings on the affected storage tanks are greater than or equal to 2.5 psig.

(viii) The information specified in §63.2386(c)(10)(i), unless the information has already been submitted with the first Compliance report. If the information specified in §63.2386(c)(10)(i) has already been submitted with the first Compliance report, the information specified in §63.2386(d)(3) and (4), as applicable, shall be submitted instead.

§ 63.2386 What reports must I submit and when and what information is to be submitted in each?

(a) You must submit each report in subpart SS of this part, Table 11 to this subpart, Table 12 to this subpart, and in paragraphs (c) through (e) of this section that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under §63.10(a), you must submit each report according to Table 11 to this subpart and by the dates shown in paragraphs (b)(1) through (3) of this section, by the dates shown in subpart SS of this part, and by the dates shown in Table 12 to this subpart, whichever are applicable.

(1)(i) The first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.2342 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your affected source in §63.2342.

(ii) The first Compliance report must be postmarked no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in §63.2342.

(2)(i) Each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(ii) Each subsequent Compliance report must be postmarked no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(3) For each affected source that is subject to permitting regulations pursuant to 40 CFR part 70 or 40 CFR part 71, if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), you may submit the first and subsequent Compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) and (2) of this section.

(c) First Compliance report. The first Compliance report must contain the information specified in paragraphs (c)(1) through (10) of this section.

(1) Company name and address.

(2) Statement by a responsible official, including the official's name, title, and signature, certifying that, based on information and belief formed after reasonable inquiry, the statements and information in the report are true, accurate, and complete.

(3) Date of report and beginning and ending dates of the reporting period.

(4) Any changes to the information listed in §63.2382(d)(2) that have occurred since the submittal of the Notification of Compliance Status.
If you had a SSM during the reporting period and you took actions consistent with your SSM plan, the Compliance report must include the information described in §63.10(d)(5)(i).

If there are no deviations from any emission limitation or operating limit that applies to you and there are no deviations from the requirements for work practice standards, a statement that there were no deviations from the emission limitations, operating limits, or work practice standards during the reporting period.

If there were no periods during which the CMS was out of control as specified in §63.8(c)(7), a statement that there were no periods during which the CMS was out of control during the reporting period.

For closed vent systems and control devices used to control emissions, the information specified in paragraphs (c)(8)(i) and (ii) of this section for those planned routine maintenance activities that would require the control device to not meet the applicable emission limit.

A description of the planned routine maintenance that is anticipated to be performed for the control device during the next 6 months. This description must include the type of maintenance necessary, planned frequency of maintenance, and lengths of maintenance periods.

A description of the planned routine maintenance that was performed for the control device during the previous 6 months. This description must include the type of maintenance performed and the total number of hours during those 6 months that the control device did not meet the applicable emission limit due to planned routine maintenance.

A listing of all transport vehicles into which organic liquids were loaded at transfer racks that are subject to control based on the criteria specified in table 2 to this subpart, items 7 through 10, during the previous 6 months for which vapor tightness documentation as required in §63.2390(c) was not on file at the facility.

A listing of all transfer racks (except those racks at which only unloading of organic liquids occurs) and of tanks greater than or equal to 18.9 cubic meters (5,000 gallons) that are part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart.

If the information specified in paragraph (c)(10)(i) of this section has already been submitted with the Notification of Compliance Status, the information specified in paragraphs (d)(3) and (4) of this section, as applicable, shall be submitted instead.

Subsequent Compliance reports. Subsequent Compliance reports must contain the information in paragraphs (c)(1) through (9) of this section and, where applicable, the information in paragraphs (d)(1) through (4) of this section.

For each deviation from an emission limitation occurring at an affected source where you are using a CMS to comply with an emission limitation in this subpart, you must include in the Compliance report the applicable information in paragraphs (d)(1)(i) through (xii) of this section. This includes periods of SSM.

The date and time that each malfunction started and stopped.

The dates and times that each CMS was inoperative, except for zero (low-level) and high-level checks.

For each CMS that was out of control, the information in §63.8(c)(8).

The date and time that each deviation started and stopped, and whether each deviation occurred during a period of SSM, or during another period.

A summary of the total duration of the deviations during the reporting period, and the total duration as a percentage of the total emission source operating time during that reporting period.

A breakdown of the total duration of the deviations during the reporting period into those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.
(vii) A summary of the total duration of CMS downtime during the reporting period, and the total duration of CMS downtime as a percentage of the total emission source operating time during that reporting period.

(viii) An identification of each organic HAP that was potentially emitted during each deviation based on the known organic HAP contained in the liquid(s).

(ix) A brief description of the emission source(s) at which the CMS deviation(s) occurred.

(x) A brief description of each CMS that was out of control during the period.

(xi) The date of the latest certification or audit for each CMS.

(xii) A brief description of any changes in CMS, processes, or controls since the last reporting period.

(2) Include in the Compliance report the information in paragraphs (d)(2)(i) through (iii) of this section, as applicable.

(i) For each storage tank and transfer rack subject to control requirements, include periods of planned routine maintenance during which the control device did not comply with the applicable emission limits in table 2 to this subpart.

(ii) For each storage tank controlled with a floating roof, include a copy of the inspection record (required in §63.1065(b)) when inspection failures occur.

(iii) If you elect to use an extension for a floating roof inspection in accordance with §63.1063(c)(2)(iv)(B) or (e)(2), include the documentation required by those paragraphs.

(3)(i) A listing of any storage tank that became subject to controls based on the criteria for control specified in table 2 to this subpart, items 1 through 6, since the filing of the last Compliance report.

(ii) A listing of any transfer rack that became subject to controls based on the criteria for control specified in table 2 to this subpart, items 7 through 10, since the filing of the last Compliance report.

(4)(i) A listing of tanks greater than or equal to 18.9 cubic meters (5,000 gallons) that became part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart, since the last Compliance report.

(ii) A listing of all transfer racks (except those racks at which only the unloading of organic liquids occurs) that became part of the affected source but are not subject to any of the emission limitations, operating limits, or work practice standards of this subpart, since the last Compliance report.

(e) Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 40 CFR part 71 must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 71.6(a)(3)(iii)(A). If an affected source submits a Compliance report pursuant to table 11 to this subpart along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 71.6(a)(3)(iii)(A), and the Compliance report includes all required information concerning deviations from any emission limitation in this subpart, we will consider submission of the Compliance report as satisfying any obligation to report the same deviations in the semiannual monitoring report. However, submission of a Compliance report will not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the applicable title V permitting authority.

§ 63.2390  What records must I keep?

(a) For each emission source identified in §63.2338 that does not require control under this subpart, you must keep all records identified in §63.2343.

(b) For each emission source identified in §63.2338 that does require control under this subpart:

(1) You must keep all records identified in subpart SS of this part and in table 12 to this subpart that are applicable, including records related to notifications and reports, SSM, performance tests, CMS, and performance evaluation plans; and
(2) You must keep the records required to show continuous compliance, as required in subpart SS of this part and in tables 8 through 10 to this subpart, with each emission limitation, operating limit, and work practice standard that applies to you.

(c) For each transport vehicle into which organic liquids are loaded at a transfer rack that is subject to control based on the criteria specified in table 2 to this subpart, items 7 through 10, you must keep the applicable records in paragraphs (c)(1) and (2) of this section or alternatively the verification records in paragraph (c)(3) of this section.

(1) For transport vehicles equipped with vapor collection equipment, the documentation described in 40 CFR 60.505(b), except that the test title is: Transport Vehicle Pressure Test-EPA Reference Method 27.

(2) For transport vehicles without vapor collection equipment, current certification in accordance with the U.S. DOT pressure test requirements in 49 CFR part 180 for cargo tanks or 49 CFR 173.31 for tank cars.

(3) In lieu of keeping the records specified in paragraph (c)(1) or (2) of this section, as applicable, the owner or operator shall record that the verification of U.S. DOT tank certification or Method 27 of appendix A to 40 CFR part 60 testing, required in table 5 to this subpart, item 2, has been performed. Various methods for the record of verification can be used, such as: A check-off on a log sheet, a list of U.S. DOT serial numbers or Method 27 data, or a position description for gate security showing that the security guard will not allow any trucks on site that do not have the appropriate documentation.

(d) You must keep records of the total actual annual facility-level organic liquid loading volume as defined in §63.2406 through transfer racks to document the applicability, or lack thereof, of the emission limitations in table 2 to this subpart, items 7 through 10.

(e) An owner or operator who elects to comply with §63.2346(a)(4) shall keep the records specified in paragraphs (e)(1) through (3) of this section.

(1) A record of the U.S. DOT certification required by §63.2346(a)(4)(ii).

(2) A record of the pressure relief vent setting specified in §63.2348(a)(4)(v).

(3) If complying with §63.2348(a)(4)(vi)(B), keep the records specified in paragraphs (e)(3)(i) and (ii) of this section.

(i) A record of the equipment to be used and the procedures to be followed when reloading the cargo tank or tank car and displacing vapors to the storage tank from which the liquid originates.

(ii) A record of each time the vapor balancing system is used to comply with §63.2348(a)(4)(vi)(B).

§ 63.2394 In what form and how long must I keep my records?

(a) Your records must be in a form suitable and readily available for expeditious inspection and review according to §63.10(b)(1), including records stored in electronic form at a separate location.

(b) As specified in §63.10(b)(1), you must keep your files of all information (including all reports and notifications) for at least 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1). You may keep the records off site for the remaining 3 years.

§ 63.2398 What parts of the General Provisions apply to me?

Table 12 to this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you.
§ 63.2402 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by the U.S. Environmental Protection Agency (U.S. EPA) or a delegated authority such as your State, local, or eligible tribal agency. If the EPA Administrator has delegated authority to your State, local, or eligible tribal agency, then that agency, as well as the EPA, has the authority to implement and enforce this subpart. You should contact your EPA Regional Office (see list in §63.13) to find out if this subpart is delegated to your State, local, or eligible tribal agency.

(b) In delegating implementation and enforcement authority for this subpart to a State, local, or eligible tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraphs (b)(1) through (4) of this section are retained by the EPA Administrator and are not delegated to the State, local, or eligible tribal agency.

(1) Approval of alternatives to the nonopacity emission limitations, operating limits, and work practice standards in §63.2346(a) through (c) under §63.6(g).

(2) Approval of major changes to test methods under §63.7(e)(2)(ii) and (f) and as defined in §63.90.

(3) Approval of major changes to monitoring under §63.8(f) and as defined in §63.90.

(4) Approval of major changes to recordkeeping and reporting under §63.10(f) and as defined in §63.90.

§ 63.2406 What definitions apply to this subpart?

Terms used in this subpart are defined in the CAA, in §63.2, 40 CFR part 63, subparts H, PP, SS, TT, UU, and WW, and in this section. If the same term is defined in another subpart and in this section, it will have the meaning given in this section for purposes of this subpart.

Notwithstanding the introductory language in §63.921, the terms “container” and “safety device” shall have the meaning found in this subpart and not in §63.921.

Actual annual average temperature, for organic liquids, means the temperature determined using the following methods:

(1) For heated or cooled storage tanks, use the calculated annual average temperature of the stored organic liquid as determined from a design analysis of the storage tank.

(2) For ambient temperature storage tanks:

(i) Use the annual average of the local (nearest) normal daily mean temperatures reported by the National Climatic Data Center; or

(ii) Use any other method that the EPA approves.

Annual average true vapor pressure means the equilibrium partial pressure exerted by the total table 1 organic HAP in the stored or transferred organic liquid. For the purpose of determining if a liquid meets the definition of an organic liquid, the vapor pressure is determined using standard conditions of 77 degrees F and 29.92 inches of mercury. For the purpose of determining whether an organic liquid meets the applicability criteria in table 2, items 1 through 6, to this subpart, use the actual annual average temperature as defined in this subpart. The vapor pressure value in either of these cases is determined:

(1) In accordance with methods described in American Petroleum Institute Publication 2517, Evaporative Loss from External Floating-Roof Tanks (incorporated by reference, see §63.14);

(2) Using standard reference texts;

(3) By the American Society for Testing and Materials Method D2879–83, 96 (incorporated by reference, see §63.14); or

(4) Using any other method that the EPA approves.

Bottoms receiver means a tank that collects distillation bottoms before the stream is sent for storage or for further processing downstream.
**Cargo tank** means a liquid-carrying tank permanently attached and forming an integral part of a motor vehicle or truck trailer. This term also refers to the entire cargo tank motor vehicle or trailer. For the purpose of this subpart, vacuum trucks used exclusively for maintenance or spill response are not considered cargo tanks.

**Closed vent system** means a system that is not open to the atmosphere and is composed of piping, ductwork, connections, and, if necessary, flow-inducing devices that transport gas or vapors from an emission point to a control device. This system does not include the vapor collection system that is part of some transport vehicles or the loading arm or hose that is used for vapor return. For transfer racks, the closed vent system begins at, and includes, the first block valve on the downstream side of the loading arm or hose used to convey displaced vapors.

**Combustion device** means an individual unit of equipment, such as a flare, oxidizer, catalytic oxidizer, process heater, or boiler, used for the combustion of organic emissions.

**Container** means a portable unit in which a material can be stored, transported, treated, disposed of, or otherwise handled. Examples of containers include, but are not limited to, drums and portable cargo containers known as “portable tanks” or “totes.”

**Control device** means any combustion device, recovery device, recapture device, or any combination of these devices used to comply with this subpart. Such equipment or devices include, but are not limited to, absorbers, adsorbers, condensers, and combustion devices. Primary condensers, steam strippers, and fuel gas systems are not considered control devices.

**Crude oil** means any of the naturally occurring liquids commonly referred to as crude oil, regardless of specific physical properties. Only those crude oils downstream of the first point of custody transfer after the production field are considered crude oils in this subpart.

**Custody transfer** means the transfer of hydrocarbon liquids after processing and/or treatment in the producing operations, or from storage tanks or automatic transfer facilities to pipelines or any other forms of transportation.

**Design evaluation** means a procedure for evaluating control devices that complies with the requirements in §63.985(b)(1)(i).

**Deviation** means any instance in which an affected source subject to this subpart, or portion thereof, or an owner or operator of such a source:

1. Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limitation (including any operating limit) or work practice standard;

2. Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart, and that is included in the operating permit for any affected source required to obtain such a permit; or

3. Fails to meet any emission limitation (including any operating limit) or work practice standard in this subpart during SSM.

**Emission limitation** means an emission limit, opacity limit, operating limit, or visible emission limit.

**Equipment leak component** means each pump, valve, and sampling connection system used in organic liquids service at an OLD operation. Valve types include control, globe, gate, plug, and ball. Relief and check valves are excluded.

**Gasoline** means any petroleum distillate or petroleum distillate/alcohol blend having a Reid vapor pressure of 27.6 kilopascals (4.0 pounds per square inch absolute (psia)) or greater which is used as a fuel for internal combustion engines. Aviation gasoline is included in this definition.

**High throughput transfer rack** means those transfer racks that transfer into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) a total of 11.8 million liters per year or greater of organic liquids.

**In organic liquids service** means that an equipment leak component contains or contacts organic liquids having 5 percent by weight or greater of the organic HAP listed in Table 1 to this subpart.
Low throughput transfer rack means those transfer racks that transfer into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) less than 11.8 million liters per year of organic liquids.

On-site or on site means, with respect to records required to be maintained by this subpart or required by another subpart referenced by this subpart, that records are stored at a location within a major source which encompasses the affected source. On-site includes, but is not limited to, storage at the affected source to which the records pertain, storage in central files elsewhere at the major source, or electronically available at the site.

Organic liquid means:

(1) Any non-crude oil liquid or liquid mixture that contains 5 percent by weight or greater of the organic HAP listed in Table 1 to this subpart, as determined using the procedures specified in §63.2354(c).

(2) Any crude oils downstream of the first point of custody transfer.

(3) Organic liquids for purposes of this subpart do not include the following liquids:

   (i) Gasoline (including aviation gasoline), kerosene (No. 1 distillate oil), diesel (No. 2 distillate oil), asphalt, and heavier distillate oils and fuel oils;

   (ii) Any fuel consumed or dispensed on the plant site directly to users (such as fuels for fleet refueling or for refueling marine vessels that support the operation of the plant);

   (iii) Hazardous waste;

   (iv) Wastewater;

   (v) Ballast water: or

   (vi) Any non-crude oil liquid with an annual average true vapor pressure less than 0.7 kilopascals (0.1 psia).

Organic liquids distribution (OLD) operation means the combination of activities and equipment used to store or transfer organic liquids into, out of, or within a plant site regardless of the specific activity being performed. Activities include, but are not limited to, storage, transfer, blending, compounding, and packaging.

Permitting authority means one of the following:

(1) The State Air Pollution Control Agency, local agency, or other agency authorized by the EPA Administrator to carry out a permit program under 40 CFR part 70; or

(2) The EPA Administrator, in the case of EPA-implemented permit programs under title V of the CAA (42 U.S.C. 7661) and 40 CFR part 71.

Plant site means all contiguous or adjoining surface property that is under common control, including surface properties that are separated only by a road or other public right-of-way. Common control includes surface properties that are owned, leased, or operated by the same entity, parent entity, subsidiary, or any combination.

Research and development facility means laboratory and pilot plant operations whose primary purpose is to conduct research and development into new processes and products, where the operations are under the close supervision of technically trained personnel, and which are not engaged in the manufacture of products for commercial sale, except in a de minimis manner.

Responsible official means responsible official as defined in 40 CFR 70.2 and 40 CFR 71.2, as applicable.

Safety device means a closure device such as a pressure relief valve, frangible disc, fusible plug, or any other type of device that functions exclusively to prevent physical damage or permanent deformation to a unit or its air emission control equipment by venting gases or vapors directly to the atmosphere during unsafe conditions resulting from an unplanned, accidental, or emergency event.
Shutdown means the cessation of operation of an OLD affected source, or portion thereof (other than as part of normal operation of a batch-type operation), including equipment required or used to comply with this subpart, or the emptying and degassing of a storage tank. Shutdown as defined here includes, but is not limited to, events that result from periodic maintenance, replacement of equipment, or repair.

Startup means the setting in operation of an OLD affected source, or portion thereof (other than as part of normal operation of a batch-type operation), for any purpose. Startup also includes the placing in operation of any individual piece of equipment required or used to comply with this subpart including, but not limited to, control devices and monitors.

Storage tank means a stationary unit that is constructed primarily of nonearthen materials (such as wood, concrete, steel, or reinforced plastic) that provide structural support and is designed to hold a bulk quantity of liquid. Storage tanks do not include:

1. Units permanently attached to conveyances such as trucks, trailers, rail cars, barges, or ships;
2. Pressure vessels designed to operate in excess of 204.9 kilopascals and without emissions to the atmosphere;
3. Bottoms receivers;
4. Surge control vessels;
5. Vessels storing wastewater; or

Surge control vessel means feed drums, recycle drums, and intermediate vessels. Surge control vessels are used within chemical manufacturing processes when in-process storage, mixing, or management of flow rates or volumes is needed to assist in production of a product.

Tank car means a car designed to carry liquid freight by rail, and including a permanently attached tank.

Total actual annual facility-level organic liquid loading volume means the total facility-level actual volume of organic liquid loaded for transport within or out of the facility through transfer racks that are part of the affected source into transport vehicles (for existing affected sources) or into transport vehicles and containers (for new affected sources) based on a 3-year rolling average, calculated annually.

For existing affected sources, each 3-year rolling average is based on actual facility-level loading volume during each calendar year (January 1 through December 31) in the 3-year period. For calendar year 2004 only (the first year of the initial 3-year rolling average), if an owner or operator of an affected source does not have actual loading volume data for the time period from January 1, 2004, through February 2, 2004 (the time period prior to the effective date of the OLD NESHAP), the owner or operator shall compute a facility-level loading volume for this time period as follows: At the end of the 2004 calendar year, the owner or operator shall calculate a daily average facility-level loading volume (based on the actual loading volume for February 3, 2004, through December 31, 2004) and use that daily average to estimate the facility-level loading volume for the period of time from January 1, 2004, through February 2, 2004. The owner or operator shall then sum the estimated facility-level loading volume from January 1, 2004, through February 2, 2004, and the actual facility-level loading volume from February 3, 2004, through December 31, 2004, to calculate the annual facility-level loading volume for calendar year 2004.

For new affected sources, the 3-year rolling average is calculated as an average of three 12-month periods. An owner or operator must select as the beginning calculation date with which to start the calculations as either the initial startup date of the new affected source or the first day of the calendar month following the month in which startup occurs. Once selected, the date with which the calculations begin cannot be changed.
(ii) The initial 3-year rolling average is based on the projected maximum facility-level annual loading volume for each of the 3 years following the selected beginning calculation date. The second 3-year rolling average is based on actual facility-level loading volume for the first year of operation plus a new projected maximum facility-level annual loading volume for second and third years following the selected beginning calculation date. The third 3-year rolling average is based on actual facility-level loading volume for the first 2 years of operation plus a new projected maximum annual facility-level loading volume for the third year following the beginning calculation date. Subsequent 3-year rolling averages are based on actual facility-level loading volume for each year in the 3-year rolling average.

**Transfer rack** means a single system used to load organic liquids into, or unload organic liquids out of, transport vehicles or containers. It includes all loading and unloading arms, pumps, meters, shutoff valves, pressure relief discharges, and other piping and equipment necessary for the transfer operation. Transfer equipment and operations that are physically separate (i.e., do not share common piping, valves, and other equipment) are considered to be separate transfer racks.

**Transport vehicle** means a cargo tank or tank car.

**Vapor balancing system** means:

1. A piping system that collects organic HAP vapors displaced from transport vehicles or containers during loading and routes the collected vapors to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header. For containers, the piping system must route the displaced vapors directly to the appropriate storage tank or to another storage tank connected to a common header in order to qualify as a vapor balancing system; or

2. A piping system that collects organic HAP vapors displaced from the loading of a storage tank and routes the collected vapors to the transport vehicle from which the storage tank is filled.

**Vapor collection system** means any equipment located at the source (i.e., at the OLD operation) that is not open to the atmosphere; that is composed of piping, connections, and, if necessary, flow-inducing devices; and that is used for:

1. Containing and conveying vapors displaced during the loading of transport vehicles to a control device;

2. Containing and directly conveying vapors displaced during the loading of containers; or

3. Vapor balancing. This does not include any of the vapor collection equipment that is installed on the transport vehicle.

**Vapor-tight transport vehicle** means a transport vehicle that has been demonstrated to be vapor-tight. To be considered vapor-tight, a transport vehicle equipped with vapor collection equipment must undergo a pressure change of no more than 250 pascals (1 inch of water) within 5 minutes after it is pressurized to 4,500 pascals (18 inches of water). This capability must be demonstrated annually using the procedures specified in EPA Method 27 of 40 CFR part 60, appendix A. For all other transport vehicles, vapor tightness is demonstrated by performing the U.S. DOT pressure test procedures for tank cars and cargo tanks.

**Work practice standard** means any design, equipment, work practice, or operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the CAA.

**Table 1 to Subpart EEEE of Part 63—Organic Hazardous Air Pollutants**

You must use the organic HAP information listed in the following table to determine which of the liquids handled at your facility meet the HAP content criteria in the definition of Organic Liquid in §63.2406.

Subpart GGGa—Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for which Construction, Reconstruction, or Modification Commenced After November 7, 2006

E.25.1 General Provisions Relating to NSPS Subpart GGGa [40 CFR Part 60, Subpart A]

Pursuant to 40 CFR Part 60.1(a), the Permittee shall comply with the provisions of 40 CFR Part 60, Subpart A – General Provisions, for each compressor, valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service, except when otherwise specified in 40 CFR Part 60, Subpart GGGa.

E.25.2 NSPS Requirements for Subpart GGGa [40 CFR Part 60, Subpart GGGa]

Pursuant to 40 CFR 60.590a, the Permittee shall comply with the provisions of 40 CFR Part 60, Subpart GGGa, for the emission units listed in Condition E.25.1, as specified below:

§ 60.590a  Applicability and designation of affected facility.

(a)(1) The provisions of this subpart apply to affected facilities in petroleum refineries.

(2) A compressor is an affected facility.

(3) The group of all the equipment (defined in §60.591a) within a process unit is an affected facility.

(b) Any affected facility under paragraph (a) of this section that commences construction, reconstruction, or modification after November 7, 2006, is subject to the requirements of this subpart.

(c) Addition or replacement of equipment (defined in §60.591a) for the purpose of process improvement which is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(d) Facilities subject to subpart VV, subpart VVa, subpart GGG, or subpart KKK of this part are excluded from this subpart.

§ 60.591a  Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act, in subpart A of part 60, or in subpart VVa of this part, and the following terms shall have the specific meanings given them.

Alaskan North Slope means the approximately 69,000 square mile area extending from the Brooks Range to the Arctic Ocean.

Asphalt (also known as Bitumen) is a black or dark brown solid or semi-solid thermoplastic material possessing waterproofing and adhesive properties. It is a complex combination of higher molecular weight organic compounds containing a relatively high proportion of hydrocarbons having carbon numbers greater than C25 with a high carbon to hydrogen ratio. It is essentially non-volatile at ambient temperatures with closed cup flash point of 445 °F (230 °C) or greater.
Equipment means each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service. For the purposes of recordkeeping and reporting only, compressors are considered equipment.

In hydrogen service means that a compressor contains a process fluid that meets the conditions specified in §60.593a(b).

In light liquid service means that the piece of equipment contains a liquid that meets the conditions specified in §60.593a(c).

Petroleum means the crude oil removed from the earth and the oils derived from tar sands, shale, and coal.

Petroleum refinery means any facility engaged in producing gasoline, kerosene, distillate fuel oils, residual fuel oils, lubricants, or other products through the distillation of petroleum, or through the redistillation, cracking, or reforming of unfinished petroleum derivatives.

Process unit means the components assembled and connected by pipes or ducts to process raw materials and to produce intermediate or final products from petroleum, unfinished petroleum derivatives, or other intermediates. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the product. For the purpose of this subpart, process unit includes any feed, intermediate and final product storage vessels (except as specified in §60.482–1a(g)), product transfer racks, and connected ducts and piping. A process unit includes all equipment as defined in this subpart.

§ 60.592a Standards.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the requirements of §§60.482–1a to 60.482–10a as soon as practicable, but no later than 180 days after initial startup.

(b) For a given process unit, an owner or operator may elect to comply with the requirements of paragraphs (b)(1), (2), or (3) of this section as an alternative to the requirements in §60.482–7a.

(1) Comply with §60.483–1a.

(2) Comply with §60.483–2a.

(3) Comply with the Phase III provisions in §63.168, except an owner or operator may elect to follow the provisions in §60.482–7a(f) instead of §63.168 for any valve that is designated as being leakless.

(c) An owner or operator may apply to the Administrator for a determination of equivalency for any means of emission limitation that achieves a reduction in emissions of VOC at least equivalent to the reduction in emissions of VOC achieved by the controls required in this subpart. In doing so, the owner or operator shall comply with requirements of §60.484a.
(d) Each owner or operator subject to the provisions of this subpart shall comply with the provisions of §60.485a except as provided in §60.593a.

(e) Each owner or operator subject to the provisions of this subpart shall comply with the provisions of §§60.486a and 60.487a.

§ 60.593a Exceptions.

(a) Each owner or operator subject to the provisions of this subpart may comply with the following exceptions to the provisions of subpart VVa of this part.

(b)(1) Compressors in hydrogen service are exempt from the requirements of §60.592a if an owner or operator demonstrates that a compressor is in hydrogen service.

(2) Each compressor is presumed not to be in hydrogen service unless an owner or operator demonstrates that the piece of equipment is in hydrogen service. For a piece of equipment to be considered in hydrogen service, it must be determined that the percent hydrogen content can be reasonably expected always to exceed 50 percent by volume. For purposes of determining the percent hydrogen content in the process fluid that is contained in or contacts a compressor, procedures that conform to the general method described in ASTM E260–73, 91, or 96, E168–67, 77, or 92, or E169–63, 77, or 93 (incorporated by reference as specified in §60.17) shall be used.

(3)(i) An owner or operator may use engineering judgment rather than procedures in paragraph (b)(2) of this section to demonstrate that the percent content exceeds 50 percent by volume, provided the engineering judgment demonstrates that the content clearly exceeds 50 percent by volume. When an owner or operator and the Administrator do not agree on whether a piece of equipment is in hydrogen service, however, the procedures in paragraph (b)(2) of this section shall be used to resolve the disagreement.

(ii) If an owner or operator determines that a piece of equipment is in hydrogen service, the determination can be revised only after following the procedures in paragraph (b)(2).

(c) Any existing reciprocating compressor that becomes an affected facility under provisions of §60.14 or §60.15 is exempt from §60.482–3a(a), (b), (c), (d), (e), and (h) provided the owner or operator demonstrates that recasting the distance piece or replacing the compressor are the only options available to bring the compressor into compliance with the provisions of §60.482–3a(a), (b), (c), (d), (e), and (h).

(d) An owner or operator may use the following provision in addition to §60.485a(e): Equipment is in light liquid service if the percent evaporated is greater than 10 percent at 150 °C as determined by ASTM Method D86–78, 82, 90, 93, 95, or 96 (incorporated by reference as specified in §60.17).

(e) Pumps in light liquid service and valves in gas/vapor and light liquid service within a process unit that is located in the Alaskan North Slope are exempt from the requirements of §§60.482–2a and 60.482–7a.

(f) Open-ended valves or lines containing asphalt as defined in §60.591a are exempt from the requirements of §60.482–6a(a) through (c).
(g) Connectors in gas/vapor or light liquid service are exempt from the requirements in §60.482–11a, provided the owner or operator complies with §60.482–8a for all connectors, not just those in heavy liquid service.

E.26.1 General Provisions Relating to NSPS Subpart VVa [40 CFR Part 60, Subpart A]

Pursuant to 40 CFR Part 60.1(a), the Permittee shall comply with the provisions of 40 CFR Part 60, Subpart A – General Provisions, for each compressor, valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service, except when otherwise specified in 40 CFR Part 60, Subpart VVa.

E.26.2 NSPS Requirements for Subpart VVa [40 CFR Part 60, Subpart VVa]

Pursuant to 40 CFR 60.480a, the Permittee shall comply with the provisions of 40 CFR Part 60, Subpart VVa, for the emission units listed in Condition E.26.1, as specified below:

§ 60.480a Applicability and designation of affected facility.

(a)(1) The provisions of this subpart apply to affected facilities in the synthetic organic chemicals manufacturing industry.

(2) The group of all equipment (defined in §60.481a) within a process unit is an affected facility.

(b) Any affected facility under paragraph (a) of this section that commences construction, reconstruction, or modification after November 7, 2006, shall be subject to the requirements of this subpart.

(c) Addition or replacement of equipment for the purpose of process improvement which is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(d)(1) If an owner or operator applies for one or more of the exemptions in this paragraph, then the owner or operator shall maintain records as required in §60.486a(i).

(2) Any affected facility that has the design capacity to produce less than 1,000 Mg/yr (1,102 ton/yr) of a chemical listed in §60.489 is exempt from §§60.482–1a through 60.482–11a.

(3) If an affected facility produces heavy liquid chemicals only from heavy liquid feed or raw materials, then it is exempt from §§60.482–1a through 60.482–11a.

(4) Any affected facility that produces beverage alcohol is exempt from §§60.482–1a through 60.482–11a.

(5) Any affected facility that has no equipment in volatile organic compounds (VOC) service is exempt from §§60.482–1a through 60.482–11a.

(e) Alternative means of compliance — (1) Option to comply with part 65. (i) Owners or operators may choose to comply with the provisions of 40 CFR part 65, subpart F, to satisfy the requirements of §§60.482–1a through 60.487a for an affected facility. When choosing to comply with 40 CFR part 65, subpart F, the requirements of §§60.485a(d), (e),
and (f), and 60.486a(i) and (j) still apply. Other provisions applying to an owner or operator who chooses to comply with 40 CFR part 65 are provided in 40 CFR 65.1.

(ii) **Part 60, subpart A.** Owners or operators who choose to comply with 40 CFR part 65, subpart F must also comply with §§60.1, 60.2, 60.5, 60.6, 60.7(a)(1) and (4), 60.14, 60.15, and 60.16 for that equipment. All sections and paragraphs of subpart A of this part that are not mentioned in this paragraph (e)(1)(ii) do not apply to owners or operators of equipment subject to this subpart complying with 40 CFR part 65, subpart F, except that provisions required to be met prior to implementing 40 CFR part 65 still apply. Owners and operators who choose to comply with 40 CFR part 65, subpart F, must comply with 40 CFR part 65, subpart A.

(2) **Part 63, subpart H.** (i) Owners or operators may choose to comply with the provisions of 40 CFR part 63, subpart H, to satisfy the requirements of §§60.482–1a through 60.487a for an affected facility. When choosing to comply with 40 CFR part 63, subpart H, the requirements of §60.485a(d), (e), and (f), and §60.486a(i) and (j) still apply.

(ii) **Part 60, subpart A.** Owners or operators who choose to comply with 40 CFR part 63, subpart H must also comply with §§60.1, 60.2, 60.5, 60.6, 60.7(a)(1) and (4), 60.14, 60.15, and 60.16 for that equipment. All sections and paragraphs of subpart A of this part that are not mentioned in this paragraph (e)(2)(ii) do not apply to owners or operators of equipment subject to this subpart complying with 40 CFR part 63, subpart H, except that provisions required to be met prior to implementing 40 CFR part 63 still apply. Owners and operators who choose to comply with 40 CFR part 63, subpart H, must comply with 40 CFR part 63, subpart A.

§ 60.481a Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act (CAA) or in subpart A of part 60, and the following terms shall have the specific meanings given them.

**Capital expenditure** means, in addition to the definition in 40 CFR 60.2, an expenditure for a physical or operational change to an existing facility that:

(a) Exceeds \( P \), the product of the facility's replacement cost, \( R \), and an adjusted annual asset guideline repair allowance, \( A \), as reflected by the following equation: \( P = R \times A \), where:

(1) The adjusted annual asset guideline repair allowance, \( A \), is the product of the percent of the replacement cost, \( Y \), and the applicable basic annual asset guideline repair allowance, \( B \), divided by 100 as reflected by the following equation:

\[
A = Y \times \left( \frac{B}{100} \right);
\]

(2) The percent \( Y \) is determined from the following equation: \( Y = 1.0 - 0.575 \log X \), where \( X \) is 2006 minus the year of construction; and

(3) The applicable basic annual asset guideline repair allowance, \( B \), is selected from the following table consistent with the applicable subpart:
Table for Determining Applicable Value for B

**Closed-loop system** means an enclosed system that returns process fluid to the process.

**Closed-purge system** means a system or combination of systems and portable containers to capture purged liquids. Containers for purged liquids must be covered or closed when not being filled or emptied.

**Closed vent system** means a system that is not open to the atmosphere and that is composed of hard-piping, ductwork, connections, and, if necessary, flow-inducing devices that transport gas or vapor from a piece or pieces of equipment to a control device or back to a process.

**Connector** means flanged, screwed, or other joined fittings used to connect two pipe lines or a pipe line and a piece of process equipment or that close an opening in a pipe that could be connected to another pipe. Joined fittings welded completely around the circumference of the interface are not considered connectors for the purpose of this regulation.

**Control device** means an enclosed combustion device, vapor recovery system, or flare.

**Distance piece** means an open or enclosed casing through which the piston rod travels, separating the compressor cylinder from the crankcase.

**Double block and bleed system** means two block valves connected in series with a bleed valve or line that can vent the line between the two block valves.

**Duct work** means a conveyance system such as those commonly used for heating and ventilation systems. It is often made of sheet metal and often has sections connected by screws or crimping. Hard-piping is not ductwork.

**Equipment** means each pump, compressor, pressure relief device, sampling connection system, open-ended valve or line, valve, and flange or other connector in VOC service and any devices or systems required by this subpart.

**First attempt at repair** means to take action for the purpose of stopping or reducing leakage of organic material to the atmosphere using best practices.

**Fuel gas** means gases that are combusted to derive useful work or heat.

**Fuel gas system** means the offsite and onsite piping and flow and pressure control system that gathers gaseous stream(s) generated by onsite operations, may blend them with other sources of gas, and transports the gaseous stream for use as fuel gas in combustion devices or in-process combustion equipment, such as furnaces and gas turbines, either singly or in combination.
Hard-piping means pipe or tubing that is manufactured and properly installed using good engineering judgment and standards such as ASME B31.3, Process Piping (available from the American Society of Mechanical Engineers, P.O. Box 2300, Fairfield, NJ 07007–2300).

In gas/vapor service means that the piece of equipment contains process fluid that is in the gaseous state at operating conditions.

In heavy liquid service means that the piece of equipment is not in gas/vapor service or in light liquid service.

In light liquid service means that the piece of equipment contains a liquid that meets the conditions specified in §60.485a(c).

In-situ sampling systems means nonextractive samplers or in-line samplers.

In vacuum service means that equipment is operating at an internal pressure which is at least 5 kilopascals (kPa) (0.7 psia) below ambient pressure.

In VOC service means that the piece of equipment contains or contacts a process fluid that is at least 10 percent VOC by weight. (The provisions of §60.485a(d) specify how to determine that a piece of equipment is not in VOC service.)

Initial calibration value means the concentration measured during the initial calibration at the beginning of each day required in §60.485a(b)(1), or the most recent calibration if the instrument is recalibrated during the day (i.e., the calibration is adjusted) after a calibration drift assessment.

Liquids dripping means any visible leakage from the seal including spraying, misting, clouding, and ice formation.

Open-ended valve or line means any valve, except safety relief valves, having one side of the valve seat in contact with process fluid and one side open to the atmosphere, either directly or through open piping.

Pressure release means the emission of materials resulting from system pressure being greater than set pressure of the pressure relief device.

Process improvement means routine changes made for safety and occupational health requirements, for energy savings, for better utility, for ease of maintenance and operation, for correction of design deficiencies, for bottleneck removal, for changing product requirements, or for environmental control.

Process unit means the components assembled and connected by pipes or ducts to process raw materials and to produce, as intermediate or final products, one or more of the chemicals listed in §60.489. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the product. For the purpose of this subpart, process unit includes any feed, intermediate and final product storage vessels (except as specified in §60.482–1a(g)), product transfer racks, and connected ducts and piping. A process unit includes all equipment as defined in this subpart.
Process unit shutdown means a work practice or operational procedure that stops production from a process unit or part of a process unit during which it is technically feasible to clear process material from a process unit or part of a process unit consistent with safety constraints and during which repairs can be accomplished. The following are not considered process unit shutdowns:

(1) An unscheduled work practice or operational procedure that stops production from a process unit or part of a process unit for less than 24 hours.

(2) An unscheduled work practice or operational procedure that would stop production from a process unit or part of a process unit for a shorter period of time than would be required to clear the process unit or part of the process unit of materials and start up the unit, and would result in greater emissions than delay of repair of leaking components until the next scheduled process unit shutdown.

(3) The use of spare equipment and technically feasible bypassing of equipment without stopping production.

Quarter means a 3-month period; the first quarter concludes on the last day of the last full month during the 180 days following initial startup.

Repaired means that equipment is adjusted, or otherwise altered, in order to eliminate a leak as defined in the applicable sections of this subpart and, except for leaks identified in accordance with §§60.482–2a(b)(2)(ii) and (d)(6)(ii) and (d)(6)(iii), 60.482–3a(f), and 60.482–10a(f)(1)(ii), is re-monitored as specified in §60.485a(b) to verify that emissions from the equipment are below the applicable leak definition.

Replacement cost means the capital needed to purchase all the depreciable components in a facility.

Sampling connection system means an assembly of equipment within a process unit used during periods of representative operation to take samples of the process fluid. Equipment used to take nonroutine grab samples is not considered a sampling connection system.

Sensor means a device that measures a physical quantity or the change in a physical quantity such as temperature, pressure, flow rate, pH, or liquid level.

Storage vessel means a tank or other vessel that is used to store organic liquids that are used in the process as raw material feedstocks, produced as intermediates or final products, or generated as wastes. Storage vessel does not include vessels permanently attached to motor vehicles, such as trucks, railcars, barges or ships.

Synthetic organic chemicals manufacturing industry means the industry that produces, as intermediates or final products, one or more of the chemicals listed in §60.489.

Transfer rack means the collection of loading arms and loading hoses, at a single loading rack, that are used to fill tank trucks and/or railcars with organic liquids.

Volatile organic compounds or VOC means, for the purposes of this subpart, any reactive organic compounds as defined in §60.2 Definitions.
§ 60.482-1a Standards: General.

(a) Each owner or operator subject to the provisions of this subpart shall demonstrate compliance with the requirements of §§60.482–1a through 60.482–10a or §60.480a(e) for all equipment within 180 days of initial startup.

(b) Compliance with §§60.482–1a to 60.482–10a will be determined by review of records and reports, review of performance test results, and inspection using the methods and procedures specified in §60.485a.

(c)(1) An owner or operator may request a determination of equivalence of a means of emission limitation to the requirements of §§60.482–2a, 60.482–3a, 60.482–5a, 60.482–6a, 60.482–7a, 60.482–8a, and 60.482–10a as provided in §60.484a.

(2) If the Administrator makes a determination that a means of emission limitation is at least equivalent to the requirements of §§60.482–2a, 60.482–3a, 60.482–5a, 60.482–6a, 60.482–7a, 60.482–8a, or 60.482–10a, an owner or operator shall comply with the requirements of that determination.

(d) Equipment that is in vacuum service is excluded from the requirements of §§60.482–2a through 60.482–10a if it is identified as required in §60.486a(e)(5).

(e) Equipment that an owner or operator designates as being in VOC service less than 300 hr/yr is excluded from the requirements of §§60.482–2a through 60.482–11a if it is identified as required in §60.486a(e)(6) and it meets any of the conditions specified in paragraphs (e)(1) through (3) of this section.

(1) The equipment is in VOC service only during startup and shutdown, excluding startup and shutdown between batches of the same campaign for a batch process.

(2) The equipment is in VOC service only during process malfunctions or other emergencies.

(3) The equipment is backup equipment that is in VOC service only when the primary equipment is out of service.

(f)(1) If a dedicated batch process unit operates less than 365 days during a year, an owner or operator may monitor to detect leaks from pumps, valves, and open-ended valves or lines at the frequency specified in the following table instead of monitoring as specified in §§60.482–2a, 60.482–7a, and 60.483.2a:

<table>
<thead>
<tr>
<th>Operating time (percent of hours during year)</th>
<th>Equivalent monitoring frequency time in use</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Monthly</td>
</tr>
<tr>
<td>0 to &lt;25</td>
<td>Quarterly</td>
</tr>
<tr>
<td>25 to &lt;50</td>
<td>Quarterly</td>

<tr>
<td>50 to &lt;75</td>
<td>Bimonthly</td>
</tr>
<tr>
<td>75 to 100</td>
<td>Monthly</td>
</tr>
</tbody>
</table>
(2) Pumps and valves that are shared among two or more batch process units that are subject to this subpart may be monitored at the frequencies specified in paragraph (f)(1) of this section, provided the operating time of all such process units is considered.

(3) The monitoring frequencies specified in paragraph (f)(1) of this section are not requirements for monitoring at specific intervals and can be adjusted to accommodate process operations. An owner or operator may monitor at any time during the specified monitoring period (e.g., month, quarter, year), provided the monitoring is conducted at a reasonable interval after completion of the last monitoring campaign. Reasonable intervals are defined in paragraphs (f)(3)(i) through (iv) of this section.

(i) When monitoring is conducted quarterly, monitoring events must be separated by at least 30 calendar days.

(ii) When monitoring is conducted semiannually (i.e., once every 2 quarters), monitoring events must be separated by at least 60 calendar days.

(iii) When monitoring is conducted in 3 quarters per year, monitoring events must be separated by at least 90 calendar days.

(iv) When monitoring is conducted annually, monitoring events must be separated by at least 120 calendar days.

(g) If the storage vessel is shared with multiple process units, the process unit with the greatest annual amount of stored materials (predominant use) is the process unit the storage vessel is assigned to. If the storage vessel is shared equally among process units, and one of the process units has equipment subject to this subpart, the storage vessel is assigned to that process unit. If the storage vessel is shared equally among process units, none of which have equipment subject to this subpart of this part, the storage vessel is assigned to any process unit subject to subpart VV of this part. If the predominant use of the storage vessel varies from year to year, then the owner or operator must estimate the predominant use initially and reassess every 3 years. The owner or operator must keep records of the information and supporting calculations that show how predominant use is determined. All equipment on the storage vessel must be monitored when in VOC service.

§ 60.482-2a Standards: Pumps in light liquid service.

(a)(1) Each pump in light liquid service shall be monitored monthly to detect leaks by the methods specified in §60.485a(b), except as provided in §60.482–1a(c) and (f) and paragraphs (d), (e), and (f) of this section. A pump that begins operation in light liquid service after the initial startup date for the process unit must be monitored for the first time within 30 days after the end of its startup period, except for a pump that replaces a leaking pump and except as provided in §60.482–1a(c) and paragraphs (d), (e), and (f) of this section.

(2) Each pump in light liquid service shall be checked by visual inspection each calendar week for indications of liquids dripping from the pump seal, except as provided in §60.482–1a(f).
(b)(1) The instrument reading that defines a leak is specified in paragraphs (b)(1)(i) and (ii) of this section.

(i) 5,000 parts per million (ppm) or greater for pumps handling polymerizing monomers;

(ii) 2,000 ppm or greater for all other pumps.

(2) If there are indications of liquids dripping from the pump seal, the owner or operator shall follow the procedure specified in either paragraph (b)(2)(i) or (ii) of this section. This requirement does not apply to a pump that was monitored after a previous weekly inspection and the instrument reading was less than the concentration specified in paragraph (b)(1)(i) or (ii) of this section, whichever is applicable.

(i) Monitor the pump within 5 days as specified in §60.485a(b). A leak is detected if the instrument reading measured during monitoring indicates a leak as specified in paragraph (b)(1)(i) or (ii) of this section, whichever is applicable. The leak shall be repaired using the procedures in paragraph (c) of this section.

(ii) Designate the visual indications of liquids dripping as a leak, and repair the leak using either the procedures in paragraph (c) of this section or by eliminating the visual indications of liquids dripping.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in §60.482–9a.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected. First attempts at repair include, but are not limited to, the practices described in paragraphs (c)(2)(i) and (ii) of this section, where practicable.

(i) Tightening the packing gland nuts;

(ii) Ensuring that the seal flush is operating at design pressure and temperature.

(d) Each pump equipped with a dual mechanical seal system that includes a barrier fluid system is exempt from the requirements of paragraph (a) of this section, provided the requirements specified in paragraphs (d)(1) through (6) of this section are met.

(1) Each dual mechanical seal system is:

(i) Operated with the barrier fluid at a pressure that is at all times greater than the pump stuffing box pressure; or

(ii) Equipped with a barrier fluid degassing reservoir that is routed to a process or fuel gas system or connected by a closed vent system to a control device that complies with the requirements of §60.482–10a; or

(iii) Equipped with a system that purges the barrier fluid into a process stream with zero VOC emissions to the atmosphere.

(2) The barrier fluid system is in heavy liquid service or is not in VOC service.
(3) Each barrier fluid system is equipped with a sensor that will detect failure of the seal system, the barrier fluid system, or both.

(4)(i) Each pump is checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seals.

(ii) If there are indications of liquids dripping from the pump seal at the time of the weekly inspection, the owner or operator shall follow the procedure specified in either paragraph (d)(4)(ii)(A) or (B) of this section prior to the next required inspection.

(A) Monitor the pump within 5 days as specified in §60.485a(b) to determine if there is a leak of VOC in the barrier fluid. If an instrument reading of 2,000 ppm or greater is measured, a leak is detected.

(B) Designate the visual indications of liquids dripping as a leak.

(5)(i) Each sensor as described in paragraph (d)(3) is checked daily or is equipped with an audible alarm.

(ii) The owner or operator determines, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(iii) If the sensor indicates failure of the seal system, the barrier fluid system, or both, based on the criterion established in paragraph (d)(5)(ii) of this section, a leak is detected.

(6)(i) When a leak is detected pursuant to paragraph (d)(4)(ii)(A) of this section, it shall be repaired as specified in paragraph (c) of this section.

(ii) A leak detected pursuant to paragraph (d)(5)(iii) of this section shall be repaired within 15 days of detection by eliminating the conditions that activated the sensor.

(iii) A designated leak pursuant to paragraph (d)(4)(ii)(B) of this section shall be repaired within 15 days of detection by eliminating visual indications of liquids dripping.

(e) Any pump that is designated, as described in §60.486a(e)(1) and (2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (c), and (d) of this section if the pump:

(1) Has no externally actuated shaft penetrating the pump housing;

(2) Is demonstrated to be operating with no detectable emissions as indicated by an instrument reading of less than 500 ppm above background as measured by the methods specified in §60.485a(c); and

(3) Is tested for compliance with paragraph (e)(2) of this section initially upon designation, annually, and at other times requested by the Administrator.

(f) If any pump is equipped with a closed vent system capable of capturing and transporting any leakage from the seal or seals to a process or to a fuel gas system or to a
control device that complies with the requirements of §60.482–10a, it is exempt from paragraphs (a) through (e) of this section.

(g) Any pump that is designated, as described in §60.486a(f)(1), as an unsafe-to-monitor pump is exempt from the monitoring and inspection requirements of paragraphs (a) and (d)(4) through (6) of this section if:

(1) The owner or operator of the pump demonstrates that the pump is unsafe-to-monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section; and

(2) The owner or operator of the pump has a written plan that requires monitoring of the pump as frequently as practicable during safe-to-monitor times, but not more frequently than the periodic monitoring schedule otherwise applicable, and repair of the equipment according to the procedures in paragraph (c) of this section if a leak is detected.

(h) Any pump that is located within the boundary of an unmanned plant site is exempt from the weekly visual inspection requirement of paragraphs (a)(2) and (d)(4) of this section, and the daily requirements of paragraph (d)(5) of this section, provided that each pump is visually inspected as often as practicable and at least monthly.

§ 60.482-3a Standards: Compressors.

(a) Each compressor shall be equipped with a seal system that includes a barrier fluid system and that prevents leakage of VOC to the atmosphere, except as provided in §60.482–1a(c) and paragraphs (h), (i), and (j) of this section.

(b) Each compressor seal system as required in paragraph (a) of this section shall be:

(1) Operated with the barrier fluid at a pressure that is greater than the compressor stuffing box pressure; or

(2) Equipped with a barrier fluid system degassing reservoir that is routed to a process or fuel gas system or connected by a closed vent system to a control device that complies with the requirements of §60.482–10a; or

(3) Equipped with a system that purges the barrier fluid into a process stream with zero VOC emissions to the atmosphere.

(c) The barrier fluid system shall be in heavy liquid service or shall not be in VOC service.

(d) Each barrier fluid system as described in paragraph (a) shall be equipped with a sensor that will detect failure of the seal system, barrier fluid system, or both.

(e)(1) Each sensor as required in paragraph (d) of this section shall be checked daily or shall be equipped with an audible alarm.

(2) The owner or operator shall determine, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.
(f) If the sensor indicates failure of the seal system, the barrier system, or both based on the criterion determined under paragraph (e)(2) of this section, a leak is detected.

(g)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in §60.482–9a.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(h) A compressor is exempt from the requirements of paragraphs (a) and (b) of this section, if it is equipped with a closed vent system to capture and transport leakage from the compressor drive shaft back to a process or fuel gas system or to a control device that complies with the requirements of §60.482–10a, except as provided in paragraph (i) of this section.

(i) Any compressor that is designated, as described in §60.486a(e)(1) and (2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a) through (h) of this section if the compressor:

(1) Is demonstrated to be operating with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the methods specified in §60.485a(c); and

(2) Is tested for compliance with paragraph (i)(1) of this section initially upon designation, annually, and at other times requested by the Administrator.

(j) Any existing reciprocating compressor in a process unit which becomes an affected facility under provisions of §60.14 or §60.15 is exempt from paragraphs (a) through (e) and (h) of this section, provided the owner or operator demonstrates that recasting the distance piece or replacing the compressor are the only options available to bring the compressor into compliance with the provisions of paragraphs (a) through (e) and (h) of this section.

§ 60.482-4a Standards: Pressure relief devices in gas/vapor service.

(a) Except during pressure releases, each pressure relief device in gas/vapor service shall be operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as determined by the methods specified in §60.485a(c).

(b)(1) After each pressure release, the pressure relief device shall be returned to a condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as soon as practicable, but no later than 5 calendar days after the pressure release, except as provided in §60.482–9a.

(2) No later than 5 calendar days after the pressure release, the pressure relief device shall be monitored to confirm the conditions of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, by the methods specified in §60.485a(c).

(c) Any pressure relief device that is routed to a process or fuel gas system or equipped with a closed vent system capable of capturing and transporting leakage through the
pressure relief device to a control device as described in §60.482–10a is exempted from the requirements of paragraphs (a) and (b) of this section.

(d)(1) Any pressure relief device that is equipped with a rupture disk upstream of the pressure relief device is exempt from the requirements of paragraphs (a) and (b) of this section, provided the owner or operator complies with the requirements in paragraph (d)(2) of this section.

(2) After each pressure release, a new rupture disk shall be installed upstream of the pressure relief device as soon as practicable, but no later than 5 calendar days after each pressure release, except as provided in §60.482–9a.

§ 60.482-5a Standards: Sampling connection systems.

(a) Each sampling connection system shall be equipped with a closed-purge, closed-loop, or closed-vent system, except as provided in §60.482–1a(c) and paragraph (c) of this section.

(b) Each closed-purge, closed-loop, or closed-vent system as required in paragraph (a) of this section shall comply with the requirements specified in paragraphs (b)(1) through (4) of this section.

(1) Gases displaced during filling of the sample container are not required to be collected or captured.

(2) Containers that are part of a closed-purge system must be covered or closed when not being filled or emptied.

(3) Gases remaining in the tubing or piping between the closed-purge system valve(s) and sample container valve(s) after the valves are closed and the sample container is disconnected are not required to be collected or captured.

(4) Each closed-purge, closed-loop, or closed-vent system shall be designed and operated to meet requirements in either paragraph (b)(4)(i), (ii), (iii), or (iv) of this section.

(i) Return the purged process fluid directly to the process line.

(ii) Collect and recycle the purged process fluid to a process.

(iii) Capture and transport all the purged process fluid to a control device that complies with the requirements of §60.482–10a.

(iv) Collect, store, and transport the purged process fluid to any of the following systems or facilities:

(A) A waste management unit as defined in 40 CFR 63.111, if the waste management unit is subject to and operated in compliance with the provisions of 40 CFR part 63, subpart G, applicable to Group 1 wastewater streams;

(B) A treatment, storage, or disposal facility subject to regulation under 40 CFR part 262, 264, 265, or 266;
(C) A facility permitted, licensed, or registered by a state to manage municipal or industrial solid waste, if the process fluids are not hazardous waste as defined in 40 CFR part 261;

(D) A waste management unit subject to and operated in compliance with the treatment requirements of 40 CFR 61.348(a), provided all waste management units that collect, store, or transport the purged process fluid to the treatment unit are subject to and operated in compliance with the management requirements of 40 CFR 61.343 through 40 CFR 61.347; or

(E) A device used to burn off-specification used oil for energy recovery in accordance with 40 CFR part 279, subpart G, provided the purged process fluid is not hazardous waste as defined in 40 CFR part 261.

(c) In-situ sampling systems and sampling systems without purges are exempt from the requirements of paragraphs (a) and (b) of this section.

§ 60.482-6a Standards: Open-ended valves or lines.

(a)(1) Each open-ended valve or line shall be equipped with a cap, blind flange, plug, or a second valve, except as provided in §60.482–1a(c) and paragraphs (d) and (e) of this section.

(2) The cap, blind flange, plug, or second valve shall seal the open end at all times except during operations requiring process fluid flow through the open-ended valve or line.

(b) Each open-ended valve or line equipped with a second valve shall be operated in a manner such that the valve on the process fluid end is closed before the second valve is closed.

(c) When a double block-and-bleed system is being used, the bleed valve or line may remain open during operations that require venting the line between the block valves but shall comply with paragraph (a) of this section at all other times.

(d) Open-ended valves or lines in an emergency shutdown system which are designed to open automatically in the event of a process upset are exempt from the requirements of paragraphs (a), (b), and (c) of this section.

(e) Open-ended valves or lines containing materials which would autocatalytically polymerize or would present an explosion, serious overpressure, or other safety hazard if capped or equipped with a double block and bleed system as specified in paragraphs (a) through (c) of this section are exempt from the requirements of paragraphs (a) through (c) of this section.

§ 60.482-7a Standards: Valves in gas/vapor service and in light liquid service.

(a)(1) Each valve shall be monitored monthly to detect leaks by the methods specified in §60.485a(b) and shall comply with paragraphs (b) through (e) of this section, except as provided in paragraphs (f), (g), and (h) of this section, §60.482–1a(c) and (f), and §§60.483–1a and 60.483–2a.

(2) A valve that begins operation in gas/vapor service or light liquid service after the initial startup date for the process unit must be monitored according to paragraphs (a)(2)(i) or
(ii), except for a valve that replaces a leaking valve and except as provided in paragraphs (f), (g), and (h) of this section, §60.482–1a(c), and §§60.483–1a and 60.483–2a.

(i) Monitor the valve as in paragraph (a)(1) of this section. The valve must be monitored for the first time within 30 days after the end of its startup period to ensure proper installation.

(ii) If the existing valves in the process unit are monitored in accordance with §60.483–1a or §60.483–2a, count the new valve as leaking when calculating the percentage of valves leaking as described in §60.483–2a(b)(5). If less than 2.0 percent of the valves are leaking for that process unit, the valve must be monitored for the first time during the next scheduled monitoring event for existing valves in the process unit or within 90 days, whichever comes first.

(b) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(c)(1)(i) Any valve for which a leak is not detected for 2 successive months may be monitored the first month of every quarter, beginning with the next quarter, until a leak is detected.

(ii) As an alternative to monitoring all of the valves in the first month of a quarter, an owner or operator may elect to subdivide the process unit into two or three subgroups of valves and monitor each subgroup in a different month during the quarter, provided each subgroup is monitored every 3 months. The owner or operator must keep records of the valves assigned to each subgroup.

(2) If a leak is detected, the valve shall be monitored monthly until a leak is not detected for 2 successive months.

(d)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after the leak is detected, except as provided in §60.482–9a.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(e) First attempts at repair include, but are not limited to, the following best practices where practicable:

(1) Tightening of bonnet bolts;

(2) Replacement of bonnet bolts;

(3) Tightening of packing gland nuts;

(4) Injection of lubricant into lubricated packing.

(f) Any valve that is designated, as described in §60.486a(e)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph (a) of this section if the valve:

(1) Has no external actuating mechanism in contact with the process fluid,
(2) Is operated with emissions less than 500 ppm above background as determined by the method specified in §60.485a(c), and

(3) Is tested for compliance with paragraph (f)(2) of this section initially upon designation, annually, and at other times requested by the Administrator.

(g) Any valve that is designated, as described in §60.486a(f)(1), as an unsafe-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve demonstrates that the valve is unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section, and

(2) The owner or operator of the valve adheres to a written plan that requires monitoring of the valve as frequently as practicable during safe-to-monitor times.

(h) Any valve that is designated, as described in §60.486a(f)(2), as a difficult-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve demonstrates that the valve cannot be monitored without elevating the monitoring personnel more than 2 meters above a support surface.

(2) The process unit within which the valve is located either:

(i) Becomes an affected facility through §60.14 or §60.15 and was constructed on or before January 5, 1981; or

(ii) Has less than 3.0 percent of its total number of valves designated as difficult-to-monitor by the owner or operator.

(3) The owner or operator of the valve follows a written plan that requires monitoring of the valve at least once per calendar year.

§ 60.482–8a Standards: Pumps, valves, and connectors in heavy liquid service and pressure relief devices in light liquid or heavy liquid service.

(a) If evidence of a potential leak is found by visual, audible, olfactory, or any other detection method at pumps, valves, and connectors in heavy liquid service and pressure relief devices in light liquid or heavy liquid service, the owner or operator shall follow either one of the following procedures:

(1) The owner or operator shall monitor the equipment within 5 days by the method specified in §60.485a(b) and shall comply with the requirements of paragraphs (b) through (d) of this section.

(2) The owner or operator shall eliminate the visual, audible, olfactory, or other indication of a potential leak within 5 calendar days of detection.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in §60.482–9a.
(2) The first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) First attempts at repair include, but are not limited to, the best practices described under §§60.482–2a(c)(2) and 60.482–7a(e).

§ 60.482-9a Standards: Delay of repair.

(a) Delay of repair of equipment for which leaks have been detected will be allowed if repair within 15 days is technically infeasible without a process unit shutdown. Repair of this equipment shall occur before the end of the next process unit shutdown. Monitoring to verify repair must occur within 15 days after startup of the process unit.

(b) Delay of repair of equipment will be allowed for equipment which is isolated from the process and which does not remain in VOC service.

(c) Delay of repair for valves and connectors will be allowed if:

(1) The owner or operator demonstrates that emissions of purged material resulting from immediate repair are greater than the fugitive emissions likely to result from delay of repair, and

(2) When repair procedures are effected, the purged material is collected and destroyed or recovered in a control device complying with §60.482–10a.

(d) Delay of repair for pumps will be allowed if:

(1) Repair requires the use of a dual mechanical seal system that includes a barrier fluid system, and

(2) Repair is completed as soon as practicable, but not later than 6 months after the leak was detected.

(e) Delay of repair beyond a process unit shutdown will be allowed for a valve, if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next process unit shutdown will not be allowed unless the next process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

(f) When delay of repair is allowed for a leaking pump, valve, or connector that remains in service, the pump, valve, or connector may be considered to be repaired and no longer subject to delay of repair requirements if two consecutive monthly monitoring instrument readings are below the leak definition.

§ 60.482-10a Standards: Closed vent systems and control devices.

(a) Owners or operators of closed vent systems and control devices used to comply with provisions of this subpart shall comply with the provisions of this section.

(b) Vapor recovery systems (for example, condensers and absorbers) shall be designed and operated to recover the VOC emissions vented to them with an efficiency of 95 percent or
greater, or to an exit concentration of 20 parts per million by volume (ppmv), whichever is less stringent.

(c) Enclosed combustion devices shall be designed and operated to reduce the VOC emissions vented to them with an efficiency of 95 percent or greater, or to an exit concentration of 20 ppmv, on a dry basis, corrected to 3 percent oxygen, whichever is less stringent or to provide a minimum residence time of 0.75 seconds at a minimum temperature of 816 °C.

(d) Flares used to comply with this subpart shall comply with the requirements of §60.18.

(e) Owners or operators of control devices used to comply with the provisions of this subpart shall monitor these control devices to ensure that they are operated and maintained in conformance with their designs.

(f) Except as provided in paragraphs (i) through (k) of this section, each closed vent system shall be inspected according to the procedures and schedule specified in paragraphs (f)(1) and (2) of this section.

(1) If the vapor collection system or closed vent system is constructed of hard-piping, the owner or operator shall comply with the requirements specified in paragraphs (f)(1)(i) and (ii) of this section:

(i) Conduct an initial inspection according to the procedures in §60.485a(b); and

(ii) Conduct annual visual inspections for visible, audible, or olfactory indications of leaks.

(2) If the vapor collection system or closed vent system is constructed of ductwork, the owner or operator shall:

(i) Conduct an initial inspection according to the procedures in §60.485a(b); and

(ii) Conduct annual inspections according to the procedures in §60.485a(b).

(g) Leaks, as indicated by an instrument reading greater than 500 ppmv above background or by visual inspections, shall be repaired as soon as practicable except as provided in paragraph (h) of this section.

(1) A first attempt at repair shall be made no later than 5 calendar days after the leak is detected.

(2) Repair shall be completed no later than 15 calendar days after the leak is detected.

(h) Delay of repair of a closed vent system for which leaks have been detected is allowed if the repair is technically infeasible without a process unit shutdown or if the owner or operator determines that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. Repair of such equipment shall be complete by the end of the next process unit shutdown.

(i) If a vapor collection system or closed vent system is operated under a vacuum, it is exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section.
(j) Any parts of the closed vent system that are designated, as described in paragraph (l)(1) of this section, as unsafe to inspect are exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section if they comply with the requirements specified in paragraphs (j)(1) and (2) of this section:

(1) The owner or operator determines that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (f)(1)(i) or (f)(2) of this section; and

(2) The owner or operator has a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(k) Any parts of the closed vent system that are designated, as described in paragraph (l)(2) of this section, as difficult to inspect are exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section if they comply with the requirements specified in paragraphs (k)(1) through (3) of this section:

(1) The owner or operator determines that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface; and

(2) The process unit within which the closed vent system is located becomes an affected facility through §§60.14 or 60.15, or the owner or operator designates less than 3.0 percent of the total number of closed vent system equipment as difficult to inspect; and

(3) The owner or operator has a written plan that requires inspection of the equipment at least once every 5 years. A closed vent system is exempt from inspection if it is operated under a vacuum.

(l) The owner or operator shall record the information specified in paragraphs (l)(1) through (5) of this section.

(1) Identification of all parts of the closed vent system that are designated as unsafe to inspect, an explanation of why the equipment is unsafe to inspect, and the plan for inspecting the equipment.

(2) Identification of all parts of the closed vent system that are designated as difficult to inspect, an explanation of why the equipment is difficult to inspect, and the plan for inspecting the equipment.

(3) For each inspection during which a leak is detected, a record of the information specified in §60.486a(c).

(4) For each inspection conducted in accordance with §60.485a(b) during which no leaks are detected, a record that the inspection was performed, the date of the inspection, and a statement that no leaks were detected.

(5) For each visual inspection conducted in accordance with paragraph (f)(1)(ii) of this section during which no leaks are detected, a record that the inspection was performed, the date of the inspection, and a statement that no leaks were detected.
(m) Closed vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

§ 60.482-11a Standards: Connectors in gas/vapor service and in light liquid service.

(a) The owner or operator shall initially monitor all connectors in the process unit for leaks by the later of either 12 months after the compliance date or 12 months after initial startup. If all connectors in the process unit have been monitored for leaks prior to the compliance date, no initial monitoring is required provided either no process changes have been made since the monitoring or the owner or operator can determine that the results of the monitoring, with or without adjustments, reliably demonstrate compliance despite process changes. If required to monitor because of a process change, the owner or operator is required to monitor only those connectors involved in the process change.

(b) Except as allowed in §60.482–1a(e), §60.482–10a, or as specified in paragraph (e) of this section, the owner or operator shall monitor all connectors in gas and vapor and light liquid service as specified in paragraphs (a) and (b)(3) of this section.

(1) The connectors shall be monitored to detect leaks by the method specified in §60.485a(b) and, as applicable, §60.485a(c).

(2) If an instrument reading greater than or equal to 500 ppm is measured, a leak is detected.

(3) The owner or operator shall perform monitoring, subsequent to the initial monitoring required in paragraph (a) of this section, as specified in paragraphs (b)(3)(i) through (iii) of this section, and shall comply with the requirements of paragraphs (b)(3)(iv) and (v) of this section. The required period in which monitoring must be conducted shall be determined from paragraphs (b)(3)(i) through (iii) of this section using the monitoring results from the preceding monitoring period. The percent leaking connectors shall be calculated as specified in paragraph (c) of this section.

(i) If the percent leaking connectors in the process unit was greater than or equal to 0.5 percent, then monitor within 12 months (1 year).

(ii) If the percent leaking connectors in the process unit was greater than or equal to 0.25 percent but less than 0.5 percent, then monitor within 4 years. An owner or operator may comply with the requirements of this paragraph by monitoring at least 40 percent of the connectors within 2 years of the start of the monitoring period, provided all connectors have been monitored by the end of the 4-year monitoring period.

(iii) If the percent leaking connectors in the process unit was less than 0.25 percent, then monitor as provided in paragraph (b)(3)(iii)(A) of this section and either paragraph (b)(3)(iii)(B) or (b)(3)(iii)(C) of this section, as appropriate.

(A) An owner or operator shall monitor at least 50 percent of the connectors within 4 years of the start of the monitoring period.

(B) If the percent of leaking connectors calculated from the monitoring results in paragraph (b)(3)(iii)(A) of this section is greater than or equal to 0.35 percent of the
monitored connectors, the owner or operator shall monitor as soon as practical, but within the next 6 months, all connectors that have not yet been monitored during the monitoring period. At the conclusion of monitoring, a new monitoring period shall be started pursuant to paragraph (b)(3) of this section, based on the percent of leaking connectors within the total monitored connectors.

(C) If the percent of leaking connectors calculated from the monitoring results in paragraph (b)(3)(iii)(A) of this section is less than 0.35 percent of the monitored connectors, the owner or operator shall monitor all connectors that have not yet been monitored within 8 years of the start of the monitoring period.

(iv) If, during the monitoring conducted pursuant to paragraphs (b)(3)(i) through (iii) of this section, a connector is found to be leaking, it shall be re-monitored once within 90 days after repair to confirm that it is not leaking.

(v) The owner or operator shall keep a record of the start date and end date of each monitoring period under this section for each process unit.

(c) For use in determining the monitoring frequency, as specified in paragraphs (a) and (b)(3) of this section, the percent leaking connectors as used in paragraphs (a) and (b)(3) of this section shall be calculated by using the following equation:

\[
\%C_L = \frac{C_L}{C_t} \times 100
\]

Where:

\(\%C_L\) = Percent of leaking connectors as determined through periodic monitoring required in paragraphs (a) and (b)(3)(i) through (iii) of this section.

\(C_L\) = Number of connectors measured at 500 ppm or greater, by the method specified in §60.485a(b).

\(C_t\) = Total number of monitored connectors in the process unit or affected facility.

(d) When a leak is detected pursuant to paragraphs (a) and (b) of this section, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in §60.482–9a. A first attempt at repair as defined in this subpart shall be made no later than 5 calendar days after the leak is detected.

(e) Any connector that is designated, as described in §60.486a(f)(1), as an unsafe-to-monitor connector is exempt from the requirements of paragraphs (a) and (b) of this section if:

(1) The owner or operator of the connector demonstrates that the connector is unsafe-to-monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraphs (a) and (b) of this section; and

(2) The owner or operator of the connector has a written plan that requires monitoring of the connector as frequently as practicable during safe-to-monitor times but not more frequently than the periodic monitoring schedule otherwise applicable, and repair of the equipment according to the procedures in paragraph (d) of this section if a leak is detected.
(f) **Inaccessible, ceramic, or ceramic-lined connectors**. (1) Any connector that is inaccessible or that is ceramic or ceramic-lined (e.g., porcelain, glass, or glass-lined), is exempt from the monitoring requirements of paragraphs (a) and (b) of this section, from the leak repair requirements of paragraph (d) of this section, and from the recordkeeping and reporting requirements of §§63.1038 and 63.1039. An inaccessible connector is one that meets any of the provisions specified in paragraphs (f)(1)(i) through (vi) of this section, as applicable:

(i) Buried;

(ii) Insulated in a manner that prevents access to the connector by a monitor probe;

(iii) Obstructed by equipment or piping that prevents access to the connector by a monitor probe;

(iv) Unable to be reached from a wheeled scissor-lift or hydraulic-type scaffold that would allow access to connectors up to 7.6 meters (25 feet) above the ground;

(v) Inaccessible because it would require elevating the monitoring personnel more than 2 meters (7 feet) above a permanent support surface or would require the erection of scaffold; or

(vi) Not able to be accessed at any time in a safe manner to perform monitoring. Unsafe access includes, but is not limited to, the use of a wheeled scissor-lift on unstable or uneven terrain, the use of a motorized man-lift basket in areas where an ignition potential exists, or access would require near proximity to hazards such as electrical lines, or would risk damage to equipment.

(2) If any inaccessible, ceramic, or ceramic-lined connector is observed by visual, audible, olfactory, or other means to be leaking, the visual, audible, olfactory, or other indications of a leak to the atmosphere shall be eliminated as soon as practical.

(g) Except for instrumentation systems and inaccessible, ceramic, or ceramic-lined connectors meeting the provisions of paragraph (f) of this section, identify the connectors subject to the requirements of this subpart. Connectors need not be individually identified if all connectors in a designated area or length of pipe subject to the provisions of this subpart are identified as a group, and the number of connectors subject is indicated.

§ 60.483-1a **Alternative standards for valves—allowable percentage of valves leaking.**

(a) An owner or operator may elect to comply with an allowable percentage of valves leaking of equal to or less than 2.0 percent.

(b) The following requirements shall be met if an owner or operator wishes to comply with an allowable percentage of valves leaking:

(1) An owner or operator must notify the Administrator that the owner or operator has elected to comply with the allowable percentage of valves leaking before implementing this alternative standard, as specified in §60.487a(d).

(2) A performance test as specified in paragraph (c) of this section shall be conducted initially upon designation, annually, and at other times requested by the Administrator.
(3) If a valve leak is detected, it shall be repaired in accordance with §60.482–7a(d) and (e).

(c) Performance tests shall be conducted in the following manner:

(1) All valves in gas/vapor and light liquid service within the affected facility shall be monitored within 1 week by the methods specified in §60.485a(b).

(2) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(3) The leak percentage shall be determined by dividing the number of valves for which leaks are detected by the number of valves in gas/vapor and light liquid service within the affected facility.

(d) Owners and operators who elect to comply with this alternative standard shall not have an affected facility with a leak percentage greater than 2.0 percent, determined as described in §60.485a(h).

§ 60.483-2a Alternative standards for valves—skip period leak detection and repair.

(a)(1) An owner or operator may elect to comply with one of the alternative work practices specified in paragraphs (b)(2) and (3) of this section.

(2) An owner or operator must notify the Administrator before implementing one of the alternative work practices, as specified in §60.487(d)a.

(b)(1) An owner or operator shall comply initially with the requirements for valves in gas/vapor service and valves in light liquid service, as described in §60.482–7a.

(2) After 2 consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0, an owner or operator may begin to skip 1 of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(3) After 5 consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0, an owner or operator may begin to skip 3 of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(4) If the percent of valves leaking is greater than 2.0, the owner or operator shall comply with the requirements as described in §60.482–7a but can again elect to use this section.

(5) The percent of valves leaking shall be determined as described in §60.485a(h).

(6) An owner or operator must keep a record of the percent of valves found leaking during each leak detection period.

(7) A valve that begins operation in gas/vapor service or light liquid service after the initial startup date for a process unit following one of the alternative standards in this section must be monitored in accordance with §60.482–7a(a)(2)(i) or (ii) before the provisions of this section can be applied to that valve.

§ 60.484a Equivalence of means of emission limitation.

(a) Each owner or operator subject to the provisions of this subpart may apply to the Administrator for determination of equivalence for any means of emission limitation that
achieves a reduction in emissions of VOC at least equivalent to the reduction in emissions of VOC achieved by the controls required in this subpart.

(b) Determination of equivalence to the equipment, design, and operational requirements of this subpart will be evaluated by the following guidelines:

(1) Each owner or operator applying for an equivalence determination shall be responsible for collecting and verifying test data to demonstrate equivalence of means of emission limitation.

(2) The Administrator will compare test data for demonstrating equivalence of the means of emission limitation to test data for the equipment, design, and operational requirements.

(3) The Administrator may condition the approval of equivalence on requirements that may be necessary to assure operation and maintenance to achieve the same emission reduction as the equipment, design, and operational requirements.

(c) Determination of equivalence to the required work practices in this subpart will be evaluated by the following guidelines:

(1) Each owner or operator applying for a determination of equivalence shall be responsible for collecting and verifying test data to demonstrate equivalence of an equivalent means of emission limitation.

(2) For each affected facility for which a determination of equivalence is requested, the emission reduction achieved by the required work practice shall be demonstrated.

(3) For each affected facility, for which a determination of equivalence is requested, the emission reduction achieved by the equivalent means of emission limitation shall be demonstrated.

(4) Each owner or operator applying for a determination of equivalence shall commit in writing to work practice(s) that provide for emission reductions equal to or greater than the emission reductions achieved by the required work practice.

(5) The Administrator will compare the demonstrated emission reduction for the equivalent means of emission limitation to the demonstrated emission reduction for the required work practices and will consider the commitment in paragraph (c)(4) of this section.

(6) The Administrator may condition the approval of equivalence on requirements that may be necessary to assure operation and maintenance to achieve the same emission reduction as the required work practice.

(d) An owner or operator may offer a unique approach to demonstrate the equivalence of any equivalent means of emission limitation.

(e)(1) After a request for determination of equivalence is received, the Administrator will publish a notice in the Federal Register and provide the opportunity for public hearing if the Administrator judges that the request may be approved.
(2) After notice and opportunity for public hearing, the Administrator will determine the equivalence of a means of emission limitation and will publish the determination in the Federal Register.

(3) Any equivalent means of emission limitations approved under this section shall constitute a required work practice, equipment, design, or operational standard within the meaning of section 111(h)(1) of the CAA.

(f)(1) Manufacturers of equipment used to control equipment leaks of VOC may apply to the Administrator for determination of equivalence for any equivalent means of emission limitation that achieves a reduction in emissions of VOC achieved by the equipment, design, and operational requirements of this subpart.

(2) The Administrator will make an equivalence determination according to the provisions of paragraphs (b), (c), (d), and (e) of this section.

§ 60.485a Test methods and procedures.

(a) In conducting the performance tests required in §60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of this part or other methods and procedures as specified in this section, except as provided in §60.8(b).

(b) The owner or operator shall determine compliance with the standards in §§60.482–1a through 60.482–11a, 60.483a, and 60.484a as follows:

(1) Method 21 shall be used to determine the presence of leaking sources. The instrument shall be calibrated before use each day of its use by the procedures specified in Method 21 of appendix A–7 of this part. The following calibration gases shall be used:

(i) Zero air (less than 10 ppm of hydrocarbon in air); and

(ii) A mixture of methane or n-hexane and air at a concentration no more than 2,000 ppm greater than the leak definition concentration of the equipment monitored. If the monitoring instrument's design allows for multiple calibration scales, then the lower scale shall be calibrated with a calibration gas that is no higher than 2,000 ppm above the concentration specified as a leak, and the highest scale shall be calibrated with a calibration gas that is approximately equal to 10,000 ppm. If only one scale on an instrument will be used during monitoring, the owner or operator need not calibrate the scales that will not be used during that day's monitoring.

(2) A calibration drift assessment shall be performed, at a minimum, at the end of each monitoring day. Check the instrument using the same calibration gas(es) that were used to calibrate the instrument before use. Follow the procedures specified in Method 21 of appendix A–7 of this part, Section 10.1, except do not adjust the meter readout to correspond to the calibration gas value. Record the instrument reading for each scale used as specified in §60.486a(e)(7). Calculate the average algebraic difference between the three meter readings and the most recent calibration value. Divide this algebraic difference by the initial calibration value and multiply by 100 to express the calibration drift as a percentage. If any calibration drift assessment shows a negative drift of more than 10 percent from the initial calibration value, then all equipment monitored since the last
calibration with instrument readings below the appropriate leak definition and above the leak definition multiplied by (100 minus the percent of negative drift/ divided by 100) must be re-monitored. If any calibration drift assessment shows a positive drift of more than 10 percent from the initial calibration value, then, at the owner/operator's discretion, all equipment since the last calibration with instrument readings above the appropriate leak definition and below the leak definition multiplied by (100 plus the percent of positive drift/ divided by 100) may be re-monitored.

(c) The owner or operator shall determine compliance with the no-detectable-emission standards in §§60.482–2a(e), 60.482–3a(i), 60.482–4a, 60.482–7a(f), and 60.482–10a(e) as follows:

(1) The requirements of paragraph (b) shall apply.

(2) Method 21 of appendix A–7 of this part shall be used to determine the background level. All potential leak interfaces shall be traversed as close to the interface as possible. The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(d) The owner or operator shall test each piece of equipment unless he demonstrates that a process unit is not in VOC service, i.e., that the VOC content would never be reasonably expected to exceed 10 percent by weight. For purposes of this demonstration, the following methods and procedures shall be used:

(1) Procedures that conform to the general methods in ASTM E260–73, 91, or 96, E168–67, 77, or 92, E169–63, 77, or 93 (incorporated by reference—see §60.17) shall be used to determine the percent VOC content in the process fluid that is contained in or contacts a piece of equipment.

(2) Organic compounds that are considered by the Administrator to have negligible photochemical reactivity may be excluded from the total quantity of organic compounds in determining the VOC content of the process fluid.

(3) Engineering judgment may be used to estimate the VOC content, if a piece of equipment had not been shown previously to be in service. If the Administrator disagrees with the judgment, paragraphs (d)(1) and (2) of this section shall be used to resolve the disagreement.

(e) The owner or operator shall demonstrate that a piece of equipment is in light liquid service by showing that all the following conditions apply:

(1) The vapor pressure of one or more of the organic components is greater than 0.3 kPa at 20 °C (1.2 in. H2O at 68 °F). Standard reference texts or ASTM D2879–83, 96, or 97 (incorporated by reference—see §60.17) shall be used to determine the vapor pressures.

(2) The total concentration of the pure organic components having a vapor pressure greater than 0.3 kPa at 20 °C (1.2 in. H2O at 68 °F) is equal to or greater than 20 percent by weight.
(3) The fluid is a liquid at operating conditions.

(f) Samples used in conjunction with paragraphs (d), (e), and (g) of this section shall be representative of the process fluid that is contained in or contacts the equipment or the gas being combusted in the flare.

(g) The owner or operator shall determine compliance with the standards of flares as follows:

(1) Method 22 of appendix A–7 of this part shall be used to determine visible emissions.

(2) A thermocouple or any other equivalent device shall be used to monitor the presence of a pilot flame in the flare.

(3) The maximum permitted velocity for air assisted flares shall be computed using the following equation:

\[ V_{\text{max}} = V_1 + V_2H_T \]

Where:

\[ V_{\text{max}} = \text{Maximum permitted velocity, m/sec (ft/sec).} \]

\[ H_T = \text{Net heating value of the gas being combusted, MJ/scm (Btu/scf).} \]

\[ V_1 = 8.706 \text{ m/sec (metric units) = 28.56 ft/sec (English units).} \]

\[ V_2 = 0.7084 \text{ m}^4/(\text{MJ-sec}) \text{ (metric units) = 0.087 ft}^4/(\text{Btu-sec}) \text{ (English units).} \]

(4) The net heating value \( (H_T) \) of the gas being combusted in a flare shall be computed using the following equation:

\[ H_T = \sum_{i=1}^{n} C_i H_i \]

Where:

\[ K = \text{Conversion constant, } 1.740 \times 10^{-7} \text{ (g-mole)(MJ)/(ppm-sc m-kcal) (metric units) = 4.674} \times 10^{-6} \text{ [(g-mole)(Btu)/(ppm-sc f-kcal)] (English units).} \]

\[ C_i = \text{Concentration of sample component “i,” ppm} \]

\[ H_i = \text{net heat of combustion of sample component “i” at 25 °C and 760 mm Hg (77 °F and 14.7 psi), kcal/g-mole.} \]

(5) Method 18 of appendix A–6 of this part or ASTM D6420–99 (2004) (where the target compound(s) are those listed in Section 1.1 of ASTM D6420–99, and the target concentration is between 150 parts per billion by volume and 100 ppmv) and ASTM D2504–67, 77, or 88 (Reapproved 1993) (incorporated by reference-see §60.17) shall be used to determine the concentration of sample component “i.”
(6) ASTM D2382–76 or 88 or D4809–95 (incorporated by reference—see §60.17) shall be used to determine the net heat of combustion of component “i” if published values are not available or cannot be calculated.

(7) Method 2, 2A, 2C, or 2D of appendix A–7 of this part, as appropriate, shall be used to determine the actual exit velocity of a flare. If needed, the unobstructed (free) cross-sectional area of the flare tip shall be used.

(h) The owner or operator shall determine compliance with §§60.483–1a or §60.483–2a as follows:

(1) The percent of valves leaking shall be determined using the following equation:

\[
\%V_L = \left( \frac{V_L}{V_T} \right) \times 100
\]

Where:

\%V_L = \text{Percent leaking valves.}

V_L = \text{Number of valves found leaking.}

V_T = \text{The sum of the total number of valves monitored.}

(2) The total number of valves monitored shall include difficult-to-monitor and unsafe-to-monitor valves only during the monitoring period in which those valves are monitored.

(3) The number of valves leaking shall include valves for which repair has been delayed.

(4) Any new valve that is not monitored within 30 days of being placed in service shall be included in the number of valves leaking and the total number of valves monitored for the monitoring period in which the valve is placed in service.

(5) If the process unit has been subdivided in accordance with §§60.482–7a(c)(1)(ii), the sum of valves found leaking during a monitoring period includes all subgroups.

(6) The total number of valves monitored does not include a valve monitored to verify repair.

§ 60.486a Recordkeeping requirements.

(a)(1) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this section.

(2) An owner or operator of more than one affected facility subject to the provisions of this subpart may comply with the recordkeeping requirements for these facilities in one recordkeeping system if the system identifies each record by each facility.

(3) The owner or operator shall record the information specified in paragraphs (a)(3)(i) through (v) of this section for each monitoring event required by §§60.482–2a, 60.482–3a, 60.482–7a, 60.482–8a, 60.482–11a, and 60.483–2a.

(i) Monitoring instrument identification.
(ii) Operator identification.

(iii) Equipment identification.

(iv) Date of monitoring.

(v) Instrument reading.

(b) When each leak is detected as specified in §§60.482–2a, 60.482–3a, 60.482–7a, 60.482–8a, 60.482–11a, and 60.483–2a, the following requirements apply:

1. A weatherproof and readily visible identification, marked with the equipment identification number, shall be attached to the leaking equipment.

2. The identification on a valve may be removed after it has been monitored for 2 successive months as specified in §60.482–7a(c) and no leak has been detected during those 2 months.

3. The identification on a connector may be removed after it has been monitored as specified in §60.482–11a(b)(3)(iv) and no leak has been detected during that monitoring.

4. The identification on equipment, except on a valve or connector, may be removed after it has been repaired.

(c) When each leak is detected as specified in §§60.482–2a, 60.482–3a, 60.482–7a, 60.482–8a, 60.482–11a, and 60.483–2a, the following information shall be recorded in a log and shall be kept for 2 years in a readily accessible location:

1. The instrument and operator identification numbers and the equipment identification number, except when indications of liquids dripping from a pump are designated as a leak.

2. The date the leak was detected and the dates of each attempt to repair the leak.

3. Repair methods applied in each attempt to repair the leak.

4. Maximum instrument reading measured by Method 21 of appendix A–7 of this part at the time the leak is successfully repaired or determined to be nonrepairable, except when a pump is repaired by eliminating indications of liquids dripping.

5. “Repair delayed” and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

6. The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

7. The expected date of successful repair of the leak if a leak is not repaired within 15 days.

8. Dates of process unit shutdowns that occur while the equipment is unrepaired.

9. The date of successful repair of the leak.
(d) The following information pertaining to the design requirements for closed vent systems and control devices described in §60.482–10a shall be recorded and kept in a readily accessible location:

(1) Detailed schematics, design specifications, and piping and instrumentation diagrams.

(2) The dates and descriptions of any changes in the design specifications.

(3) A description of the parameter or parameters monitored, as required in §60.482–10a(e), to ensure that control devices are operated and maintained in conformance with their design and an explanation of why that parameter (or parameters) was selected for the monitoring.

(4) Periods when the closed vent systems and control devices required in §§60.482–2a, 60.482–3a, 60.482–4a, and 60.482–5a are not operated as designed, including periods when a flare pilot light does not have a flame.

(5) Dates of startups and shutdowns of the closed vent systems and control devices required in §§60.482–2a, 60.482–3a, 60.482–4a, and 60.482–5a.

(e) The following information pertaining to all equipment subject to the requirements in §§60.482–1a to 60.482–11a shall be recorded in a log that is kept in a readily accessible location:

(1) A list of identification numbers for equipment subject to the requirements of this subpart.

(2)(i) A list of identification numbers for equipment that are designated for no detectable emissions under the provisions of §§60.482–2a(e), 60.482–3a(i), and 60.482–7a(f).

(ii) The designation of equipment as subject to the requirements of §60.482–2a(e), §60.482–3a(i), or §60.482–7a(f) shall be signed by the owner or operator. Alternatively, the owner or operator may establish a mechanism with their permitting authority that satisfies this requirement.

(3) A list of equipment identification numbers for pressure relief devices required to comply with §60.482–4a.

(4)(i) The dates of each compliance test as required in §§60.482–2a(e), 60.482–3a(i), 60.482–4a, and 60.482–7a(f).

(ii) The background level measured during each compliance test.

(iii) The maximum instrument reading measured at the equipment during each compliance test.

(5) A list of identification numbers for equipment in vacuum service.

(6) A list of identification numbers for equipment that the owner or operator designates as operating in VOC service less than 300 hr/yr in accordance with §60.482–1a(e), a
description of the conditions under which the equipment is in VOC service, and rationale supporting the designation that it is in VOC service less than 300 hr/yr.

(7) The date and results of the weekly visual inspection for indications of liquids dripping from pumps in light liquid service.

(8) Records of the information specified in paragraphs (e)(8)(i) through (vi) of this section for monitoring instrument calibrations conducted according to sections 8.1.2 and 10 of Method 21 of appendix A–7 of this part and §60.485a(b).

(i) Date of calibration and initials of operator performing the calibration.

(ii) Calibration gas cylinder identification, certification date, and certified concentration.

(iii) Instrument scale(s) used.

(iv) A description of any corrective action taken if the meter readout could not be adjusted to correspond to the calibration gas value in accordance with section 10.1 of Method 21 of appendix A–7 of this part.

(v) Results of each calibration drift assessment required by §60.485a(b)(2) (i.e., instrument reading for calibration at end of monitoring day and the calculated percent difference from the initial calibration value).

(vi) If an owner or operator makes their own calibration gas, a description of the procedure used.

(9) The connector monitoring schedule for each process unit as specified in §60.482–11a(b)(3)(v).

(10) Records of each release from a pressure relief device subject to §60.482–4a.

(f) The following information pertaining to all valves subject to the requirements of §60.482–7a(g) and (h), all pumps subject to the requirements of §60.482–2a(g), and all connectors subject to the requirements of §60.482–11a(e) shall be recorded in a log that is kept in a readily accessible location:

(1) A list of identification numbers for valves, pumps, and connectors that are designated as unsafe-to-monitor, an explanation for each valve, pump, or connector stating why the valve, pump, or connector is unsafe-to-monitor, and the plan for monitoring each valve, pump, or connector.

(2) A list of identification numbers for valves that are designated as difficult-to-monitor, an explanation for each valve stating why the valve is difficult-to-monitor, and the schedule for monitoring each valve.

(g) The following information shall be recorded for valves complying with §60.483–2a:

(1) A schedule of monitoring.

(2) The percent of valves found leaking during each monitoring period.
(h) The following information shall be recorded in a log that is kept in a readily accessible location:

(1) Design criterion required in §§60.482–2a(d)(5) and 60.482–3a(e)(2) and explanation of the design criterion; and

(2) Any changes to this criterion and the reasons for the changes.

(i) The following information shall be recorded in a log that is kept in a readily accessible location for use in determining exemptions as provided in §60.480a(d):

(1) An analysis demonstrating the design capacity of the affected facility,

(2) A statement listing the feed or raw materials and products from the affected facilities and an analysis demonstrating whether these chemicals are heavy liquids or beverage alcohol, and

(3) An analysis demonstrating that equipment is not in VOC service.

(j) Information and data used to demonstrate that a piece of equipment is not in VOC service shall be recorded in a log that is kept in a readily accessible location.

(k) The provisions of §60.7(b) and (d) do not apply to affected facilities subject to this subpart.

§ 60.487a Reporting requirements.

(a) Each owner or operator subject to the provisions of this subpart shall submit semiannual reports to the Administrator beginning 6 months after the initial startup date.

(b) The initial semiannual report to the Administrator shall include the following information:

(1) Process unit identification.

(2) Number of valves subject to the requirements of §60.482–7a, excluding those valves designated for no detectable emissions under the provisions of §60.482–7a(f).

(3) Number of pumps subject to the requirements of §60.482–2a, excluding those pumps designated for no detectable emissions under the provisions of §60.482–2a(e) and those pumps complying with §60.482–2a(f).

(4) Number of compressors subject to the requirements of §60.482–3a, excluding those compressors designated for no detectable emissions under the provisions of §60.482–3a(i) and those compressors complying with §60.482–3a(h).

(5) Number of connectors subject to the requirements of §60.482–11a.

(c) All semiannual reports to the Administrator shall include the following information, summarized from the information in §60.486a:

(1) Process unit identification.
(2) For each month during the semiannual reporting period,

(i) Number of valves for which leaks were detected as described in §60.482–7a(b) or §60.483–2a,

(ii) Number of valves for which leaks were not repaired as required in §60.482–7a(d)(1),

(iii) Number of pumps for which leaks were detected as described in §60.482–2a(b), (d)(4)(ii)(A) or (B), or (d)(5)(iii),

(iv) Number of pumps for which leaks were not repaired as required in §60.482–2a(c)(1) and (d)(6),

(v) Number of compressors for which leaks were detected as described in §60.482–3a(f),

(vi) Number of compressors for which leaks were not repaired as required in §60.482–3a(g)(1),

(vii) Number of connectors for which leaks were detected as described in §60.482–11a(b)

(viii) Number of connectors for which leaks were not repaired as required in §60.482–11a(d), and

(xi) The facts that explain each delay of repair and, where appropriate, why a process unit shutdown was technically infeasible.

(3) Dates of process unit shutdowns which occurred within the semiannual reporting period.

(4) Revisions to items reported according to paragraph (b) of this section if changes have occurred since the initial report or subsequent revisions to the initial report.

(d) An owner or operator electing to comply with the provisions of §§60.483–1a or 60.483–2a shall notify the Administrator of the alternative standard selected 90 days before implementing either of the provisions.

(e) An owner or operator shall report the results of all performance tests in accordance with §60.8 of the General Provisions. The provisions of §60.8(d) do not apply to affected facilities subject to the provisions of this subpart except that an owner or operator must notify the Administrator of the schedule for the initial performance tests at least 30 days before the initial performance tests.

(f) The requirements of paragraphs (a) through (c) of this section remain in force until and unless EPA, in delegating enforcement authority to a state under section 111(c) of the CAA, approves reporting requirements or an alternative means of compliance surveillance adopted by such state. In that event, affected sources within the state will be relieved of the obligation to comply with the requirements of paragraphs (a) through (c) of this section, provided that they comply with the requirements established by the state.

§ 60.488a Reconstruction.

For the purposes of this subpart:
(a) The cost of the following frequently replaced components of the facility shall not be considered in calculating either the “fixed capital cost of the new components” or the “fixed capital costs that would be required to construct a comparable new facility” under §60.15: Pump seals, nuts and bolts, rupture disks, and packings.

(b) Under §60.15, the “fixed capital cost of new components” includes the fixed capital cost of all depreciable components (except components specified in §60.488a(a)) which are or will be replaced pursuant to all continuous programs of component replacement which are commenced within any 2-year period following the applicability date for the appropriate subpart. (See the “Applicability and designation of affected facility” section of the appropriate subpart.) For purposes of this paragraph, “commenced” means that an owner or operator has undertaken a continuous program of component replacement or that an owner or operator has entered into a contractual obligation to undertake and complete, within a reasonable time, a continuous program of component replacement.

§ 60.489a List of chemicals produced by affected facilities.

Process units that produce, as intermediates or final products, chemicals listed in §60.489 are covered under this subpart. The applicability date for process units producing one or more of these chemicals is November 8, 2006.
