(iii) If you elect Option 3 in paragraph (a)(1)(v) of this section, the Ni lb/hr emission limit, compute your Ni emission rate using Equation 5 of this section and your site-specific Ni operating limit (if you use a continuous opacity monitoring system) using Equations 6 and 7 of this section as follows:

$$E_{Ni} = C_{Ni} \times Q_{sd} \quad (\text{Eq. 5})$$

Where:

$E_{Ni}$  = Mass emission rate of Ni, mg/hr (lb/hr); and

$C_{Ni}$  = Ni concentration in the catalytic cracking unit catalyst regenerator flue gas as measured by Method 29 in appendix A to part 60 of this chapter, mg/dscm (lbs/dscf).

$$Opacity_1 = \frac{13 \text{ g Ni/hr}}{NiEmR1_{st}} \times Opacity_{st} \quad (Eq. 6)$$

Where:

Opacity<sub>1</sub> = Opacity value for use in Equation 7 of this section, percent, or 10 percent, whichever is greater; and

NiEmR1<sub>st</sub> = Average Ni emission rate calculated as the arithmetic average Ni emission rate using Equation 5 of this section for each of the performance test runs, g Ni/hr.

$$Ni \text{ Operating Limit}_1 = Opacity_1 \times Q_{mon,st} \times E-Cat_{st} \quad (Eq. 7)$$

Where:

Ni operating limit<sub>1</sub> = Maximum permissible hourly average Ni operating limit, percent-acfm-ppmw, i.e., your site-specific Ni operating limit;

Q<sub>mon,st</sub> = Hourly average actual gas flow rate as measured by the continuous parameter monitoring system during the performance test or using the alternative procedure in §63.1573, acfm; and

E-Cat<sub>st</sub> = Ni concentration on equilibrium catalyst measured during source test, ppmw.

(iv) If you elect Option 4 in paragraph (a)(1)(vi) of this section, the Ni per coke burn-off emission limit, compute your Ni emission rate using Equations 1 and 8 of this section and your site-specific Ni operating limit (if you use a continuous opacity monitoring system) using Equations 9 and 10 of this section as follows:

$$E_{Ni} = \frac{C_{Ni} \times Q_{sd}}{R_c} \quad (Eq. 8)$$

Where:

E<sub>Ni</sub> = Normalized mass emission rate of Ni, mg/kg coke (lb/1,000 lb coke).

$$Opacity_2 = \frac{1.0 \text{ mg/kg coke}}{NiEmR2_{st}} \times Opacity_{st} \quad (Eq. 9)$$

Where:

Opacity<sub>2</sub> = Opacity value for use in Equation 10 of this section, percent, or 10 percent, whichever is greater; and

NiEmR2<sub>st</sub> = Average Ni emission rate calculated as the arithmetic average Ni emission rate using Equation 8 of this section for each of the performance test runs, mg/kg coke.

$$Ni \text{ Operating Limit}_2 = Opacity_2 \times E-Cat_{st} \times \frac{Q_{mon,st}}{R_{c,st}} \quad (Eq. 10)$$

Where:

Ni Operating Limit<sub>2</sub> = Maximum permissible hourly average Ni operating limit, percent-ppmw-acfm-hr/kg coke, i.e., your site-specific Ni operating limit; and

R<sub>c,st</sub> = Coke burn rate from Equation 1 of this section, as measured during the initial performance test, kg coke/hr.

(5) Demonstrate initial compliance with each emission limitation that applies to you according to Table 5 of this subpart.

(6) Demonstrate initial compliance with the work practice standard in paragraph (a)(3) of this section by submitting your operation, maintenance, and monitoring plan to your permitting authority as part of your Notification of Compliance Status.

(7) Submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the emission limitations and work practice standards? You must:*

(1) Demonstrate continuous compliance with each emission limitation in Tables 1 and 2 of this subpart that applies to you according to the methods specified in Tables 6 and 7 of this subpart.

(2) Demonstrate continuous compliance with the work practice standard in paragraph (a)(3) of this section by maintaining records to document conformance with the procedures in your operation, maintenance, and monitoring plan.

(3) If you use a continuous opacity monitoring system and elect to comply with Option 3 in paragraph (a)(1)(v) of this section, determine continuous compliance with your site-specific Ni operating limit by using Equation 11 of this section as follows:

$$Ni \text{ Operating Value}_1 = Opacity \times Q_{mon} \times E-Cat \quad (Eq. 11)$$

Where:

Ni operating value<sub>1</sub> = Maximum permissible hourly average Ni standard operating value, %-acfm-ppmw;

Opacity = Hourly average opacity, percent;

Q<sub>mon</sub> = Hourly average actual gas flow rate as measured by continuous parameter monitoring system or calculated by alternative procedure in §63.1573, acfm; and

E-Cat = Ni concentration on equilibrium catalyst from weekly or more recent measurement, ppmw.

(4) If you use a continuous opacity monitoring system and elect to comply with Option 4 in paragraph (a)(1)(vi) of this section, determine continuous compliance with your site-specific Ni operating limit by using Equation 12 of this section as follows:

$$Ni \text{ Operating Value}_2 = \frac{Opacity \times E-Cat \times Q_{mon}}{R_c} \quad (Eq. 12)$$

Where:

Ni operating value<sub>2</sub> = Maximum permissible hourly average Ni standard operating value, percent-acfm-ppmw-hr/kg coke.

(5) If you elect to comply with the alternative limit in paragraph (a)(5)(ii) of this section during periods of startup, shutdown and hot standby, demonstrate continuous compliance on or before the date specified in §63.1563(d) by:

(i) Collecting the volumetric flow rate from the catalyst regenerator (in acfm) and determining the average flow rate for each hour. For events lasting less than one hour, determine the average flow rate during the event.

(ii) Determining the cumulative cross-sectional area of the primary internal cyclone inlets in square feet (ft<sup>2</sup>) using design drawings of the primary (first-stage) internal cyclones to determine the inlet cross-sectional area of each primary internal cyclone and summing the cross-sectional areas for all primary internal cyclones in the catalyst regenerator or, if primary cyclones. If all primary internal cyclones are identical, you may alternatively determine the inlet cross-sectional area of one primary internal cyclone using design drawings and multiply that area by the total number of primary internal cyclones in the catalyst regenerator.

(iii) Calculating the inlet velocity to the primary internal cyclones in feet per second (ft/sec) by dividing the average volumetric flow rate (acfm) by the cumulative cross-sectional area of the primary internal cyclone inlets (ft<sup>2</sup>) and by 60 seconds/minute (for unit conversion).

(iv) Maintaining the inlet velocity to the primary internal cyclones at or above 20 feet per second for each hour during the startup, shutdown, or hot standby event or, for events lasting less than 1 hour, for the duration of the event.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6938, Feb. 9, 2005; 80 FR 75273, Dec. 1, 2015; 81 FR 45243, July 13, 2016; 83 FR 60722, Nov. 26, 2018]

**§63.1565 What are my requirements for organic HAP emissions from catalytic cracking units?**

(a) *What emission limitations and work practice standards must I meet? You must:*

(1) Except as provided in paragraph (a)(5) of this section, meet each emission limitation in Table 8 of this subpart that applies to you. If your catalytic cracking unit is subject to the NSPS for carbon monoxide (CO) in §60.103 of this chapter or is subject to §60.102a(b)(4) of this chapter, you must meet the emission limitations for NSPS units. If your catalytic cracking unit is not subject to the NSPS for CO, you can choose from the two options in paragraphs (a)(1)(i) through (ii) of this section:

(i) You can elect to comply with the NSPS requirements (Option 1); or

(ii) You can elect to comply with the CO emission limit (Option 2).

(2) Comply with each site-specific operating limit in Table 9 of this subpart that applies to you.

(3) Prepare an operation, maintenance, and monitoring plan according to the requirements in §63.1574(f) and operate at all times according to the procedures in the plan.

(4) The emission limitations and operating limits for organic HAP emissions from catalytic cracking units required in paragraphs (a)(1) and (2) of this section do not apply during periods of planned maintenance preapproved by the applicable permitting authority according to the requirements in §63.1575(j).

(5) On or before the date specified in §63.1563(d), you must comply with one of the two options in paragraphs (a)(5)(i) and (ii) of this section during periods of startup, shutdown and hot standby:

(i) You can elect to comply with the requirements in paragraphs (a)(1) and (2) of this section; or

(ii) You can elect to maintain the oxygen (O<sub>2</sub>) concentration in the exhaust gas from your catalyst regenerator at or above 1 volume percent (dry basis) or 1 volume percent (wet basis with no moisture correction).

(b) *How do I demonstrate initial compliance with the emission limitations and work practice standards? You must:*

(1) Install, operate, and maintain a continuous monitoring system according to the requirements in §63.1572 and Table 10 of this subpart. Except:

(i) Whether or not your catalytic cracking unit is subject to the NSPS for CO in §60.103 of this chapter, you don't have to install and operate a continuous emission monitoring system if you show that CO emissions from your vent average less than 50 parts per million (ppm), dry basis. You must get an exemption from your permitting authority,

based on your written request. To show that the emissions average is less than 50 ppm (dry basis), you must continuously monitor CO emissions for 30 days using a CO continuous emission monitoring system that meets the requirements in §63.1572.

(ii) If your catalytic cracking unit isn't subject to the NSPS for CO, you don't have to install and operate a continuous emission monitoring system or a continuous parameter monitoring system if you vent emissions to a boiler (including a "CO boiler") or process heater that has a design heat input capacity of at least 44 megawatts (MW).

(iii) If your catalytic cracking unit isn't subject to the NSPS for CO, you don't have to install and operate a continuous emission monitoring system or a continuous parameter monitoring system if you vent emissions to a boiler or process heater in which all vent streams are introduced into the flame zone.

(2) Conduct each performance test for a catalytic cracking unit not subject to the NSPS for CO according to the requirements in §63.1571 and under the conditions specified in Table 11 of this subpart.

(3) Establish each site-specific operating limit in Table 9 of this subpart that applies to you according to the procedures in Table 11 of this subpart.

(4) Demonstrate initial compliance with each emission limitation that applies to you according to Table 12 of this subpart.

(5) Demonstrate initial compliance with the work practice standard in paragraph (a)(3) of this section by submitting the operation, maintenance, and monitoring plan to your permitting authority as part of your Notification of Compliance Status according to §63.1574.

(6) Submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the emission limitations and work practice standards? You must:*

(1) Demonstrate continuous compliance with each emission limitation in Tables 8 and 9 of this subpart that applies to you according to the methods specified in Tables 13 and 14 of this subpart.

(2) Demonstrate continuous compliance with the work practice standard in paragraph (a)(3) of this section by complying with the procedures in your operation, maintenance, and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 80 FR 75275, Dec. 1, 2015; 81 FR 45243, July 13, 2016; 83 FR 60723, Nov. 26, 2018]

### **§63.1566 What are my requirements for organic HAP emissions from catalytic reforming units?**

(a) *What emission limitations and work practice standards must I meet? You must:*

(1) Meet each emission limitation in Table 15 of this subpart that applies to you. You can choose from the two options in paragraphs (a)(1)(i) and (ii) of this section.

(i) You can elect to vent emissions of total organic compounds (TOC) to a flare (Option 1). On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare must meet the control device requirements in §63.11(b) or the requirements of §63.670.

(ii) You can elect to meet a TOC or nonmethane TOC percent reduction standard or concentration limit, whichever is less stringent (Option 2).

(2) Comply with each site-specific operating limit in Table 16 of this subpart that applies to you.

(3) Except as provided in paragraph (a)(4) of this section, the emission limitations in Tables 15 and 16 of this subpart apply to emissions from catalytic reforming unit process vents associated with initial catalyst depressuring and catalyst purging operations that occur prior to the coke burn-off cycle. The emission limitations in Tables 15 and 16 of this subpart do not apply to the coke burn-off, catalyst rejuvenation, reduction or activation vents, or to the control systems used for these vents.

(4) The emission limitations in tables 15 and 16 of this subpart do not apply to emissions from process vents during passive depressuring when the reactor vent pressure is 5 pounds per square inch gauge (psig) or less or during active depressuring or purging prior to January 30, 2019, when the reactor vent pressure is 5 psig or less. On and after January 30, 2019, the emission limitations in tables 15 and 16 of this subpart do apply to emissions from process vents during active purging operations (when nitrogen or other purge gas is actively introduced to the reactor vessel) or active depressuring (using a vacuum pump, ejector system, or similar device) regardless of the reactor vent pressure.

(5) Prepare an operation, maintenance, and monitoring plan according to the requirements in §63.1574(f) and operate at all times according to the procedures in the plan.

(b) *How do I demonstrate initial compliance with the emission limitations and work practice standard?* You must:

(1) Install, operate, and maintain a continuous monitoring system(s) according to the requirements in §63.1572 and Table 17 of this subpart.

(2) Conduct each performance test for a catalytic reforming unit according to the requirements in §63.1571 and under the conditions specified in Table 18 of this subpart.

(3) Establish each site-specific operating limit in Table 16 of this subpart that applies to you according to the procedures in Table 18 of this subpart.

(4) Use the procedures in paragraph (b)(4)(i) or (ii) of this section to determine initial compliance with the emission limitations.

(i) If you elect the percent reduction standard under Option 2, calculate the emission rate of nonmethane TOC using Equation 1 of this section (if you use Method 25) or Equation 2 of this section (if you use Method 25A or Methods 25A and 18), then calculate the mass emission reduction using Equation 3 of this section as follows:

$$E = K_4 M_c Q_s \quad (\text{Eq. 1})$$

Where:

E = Emission rate of nonmethane TOC in the vent stream, kilograms-C per hour;

$K_4$  = Constant,  $6.0 \times 10^{-5}$  (kilograms per milligram)(minutes per hour);

$M_c$  = Mass concentration of total gaseous nonmethane organic (as carbon) as measured and calculated using Method 25 in appendix A to part 60 of this chapter, mg/dscm; and

$Q_s$  = Vent stream flow rate, dscm/min, at a temperature of 20 degrees Celsius (C).

$$E = K_5 (C_{\text{TOC}} - \frac{1}{6} C_{\text{methane}}) Q_s \quad (\text{Eq. 2})$$

Where:

$K_s$  = Constant,  $1.8 \times 10^{-4}$  (parts per million)<sup>-1</sup> (gram-mole per standard cubic meter) (gram-C per gram-mole-hexane) (kilogram per gram) (minutes per hour), where the standard temperature (standard cubic meter) is at 20 degrees C (uses 72g-C/g.mole hexane);

$C_{\text{TOC}}$  = Concentration of TOC on a dry basis in ppmv as hexane as measured by Method 25A in appendix A to part 60 of this chapter;

$C_{\text{methane}}$  = Concentration of methane on a dry basis in ppmv as measured by Method 18 in appendix A to part 60 of this chapter. If the concentration of methane is not determined, assume  $C_{\text{methane}}$  equals zero; and

$Q_s$  = Vent stream flow rate, dry standard cubic meters per minute, at a temperature of 20 degrees C.

$$\% \text{ reduction} = \frac{E_i - E_o}{E_i} \times 100\% \quad (\text{Eq. 3})$$

Where:

$E_i$  = Mass emission rate of TOC at control device inlet, kg/hr; and

$E_o$  = Mass emission rate of TOC at control device outlet, kg/hr.

(ii) If you elect the 20 parts per million by volume (ppmv) concentration limit, correct the measured TOC concentration for oxygen ( $O_2$ ) content in the gas stream using Equation 4 of this section as follows:

$$C_{\text{NMTOC, 3\%O}_2} = (C_{\text{TOC}} - \frac{1}{6} C_{\text{methane}}) \left( \frac{17.9\%}{20.9\% - \%O_2} \right) \quad (\text{Eq. 4})$$

Where:

$C_{\text{NMTOC, 3\%O}_2}$  = Concentration of nonmethane TOC on a dry basis in ppmv as hexane corrected to 3 percent oxygen.

(5) You are not required to do a TOC performance test if:

(i) You elect to vent emissions to a flare as provided in paragraph (a)(1)(i) of this section (Option 1); or

(ii) You elect the TOC percent reduction or concentration limit in paragraph (a)(1)(ii) of this section (Option 2), and you use a boiler or process heater with a design heat input capacity of 44 MW or greater or a boiler or process heater in which all vent streams are introduced into the flame zone.

(6) Demonstrate initial compliance with each emission limitation that applies to you according to Table 19 of this subpart.

(7) Demonstrate initial compliance with the work practice standard in paragraph (a)(5) of this section by submitting the operation, maintenance, and monitoring plan to your permitting authority as part of your Notification of Compliance Status.

(8) Submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the emission limitations and work practice standards? You must:*

(1) Demonstrate continuous compliance with each emission limitation in Tables 15 and 16 of this subpart that applies to you according to the methods specified in Tables 20 and 21 of this subpart.

(2) Demonstrate continuous compliance with the work practice standards in paragraph (a)(3) of this section by complying with the procedures in your operation, maintenance, and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6938, Feb. 9, 2005; 80 FR 75275, Dec. 1, 2015; 81 FR 45243, July 13, 2016]

**§63.1567 What are my requirements for inorganic HAP emissions from catalytic reforming units?**

(a) *What emission limitations and work practice standards must I meet?* You must:

(1) Meet each emission limitation in Table 22 to this subpart that applies to you. If you operate a catalytic reforming unit in which different reactors in the catalytic reforming unit are regenerated in separate regeneration systems, then these emission limitations apply to each separate regeneration system. These emission limitations apply to emissions from catalytic reforming unit process vents associated with the coke burn-off and catalyst rejuvenation operations during coke burn-off and catalyst regeneration. You can choose from the two options in paragraphs (a)(1)(i) through (ii) of this section:

(i) You can elect to meet a percent reduction standard for hydrogen chloride (HCl) emissions (Option 1); or

(ii) You can elect to meet an HCl concentration limit (Option 2).

(2) Meet each site-specific operating limit in Table 23 of this subpart that applies to you. These operating limits apply during coke burn-off and catalyst rejuvenation.

(3) Prepare an operation, maintenance, and monitoring plan according to the requirements in §63.1574(f) and operate at all times according to the procedures in the plan.

(b) *How do I demonstrate initial compliance with the emission limitations and work practice standard?* You must:

(1) Install, operate, and maintain a continuous monitoring system(s) according to the requirements in §63.1572 and Table 24 of this subpart.

(2) Conduct each performance test for a catalytic reforming unit according to the requirements in §63.1571 and the conditions specified in Table 25 of this subpart.

(3) Establish each site-specific operating limit in Table 23 of this subpart that applies to you according to the procedures in Table 25 of this subpart.

(4) Use the equations in paragraphs (b)(4)(i) through (iv) of this section to determine initial compliance with the emission limitations.

(i) Correct the measured HCl concentration for oxygen (O<sub>2</sub>) content in the gas stream using Equation 1 of this section as follows:

$$C_{\text{HCl},3\%O_2} = \left( \frac{17.9\%}{20.9\% - \%O_2} \right) C_{\text{HCl}} \quad (\text{Eq. 1})$$

Where:

$C_{\text{HCl},3\%O_2}$  = Concentration of HCl on a dry basis in ppmv corrected to 3 percent oxygen or 1 ppmv, whichever is greater;

$C_{HCl}$  = Concentration of HCl on a dry basis in ppmv, as measured by Method 26A in 40 CFR part 60, appendix A; and

$\%O_2$  = Oxygen concentration in percent by volume (dry basis).

(ii) If you elect the percent reduction standard, calculate the emission rate of HCl using Equation 2 of this section; then calculate the mass emission reduction from the mass emission rates using Equation 3 of this section as follows:

$$E_{HCl} = K_6 C_{HCl} Q_s \quad (\text{Eq. 2})$$

Where:

$E_{HCl}$  = Emission rate of HCl in the vent stream, grams per hour;

$K_6$  = Constant,  $0.091 (\text{parts per million})^{-1}$  (grams HCl per standard cubic meter) (minutes per hour), where the standard temperature (standard cubic meter) is at 20 degrees Celsius (C); and

$Q_s$  = Vent stream flow rate, dscm/min, at a temperature of 20 degrees C.

$$\text{HCl}\% \text{reduction} = \frac{E_{HCl,i} - E_{HCl,o}}{E_{HCl,i}} \times 100\% \quad (\text{Eq. 3})$$

Where:

$E_{HCl,i}$  = Mass emission rate of HCl at control device inlet, g/hr; and

$E_{HCl,o}$  = Mass emission rate of HCl at control device outlet, g/hr.

(iii) If you are required to use a colormetric tube sampling system to demonstrate continuous compliance with the HCl concentration operating limit, calculate the HCl operating limit using Equation 4 of this section as follows:

$$C_{HCl,ppmvLimit} = 0.9 C_{HCl,AveTube} \left( \frac{C_{HCl,RegLimit}}{C_{HCl,3\%O_2}} \right) \quad (\text{Eq. 4})$$

Where:

$C_{HCl,ppmvLimit}$  = Maximum permissible HCl concentration for the HCl concentration operating limit, ppmv;

$C_{HCl,AveTube}$  = Average HCl concentration from the colormetric tube sampling system, calculated as the arithmetic average of the average HCl concentration measured for each performance test run, ppmv or 1 ppmv, whichever is greater; and

$C_{HCl,RegLimit}$  = Maximum permissible outlet HCl concentration for the applicable catalytic reforming unit as listed in Table 22 of this subpart, either 10 or 30 ppmv.

(iv) If you are required to use a colormetric tube sampling system to demonstrate continuous compliance with the percent reduction operating limit, calculate the HCl operating limit using Equation 5 of this section as follows:

$$C_{HCl,\%Limit} = 0.9 C_{HCl,AveTube} \left( \frac{100 - \%HClReduction_{Limit}}{100 - \%HClReduction_{Test}} \right) \quad (\text{Eq. 5})$$

Where:

$C_{\text{HCl, \%Limit}}$  = Maximum permissible HCl concentration for the percent reduction operating limit, ppmv;

$\% \text{HCl Reduction}_{\text{Limit}}$  = Minimum permissible HCl reduction for the applicable catalytic reforming unit as listed in Table 22 of this subpart, either 97 or 92 percent; and

$\% \text{HCl Reduction}_{\text{Test}}$  = Average percent HCl reduction calculated as the arithmetic average HCl reduction calculated using Equation 3 of this section for each performance source test, percent.

(5) Demonstrate initial compliance with each emission limitation that applies to you according to Table 26 of this subpart.

(6) Demonstrate initial compliance with the work practice standard in paragraph (a)(3) of this section by submitting the operation, maintenance, and monitoring plan to your permitting authority as part of your Notification of Compliance Status.

(7) Submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the emission limitations and work practice standard? You must:*

(1) Demonstrate continuous compliance with each emission limitation in Tables 22 and 23 of this subpart that applies to you according to the methods specified in Tables 27 and 28 of this subpart.

(2) Demonstrate continuous compliance with the work practice standard in paragraph (a)(3) of this section by maintaining records to document conformance with the procedures in your operation, maintenance and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6939, Feb. 9, 2005]

**§63.1568 What are my requirements for HAP emissions from sulfur recovery units?**

(a) *What emission limitations and work practice standard must I meet? You must:*

(1) Meet each emission limitation in Table 29 of this subpart that applies to you. If your sulfur recovery unit is subject to the NSPS for sulfur oxides in §60.104 or §60.102a(f)(1) of this chapter, you must meet the emission limitations for NSPS units. If your sulfur recovery unit is not subject to one of these NSPS for sulfur oxides, you can choose from the options in paragraphs (a)(1)(i) through (ii) of this section:

(i) You can elect to meet the NSPS requirements in §60.104(a)(2) or §60.102a(f)(1) of this chapter (Option 1); or

(ii) You can elect to meet the total reduced sulfur (TRS) emission limitation (Option 2).

(2) Meet each operating limit in Table 30 of this subpart that applies to you.

(3) Prepare an operation, maintenance, and monitoring plan according to the requirements in §63.1574(f) and operate at all times according to the procedures in the plan.

(4) On or before the date specified in §63.1563(d), you must comply with one of the three options in paragraphs (a)(4)(i) through (iii) of this section during periods of startup and shutdown.

(i) You can elect to comply with the requirements in paragraphs (a)(1) and (2) of this section.

(ii) You can elect to send any startup or shutdown purge gases to a flare. On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare must meet the design and operating requirements in §63.11(b) or the requirements of §63.670.

(iii) You can elect to send any startup or shutdown purge gases to a thermal oxidizer or incinerator operated at a minimum hourly average temperature of 1,200 degrees Fahrenheit in the firebox and a minimum hourly average outlet oxygen (O<sub>2</sub>) concentration of 2 volume percent (dry basis).

(b) *How do I demonstrate initial compliance with the emission limitations and work practice standards?* You must:

(1) Install, operate, and maintain a continuous monitoring system according to the requirements in §63.1572 and Table 31 of this subpart.

(2) Conduct each performance test for a sulfur recovery unit not subject to the NSPS for sulfur oxides according to the requirements in §63.1571 and under the conditions specified in Table 32 of this subpart.

(3) Establish each site-specific operating limit in Table 30 of this subpart that applies to you according to the procedures in Table 32 of this subpart.

(4) Correct the reduced sulfur samples to zero percent excess air using Equation 1 of this section as follows:

$$C_{adj} = C_{meas} \left[ \frac{20.9_c}{20.9 - \%O_2} \right] \quad (Eq. 1)$$

Where:

C<sub>adj</sub> = pollutant concentration adjusted to zero percent oxygen, ppm or g/dscm;

C<sub>meas</sub> = pollutant concentration measured on a dry basis, ppm or g/dscm;

20.9<sub>c</sub> = 20.9 percent oxygen—0.0 percent oxygen (defined oxygen correction basis), percent;

20.9 = oxygen concentration in air, percent;

%O<sub>2</sub> = oxygen concentration measured on a dry basis, percent.

(5) Demonstrate initial compliance with each emission limitation that applies to you according to Table 33 of this subpart.

(6) Demonstrate initial compliance with the work practice standard in paragraph (a)(3) of this section by submitting the operation, maintenance, and monitoring plan to your permitting authority as part of your notification of compliance status.

(7) Submit the notification of compliance status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the emission limitations and work practice standards?* You must:

(1) Demonstrate continuous compliance with each emission limitation in Tables 29 and 30 of this subpart that applies to you according to the methods specified in Tables 34 and 35 of this subpart.

(2) Demonstrate continuous compliance with the work practice standard in paragraph (a)(3) of this section by complying with the procedures in your operation, maintenance, and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 80 FR 75275, Dec. 1, 2015; 81 FR 45244, July 13, 2016]

**§63.1569 What are my requirements for HAP emissions from bypass lines?**

(a) *What work practice standards must I meet?* (1) You must meet each work practice standard in Table 36 of this subpart that applies to you. You can choose from the four options in paragraphs (a)(1)(i) through (iv) of this section:

(i) You can elect to install an automated system (Option 1);

(ii) You can elect to use a manual lock system (Option 2);

(iii) You can elect to seal the line (Option 3); or

(iv) You can elect to vent to a control device (Option 4).

(2) As provided in §63.6(g), we, the EPA, may choose to grant you permission to use an alternative to the work practice standard in paragraph (a)(1) of this section.

(3) You must prepare an operation, maintenance, and monitoring plan according to the requirements in §63.1574(f) and operate at all times according to the procedures in the plan.

(b) *How do I demonstrate initial compliance with the work practice standards?* You must:

(1) If you elect the option in paragraph (a)(1)(i) of this section, conduct each performance test for a bypass line according to the requirements in §63.1571 and under the conditions specified in Table 37 of this subpart.

(2) Demonstrate initial compliance with each work practice standard in Table 36 of this subpart that applies to you according to Table 38 of this subpart.

(3) Demonstrate initial compliance with the work practice standard in paragraph (a)(3) of this section by submitting the operation, maintenance, and monitoring plan to your permitting authority as part of your notification of compliance status.

(4) Submit the notification of compliance status containing the results of the initial compliance demonstration according to the requirements in §63.1574.

(c) *How do I demonstrate continuous compliance with the work practice standards?* You must:

(1) Demonstrate continuous compliance with each work practice standard in Table 36 of this subpart that applies to you according to the requirements in Table 39 of this subpart.

(2) Demonstrate continuous compliance with the work practice standard in paragraph (a)(3) of this section by complying with the procedures in your operation, maintenance, and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 83 FR 60723, Nov. 26, 2018]

**General Compliance Requirements**

**§63.1570 What are my general requirements for complying with this subpart?**

(a) You must be in compliance with all of the non-opacity standards in this subpart at all times.

(b) You must be in compliance with the opacity and visible emission limits in this subpart at all times.

(c) At all times, you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

(d) During the period between the compliance date specified for your affected source and the date upon which continuous monitoring systems have been installed and validated and any applicable operating limits have been set, you must maintain a log that documents the procedures used to minimize emissions from process and emissions control equipment according to the general duty in paragraph (c) of this section.

(e) [Reserved]

(f) You must report each instance in which you did not meet each emission limitation and each operating limit in this subpart that applies to you. This includes periods of startup, shutdown, and malfunction. You also must report each instance in which you did not meet the work practice standards in this subpart that apply to you. These instances are deviations from the emission limitations and work practice standards in this subpart. These deviations must be reported according to the requirements in §63.1575.

[67 FR 17773, Apr. 11, 2002, as amended at 71 FR 20462, Apr. 20, 2006; 80 FR 75276, Dec. 1, 2015]

**§63.1571 How and when do I conduct a performance test or other initial compliance demonstration?**

(a) *When must I conduct a performance test?* You must conduct initial performance tests and report the results by no later than 150 days after the compliance date specified for your source in §63.1563 and according to the provisions in §§63.7(a)(2) and 63.1574(a)(3). If you are required to do a performance evaluation or test for a semi-regenerative catalytic reforming unit catalyst regenerator vent, you may do them at the first regeneration cycle after your compliance date and report the results in a followup Notification of Compliance Status report due no later than 150 days after the test. You must conduct additional performance tests as specified in paragraphs (a)(5) and (6) of this section and report the results of these performance tests according to the provisions in §63.1575(f).

(1) For each emission limitation or work practice standard where initial compliance is not demonstrated using a performance test, opacity observation, or visible emission observation, you must conduct the initial compliance demonstration within 30 calendar days after the compliance date that is specified for your source in §63.1563.

(2) For each emission limitation where the averaging period is 30 days, the 30-day period for demonstrating initial compliance begins at 12:00 a.m. on the compliance date that is specified for your source in §63.1563 and ends at 11:59 p.m., 30 calendar days after the compliance date that is specified for your source in §63.1563.

(3) If you commenced construction or reconstruction between September 11, 1998 and April 11, 2002, you must demonstrate initial compliance with either the proposed emission limitation or the promulgated emission limitation no later than October 8, 2002 or within 180 calendar days after startup of the source, whichever is later, according to §63.7(a)(2)(ix).

(4) If you commenced construction or reconstruction between September 11, 1998 and April 11, 2002, and you chose to comply with the proposed emission limitation when demonstrating initial compliance, you must conduct a second compliance demonstration for the promulgated emission limitation by October 10, 2005, or after startup of the source, whichever is later, according to §63.7(a)(2)(ix).

(5) *Periodic performance testing for PM or Ni.* Except as provided in paragraphs (a)(5)(i) and (ii) of this section, conduct a periodic performance test for PM or Ni for each catalytic cracking unit at least once every 5 years according to the requirements in Table 4 of this subpart. You must conduct the first periodic performance test no later than August 1, 2017 or within 150 days of startup of a new unit.

(i) Catalytic cracking units monitoring PM concentration with a PM CEMS are not required to conduct a periodic PM performance test.

(ii) Conduct a performance test annually if you comply with the emission limits in Item 1 (NSPS subpart J) or Item 4 (Option 1a) in Table 1 of this subpart and the PM emissions measured during the most recent performance source test are greater than 0.80 g/kg coke burn-off.

(6) *One-time performance testing for Hydrogen Cyanide (HCN)*. Conduct a performance test for HCN from each catalytic cracking unit no later than August 1, 2017 or within 150 days of startup of a new unit according to the applicable requirements in paragraphs (a)(6)(i) and (ii) of this section.

(i) If you conducted a performance test for HCN for a specific catalytic cracking unit between March 31, 2011 and February 1, 2016, you may submit a request to the Administrator to use the previously conducted performance test results to fulfill the one-time performance test requirement for HCN for each of the catalytic cracking units tested according to the requirements in paragraphs (a)(6)(i)(A) through (D) of this section.

(A) The request must include a copy of the complete source test report, the date(s) of the performance test and the test methods used. If available, you must also indicate whether the catalytic cracking unit catalyst regenerator was operated in partial or complete combustion mode during the test, the control device configuration, including whether platinum or palladium combustion promoters were used during the test, and the CO concentration (measured using CO CEMS or manual test method) for each test run.

(B) You must submit a separate request for each catalytic cracking unit tested and you must submit each request to the Administrator no later than March 30, 2016.

(C) The Administrator will evaluate each request with respect to the completeness of the request, the completeness of the submitted test report and the appropriateness of the test methods used. The Administrator will notify the facility within 60 days of receipt of the request if it is approved or denied. If the Administrator fails to respond to the facility within 60 days of receipt of the request, the request will be automatically approved.

(D) If the request is approved, you do not need to conduct an additional HCN performance test. If the request is denied, you must conduct an additional HCN performance test following the requirements in (a)(6)(ii) of this section.

(ii) Unless you receive approval to use a previously conducted performance test to fulfill the one-time performance test requirement for HCN for your catalytic cracking unit as provided in paragraph (a)(6)(i) of this section, conduct a performance test for HCN for each catalytic cracking unit no later than August 1, 2017 according to following requirements:

(A) Select sampling port location, determine volumetric flow rate, conduct gas molecular weight analysis and measure moisture content as specified in either Item 1 of Table 4 of this subpart or Item 1 of Table 11 of this subpart.

(B) Measure HCN concentration using Method 320 of appendix A of this part. The method ASTM D6348-03 (Reapproved 2010) including Annexes A1 through A8 (incorporated by reference—see §63.14) is an acceptable alternative to EPA Method 320 of appendix A of this part. The method ASTM D6348-12e1 (incorporated by reference—see §63.14) is an acceptable alternative to EPA Method 320 of appendix A of this part with the following two caveats:

(1) The test plan preparation and implementation in the Annexes to ASTM D6348-03 (Reapproved 2010), Sections A1 through A8 are mandatory; and

(2) In ASTM D6348-03 (Reapproved 2010) Annex A5 (Analyte Spiking Technique), the percent (%) R must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be  $70\% \geq R \leq 130\%$ . If the %R value does not meet this criterion for a target compound, the test data is not acceptable for that compound and the test must be repeated for that analyte (*i.e.*, the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation:

Reported Result = (Measured Concentration in the Stack × 100 ÷ % R).

(C) Measure CO concentration as specified in either Item 2 or 3a of Table 11 of this subpart.

(D) Record and include in the test report an indication of whether the catalytic cracking unit catalyst regenerator was operated in partial or complete combustion mode and the control device configuration, including whether platinum or palladium combustion promoters were used during the test.

(b) *What are the general requirements for performance test and performance evaluations? You must:*

(1) Performance tests shall be conducted according to the provisions of §63.7(e) except that performance tests shall be conducted at maximum representative operating capacity for the process. During the performance test, you must operate the control device at either maximum or minimum representative operating conditions for monitored control device parameters, whichever results in lower emission reduction. You must not conduct a performance test during startup, shutdown, periods when the control device is bypassed or periods when the process, monitoring equipment or control device is not operating properly. You may not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that the test was conducted at maximum representative operating capacity. Upon request, you must make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(2) Except for opacity and visible emission observations, conduct three separate test runs for each performance test as specified in §63.7(e)(3). Each test run must last at least 1 hour.

(3) Conduct each performance evaluation according to the requirements in §63.8(e).

(4) Calculate the average emission rate for the performance test by calculating the emission rate for each individual test run in the units of the applicable emission limitation using Equation 2, 5, or 8 of §63.1564, and determining the arithmetic average of the calculated emission rates.

(c) *What procedures must I use for an engineering assessment? You may choose to use an engineering assessment to calculate the process vent flow rate, net heating value, TOC emission rate, and total organic HAP emission rate expected to yield the highest daily emission rate when determining the emission reduction or outlet concentration for the organic HAP standard for catalytic reforming units. If you use an engineering assessment, you must document all data, assumptions, and procedures to the satisfaction of the applicable permitting authority. An engineering assessment may include the approaches listed in paragraphs (c)(1) through (c)(4) of this section. Other engineering assessments may be used but are subject to review and approval by the applicable permitting authority.*

(1) You may use previous test results provided the tests are representative of current operating practices at the process unit, and provided EPA methods or approved alternatives were used;

(2) You may use bench-scale or pilot-scale test data representative of the process under representative operating conditions;

(3) You may use maximum flow rate, TOC emission rate, organic HAP emission rate, or organic HAP or TOC concentration specified or implied within a permit limit applicable to the process vent; or

(4) You may use design analysis based on engineering principles, measurable process parameters, or physical or chemical laws or properties. Examples of analytical methods include, but are not limited to:

(i) Use of material balances based on process stoichiometry to estimate maximum TOC concentrations;

(ii) Calculation of hourly average maximum flow rate based on physical equipment design such as pump or blower capacities; and

(iii) Calculation of TOC concentrations based on saturation conditions.

(d) *Can I adjust the process or control device measured values when establishing an operating limit? If you do a performance test to demonstrate compliance, you must base the process or control device operating limits for continuous parameter monitoring systems on the results measured during the performance test. You may adjust the values measured during the performance test according to the criteria in paragraphs (d)(1) through (3) of this section.*

(1) If you must meet the HAP metal emission limitations in §63.1564, you elect the option in paragraph (a)(1)(v) in §63.1564 (Ni lb/hr), and you use continuous parameter monitoring systems, you must establish an operating limit for the equilibrium catalyst Ni concentration based on the laboratory analysis of the equilibrium catalyst Ni concentration from the initial performance test. Section 63.1564(b)(2) allows you to adjust the laboratory measurements of the equilibrium catalyst Ni concentration to the maximum level. You must make this adjustment using Equation 1 of this section as follows:

$$E_{cat-Limit} = \frac{13 \text{ g Ni/hr}}{NiEmR1_{st}} \times E_{cat_{st}} \quad (Eq. 1)$$

Where:

$E_{cat-Limit}$  = Operating limit for equilibrium catalyst Ni concentration, mg/kg;

$NiEmR1_{st}$  = Average Ni emission rate calculated as the arithmetic average Ni emission rate using Equation 5 of this section for each performance test run, g Ni/hr; and

$E_{cat_{st}}$  = Average equilibrium Ni concentration from laboratory test results, mg/kg.

(2) If you must meet the HAP metal emission limitations in §63.1564, you elect the option in paragraph (a)(1)(vi) in §63.1564 (Ni per coke burn-off), and you use continuous parameter monitoring systems, you must establish an operating limit for the equilibrium catalyst Ni concentration based on the laboratory analysis of the equilibrium catalyst Ni concentration from the initial performance test. Section 63.1564(b)(2) allows you to adjust the laboratory measurements of the equilibrium catalyst Ni concentration to the maximum level. You must make this adjustment using Equation 2 of this section as follows:

$$E_{cat-Limit} = \frac{1.0 \text{ mg/kg coke burn-off}}{NiEmR2_{st}} \times E_{cat_{st}} \quad (Eq. 2)$$

Where:

$NiEmR2_{st}$  = Average Ni emission rate calculated as the arithmetic average Ni emission rate using Equation 8 of §63.1564 for each performance test run, mg/kg coke burn-off.

(3) If you choose to adjust the equilibrium catalyst Ni concentration to the maximum level, you can't adjust any other monitored operating parameter (i.e., gas flow rate, voltage, pressure drop, liquid-to-gas ratio).

(4) Except as specified in paragraph (d)(3) of this section, if you use continuous parameter monitoring systems, you may adjust one of your monitored operating parameters (flow rate, total power and secondary current, pressure drop, liquid-to-gas ratio) from the average of measured values during the performance test to the maximum value (or minimum value, if applicable) representative of worst-case operating conditions, if necessary. This adjustment of measured values may be done using control device design specifications, manufacturer recommendations, or other applicable information. You must provide supporting documentation and rationale in your Notification of Compliance Status, demonstrating to the satisfaction of your permitting authority, that your affected source complies with the applicable emission limit at the operating limit based on adjusted values.

(e) *Can I change my operating limit?* You may change the established operating limit by meeting the requirements in paragraphs (e)(1) through (3) of this section.

(1) You may change your established operating limit for a continuous parameter monitoring system by doing an additional performance test, a performance test in conjunction with an engineering assessment, or an engineering assessment to verify that, at the new operating limit, you are in compliance with the applicable emission limitation.

(2) You must establish a revised operating limit for your continuous parameter monitoring system if you make any change in process or operating conditions that could affect control system performance or you change designated

conditions after the last performance or compliance tests were done. You can establish the revised operating limit as described in paragraph (e)(1) of this section.

(3) You may change your site-specific opacity operating limit or Ni operating limit only by doing a new performance test.

[67 FR 17773, Apr. 11, 2002, as amended at 80 FR 75276, Dec. 1, 2015; 83 FR 60723, Nov. 26, 2018]

**§63.1572 What are my monitoring installation, operation, and maintenance requirements?**

(a) You must install, operate, and maintain each continuous emission monitoring system according to the requirements in paragraphs (a)(1) through (4) of this section.

(1) You must install, operate, and maintain each continuous emission monitoring system according to the requirements in Table 40 of this subpart.

(2) If you use a continuous emission monitoring system to meet the NSPS CO or SO<sub>2</sub> limit, you must conduct a performance evaluation of each continuous emission monitoring system according to the requirements in §63.8 and Table 40 of this subpart. This requirement does not apply to an affected source subject to the NSPS that has already demonstrated initial compliance with the applicable performance specification.

(3) As specified in §63.8(c)(4)(ii), each continuous emission monitoring system must complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(4) Data must be reduced as specified in §63.8(g)(2).

(b) You must install, operate, and maintain each continuous opacity monitoring system according to the requirements in paragraphs (b)(1) through (3) of this section.

(1) Each continuous opacity monitoring system must be installed, operated, and maintained according to the requirements in Table 40 of this subpart.

(2) If you use a continuous opacity monitoring system to meet the NSPS opacity limit, you must conduct a performance evaluation of each continuous opacity monitoring system according to the requirements in §63.8 and Table 40 of this subpart. This requirement does not apply to an affected source subject to the NSPS that has already demonstrated initial compliance with the applicable performance specification.

(3) As specified in §63.8(c)(4)(i), each continuous opacity monitoring system must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(c) Except for flare monitoring systems, you must install, operate, and maintain each continuous parameter monitoring system according to the requirements in paragraphs (c)(1) through (5) of this section. For flares, on and after January 30, 2019, you must install, operate, calibrate, and maintain monitoring systems as specified in §§63.670 and 63.671. Prior to January 30, 2019, you must either meet the monitoring system requirements in paragraphs (c)(1) through (5) of this section or meet the requirements in §§63.670 and 63.671.

(1) You must install, operate, and maintain each continuous parameter monitoring system according to the requirements in Table 41 of this subpart. You must also meet the equipment specifications in Table 41 of this subpart if pH strips or colorimetric tube sampling systems are used. You must meet the requirements in Table 41 of this subpart for BLD systems. Alternatively, before August 1, 2017, you may install, operate, and maintain each continuous parameter monitoring system in a manner consistent with the manufacturer's specifications or other written procedures that provide adequate assurance that the equipment will monitor accurately.

(2) The continuous parameter monitoring system must complete a minimum of one cycle of operation for each successive 15-minute period. You must have a minimum of four successive cycles of operation to have a valid hour

of data (or at least two if a calibration check is performed during that hour or if the continuous parameter monitoring system is out-of-control).

(3) Each continuous parameter monitoring system must have valid hourly average data from at least 75 percent of the hours during which the process operated, except for BLD systems.

(4) Each continuous parameter monitoring system must determine and record the hourly average of all recorded readings and if applicable, the daily average of all recorded readings for each operating day, except for BLD systems. The daily average must cover a 24-hour period if operation is continuous or the number of hours of operation per day if operation is not continuous, except for BLD systems.

(5) Each continuous parameter monitoring system must record the results of each inspection, calibration, and validation check.

(d) You must monitor and collect data according to the requirements in paragraphs (d)(1) and (2) of this section.

(1) Except for monitoring malfunctions, associated repairs, and required quality assurance or control activities (including as applicable, calibration checks and required zero and span adjustments), you must conduct all monitoring in continuous operation (or collect data at all required intervals) at all times the affected source is operating.

(2) You may not use data recorded during required quality assurance or control activities (including, as applicable, calibration checks and required zero and span adjustments) for purposes of this regulation, including data averages and calculations, for fulfilling a minimum data availability requirement, if applicable. You must use all the data collected during all other periods in assessing the operation of the control device and associated control system.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6940, Feb. 9, 2005; 80 FR 75277, Dec. 1, 2015; 83 FR 60723, Nov. 26, 2018]

### §63.1573 What are my monitoring alternatives?

(a) *What are the approved alternatives for measuring gas flow rate?* (1) You may use this alternative to a continuous parameter monitoring system for the catalytic regenerator exhaust gas flow rate for your catalytic cracking unit if the unit does not introduce any other gas streams into the catalyst regeneration vent (*i.e.*, complete combustion units with no additional combustion devices). You may also use this alternative to a continuous parameter monitoring system for the catalytic regenerator atmospheric exhaust gas flow rate for your catalytic reforming unit during the coke burn and rejuvenation cycles if the unit operates as a constant pressure system during these cycles. You may also use this alternative to a continuous parameter monitoring system for the gas flow rate exiting the catalyst regenerator to determine inlet velocity to the primary internal cyclones as required in §63.1564(c)(5) regardless of the configuration of the catalytic regenerator exhaust vent downstream of the regenerator (*i.e.*, regardless of whether or not any other gas streams are introduced into the catalyst regeneration vent). Except, if you only use this alternative to demonstrate compliance with §63.1564(c)(5), you shall use this procedure for the performance test and for monitoring after the performance test. You shall:

(i) Install and operate a continuous parameter monitoring system to measure and record the hourly average volumetric air flow rate to the catalytic cracking unit or catalytic reforming unit regenerator. Or, you may determine and record the hourly average volumetric air flow rate to the catalytic cracking unit or catalytic reforming unit regenerator using the appropriate control room instrumentation.

(ii) Install and operate a continuous parameter monitoring system to measure and record the temperature of the gases entering the control device (or exiting the catalyst regenerator if you do not use an add-on control device).

(iii) Calculate and record the hourly average actual exhaust gas flow rate using Equation 1 of this section as follows:

$$Q_{gas} = (1.12 \text{ scfm/dscfm}) \times (Q_{air} + Q_{other}) \times \left( \frac{\text{Temp}_{gas}}{293^{\circ}\text{K}} \right) \times \left( \frac{1 \text{ atm.}}{P_{vent}} \right) \quad (\text{Eq. 1})$$

Where

$Q_{\text{gas}}$  = Hourly average actual gas flow rate, acfm;

1.12 = Default correction factor to convert gas flow from dry standard cubic feet per minute (dscfm) to standard cubic feet per minute (scfm);

$Q_{\text{air}}$  = Volumetric flow rate of air to regenerator, as determined from the control room instrumentations, dscfm;

$Q_{\text{other}}$  = Volumetric flow rate of other gases entering the regenerator as determined from the control room instrumentations, dscfm. (Examples of "other" gases include an oxygen-enriched air stream to catalytic cracking unit regenerators and a nitrogen stream to catalytic reforming unit regenerators.);

$\text{Temp}_{\text{gas}}$  = Temperature of gas stream in vent measured as near as practical to the control device or opacity monitor, °K. For wet scrubbers, temperature of gas prior to the wet scrubber; and

$P_{\text{vent}}$  = Absolute pressure in the vent measured as near as practical to the control device or opacity monitor, as applicable, atm. When used to assess the gas flow rate in the final atmospheric vent stack, you can assume  $P_{\text{vent}} = 1$  atm.

(2) You may use this alternative to calculating  $Q_r$ , the volumetric flow rate of exhaust gas for the catalytic cracking regenerator as required in Equation 1 of §63.1564, if you have a gas analyzer installed in the catalytic cracking regenerator exhaust vent prior to the addition of air or other gas streams. You may measure upstream or downstream of an electrostatic precipitator, but you shall measure upstream of a carbon monoxide boiler. You shall:

(i) Install and operate a continuous parameter monitoring system to measure and record the hourly average volumetric air flow rate to the catalytic cracking unit regenerator. Or, you can determine and record the hourly average volumetric air flow rate to the catalytic cracking unit regenerator using the catalytic cracking unit control room instrumentation.

(ii) Install and operate a continuous gas analyzer to measure and record the concentration of carbon dioxide, carbon monoxide, and oxygen of the catalytic cracking regenerator exhaust.

(iii) Calculate and record the hourly average flow rate using Equation 2 of this section as follows:

$$Q_r = \frac{79 \times Q_{\text{air}} + (100 - \%O_{xy}) \times Q_{\text{oxy}}}{100 - \%CO_2 - \%CO - \%O_2} \quad (\text{Eq. 2})$$

Where:

$Q_r$  = Volumetric flow rate of exhaust gas from the catalyst regenerator before adding air or gas streams, dscm/min (dscf/min);

79 = Default concentration of nitrogen and argon in dry air, percent by volume (dry basis);

$\%O_{xy}$  = Oxygen concentration in oxygen-enriched air stream, percent by volume (dry basis);

$Q_{\text{oxy}}$  = Volumetric flow rate of oxygen-enriched air stream to regenerator as determined from the catalytic cracking unit control room instrumentations, dscm/min (dscf/min);

$\%CO_2$  = Carbon dioxide concentration in regenerator exhaust, percent by volume (dry basis);

CO = Carbon monoxide concentration in regenerator exhaust, percent by volume (dry basis); and

%O<sub>2</sub> = Oxygen concentration in regenerator exhaust, percent by volume (dry basis).

(b) *What is the approved alternative for monitoring pressure drop?* You may use this alternative to a continuous parameter monitoring system for pressure drop if you operate a jet ejector type wet scrubber or other type of wet scrubber equipped with atomizing spray nozzles. You shall:

- (1) Conduct a daily check of the air or water pressure to the spray nozzles;
- (2) Maintain records of the results of each daily check; and
- (3) Repair or replace faulty (e.g., leaking or plugged) air or water lines within 12 hours of identification of an abnormal pressure reading.

(c) *What is the approved alternative for monitoring pH or alkalinity levels?* You may use the alternative in paragraph (c)(1) or (2) of this section for a catalytic reforming unit.

(1) You shall measure and record the pH of the water (or scrubbing liquid) exiting the wet scrubber or internal scrubbing system at least once an hour during coke burn-off and catalyst rejuvenation using pH strips as an alternative to a continuous parameter monitoring system. The pH strips must meet the requirements in Table 41 of this subpart.

(2) You shall measure and record the alkalinity of the water (or scrubbing liquid) exiting the wet scrubber or internal scrubbing system at least once an hour during coke burn-off and catalyst rejuvenation using titration as an alternative to a continuous parameter monitoring system.

(d) *Can I use another type of monitoring system?* You may use an automated data compression system. An automated data compression system does not record monitored operating parameter values at a set frequency (e.g., once every hour) but records all values that meet set criteria for variation from previously recorded values. You must maintain a record of the description of the monitoring system and data recording system, including the criteria used to determine which monitored values are recorded and retained, the method for calculating daily averages, and a demonstration that the system meets all of the criteria in paragraphs (d)(1) through (5) of this section:

- (1) The system measures the operating parameter value at least once every hour;
- (2) The system records at least 24 values each day during periods of operation;
- (3) The system records the date and time when monitors are turned off or on;
- (4) The system recognizes unchanging data that may indicate the monitor is not functioning properly, alerts the operator, and records the incident; and
- (5) The system computes daily average values of the monitored operating parameter based on recorded data.

(e) *Can I monitor other process or control device operating parameters?* You may request approval to monitor parameters other than those required in this subpart. You must request approval if:

- (1) You use a control device other than a thermal incinerator, boiler, process heater, flare, electrostatic precipitator, or wet scrubber;
- (2) You use a combustion control device (e.g., incinerator, flare, boiler or process heater with a design heat capacity of at least 44 MW, boiler or process heater where the vent stream is introduced into the flame zone), electrostatic precipitator, or scrubber but want to monitor a parameter other than those specified; or
- (3) You wish to use another type of continuous emission monitoring system that provides direct measurement of a pollutant (i.e., a PM or multi-metals HAP continuous emission monitoring system, a carbonyl sulfide/carbon disulfide

continuous emission monitoring system, a TOC continuous emission monitoring system, or HCl continuous emission monitoring system).

(f) *How do I request to monitor alternative parameters?* You must submit a request for review and approval or disapproval to the Administrator. The request must include the information in paragraphs (f)(1) through (5) of this section.

(1) A description of each affected source and the parameter(s) to be monitored to determine whether the affected source will continuously comply with the emission limitations and an explanation of the criteria used to select the parameter(s).

(2) A description of the methods and procedures that will be used to demonstrate that the parameter can be used to determine whether the affected source will continuously comply with the emission limitations and the schedule for this demonstration. You must certify that you will establish an operating limit for the monitored parameter(s) that represents the conditions in existence when the control device is being properly operated and maintained to meet the emission limitation.

(3) The frequency and content of monitoring, recording, and reporting, if monitoring and recording are not continuous. You also must include the rationale for the proposed monitoring, recording, and reporting requirements.

(4) Supporting calculations.

(5) Averaging time for the alternative operating parameter.

(g) *How do I apply for alternative monitoring requirements if my catalytic cracking unit is equipped with a wet scrubber and I have approved alternative monitoring requirements under the new source performance standards for petroleum refineries?* (1) You may request alternative monitoring requirements according to the procedures in this paragraph if you meet each of the conditions in paragraphs (g)(1)(i) through (iii) of this section:

(i) Your fluid catalytic cracking unit regenerator vent is subject to the PM limit in 40 CFR 60.102(a)(1) and uses a wet scrubber for PM emissions control;

(ii) You have alternative monitoring requirements for the continuous opacity monitoring system requirement in 40 CFR 60.105(a)(1) approved by the Administrator; and

(iii) You are required by this subpart to install, operate, and maintain a continuous opacity monitoring system for the same catalytic cracking unit regenerator vent for which you have approved alternative monitoring requirements.

(2) You can request approval to use an alternative monitoring method prior to submitting your notification of compliance status, in your notification of compliance status, or at any time.

(3) You must submit a copy of the approved alternative monitoring requirements along with a monitoring plan that includes a description of the continuous monitoring system or method, including appropriate operating parameters that will be monitored, test results demonstrating compliance with the opacity limit used to establish an enforceable operating limit(s), and the frequency of measuring and recording to establish continuous compliance. If applicable, you must also include operation and maintenance requirements for the continuous monitoring system.

(4) We will contact you within 30 days of receipt of your application to inform you of approval or of our intent to disapprove your request.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6940, Feb. 9, 2005; 80 FR 75277, Dec. 1, 2015; 83 FR 60723, Nov. 26, 2018]

## Notifications, Reports, and Records

### §63.1574 What notifications must I submit and when?

(a) Except as allowed in paragraphs (a)(1) through (3) of this section, you must submit all of the notifications in §§63.6(h), 63.7(b) and (c), 63.8(e), 63.8(f)(4), 63.8(f)(6), and 63.9(b) through (h) that apply to you by the dates specified.

(1) You must submit the notification of your intention to construct or reconstruct according to §63.9(b)(5) unless construction or reconstruction had commenced and initial startup had not occurred before April 11, 2002. In this case, you must submit the notification as soon as practicable before startup but no later than July 10, 2002. This deadline also applies to the application for approval of construction or reconstruction and approval of construction or reconstruction based on State preconstruction review required in §§63.5(d)(1)(i) and 63.5(f)(2).

(2) You must submit the notification of intent to conduct a performance test required in §63.7(b) at least 30 calendar days before the performance test is scheduled to begin (instead of 60 days).

(3) If you are required to conduct an initial performance test, performance evaluation, design evaluation, opacity observation, visible emission observation, or other initial compliance demonstration, you must submit a notification of compliance status according to §63.9(h)(2)(ii). You can submit this information in an operating permit application, in an amendment to an operating permit application, in a separate submission, or in any combination. In a State with an approved operating permit program where delegation of authority under section 112(l) of the CAA has not been requested or approved, you must provide a duplicate notification to the applicable Regional Administrator. If the required information has been submitted previously, you do not have to provide a separate notification of compliance status. Just refer to the earlier submissions instead of duplicating and resubmitting the previously submitted information.

(i) For each initial compliance demonstration that does not include a performance test, you must submit the Notification of Compliance Status no later than 30 calendar days following completion of the initial compliance demonstration.

(ii) For each initial compliance demonstration that includes a performance test, you must submit the notification of compliance status no later than 150 calendar days after the compliance date specified for your affected source in §63.1563. For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (<https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert>) at the time of the test, you must submit the results in accordance with §63.1575(k)(1)(i) by the date that you submit the Notification of Compliance Status, and you must include the process unit(s) tested, the pollutant(s) tested, and the date that such performance test was conducted in the Notification of Compliance Status. For performance evaluations of continuous monitoring systems (CMS) measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation, you must submit the results in accordance with §63.1575(k)(2)(i) by the date that you submit the Notification of Compliance Status, and you must include the process unit where the CMS is installed, the parameter measured by the CMS, and the date that the performance evaluation was conducted in the Notification of Compliance Status. All other performance test and performance evaluation results (*i.e.*, those not supported by EPA's ERT) must be reported in the Notification of Compliance Status.

(b) As specified in §63.9(b)(2), if you startup your new affected source before April 11, 2002, you must submit the initial notification no later than August 9, 2002.

(c) If you startup your new or reconstructed affected source on or after April 11, 2002, you must submit the initial notification no later than 120 days after you become subject to this subpart.

(d) You also must include the information in Table 42 of this subpart in your notification of compliance status.

(e) If you request an extension of compliance for an existing catalytic cracking unit as allowed in §63.1563(c), you must submit a notification to your permitting authority containing the required information by October 13, 2003.

(f) As required by this subpart, you must prepare and implement an operation, maintenance, and monitoring plan for each control system and continuous monitoring system for each affected source. The purpose of this plan is to detail the operation, maintenance, and monitoring procedures you will follow.

(1) You must submit the plan to your permitting authority for review and approval along with your notification of compliance status. While you do not have to include the entire plan in your permit under part 70 or 71 of this chapter, you must include the duty to prepare and implement the plan as an applicable requirement in your part 70 or 71 operating permit. You must submit any changes to your permitting authority for review and approval and comply with the plan as submitted until the change is approved.

(2) Each plan must include, at a minimum, the information specified in paragraphs (f)(2)(i) through (xii) of this section.

(i) Process and control device parameters to be monitored for each affected source, along with established operating limits.

(ii) Procedures for monitoring emissions and process and control device operating parameters for each affected source.

(iii) Procedures that you will use to determine the coke burn-rate, the volumetric flow rate (if you use process data rather than direct measurement), and the rate of combustion of liquid or solid fossil fuels if you use an incinerator-waste heat boiler to burn the exhaust gases from a catalyst regenerator.

(iv) Procedures and analytical methods you will use to determine the equilibrium catalyst Ni concentration, the equilibrium catalyst Ni concentration monthly rolling average, and the hourly or hourly average Ni operating value.

(v) Procedures you will use to determine the pH of the water (or scrubbing liquid) exiting a wet scrubber if you use pH strips.

(vi) Procedures you will use to determine the HCl concentration of gases from a catalytic reforming unit when you use a colorimetric tube sampling system, including procedures for correcting for pressure (if applicable to the sampling equipment) and the sampling locations that will be used for compliance monitoring purposes.

(vii) Procedures you will use to determine the gas flow rate for a catalytic cracking unit if you use the alternative procedure based on air flow rate and temperature.

(viii) Monitoring schedule, including when you will monitor and when you will not monitor an affected source (e.g., during the coke burn-off, regeneration process).

(ix) Quality control plan for each continuous opacity monitoring system and continuous emission monitoring system you use to meet an emission limit in this subpart. This plan must include procedures you will use for calibrations, accuracy audits, and adjustments to the system needed to meet applicable requirements for the system.

(x) Maintenance schedule for each monitoring system and control device for each affected source that is generally consistent with the manufacturer's instructions for routine and long-term maintenance.

(xi) If you use a fixed-bed gas-solid adsorption system to control emissions from a catalytic reforming unit, you must implement corrective action procedures if the HCl concentration measured at the selected compliance monitoring sampling location within the bed exceeds the operating limit. These procedures must require, at minimum, repeat measurement and recording of the HCl concentration in the adsorption system exhaust gases and at the selected compliance monitoring sampling location within the bed. If the HCl concentration at the selected compliance monitoring location within the bed is above the operating limit during the repeat measurement while the HCl concentration in the adsorption system exhaust gases remains below the operating limit, the adsorption bed must be replaced as soon as practicable. Your procedures must specify the sampling frequency that will be used to monitor the HCl concentration in the adsorption system exhaust gases subsequent to the repeat measurement and prior to replacement of the sorbent material (but not less frequent than once every 4 hours during coke burn-off). If the HCl concentration of the adsorption system exhaust gases is above the operating limit when measured at any time, the adsorption bed must be replaced within 24 hours or before the next regeneration cycle, whichever is longer.

(xii) Procedures that will be used for purging the catalyst if you do not use a control device to comply with the organic HAP emission limits for catalytic reforming units. These procedures will include, but are not limited to, specification of the minimum catalyst temperature and the minimum cumulative volume of gas per mass of catalyst used for purging prior to uncontrolled releases (i.e., during controlled purging events); the maximum purge gas temperature for uncontrolled purge events; and specification of the monitoring systems that will be used to monitor and record data during each purge event.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6941, Feb. 9, 2005; 80 FR 75278, Dec. 1, 2015; 83 FR 60724, Nov. 26, 2018]

**§63.1575 What reports must I submit and when?**

(a) You must submit each report in Table 43 of this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule, you must submit each report by the date in Table 43 of this subpart and according to the requirements in paragraphs (b)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.1563 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your affected source in §63.1563.

(2) The first compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in §63.1563.

(3) Each subsequent compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) Each subsequent compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to part 70 or 71 of this chapter, and if the permitting authority has established dates for submitting semiannual reports pursuant to §70.6(a)(3)(iii)(A) or §71.6(a)(3)(iii)(A) of this chapter, you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) The compliance report must contain the information required in paragraphs (c)(1) through (4) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If there are no deviations from any emission limitation that applies to you and there are no deviations from the requirements for work practice standards, a statement that there were no deviations from the emission limitations or work practice standards during the reporting period and that no continuous emission monitoring system or continuous opacity monitoring system was inoperative, inactive, malfunctioning, out-of-control, repaired, or adjusted.

(d) For each deviation from an emission limitation and for each deviation from the requirements for work practice standards that occurs at an affected source where you are not using a continuous opacity monitoring system or a continuous emission monitoring system to comply with the emission limitation or work practice standard in this subpart, the semiannual compliance report must contain the information in paragraphs (c)(1) through (3) of this section and the information in paragraphs (d)(1) through (4) of this section.

- (1) The total operating time of each affected source during the reporting period and identification of the sources for which there was a deviation.
- (2) Information on the number, date, time, duration, and cause of deviations (including unknown cause, if applicable).
- (3) Information on the number, duration, and cause for monitor downtime incidents (including unknown cause, if applicable, other than downtime associated with zero and span and other daily calibration checks).
- (4) The applicable operating limit or work practice standard from which you deviated and either the parameter monitor reading during the deviation or a description of how you deviated from the work practice standard.
- (e) For each deviation from an emission limitation occurring at an affected source where you are using a continuous opacity monitoring system or a continuous emission monitoring system to comply with the emission limitation, you must include the information in paragraphs (c)(1) through (3) of this section, in paragraphs (d)(1) through (3) of this section, and in paragraphs (e)(2) through (13) of this section.
- (1) [Reserved]
- (2) The date and time that each continuous opacity monitoring system or continuous emission monitoring system was inoperative, except for zero (low-level) and high-level checks.
- (3) The date and time that each continuous opacity monitoring system or continuous emission monitoring system was out-of-control, including the information in §63.8(c)(8).
- (4) An estimate of the quantity of each regulated pollutant emitted over the emission limit during the deviation, and a description of the method used to estimate the emissions.
- (5) A summary of the total duration of the deviation during the reporting period (recorded in minutes for opacity and hours for gases and in the averaging period specified in the regulation for other types of emission limitations), and the total duration as a percent of the total source operating time during that reporting period.
- (6) A breakdown of the total duration of the deviations during the reporting period and into those that are due to control equipment problems, process problems, other known causes, and other unknown causes.
- (7) A summary of the total duration of downtime for the continuous opacity monitoring system or continuous emission monitoring system during the reporting period (recorded in minutes for opacity and hours for gases and in the averaging time specified in the regulation for other types of standards), and the total duration of downtime for the continuous opacity monitoring system or continuous emission monitoring system as a percent of the total source operating time during that reporting period.
- (8) A breakdown of the total duration of downtime for the continuous opacity monitoring system or continuous emission monitoring system during the reporting period into periods that are due to monitoring equipment malfunctions, non-monitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and other unknown causes.
- (9) An identification of each HAP that was monitored at the affected source.
- (10) A brief description of the process units.
- (11) The monitoring equipment manufacturer(s) and model number(s).
- (12) The date of the latest certification or audit for the continuous opacity monitoring system or continuous emission monitoring system.
- (13) A description of any change in the continuous emission monitoring system or continuous opacity monitoring system, processes, or controls since the last reporting period.

(f) You also must include the information required in paragraphs (f)(1) through (2) of this section in each compliance report, if applicable.

(1) A copy of any performance test or performance evaluation of a CMS done during the reporting period on any affected unit, if applicable. The report must be included in the next semiannual compliance report. The copy must include a complete report for each test method used for a particular kind of emission point tested. For additional tests performed for a similar emission point using the same method, you must submit the results and any other information required, but a complete test report is not required. A complete test report contains a brief process description; a simplified flow diagram showing affected processes, control equipment, and sampling point locations; sampling site data; description of sampling and analysis procedures and any modifications to standard procedures; quality assurance procedures; record of operating conditions during the test; record of preparation of standards; record of calibrations; raw data sheets for field sampling; raw data sheets for field and laboratory analyses; documentation of calculations; and any other information required by the test method. For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (<https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert>) at the time of the test, you must submit the results in accordance with paragraph (k)(1)(i) of this section by the date that you submit the compliance report, and instead of including a copy of the test report in the compliance report, you must include the process unit(s) tested, the pollutant(s) tested, and the date that such performance test was conducted in the compliance report. For performance evaluations of CMS measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation, you must submit the results in accordance with paragraph (k)(2)(i) of this section by the date that you submit the compliance report, and you must include the process unit where the CMS is installed, the parameter measured by the CMS, and the date that the performance evaluation was conducted in the compliance report. All other performance test and performance evaluation results (*i.e.*, those not supported by EPA's ERT) must be reported in the compliance report.

(2) Any requested change in the applicability of an emission standard (*e.g.*, you want to change from the PM standard to the Ni standard for catalytic cracking units or from the HCl concentration standard to percent reduction for catalytic reforming units) in your compliance report. You must include all information and data necessary to demonstrate compliance with the new emission standard selected and any other associated requirements.

(g) You may submit reports required by other regulations in place of or as part of the compliance report if they contain the required information.

(h) [Reserved]

(i) If the applicable permitting authority has approved a period of planned maintenance for your catalytic cracking unit according to the requirements in paragraph (j) of this section, you must include the following information in your compliance report.

(1) In the compliance report due for the 6-month period before the routine planned maintenance is to begin, you must include a full copy of your written request to the applicable permitting authority and written approval received from the applicable permitting authority.

(2) In the compliance report due after the routine planned maintenance is complete, you must include a description of the planned routine maintenance that was performed for the control device during the previous 6-month period, and the total number of hours during those 6 months that the control device did not meet the emission limitations and monitoring requirements as a result of the approved routine planned maintenance.

(j) If you own or operate multiple catalytic cracking units that are served by a single wet scrubber emission control device (*e.g.*, a Venturi scrubber), you may request the applicable permitting authority to approve a period of planned routine maintenance for the control device needed to meet requirements in your operation, maintenance, and monitoring plan. You must present data to the applicable permitting authority demonstrating that the period of planned maintenance results in overall emissions reductions. During this pre-approved time period, the emission control device may be taken out of service while maintenance is performed on the control device and/or one of the process units while the remaining process unit(s) continue to operate. During the period the emission control device is unable to operate, the emission limits, operating limits, and monitoring requirements applicable to the unit that is operating and the wet scrubber emission control device do not apply. The applicable permitting authority may require that you take specified actions to minimize emissions during the period of planned maintenance.

(1) You must submit a written request to the applicable permitting authority at least 6 months before the planned maintenance is scheduled to begin with a copy to the EPA Regional Administrator.

(2) Your written request must contain the information in paragraphs (j)(2)(i) through (v) of this section.

(i) A description of the planned routine maintenance to be performed during the next 6 months and why it is necessary.

(ii) The date the planned maintenance will begin and end.

(iii) A quantified estimate of the HAP and criteria pollutant emissions that will be emitted during the period of planned maintenance.

(iv) An analysis showing the emissions reductions resulting from the planned maintenance as opposed to delaying the maintenance until the next unit turnaround.

(v) Actions you will take to minimize emissions during the period of planned maintenance.

(k) *Electronic submittal of performance test and CEMS performance evaluation data.* For performance tests or CEMS performance evaluations conducted on and after February 1, 2016, if required to submit the results of a performance test or CEMS performance evaluation, you must submit the results according to the procedures in paragraphs (k)(1) and (2) of this section.

(1) Unless otherwise specified by this subpart, within 60 days after the date of completing each performance test as required by this subpart, you must submit the results of the performance tests following the procedure specified in either paragraph (k)(1)(i) or (ii) of this section.

(i) For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT Web site (<http://www.epa.gov/ttn/chief/ert/index.html>) at the time of the test, you must submit the results of the performance test to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (<https://cdx.epa.gov/>.) Performance test data must be submitted in a file format generated through use of the EPA's ERT or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the EPA's ERT Web site. If you claim that some of the performance test information being submitted is confidential business information (CBI), you must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive or other commonly used electronic storage media to the EPA. The electronic storage media must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph (k)(1)(i).

(ii) For data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the test, you must submit the results of the performance test to the Administrator at the appropriate address listed in §63.13.

(2) Unless otherwise specified by this subpart, within 60 days after the date of completing each CEMS performance evaluation required by §63.1571(a) and (b), you must submit the results of the performance evaluation following the procedure specified in either paragraph (k)(2)(i) or (ii) of this section.

(i) For performance evaluations of continuous monitoring systems measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the evaluation, you must submit the results of the performance evaluation to the EPA via the CEDRI. (CEDRI is accessed through the EPA's CDX.) Performance evaluation data must be submitted in a file format generated through the use of the EPA's ERT or an alternate file format consistent with the XML schema listed on the EPA's ERT Web site. If you claim that some of the performance evaluation information being submitted is CBI, you must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive or other commonly used electronic storage media to the EPA. The electronic storage media must be clearly marked as CBI and mailed

to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph (k)(2)(i).

(ii) For any performance evaluations of continuous monitoring systems measuring RATA pollutants that are not supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the evaluation, you must submit the results of the performance evaluation to the Administrator at the appropriate address listed in §63.13.

(l) *Extensions to electronic reporting deadlines.* (1) If you are required to electronically submit a report through the Compliance and Emissions Data Reporting Interface (CEDRI) in the EPA's Central Data Exchange (CDX), and due to a planned or actual outage of either the EPA's CEDRI or CDX systems within the period of time beginning 5 business days prior to the date that the submission is due, you will be or are precluded from accessing CEDRI or CDX and submitting a required report within the time prescribed, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or caused a delay in reporting. You must provide to the Administrator a written description identifying the date(s) and time(s) the CDX or CEDRI were unavailable when you attempted to access it in the 5 business days prior to the submission deadline; a rationale for attributing the delay in reporting beyond the regulatory deadline to the EPA system outage; describe the measures taken or to be taken to minimize the delay in reporting; and identify a date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported. In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved. The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(2) If you are required to electronically submit a report through CEDRI in the EPA's CDX and a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning 5 business days prior to the date the submission is due, the owner or operator may assert a claim of force majeure for failure to timely comply with the reporting requirement. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (e.g., hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (e.g., large scale power outage). If you intend to assert a claim of force majeure, you must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or caused a delay in reporting. You must provide to the Administrator a written description of the force majeure event and a rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event; describe the measures taken or to be taken to minimize the delay in reporting; and identify a date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported. In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs. The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

[67 FR 17773, Apr. 11, 2002, as amended at 80 FR 75278, Dec. 1, 2015; 83 FR 60724, Nov. 26, 2018]

**§63.1576 What records must I keep, in what form, and for how long?**

(a) You must keep the records specified in paragraphs (a)(1) through (3) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any initial notification or Notification of Compliance Status that you submitted, according to the requirements in §63.10(b)(2)(xiv).

(2) The records specified in paragraphs (a)(2)(i) through (iv) of this section.

(i) Record the date, time, and duration of each startup and/or shutdown period for which the facility elected to comply with the alternative standards in §63.1564(a)(5)(ii) or §63.1565(a)(5)(ii) or §63.1568(a)(4)(ii) or (iii).

(ii) In the event that an affected unit fails to meet an applicable standard, record the number of failures. For each failure record the date, time and duration of each failure.

(iii) For each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the volume of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(iv) Record actions taken to minimize emissions in accordance with §63.1570(c) and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

(3) Records of performance tests, performance evaluations, and opacity and visible emission observations as required in §63.10(b)(2)(viii).

(b) For each continuous emission monitoring system and continuous opacity monitoring system, you must keep the records required in paragraphs (b)(1) through (5) of this section.

(1) Records described in §63.10(b)(2)(vi) through (xi).

(2) Monitoring data for continuous opacity monitoring systems during a performance evaluation as required in §63.6(h)(7)(i) and (ii).

(3) The performance evaluation plan as described in §63.8(d)(2) for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, you must keep previous (*i.e.*, superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan required under §63.8(d)(2).

(4) Requests for alternatives to the relative accuracy test for continuous emission monitoring systems as required in §63.8(f)(6)(i).

(5) Records of the date and time that each deviation started and stopped.

(c) You must keep the records in §63.6(h) for visible emission observations.

(d) You must keep records required by Tables 6, 7, 13, and 14 of this subpart (for catalytic cracking units); Tables 20, 21, 27 and 28 of this subpart (for catalytic reforming units); Tables 34 and 35 of this subpart (for sulfur recovery units); and Table 39 of this subpart (for bypass lines) to show continuous compliance with each emission limitation that applies to you.

(e) You must keep a current copy of your operation, maintenance, and monitoring plan onsite and available for inspection. You also must keep records to show continuous compliance with the procedures in your operation, maintenance, and monitoring plan.

(f) You also must keep the records of any changes that affect emission control system performance including, but not limited to, the location at which the vent stream is introduced into the flame zone for a boiler or process heater.

(g) Your records must be in a form suitable and readily available for expeditious review according to §63.10(b)(1).

(h) As specified in §63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(i) You must keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1). You can keep the records offsite for the remaining 3 years.

## Other Requirements and Information

### §63.1577 What parts of the General Provisions apply to me?

Table 44 of this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you.

### §63.1578 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by us, the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that Agency has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are listed in paragraphs (c)(1) through (5) of this section.

(1) Approval of alternatives to the non-opacity emission limitations and work practice standards in §§63.1564 through 63.1569 under §63.6(g).

(2) Approval of alternative opacity emission limitations in §§63.1564 through 63.1569 under §63.6(h)(9).

(3) Approval of major alternatives to test methods under §63.7(e)(2)(ii) and (f) and as defined in §63.90.

(4) Approval of major alternatives to monitoring under §63.8(f) and as defined in §63.90.

(5) Approval of major alternatives to recordkeeping and reporting under §63.10(f) and as defined in §63.90.

### §63.1579 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act (CAA), in 40 CFR 63.2, the General Provisions of this part (§§63.1 through 63.15), and in this section as listed. If the same term is defined in subpart A of this part and in this section, it shall have the meaning given in this section for purposes of this subpart.

*Boiler* means any enclosed combustion device that extracts useful energy in the form of steam and is not an incinerator.

*Catalytic cracking unit* means a refinery process unit in which petroleum derivatives are continuously charged; hydrocarbon molecules in the presence of a catalyst suspended in a fluidized bed are fractured into smaller molecules, or react with a contact material suspended in a fluidized bed to improve feedstock quality for additional processing; and the catalyst or contact material is continuously regenerated by burning off coke and other deposits. The unit includes, but is not limited to, the riser, reactor, regenerator, air blowers, spent catalyst or contact material stripper, catalyst or contact material recovery equipment, and regenerator equipment for controlling air pollutant emissions and equipment used for heat recovery.

*Catalytic cracking unit catalyst regenerator* means one or more regenerators (multiple regenerators) which comprise that portion of the catalytic cracking unit in which coke burn-off and catalyst or contact material regeneration occurs and includes the regenerator combustion air blower(s).

*Catalytic reforming unit* means a refinery process unit that reforms or changes the chemical structure of naphtha into higher octane aromatics through the use of a metal catalyst and chemical reactions that include dehydrogenation, isomerization, and hydrogenolysis. The catalytic reforming unit includes the reactor, regenerator (if separate),

separators, catalyst isolation and transport vessels (e.g., lock and lift hoppers), recirculation equipment, scrubbers, and other ancillary equipment.

*Catalytic reforming unit regenerator* means one or more regenerators which comprise that portion of the catalytic reforming unit and ancillary equipment in which the following regeneration steps typically are performed: depressurization, purge, coke burn-off, catalyst rejuvenation with a chloride (or other halogenated) compound(s), and a final purge. The catalytic reforming unit catalyst regeneration process can be done either as a semi-regenerative, cyclic, or continuous regeneration process.

*Coke burn-off* means the coke removed from the surface of the catalytic cracking unit catalyst or the catalytic reforming unit catalyst by combustion in the catalyst regenerator. The rate of coke burn-off is calculated using Equation 2 in §63.1564.

*Combustion device* means an individual unit of equipment such as a flare, incinerator, process heater, or boiler used for the destruction of organic HAP or VOC.

*Combustion zone* means the space in an enclosed combustion device (e.g., vapor incinerator, boiler, furnace, or process heater) occupied by the organic HAP and any supplemental fuel while burning. The combustion zone includes any flame that is visible or luminous as well as that space outside the flame envelope in which the organic HAP continues to be oxidized to form the combustion products.

*Contact material* means any substance formulated to remove metals, sulfur, nitrogen, or any other contaminants from petroleum derivatives.

*Continuous regeneration reforming* means a catalytic reforming process characterized by continuous flow of catalyst material through a reactor where it mixes with feedstock, and a portion of the catalyst is continuously removed and sent to a special regenerator where it is regenerated and continuously recycled back to the reactor.

*Control device* means any equipment used for recovering, removing, or oxidizing HAP in either gaseous or solid form. Such equipment includes, but is not limited to, condensers, scrubbers, electrostatic precipitators, incinerators, flares, boilers, and process heaters.

*Cyclic regeneration reforming* means a catalytic reforming process characterized by continual batch regeneration of catalyst in situ in any one of several reactors (e.g., 4 or 5 separate reactors) that can be isolated from and returned to the reforming operation while maintaining continuous reforming process operations (i.e., feedstock continues flowing through the remaining reactors without change in feed rate or product octane).

*Deviation* means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

- (1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limit, operating limit, or work practice standard; or
- (2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit.

*Emission limitation* means any emission limit, opacity limit, operating limit, or visible emission limit.

*Flame zone* means the portion of a combustion chamber of a boiler or process heater occupied by the flame envelope created by the primary fuel.

*Flow indicator* means a device that indicates whether gas is flowing, or whether the valve position would allow gas to flow, in or through a line.

*Fuel gas system* means the offsite and onsite piping and control system that gathers gaseous streams generated by the source, may blend them with sources of gas, if available, and transports the blended gaseous fuel at suitable pressures for use as fuel in heaters, furnaces, boilers, incinerators, gas turbines, and other combustion devices

located within or outside of the refinery. The fuel is piped directly to each individual combustion device, and the system typically operates at pressures over atmospheric. The gaseous streams can contain a mixture of methane, light hydrocarbons, hydrogen, and other miscellaneous species.

*HCl* means for the purposes of this subpart, gaseous emissions of hydrogen chloride that serve as a surrogate measure for total emissions of hydrogen chloride and chlorine as measured by Method 26 or 26A in appendix A to part 60 of this chapter or an approved alternative method.

*Hot standby* means periods when the catalytic cracking unit is not receiving fresh or recycled feed oil but the catalytic cracking unit is maintained at elevated temperatures, typically using torch oil in the catalyst regenerator and recirculating catalyst, to prevent a complete shutdown and cold restart of the catalytic cracking unit.

*Incinerator* means an enclosed combustion device that is used for destroying organic compounds, with or without heat recovery. Auxiliary fuel may be used to heat waste gas to combustion temperatures. An incinerator may use a catalytic combustion process where a substance is introduced into an exhaust stream to burn or oxidize contaminants while the substance itself remains intact, or a thermal process which uses elevated temperatures as a primary means to burn or oxidize contaminants.

*Internal scrubbing system* means a wet scrubbing, wet injection, or caustic injection control device that treats (in-situ) the catalytic reforming unit recirculating coke burn exhaust gases for acid (HCl) control during reforming catalyst regeneration upstream of the atmospheric coke burn vent.

*Ni* means, for the purposes of this subpart, particulate emissions of nickel that serve as a surrogate measure for total emissions of metal HAP, including but not limited to: antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, and selenium as measured by Method 29 in appendix A to part 60 of this chapter or by an approved alternative method.

*Nonmethane TOC* means, for the purposes of this subpart, emissions of total organic compounds, excluding methane, that serve as a surrogate measure of the total emissions of organic HAP compounds including, but not limited to, acetaldehyde, benzene, hexane, phenol, toluene, and xylenes and nonHAP VOC as measured by Method 25 in appendix A to part 60 of this chapter, by the combination of Methods 18 and 25A in appendix A to part 60 of this chapter, or by an approved alternative method.

*Oxidation control system* means an emission control system which reduces emissions from sulfur recovery units by converting these emissions to sulfur dioxide.

*PM* means, for the purposes of this subpart, emissions of particulate matter that serve as a surrogate measure of the total emissions of particulate matter and metal HAP contained in the particulate matter, including but not limited to: Antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, and selenium as measured by Methods 5, 5B or 5F in appendix A-3 to part 60 of this chapter or by an approved alternative method.

*Process heater* means an enclosed combustion device that primarily transfers heat liberated by burning fuel directly to process streams or to heat transfer liquids other than water.

*Process vent* means, for the purposes of this subpart, a gas stream that is continuously or periodically discharged during normal operation of a catalytic cracking unit, catalytic reforming unit, or sulfur recovery unit, including gas streams that are discharged directly to the atmosphere, gas streams that are routed to a control device prior to discharge to the atmosphere, or gas streams that are diverted through a product recovery device line prior to control or discharge to the atmosphere.

*Reduced sulfur compounds* means hydrogen sulfide, carbonyl sulfide, and carbon disulfide.

*Reduction control system* means an emission control system which reduces emissions from sulfur recovery units by converting these emissions to hydrogen sulfide.

*Responsible official* means responsible official as defined in 40 CFR 70.2.

*Semi-regenerative reforming* means a catalytic reforming process characterized by shutdown of the entire reforming unit (e.g., which may employ three to four separate reactors) at specified intervals or at the owner's or operator's convenience for in situ catalyst regeneration.

*Sulfur recovery unit* means a process unit that recovers elemental sulfur from gases that contain reduced sulfur compounds and other pollutants, usually by a vapor-phase catalytic reaction of sulfur dioxide and hydrogen sulfide. This definition does not include a unit where the modified reaction is carried out in a water solution which contains a metal ion capable of oxidizing the sulfide ion to sulfur, e.g., the LO-CAT II process.

*TOC* means, for the purposes of this subpart, emissions of total organic compounds that serve as a surrogate measure of the total emissions of organic HAP compounds including, but not limited to, acetaldehyde, benzene, hexane, phenol, toluene, and xylenes and nonHAP VOC as measured by Method 25A in appendix A to part 60 of this chapter or by an approved alternative method.

*TRS* means, for the purposes of this subpart, emissions of total reduced sulfur compounds, expressed as an equivalent sulfur dioxide concentration, that serve as a surrogate measure of the total emissions of sulfide HAP carbonyl sulfide and carbon disulfide as measured by Method 15 in appendix A to part 60 of this chapter or by an approved alternative method.

*Work practice standard* means any design, equipment, work practice, or operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the CAA.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, Feb. 9, 2005; 80 FR 75279, Dec. 1, 2015]

**Table 1 to Subpart UUU of Part 63—Metal HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1564(a)(1), you shall meet each emission limitation in the following table that applies to you.

For each new or existing catalytic cracking unit . . .	You shall meet the following emission limits for each catalyst regenerator vent . . .
1. Subject to new source performance standard (NSPS) for PM in 40 CFR 60.102 and not electing §60.100(e)	PM emissions must not exceed 1.0 gram per kilogram (g/kg) (1.0 lb/1,000 lb) of coke burn-off, and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period. Before August 1, 2017, if the discharged gases pass through an incinerator or waste heat boiler in which you burn auxiliary or in supplemental liquid or solid fossil fuel, the incremental rate of PM emissions must not exceed 43.0 grams per Gigajoule (g/GJ) or 0.10 pounds per million British thermal units (lb/million Btu) of heat input attributable to the liquid or solid fossil fuel; and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period.
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i); or 40 CFR 60.102 and electing §60.100(e)	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off or, if a PM CEMS is used, 0.040 grain per dry standard cubic feet (gr/dscf) corrected to 0 percent excess air.
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii)	PM emissions must not exceed 0.5 g/kg coke burn-off (0.5 lb/1000 lb coke burn-off) or, if a PM CEMS is used, 0.020 gr/dscf corrected to 0 percent excess air.
4. Option 1a: Elect NSPS subpart J requirements for PM per coke burn limit and 30% opacity, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed the limits specified in Item 1 of this table.
5. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1000 lb) of coke burn-off.

For each new or existing catalytic cracking unit . . .	You shall meet the following emission limits for each catalyst regenerator vent . . .
6. Option 1c: Elect NSPS subpart Ja requirements for PM concentration limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 0.040 gr/dscf corrected to 0 percent excess air.
7. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1000 lb) of coke burn-off in the catalyst regenerator.
8. Option 3: Ni lb/hr limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Nickel (Ni) emissions must not exceed 13,000 milligrams per hour (mg/hr) (0.029 lb/hr).
9. Option 4: Ni per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Ni emissions must not exceed 1.0 mg/kg (0.001 lb/1,000 lb) of coke burn-off in the catalyst regenerator.

[80 FR 75280, Dec. 1, 2015]

**Table 2 to Subpart UUU of Part 63—Operating Limits for Metal HAP Emissions From Catalytic Cracking Units**

As stated in §63.1564(a)(2), you shall meet each operating limit in the following table that applies to you.

For each new or existing catalytic cracking unit . . .	For this type of continuous monitoring system . . .	For this type of control device . . .	You shall meet this operating limit . . .
1. Subject to the NSPS for PM in 40 CFR 60.102 and not elect §60.100(e)	Continuous opacity monitoring system	Any	On and after August 1, 2017, maintain the 3-hour rolling average opacity of emissions from your catalyst regenerator vent no higher than 20 percent.
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i) or electing §60.100(e)	a. PM CEMS	Any	Not applicable.
	b. Continuous opacity monitoring system used to comply with a site-specific opacity limit	Cyclone or electrostatic precipitator	Maintain the 3-hour rolling average opacity of emissions from your catalyst regenerator vent no higher than the site-specific opacity limit established during the performance test.
	c. Continuous parameter monitoring systems	Electrostatic precipitator	i. Maintain the daily average coke burn-off rate or daily average flow rate no higher than the limit established in the performance test.
			ii. Maintain the 3-hour rolling average total power and secondary current above the limit established in the performance test.
	d. Continuous parameter monitoring systems	Wet scrubber	i. Maintain the 3-hour rolling average liquid-to-gas ratio above the limit established in the performance test.
			ii. Except for periods of startup, shutdown, and hot standby, maintain the 3-hour rolling average pressure drop above the limit established in the performance test. <sup>1</sup>

For each new or existing catalytic cracking unit . . .	For this type of continuous monitoring system . . .	For this type of control device . . .	You shall meet this operating limit . . .
	e. Bag leak detection (BLD) system	Fabric filter	Maintain particulate loading below the BLD alarm set point established in the initial adjustment of the BLD system or allowable seasonal adjustments.
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii)	Any	Any	The applicable operating limits in Item 2 of this table.
4. Option 1a: Elect NSPS subpart J requirements for PM per coke burn limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	Any	See Item 1 of this table.
5. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	Any	The applicable operating limits in Item 2.b, 2.c, 2.d, and 2.e of this table.
6. Option 1c: Elect NSPS subpart Ja requirements for PM concentration limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM CEMS	Any	Not applicable.
7. Option 2: PM per coke burn-off limit not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Continuous opacity monitoring system used to comply with a site-specific opacity limit	Cyclone, fabric filter, or electrostatic precipitator	See Item 2.b of this table. Alternatively, before August 1, 2017, you may maintain the hourly average opacity of emissions from your catalyst generator vent no higher than the site-specific opacity limit established during the performance test.
	b. Continuous parameter monitoring systems	i. Electrostatic precipitator	(1) See Item 2.c.i of this table. (2) See item 2.c.ii of this table. Alternatively, before August 1, 2017, you may maintain the daily average voltage and secondary current above the limit established in the performance test.
		ii. Wet scrubber	(1) See Item 2.d.i of this table. Alternatively, before August 1, 2017, you may maintain the daily average liquid-to-gas ratio above the limit established in the performance test. (2) See Item 2.d.ii of the table. Alternatively, before August 1, 2017, you may maintain the daily average pressure drop above the limit established in the performance test (not applicable to a wet scrubber of the non-venturi jet-ejector design).
	c. Bag leak detection (BLD) system	Fabric filter	See item 2.e of this table.

For each new or existing catalytic cracking unit . . .	For this type of continuous monitoring system . . .	For this type of control device . . .	You shall meet this operating limit . . .
8. Option 3: Ni lb/hr limit not subject to the NSPS for PM in 40 CFR 60.102	a. Continuous opacity monitoring system	Cyclone, fabric filter, or electrostatic precipitator	Maintain the 3-hour rolling average Ni operating value no higher than the limit established during the performance test. Alternatively, before August 1, 2017, you may maintain the daily average Ni operating value no higher than the limit established during the performance test.
	b. Continuous parameter monitoring systems	i. Electrostatic precipitator	(1) See Item 2.c.i of this table. (2) Maintain the monthly rolling average of the equilibrium catalyst Ni concentration no higher than the limit established during the performance test.
			(3) See Item 2.c.ii of this table. Alternatively, before August 1, 2017, you may maintain the daily average voltage and secondary current (or total power input) above the established during the performance test.
		ii. Wet scrubber	(1) Maintain the monthly rolling average of the equilibrium catalyst Ni concentration no higher than the limit established during the performance test.
			(2) See Item 2.d.i of this table. Alternatively, before August 1, 2017, you may maintain the daily average liquid-to-gas ratio above the limit established during the performance test.
			(3) See Item 2.d.ii of this table. Alternatively, before August 1, 2017, you may maintain the daily average pressure drop above the limit established during the performance test (not applicable to a non-venturi wet scrubber of the jet-ejector design).
	c. Bag leak detection (BLD) system	Fabric filter	See item 2.e of this table.
9. Option 4: Ni per coke burn-off limit not subject to the NSPS for PM in 40 CFR 60.102	a. Continuous opacity monitoring system	Cyclone, fabric filter, or electrostatic precipitator	Maintain the 3-hour rolling average Ni operating value no higher than Ni operating limit established during the performance test. Alternatively, before August 1, 2017, you may elect to maintain the daily average Ni operating value no higher than the Ni operating limit established during the performance test.
	b. Continuous parameter monitoring systems	i. Electrostatic precipitator	(1) Maintain the monthly rolling average of the equilibrium catalyst Ni concentration no higher than the limit established during the performance test.

For each new or existing catalytic cracking unit . . .	For this type of continuous monitoring system . . .	For this type of control device . . .	You shall meet this operating limit . . .
			(2) See Item 2.c.ii of this table. Alternatively, before August 1, 2017, you may maintain the daily average voltage and secondary current (or total power input) above the limit established during the performance test.
		ii. Wet scrubber	(1) Maintain the monthly rolling average of the equilibrium catalyst Ni concentration no higher than the limit established during the performance test.
			(2) See Item 2.d.i of this table. Alternatively, before August 1, 2017, you may maintain the daily average liquid-to-gas ratio above the limit established during the performance test.
			(3) See Item 2.d.ii of this table. Alternatively, before August 1, 2017, you may maintain the daily average pressure drop above the limit established during the performance test (not applicable to a non-venturi wet scrubber of the jet-ejector design).
	c. Bag leak detection (BLD) system	Fabric filter	See item 2.e of this table.
10. During periods of startup, shutdown, or hot standby	Any	Any	Meet the requirements in §63.1564(a)(5).

<sup>1</sup>If you use a jet ejector type wet scrubber or other type of wet scrubber equipped with atomizing spray nozzles, you can use the alternative in §63.1573(b), and comply with the daily inspections, recordkeeping, and repair provisions, instead of a continuous parameter monitoring system for pressure drop across the scrubber.

[80 FR 75280, Dec. 1, 2015, as amended at 81 FR 45244, July 13, 2016]

**Table 3 to Subpart UUU of Part 63—Continuous Monitoring Systems for Metal HAP Emissions From Catalytic Cracking Units**

As stated in §63.1564(b)(1), you shall meet each requirement in the following table that applies to you.

For each new or existing catalytic cracking unit . . .	If you use this type of control device for your vent . . .	You shall install, operate, and maintain a . . .
1. Subject to the NSPS for PM in 40 CFR 60.102 and not electing §60.100(e)	Any	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent.

For each new or existing catalytic cracking unit . . .	If you use this type of control device for your vent . . .	You shall install, operate, and maintain a . . .
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i); or in §60.102 and electing §60.100(e); electing to meet the PM per coke burn-off limit	a. Cyclone b. Electrostatic precipitator	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent. Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent; or continuous parameter monitoring systems to measure and record the coke burn-off rate or the gas flow rate entering or exiting the control device, <sup>1</sup> the voltage, current, and secondary current to the control device.
	c. Wet scrubber	Continuous parameter monitoring system to measure and record the pressure drop across the scrubber, <sup>2</sup> the gas flow rate entering or exiting the control device, <sup>1</sup> and total liquid (or scrubbing liquor) flow rate to the control device.
	d. Fabric Filter	Continuous bag leak detection system to measure and record increases in relative particulate loading from each catalyst regenerator vent.
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i); or in §60.102 and electing §60.100(e); electing to meet the PM concentration limit	Any	Continuous emission monitoring system to measure and record the concentration of PM and oxygen from each catalyst regenerator vent.
4. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii) electing to meet the PM per coke burn-off limit	Any	The applicable continuous monitoring systems in item 2 of this table.
5. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii) electing to meet the PM concentration limit	Any	See item 3 of this table.
6. Option 1a: Elect NSPS subpart J, PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	See item 1 of this table.
7. Option 1b: Elect NSPS subpart Ja, PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	The applicable continuous monitoring systems in item 2 of this table.
8. Option 1c: Elect NSPS subpart Ja, PM concentration limit not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	See item 3 of this table.
9. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Any	The applicable continuous monitoring systems in item 2 of this table.
10. Option 3: Ni lb/hr limit not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Cyclone	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent and continuous parameter monitoring system to measure and record the gas flow rate entering or exiting the control device. <sup>1</sup>

For each new or existing catalytic cracking unit . . .	If you use this type of control device for your vent . . .	You shall install, operate, and maintain a . . .
	b. Electrostatic precipitator	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent and continuous parameter monitoring system to measure and record the gas flow rate entering or exiting the control device <sup>1</sup> ; or continuous parameter monitoring systems to measure and record the coke burn-off rate or the gas flow rate entering or exiting the control device <sup>1</sup> and the voltage and current (to measure the total power to the system) and secondary current to the control device.
	c. Wet scrubber	Continuous parameter monitoring system to measure and record the pressure drop across the scrubber, <sup>2</sup> gas flow rate entering or exiting the control device, <sup>1</sup> and total liquid (or scrubbing liquor) flow rate to the control device.
	d. Fabric Filter	Continuous bag leak detection system to measure and record increases in relative particulate loading from each catalyst regenerator vent or the monitoring systems specified in item 10.a of this table.
11. Option 4: Ni per coke burn-off limit not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Cyclone	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent and continuous parameter monitoring system to measure and record the coke burn-off rate and the gas flow rate entering or exiting the control device. <sup>1</sup>
	b. Electrostatic precipitator	Continuous opacity monitoring system to measure and record the opacity of emissions from each catalyst regenerator vent and continuous parameter monitoring system to measure and record the coke burn-off rate and the gas flow rate entering or exiting the control device <sup>1</sup> ; or continuous parameter monitoring systems to measure and record the coke burn-off rate or the gas flow rate entering or exiting the control device <sup>1</sup> and voltage and current (to measure the total power to the system) and secondary current to the control device.
	c. Wet scrubber	Continuous parameter monitoring system to measure and record the pressure drop across the scrubber, <sup>2</sup> gas flow rate entering or exiting the control device, <sup>1</sup> and total liquid (or scrubbing liquor) flow rate to the control device.
	d. Fabric Filter	Continuous bag leak detection system to measure and record increases in relative particulate loading from each catalyst regenerator vent or the monitoring systems specified in item 11.a of this table.
12. Electing to comply with the operating limits in §63.1564(a)(5)(ii) during periods of startup, shutdown, or hot standby	Any	Continuous parameter monitoring system to measure and record the gas flow rate exiting the catalyst regenerator. <sup>1</sup>

<sup>1</sup>If applicable, you can use the alternative in §63.1573(a)(1) instead of a continuous parameter monitoring system for gas flow rate.

<sup>2</sup>If you use a jet ejector type wet scrubber or other type of wet scrubber equipped with atomizing spray nozzles, you can use the alternative in §63.1573(b) instead of a continuous parameter monitoring system for pressure drop across the scrubber.

[80 FR 75283, Dec. 1, 2015, as amended at 81 FR 45244, July 13, 2016; 83 FR 60725, Nov. 26, 2018]

**Table 4 to Subpart UUU of Part 63—Requirements for Performance Tests for Metal HAP Emissions From Catalytic Cracking Units**

As stated in §§63.1564(b)(2) and 63.1571(a)(5), you shall meet each requirement in the following table that applies to you.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
1. Any	a. Select sampling port's location and the number of traverse ports	Method 1 or 1A in appendix A-1 to part 60 of this chapter	Sampling sites must be located at the outlet of the control device or the outlet of the regenerator, as applicable, and prior to any releases to the atmosphere.
	b. Determine velocity and volumetric flow rate	Method 2, 2A, 2C, 2D, or 2F in appendix A-1 to part 60 of this chapter, or Method 2G in appendix A-2 to part 60 of this chapter, as applicable	
	c. Conduct gas molecular weight analysis	Method 3, 3A, or 3B in appendix A-2 to part 60 of this chapter, as applicable	
	d. Measure moisture content of the stack gas	Method 4 in appendix A-3 to part 60 of this chapter	
	e. If you use an electrostatic precipitator, record the total number of fields in the control system and how many operated during the applicable performance test		
	f. If you use a wet scrubber, record the total amount (rate) of water (or scrubbing liquid) and the amount (rate) of make-up liquid to the scrubber during each test run		

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
2. Subject to the NSPS for PM in 40 CFR 60.102 and not elect §60.100(e)	a. Measure PM emissions	Method 5, 5B, or 5F (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for units without wet scrubbers. Method 5 or 5B (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for unit with wet scrubber	You must maintain a sampling rate of at least 0.15 dry standard cubic meters per minute (dscm/min) (0.53 dry standard cubic feet per minute (dscf/min)).
	b. Compute coke burn-off rate and PM emission rate (lb/1,000 lb of coke burn-off)	Equations 1, 2, and 3 of §63.1564 (if applicable)	
	c. Measure opacity of emissions	Continuous opacity monitoring system	You must collect opacity monitoring data every 10 seconds during the entire period of the Method 5, 5B, or 5F performance test and reduce the data to 6-minute averages.
3. Subject to the NSPS for PM in 40 CFR 60.102a(b)(1) or elect §60.100(e), electing the PM for coke burn-off limit	a. Measure PM emissions	Method 5, 5B, or 5F (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for units without wet scrubbers. Method 5 or 5B (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for unit with wet scrubber	You must maintain a sampling rate of at least 0.15 dscm/min (0.53 dscf/min).
	b. Compute coke burn-off rate and PM emission rate (lb/1,000 lb of coke burn-off)	Equations 1, 2, and 3 of §63.1564 (if applicable)	
	c. Establish site-specific limit if you use a COMS	Continuous opacity monitoring system	If you elect to comply with the site-specific opacity limit in §63.1564(b)(4)(i), you must collect opacity monitoring data every 10 seconds during the entire period of the Method 5, 5B, or 5F performance test. For site specific opacity monitoring, reduce the data to 6-minute averages; determine and record the average opacity for each test run; and compute the site-specific opacity limit using Equation 4 of §63.1564.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
4. Subject to the NSPS for PM in 40 CFR 60.102a(b)(1) or elect §60.100(e)	a. Measure PM emissions	Method 5, 5B, or 5F (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for units without wet scrubbers. Method 5 or 5B (40 CFR part 60, appendix A-3) to determine PM emissions and associated moisture content for unit with wet scrubber	You must maintain a sampling rate of at least 0.15 dscm/min (0.53 dscf/min).
5. Option 1a: Elect NSPS subpart J requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	See item 2 of this table.		
6. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	See item 3 of this table		
7. Option 1c: Elect NSPS requirements for PM concentration, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	See item 4 of this table		
8. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	See item 3 of this table		
9. Option 3: Ni lb/hr limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Measure concentration of Ni b. Compute Ni emission rate (lb/hr)	Method 29 (40 CFR part 60, appendix A-8) Equation 5 of §63.1564	
	c. Determine the equilibrium catalyst Ni concentration	XRF procedure in appendix A to this subpart 1; or EPA Method 6010B or 6020 or EPA Method 7520 or 7521 in SW-8462; or an alternative to the SW-846 method satisfactory to the Administrator	You must obtain 1 sample for each of the 3 test runs; determine and record the equilibrium catalyst Ni concentration for each of the 3 samples; and you may adjust the laboratory results to the maximum value using Equation 1 of §63.1571, if applicable.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
	d. If you use a continuous opacity monitoring system, establish your site-specific Ni operating limit	i. Equations 6 and 7 of §63.1564 using data from continuous opacity monitoring system, gas flow rate, results of equilibrium catalyst Ni concentration analysis, and Ni emission rate from Method 29 test	(1) You must collect opacity monitoring data every 10 seconds during the entire period of the initial Ni performance test; reduce the data to 6-minute averages; and determine and record the average opacity from all the 6-minute averages for each test run.
			(2) You must collect gas flow rate monitoring data every 15 minutes during the entire period of the initial Ni performance test; measure the gas flow as near as practical to the continuous opacity monitoring system; and determine and record the hourly average actual gas flow rate for each test run.
10. Option 4: Ni per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Measure concentration of Ni. b. Compute Ni emission rate (lb/1,000 lb of coke burn-off)	Method 29 (40 CFR part 60, appendix A-8). Equations 1 and 8 of §63.1564	
	c. Determine the equilibrium catalyst Ni concentration	See item 9.c. of this table	You must obtain 1 sample for each of the 3 test runs; determine and record the equilibrium catalyst Ni concentration for each of the 3 samples; and you may adjust the laboratory results to the maximum value using Equation 2 of §63.1571, if applicable.
	d. If you use a continuous opacity monitoring system, establish your site-specific Ni operating limit	i. Equations 9 and 10 of §63.1564 with data from continuous opacity monitoring system, coke burn-off rate, results of equilibrium catalyst Ni concentration analysis, and Ni emission rate from Method 29 test	(1) You must collect opacity monitoring data every 10 seconds during the entire period of the initial Ni performance test; reduce the data to 6-minute averages; and determine and record the average opacity from all the 6-minute averages for each test run.
			(2) You must collect gas flow rate monitoring data every 15 minutes during the entire period of the initial Ni performance test; measure the gas flow rate as near as practical to the continuous opacity monitoring system; and determine and record the hourly average actual gas flow rate for each test run.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
	e. Record the catalyst addition rate for each test and schedule for the 10-day period prior to the test		
11. If you elect item 5 Option 1b in Table 1, item 7 Option 2 in Table 1, item 8 Option 3 in Table 1, or item 9 Option 4 in Table 1 of this subpart and you use continuous parameter monitoring systems	a. Establish each operating limit in Table 2 of this subpart that applies to you	Data from the continuous parameter monitoring systems and applicable performance test methods	
	b. Electrostatic precipitator or wet scrubber: Gas flow rate	i. Data from the continuous parameter monitoring systems and applicable performance test methods	(1) You must collect gas flow rate monitoring data every 15 minutes during the entire period of the initial performance test; determine and record the average gas flow rate for each test run.
			(2) You must determine and record the 3-hr average gas flow rate from the test runs. Alternatively, before August 1, 2017, you may determine and record the maximum hourly average gas flow rate from all the readings.
	c. Electrostatic precipitator: Total power (voltage and current) and secondary current	i. Data from the continuous parameter monitoring systems and applicable performance test methods	(1) You must collect voltage, current, and secondary current monitoring data every 15 minutes during the entire period of the performance test; and determine and record the average voltage, current, and secondary current for each test run. Alternatively, before August 1, 2017, you may collect voltage and secondary current (or total power input) monitoring data every 15 minutes during the entire period of the initial performance test.
			(2) You must determine and record the 3-hr average total power to the system for the test runs and the 3-hr average secondary current from the test runs. Alternatively, before August 1, 2017, you may determine and record the minimum hourly average voltage and secondary current (or total power input) from all the readings.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
	d. Electrostatic precipitator or wet scrubber: Equilibrium catalyst Ni concentration	Results of analysis for equilibrium catalyst Ni concentration	You must determine and record the average equilibrium catalyst Ni concentration for the 3 runs based on the laboratory results. You may adjust the value using Equation 1 or 2 of §63.1571 as applicable.
	e. Wet scrubber: Pressure drop (not applicable to non-venturi scrubber of jet ejector design)	i. Data from the continuous parameter monitoring systems and applicable performance test methods	(1) You must collect pressure drop monitoring data every 15 minutes during the entire period of the initial performance test; and determine and record the average pressure drop for each test run. (2) You must determine and record the 3-hr average pressure drop from the test runs. Alternatively, before August 1, 2017, you may determine and record the minimum hourly average pressure drop from all the readings.
	f. Wet scrubber: Liquid-to-gas ratio	i. Data from the continuous parameter monitoring systems and applicable performance test methods	(1) You must collect gas flow rate and total water (or scrubbing liquid) flow rate monitoring data every 15 minutes during the entire period of the initial performance test; determine and record the average gas flow rate for each test run; and determine the average total water (or scrubbing liquid) flow for each test run.
			(2) You must determine and record the hourly average liquid-to-gas ratio from the test runs. Alternatively, before August 1, 2017, you may determine and record the hourly average gas flow rate and total water (or scrubbing liquid) flow rate from all the readings.
			(3) You must determine and record the 3-hr average liquid-to-gas ratio. Alternatively, before August 1, 2017, you may determine and record the minimum liquid-to-gas ratio.
	g. Alternative procedure for gas flow rate	i. Data from the continuous parameter monitoring systems and applicable performance test methods	(1) You must collect air flow rate monitoring data or determine the air flow rate using control room instrumentation every 15 minutes during the entire period of the initial performance test.
			(2) You must determine and record the 3-hr average rate of all the readings from the test runs. Alternatively, before August 1, 2017, you may determine and record the hourly average rate of all the readings.

For each new or existing catalytic cracking unit catalyst regenerator vent . . .	You must . . .	Using . . .	According to these requirements . . .
			(3) You must determine and record the maximum gas flow rate using Equation 1 of §63.1573.

<sup>1</sup>Determination of Metal Concentration on Catalyst Particles (Instrumental Analyzer Procedure).

<sup>2</sup>EPA Method 6010B, Inductively Coupled Plasma-Atomic Emission Spectrometry, EPA Method 6020, Inductively Coupled Plasma-Mass Spectrometry, EPA Method 7520, Nickel Atomic Absorption, Direct Aspiration, and EPA Method 7521, Nickel Atomic Absorption, Direct Aspiration are included in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, Revision 5 (April 1998). The SW-846 and Updates (document number 955-001-00000-1) are available for purchase from the Superintendent of Documents, U.S. Government Publishing Office, Washington, DC 20402, (202) 512-1800; and from the National Technical Information Services (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 487-4650. [80 FR 75285, Dec. 1, 2015, as amended at 83 FR 60725, Nov. 26, 2018]

**Table 5 to Subpart UUU of Part 63—Initial Compliance With Metal HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1564(b)(5), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic cracking unit catalyst regenerator vent . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
1. Subject to the NSPS for PM in 40 CFR 60.102 and not electing §60.100(e)	PM emissions must not exceed 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off, and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period. Before August 1, 2017, if the discharged gases pass through an incinerator or waste heat boiler in which you burn auxiliary or supplemental liquid or solid fossil fuel, the incremental rate of PM must not exceed 43.0 g/GJ or 0.10 lb/million Btu of heat input attributable to the liquid or solid fossil fuel; and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured PM emission rate is less than or equal to 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off in the catalyst regenerator. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. You are not required to do another performance test to demonstrate initial compliance. You have already conducted a performance test to demonstrate initial compliance with the NSPS and the average hourly opacity is no more than 30 percent, except that one 6-minute average in any 1-hour period can exceed 30 percent. As part of the Notification of Compliance Status, you must certify that your vent meets the 30 percent opacity limit. As part of your Notification of Compliance Status, you certify that your continuous opacity monitoring system meets the requirements in §63.1572.

For each new and existing catalytic cracking unit catalyst regenerator vent . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i); or in §60.102 and electing §60.100(e) and electing to meet the PM per coke burn-off limit	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured PM emission rate is less than or equal to 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off in the catalyst regenerator. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. You are not required to do another performance test to demonstrate initial compliance. As part of your Notification of Compliance Status, you certify that your BLD; CO <sub>2</sub> , O <sub>2</sub> , or CO monitor; or continuous opacity monitoring system meets the requirements in §63.1572.
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii), electing to meet the PM per coke burn-off limit	PM emissions must not exceed 0.5 g/kg (0.5 lb PM/1,000 lb) of coke burn-off	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured PM emission rate is less than or equal to 0.5 g/kg (0.5 lb/1,000 lb) of coke burn-off in the catalyst regenerator. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. You are not required to do another performance test to demonstrate initial compliance. As part of your Notification of Compliance Status, you certify that your BLD; CO <sub>2</sub> , O <sub>2</sub> , or CO monitor; or continuous opacity monitoring system meets the requirements in §63.1572.
4. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i), electing to meet the PM concentration limit	If a PM CEMS is used, 0.040 grain per dry standard cubic feet (gr/dscf) corrected to 0 percent excess air	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured PM concentration is less than or equal to 0.040 grain per dry standard cubic feet (gr/dscf) corrected to 0 percent excess air. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. You are not required to do another performance test to demonstrate initial compliance. As part of your Notification of Compliance Status, you certify that your PM CEMS meets the requirements in §63.1572.

For each new and existing catalytic cracking unit catalyst regenerator vent . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
5. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii), electing to meet the PM concentration limit	If a PM CEMS is used, 0.020 gr/dscf corrected to 0 percent excess air	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured PM concentration is less than or equal to 0.020 gr/dscf corrected to 0 percent excess air. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. You are not required to do another performance test to demonstrate initial compliance. As part of your Notification of Compliance Status, you certify that your PM CEMS meets the requirements in §63.1572.
6. Option 1a: Elect NSPS subpart J requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 gram per kilogram (g/kg) (1.0 lb/1,000 lb) of coke burn-off, and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period. Before August 1, 2017, PM emission must not exceed 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off in the catalyst regenerator; if the discharged gases pass through an incinerator or waste heat boiler in which you burn auxiliary or supplemental liquid or solid fossil fuel, the incremental rate of PM must not exceed 43.0 g/GJ (0.10 lb/million Btu) of heat input attributable to the liquid or solid fossil fuel; and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period	The average PM emission rate, measured using EPA Method 5, 5B, or 5F (for a unit without a wet scrubber) or 5 or 5B (for a unit with a wet scrubber) (40 CFR part 60, appendix A-3), over the period of the initial performance test, is no higher than 1.0 g/kg coke burn-off (1.0 lb/1,000 lb) in the catalyst regenerator. The PM emission rate is calculated using Equations 1, 2, and 3 of §63.1564. As part of the Notification of Compliance Status, you must certify that your vent meets the PM limit. The average hourly opacity is no more than 30 percent, except that one 6-minute average in any 1-hour period can exceed 30 percent. As part of the Notification of Compliance Status, you must certify that your vent meets the 30 percent opacity limit. If you use a continuous opacity monitoring system, your performance evaluation shows the system meets the applicable requirements in §63.1572.
7. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off	The average PM emission rate, measured using EPA Method 5, 5B, or 5F (for a unit without a wet scrubber) or 5 or 5B (for a unit with a wet scrubber) (40 CFR part 60, appendix A-3), over the period of the initial performance test, is no higher than 1.0 g/kg coke burn-off (1.0 lb/1,000 lb) in the catalyst regenerator. The PM emission rate is calculated using Equations 1, 2, and 3 of §63.1564. If you use a BLD; CO <sub>2</sub> , O <sub>2</sub> , CO monitor; or continuous opacity monitoring system, your performance evaluation shows the system meets the applicable requirements in §63.1572.

For each new and existing catalytic cracking unit catalyst regenerator vent . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
8. Option 1c: Elect NSPS subpart Ja requirements for PM concentration limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 0.040 gr/dscf corrected to 0 percent excess air	The average PM concentration, measured using EPA Method 5, 5B, or 5F (for a unit without a wet scrubber) or Method 5 or 5B (for a unit with a wet scrubber) (40 CFR part 60, appendix A-3), over the period of the initial performance test, is less than or equal to 0.040 gr/dscf corrected to 0 percent excess air. Your performance evaluation shows your PM CEMS meets the applicable requirements in §63.1572.
9. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off	The average PM emission rate, measured using EPA Method 5, 5B, or 5F (for a unit without a wet scrubber) or 5 or 5B (for a unit with a wet scrubber) (40 CFR part 60, appendix A-3), over the period of the initial performance test, is no higher than 1.0 g/kg coke burn-off (1.0 lb/1,000 lb) in the catalyst regenerator. The PM emission rate is calculated using Equations 1, 2, and 3 of §63.1564. If you use a BLD; CO <sub>2</sub> , O <sub>2</sub> , CO monitor; or continuous opacity monitoring system, your performance evaluation shows the system meets the applicable requirements in §63.1572.
10. Option 3: Ni lb/hr limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Nickel (Ni) emissions from your catalyst regenerator vent must not exceed 13,000 mg/hr (0.029 lb/hr)	The average Ni emission rate, measured using Method 29 (40 CFR part 60, appendix A-8) over the period of the initial performance test, is not more than 13,000 mg/hr (0.029 lb/hr). The Ni emission rate is calculated using Equation 5 of §63.1564; and if you use a BLD; CO <sub>2</sub> , O <sub>2</sub> , or CO monitor; or continuous opacity monitoring system, your performance evaluation shows the system meets the applicable requirements in §63.1572.
11. Option 4: Ni per coke burn-off limit not subject to the NSPS for PM	Ni emissions from your catalyst regenerator vent must not exceed 1.0 mg/kg (0.001 lb/1,000 lb) of coke burn-off in the catalyst regenerator	The average Ni emission rate, measured using Method 29 (40 CFR part 60, appendix A-8) over the period of the initial performance test, is not more than 1.0 mg/kg (0.001 lb/1,000 lb) of coke burn-off in the catalyst regenerator. The Ni emission rate is calculated using Equation 8 of §63.1564; and if you use a BLD; CO <sub>2</sub> , O <sub>2</sub> , or CO monitor; or continuous opacity monitoring system, your performance evaluation shows the system meets the applicable requirements in §63.1572.

**Table 6 to Subpart UUU of Part 63—Continuous Compliance With Metal HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1564(c)(1), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic cracking unit . . .	Subject to this emission limit for your catalyst regenerator vent . . .	You shall demonstrate continuous compliance by . . .
1. Subject to the NSPS for PM in 40 CFR 60.102 and not electing §60.100(e)	a. PM emissions must not exceed 1.0 g/kg (1.0 lb/1,000 lb) of coke burn-off, and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period. Before August 1, 2017, if the discharged gases pass through an incinerator or waste heat boiler in which you burn auxiliary or supplemental liquid or solid fossil fuel, the incremental rate of PM must not exceed 43.0 g/GJ (0.10 lb/million Btu) of heat input attributable to the liquid or solid fossil fuel; and the opacity of emissions must not exceed 30 percent, except for one 6-minute average opacity reading in any 1-hour period	i. Determining and recording each day the average coke burn-off rate (thousands of kilograms per hour) using Equation 1 in §63.1564 and the hours of operation for each catalyst regenerator.
		ii. Conducting a performance test before August 1, 2017 or within 150 days of startup of a new unit and thereafter following the testing frequency in §63.1571(a)(5) as applicable to your unit.
		iii. Collecting the continuous opacity monitoring data for each catalyst regenerator vent according to §63.1572 and maintaining each 6-minute average at or below 30 percent, except that one 6-minute average during a 1-hour period can exceed 30 percent.
		iv. Before August 1, 2017, if applicable, determining and recording each day the rate of combustion of liquid or solid fossil fuels (liters/hour or kilograms/hour) and the hours of operation during which liquid or solid fossil-fuels are combusted in the incinerator-waste heat boiler; if applicable, maintaining the incremental rate of PM at or below 43 g/GJ (0.10 lb/million Btu) of heat input attributable to the solid or liquid fossil fuel.
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i), electing to meet the PM per coke burn-off limit	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off	Determining and recording each day the average coke burn-off rate (thousands of kilograms per hour) using Equation 1 in §63.1564 and the hours of operation for each catalyst regenerator; maintaining PM emission rate below 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off; and conducting a performance test once every year.

<b>For each new and existing catalytic cracking unit . . .</b>	<b>Subject to this emission limit for your catalyst regenerator vent . . .</b>	<b>You shall demonstrate continuous compliance by . . .</b>
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii), electing to meet the PM per coke burn-off limit	PM emissions must not exceed 0.5 g/kg coke burn-off (0.5 lb/1000 lb coke burn-off)	Determining and recording each day the average coke burn-off rate (thousands of kilograms per hour) using Equation 1 in §63.1564 and the hours of operation for each catalyst regenerator; maintaining PM emission rate below 0.5 g/kg (0.5 lb/1,000 lb) of coke burn-off; and conducting a performance test once every year.
4. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(i), electing to meet the PM concentration limit	If a PM CEMS is used, 0.040 grain per dry standard cubic feet (gr/dscf) corrected to 0 percent excess air	Maintaining PM concentration below 0.040 gr/dscf corrected to 0 percent excess air.
5. Subject to NSPS for PM in 40 CFR 60.102a(b)(1)(ii), electing to meet the PM concentration limit	If a PM CEMS is used, 0.020 gr/dscf corrected to 0 percent excess air	Maintaining PM concentration below 0.020 gr/dscf corrected to 0 percent excess air.
6. Option 1a: Elect NSPS subpart J requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	See item 1 of this table	See item 1 of this table.
7. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off	See item 2 of this table.
8. Option 1c: Elect NSPS subpart Ja requirements for PM concentration limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 0.040 gr/dscf corrected to 0 percent excess air	See item 4 of this table.
9. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM emissions must not exceed 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off	Determining and recording each day the average coke burn-off rate and the hours of operation and the hours of operation for each catalyst regenerator by Equation 1 of §63.1564 (you can use process data to determine the volumetric flow rate); maintaining PM emission rate below 1.0 g/kg (1.0 lb PM/1,000 lb) of coke burn-off; and conducting a performance test before August 1, 2017 and thereafter following the testing frequency in §63.1571(a)(5) as applicable to your unit.
10. Option 3: Ni lb/hr limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Ni emissions must not exceed 13,000 mg/hr (0.029 lb/hr)	Maintaining Ni emission rate below 13,000 mg/hr (0.029 lb/hr); and conducting a performance test before August 1, 2017 and thereafter following the testing frequency in §63.1571(a)(5) as applicable to your unit.

For each new and existing catalytic cracking unit . . .	Subject to this emission limit for your catalyst regenerator vent . . .	You shall demonstrate continuous compliance by . . .
11. Option 4: Ni per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Ni emissions must not exceed 1.0 mg/kg (0.001 lb/1,000 lb) of coke burn-off in the catalyst regenerator	Determining and recording each day the average coke burn-off rate (thousands of kilograms per hour) and the hours of operation for each catalyst regenerator by Equation 1 of §63.1564 (you can use process data to determine the volumetric flow rate); and maintaining Ni emission rate below 1.0 mg/kg (0.001 lb/1,000 lb) of coke burn-off in the catalyst regenerator; and conducting a performance test before August 1, 2017 and thereafter following the testing frequency in §63.1571(a)(5) as applicable to your unit.

[80 FR 75292, Dec. 1, 2015, as amended at 83 FR 60726, Nov. 26, 2018]

**Table 7 to Subpart UUU of Part 63—Continuous Compliance With Operating Limits for Metal HAP Emissions From Catalytic Cracking Units**

As stated in §63.1564(c)(1), you shall meet each requirement in the following table that applies to you.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
1. Subject to NSPS for PM in 40 CFR 60.102 and not electing §60.100(e)	Continuous opacity monitoring system	The 3-hour average opacity of emissions from your catalyst regenerator vent must not exceed 20 percent	Collecting the continuous opacity monitoring data for each regenerator vent according to §63.1572 and maintain each 3-hour rolling average opacity of emissions no higher than 20 percent.
2. Subject to NSPS for PM in 40 CFR 60.102a(b)(1); or 40 CFR 60.102 and elect §60.100(e), electing to meet the PM per coke burn-off limit	a. Continuous opacity monitoring system, used for site-specific opacity limit—Cyclone or electrostatic precipitator	The average opacity must not exceed the opacity established during the performance test	Collecting the hourly and 3-hr rolling average opacity monitoring data according to §63.1572; maintaining the 3-hr rolling average opacity at or above the site-specific limit established during the performance test.
	b. Continuous parametric monitoring systems—electrostatic precipitator	i. The average gas flow rate entering or exiting the control device must not exceed the operating limit established during the performance test	Collecting the hourly and daily average coke burn-off rate or average gas flow rate monitoring data according to §63.1572; and maintaining the daily average coke burn-off rate or average gas flow rate at or below the limit established during the performance test.
		ii. The average total power and secondary current to the control device must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average total power and secondary current monitoring data according to §63.1572; and maintaining the 3-hr rolling average total power and secondary current at or above the limit established during the performance test.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
	c. Continuous parametric monitoring systems—wet scrubber	i. The average liquid-to-gas ratio must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average gas flow rate and scrubber liquid flow rate monitoring data according to §63.1572; determining and recording the 3-hr liquid-to-gas ratio; and maintaining the 3-hr rolling average liquid-to-gas ratio at or above the limit established during the performance test.
		ii. Except for periods of startup, shutdown and hot standby, the average pressure drop across the scrubber must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average pressure drop monitoring data according to §63.1572; and except for periods of startup, shutdown and hot standby, maintaining the 3-hr rolling average pressure drop at or above the limit established during the performance test.
	d. BLD—fabric filter	Increases in relative particulate	Collecting and maintaining records of BLD system output; determining the cause of the alarm within 1 hour of the alarm; and alleviating the cause of the alarm within 3 hours by corrective action.
3. Subject to NSPS for PM in 40 CFR 60.102a(b)(1), electing to meet the PM concentration limit	PM CEMS	Not applicable	Complying with Table 6 of this subpart, item 4 or 5.
4. Option 1a: Elect NSPS subpart J requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	Continuous opacity monitoring system	The 3-hour average opacity of emissions from your catalyst regenerator vent must not exceed 20 percent	Collecting the 3-hr rolling average continuous opacity monitoring system data according to §63.1572; and maintaining the 3-hr rolling average opacity no higher than 20 percent.
5. Option 1b: Elect NSPS subpart Ja requirements for PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Continuous opacity monitoring system	The opacity of emissions from your catalyst regenerator vent must not exceed the site-specific opacity operating limit established during the performance test	Collecting the 3-hr rolling average continuous opacity monitoring system data according to §63.1572; maintaining the 3-hr rolling average opacity at or below the site-specific limit.
	b. Continuous parametric monitoring systems—electrostatic precipitator	See item 2.b of this table	See item 2.b of this table.
	c. Continuous parametric monitoring systems—wet scrubber	See item 2.c of this table	See item 2.c of this table.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
	d. BLD—fabric filter	See item 2.d of this table	See item 2.d of this table.
6. Option 1c: Elect NSPS subpart Ja requirements for PM concentration limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	PM CEMS	Not applicable	Complying with Table 6 of this subpart, item 4.
7. Option 2: PM per coke burn-off limit, not subject to the NSPS for PM in 40 CFR 60.102 or 60.102a(b)(1)	a. Continuous opacity monitoring system	The opacity of emissions from your catalyst regenerator vent must not exceed the site-specific opacity operating limit established during the performance test	Collecting the hourly and 3-hr rolling average continuous opacity monitoring system data according to §63.1572; and maintaining the 3-hr rolling average opacity at or below the site-specific limit established during the performance test. Alternatively, before August 1, 2017, collecting the hourly average continuous opacity monitoring system data according to §63.1572; and maintaining the hourly average opacity at or below the site-specific limit.
	b. Continuous parameter monitoring systems—electrostatic precipitator	i. The average coke burn-off rate or average gas flow rate entering or exiting the control device must not exceed the operating limit established during the performance test	Collecting the hourly and daily average coke burn-off rate or gas flow rate monitoring data according to §63.1572; and maintaining the daily coke burn-off rate or average gas flow rate at or below the limit established during the performance test.
		ii. The average total power (voltage and current) and secondary current to the control device must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average total power and secondary current monitoring data according to §63.1572; and maintaining the 3-hr rolling average total power and secondary current at or above the limit established during the performance test. Alternatively, before August 1, 2017, collecting the hourly and daily average voltage and secondary current (or total power input) monitoring data according to §63.1572; and maintaining the daily average voltage and secondary current (or total power input) at or above the limit established during the performance test.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
	c. Continuous parameter monitoring systems—wet scrubber	i. The average liquid-to-gas ratio must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average gas flow rate and scrubber liquid flow rate monitoring data according to §63.1572; determining and recording the 3-hr liquid-to-gas ratio; and maintaining the 3-hr rolling average liquid-to-gas ratio at or above the limit established during the performance test. Alternatively, before August 1, 2017, collecting the hourly average gas flow rate and water (or scrubbing liquid) flow rate monitoring data according to §63.1572 <sup>1</sup> ; determining and recording the hourly average liquid-to-gas ratio; determining and recording the daily average liquid-to-gas ratio; and maintaining the daily average liquid-to-gas ratio above the limit established during the performance test.
		ii. Except for periods of startup, shutdown and hot standby, the average pressure drop across the scrubber must not fall below the operating limit established during the performance test	Collecting the hourly and 3-hr rolling average pressure drop monitoring data according to §63.1572; and except for periods of startup, shutdown and hot standby, maintaining the 3-hr rolling average pressure drop at or above the limit established during the performance test. Alternatively, before August 1, 2017, collecting the hourly and daily average pressure drop monitoring data according to §63.1572; and maintaining the daily average pressure drop above the limit established during the performance test.
	d. BLD—fabric filter	See item 2.d of this table	See item 2.d of this table.
8. Option 3: Ni lb/hr limit not subject to the NSPS for PM in 40 CFR 60.102	a. Continuous opacity monitoring system	i. The daily average Ni operating value must not exceed the site-specific Ni operating limit established during the performance test	(1) Collecting the hourly average continuous opacity monitoring system data according to §63.1572; determining and recording equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; collecting the hourly average gas flow rate monitoring data according to §63.1572 <sup>1</sup> ; and determining and recording the hourly average Ni operating value using Equation 11 of §63.1564.
			(2) Determining and recording the 3-hour rolling average Ni operating value and maintaining the 3-hour rolling average Ni operating value below the site-specific Ni operating limit established during the performance test. Alternatively, before August 1, 2017, determining and recording the daily average Ni operating value and maintaining the daily average Ni operating value below the site-specific Ni operating limit established during the performance test.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
	b. Continuous parameter monitoring systems—electrostatic precipitator	i. The average gas flow rate entering or exiting the control device must not exceed the operating limit established during the performance test	See item 7.b.i of this table.
		ii. The average total power (voltage and current) and secondary current must not fall below the level established in the performance test	See item 7.b.ii of this table.
		iii. The monthly rolling average of the equilibrium catalyst Ni concentration must not exceed the level established during the performance test	Determining and recording the equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; determining and recording the monthly rolling average of the equilibrium catalyst Ni concentration once each week using the weekly or most recent value; and maintaining the monthly rolling average below the limit established in the performance test.
	c. Continuous parameter monitoring systems—wet scrubber	i. The average liquid-to-gas ratio must not fall below the operating limit established during the performance test.	See item 7.c.i of this table.
		ii. Except for periods of startup, shutdown and hot standby, the average pressure drop must not fall below the operating limit established in the performance test	See item 7.c.ii of this table.
		iii. The monthly rolling average equilibrium catalyst Ni concentration must not exceed the level established during the performance test	Determining and recording the equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; determining and recording the monthly rolling average of equilibrium catalyst Ni concentration once each week using the weekly or most recent value; and maintaining the monthly rolling average below the limit established in the performance test.
	d. BLD—fabric filter	i. Increases in relative particulate	See item 7.d of this table.
		ii. The monthly rolling average of the equilibrium catalyst Ni concentration must not exceed the level established during the performance test	Determining and recording the equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; determining and recording the monthly rolling average of the equilibrium catalyst Ni concentration once each week using the weekly or most recent value; and maintaining the monthly rolling average below the limit established in the performance test.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
9. Option 4: Ni per coke burn-off limit not subject to the NSPS for PM in 40 CFR 60.102	a. Continuous opacity monitoring system	i. The daily average Ni operating value must not exceed the site-specific Ni operating limit established during the performance test	(1) Collecting the hourly average continuous opacity monitoring system data according to §63.1572; collecting the hourly average coke burn rate and hourly average gas flow rate monitoring data according to §63.15721; determining and recording equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; and determining and recording the hourly average Ni operating value using Equation 12 of §63.1564.
			(2) Determining and recording the 3-hour rolling average Ni operating value and maintaining the 3-hour rolling average Ni operating value below the site-specific Ni operating limit established during the performance test Alternatively, before August 1, 2017, determining and recording the daily average Ni operating value and maintaining the daily average Ni operating value below the site-specific Ni operating limit established during the performance test.
	b. Continuous parameter monitoring systems—electrostatic precipitator	i. The average gas flow rate to the control device must not exceed the level established in the performance test	See item 7.b.i of this table.
		ii. The average voltage and secondary current (or total power input) must not fall below the level established in the performance test	See item 7.b.ii of this table.
		iii. The monthly rolling average equilibrium catalyst Ni concentration must not exceed the level established during the performance test	See item 8.b.iii of this table.
	c. Continuous parameter monitoring systems—wet scrubber	i. The average liquid-to-gas ratio must not fall below the operating limit established during the performance test	See item 7.c.i of this table.
		ii. Except for periods of startup, shutdown and hot standby, the daily average pressure drop must not fall below the operating limit established in the performance test	See item 7.c.ii of this table.

For each new or existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
		iii. The monthly rolling average equilibrium catalyst Ni concentration must not exceed the level established during the performance test	See item 8.c.iii of this table.
	d. BLD—fabric filter	i. See item 2.d of this table	See item 2.d of this table.
		ii. The monthly rolling average of the equilibrium catalyst Ni concentration must not exceed the level established during the performance test	Determining and recording the equilibrium catalyst Ni concentration at least once a week <sup>2</sup> ; determining and recording the monthly rolling average of the equilibrium catalyst Ni concentration once each week using the weekly or most recent value; and maintaining the monthly rolling average below the limit established in the performance test.
10. During periods of startup, shutdown, or hot standby	Any control device, if elected	The inlet velocity limit to the primary internal cyclones of the catalytic cracking unit catalyst regenerator in §63.1564(a)(5)(ii)	Meeting the requirements in §63.1564(c)(5).

<sup>1</sup>If applicable, you can use the alternative in §63.1573(a)(1) for gas flow rate instead of a continuous parameter monitoring system if you used the alternative method in the initial performance test.

<sup>2</sup>The equilibrium catalyst Ni concentration must be measured by the procedure, Determination of Metal Concentration on Catalyst Particles (Instrumental Analyzer Procedure) in appendix A to this subpart; or by EPA Method 6010B, Inductively Coupled Plasma-Atomic Emission Spectrometry, EPA Method 6020, Inductively Coupled Plasma-Mass Spectrometry, EPA Method 7520, Nickel Atomic Absorption, Direct Aspiration, or EPA Method 7521, Nickel Atomic Absorption, Direct Aspiration; or by an alternative to EPA Method 6010B, 6020, 7520, or 7521 satisfactory to the Administrator. The EPA Methods 6010B, 6020, 7520, and 7521 are included in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,” EPA Publication SW-846, Revision 5 (April 1998). The SW-846 and Updates (document number 955-001-00000-1) are available for purchase from the Superintendent of Documents, U.S. Government Publishing Office, Washington, DC 20402, (202) 512-1800; and from the National Technical Information Services (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 487-4650. Copies may be inspected at the EPA Docket Center, William Jefferson Clinton (WJC) West Building (Air Docket), Room 3334, 1301 Constitution Ave. NW., Washington, DC; or at the Office of the Federal Register, 800 North Capitol Street NW., Suite 700, Washington, DC. These methods are also available at <http://www.epa.gov/epaoswer/hazwaste/test/main.htm>.

[80 FR 75293, Dec. 1, 2015]

**Table 8 to Subpart UUU of Part 63—Organic HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1565(a)(1), you shall meet each emission limitation in the following table that applies to you.

For each new and existing catalytic cracking unit . . .	You shall meet the following emission limit for each catalyst regenerator vent . . .
1. Subject to the NSPS for carbon monoxide (CO) in 40 CFR 60.103 or 60.102a(b)(4)	CO emissions from the catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 parts per million volume (ppmv) (dry basis).

For each new and existing catalytic cracking unit . . .	You shall meet the following emission limit for each catalyst regenerator vent . . .
2. Not subject to the NSPS for CO in 40 CFR 60.103 or 60.102a(b)(4)	<p>a. CO emissions from the catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis).</p> <p>b. If you use a flare to meet the CO limit, then on and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare must meet the requirements for control devices in §63.11(b) and visible emissions must not exceed a total of 5 minutes during any 2 consecutive hours, or the flare must meet the requirements of §63.670.</p>

[80 FR 75299, Dec. 1, 2015]

**Table 9 to Subpart UUU of Part 63—Operating Limits for Organic HAP Emissions From Catalytic Cracking Units**

As stated in §63.1565(a)(2), you shall meet each operating limit in the following table that applies to you.

For each new or existing catalytic cracking unit . . .	For this type of continuous monitoring system . . .	For this type of control device . . .	You shall meet this operating limit . . .
1. Subject to the NSPS for carbon monoxide (CO) in 40 CFR 60.103 or 60.102a(b)(4)	Continuous emission monitoring system	Not applicable	Not applicable.
2. Not subject to the NSPS for CO in 40 CFR 60.103 or 60.102a(b)(4)	a. Continuous emission monitoring system.	Not applicable	Not applicable.
	b. Continuous parameter monitoring systems.	i. Thermal incinerator	Maintain the daily average combustion zone temperature above the limit established during the performance test; and maintain the daily average oxygen concentration in the vent stream (percent, dry basis) above the limit established during the performance test.
		ii. Boiler or process heater with a design heat input capacity under 44 MW or a boiler or process heater in which all vent streams are not introduced into the flame zone.	Maintain the daily average combustion zone temperature above the limit established in the performance test.
		iii. Flare	On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare pilot light must be present at all times and the flare must be operating at all times that emissions may be vented to it, or the flare must meet the requirements of §63.670.
3. During periods of startup, shutdown or hot standby	Any	Any	Meet the requirements in §63.1565(a)(5).

[80 FR 75299, Dec. 1, 2015]

**Table 10 to Subpart UUU of Part 63—Continuous Monitoring Systems for Organic HAP Emissions From Catalytic Cracking Units**

As stated in §63.1565(b)(1), you shall meet each requirement in the following table that applies to you.

<b>For each new or existing catalytic cracking unit . . .</b>	<b>And you use this type of control device for your vent . . .</b>	<b>You shall install, operate, and maintain this type of continuous monitoring system . . .</b>
1. Subject to the NSPS for carbon monoxide (CO) in 40 CFR 60.103 or 60.102a(b)(4)	Not applicable	Continuous emission monitoring system to measure and record the concentration by volume (dry basis) of CO emissions from each catalyst regenerator vent.
2. Not subject to the NSPS for CO in 40 CFR 60.103 or 60.102a(b)(4)	a. Thermal incinerator	Continuous emission monitoring system to measure and record the concentration by volume (dry basis) of CO emissions from each catalyst regenerator vent; or continuous parameter monitoring systems to measure and record the combustion zone temperature and oxygen content (percent, dry basis) in the incinerator vent stream.
	b. Process heater or boiler with a design heat input capacity under 44 MW or process heater or boiler in which all vent streams are not introduced into the flame zone.	Continuous emission monitoring system to measure and record the concentration by volume (dry basis) of CO emissions from each catalyst regenerator vent; or continuous parameter monitoring systems to measure and record the combustion zone temperature.
	c. Flare	On and after January 30, 2019, the monitoring systems required in §§63.670 and 63.671. Prior to January 30, 2019, monitoring device such as a thermocouple, an ultraviolet beam sensor, or infrared sensor to continuously detect the presence of a pilot flame, or the monitoring systems required in §§63.670 and 63.671.
	d. No control device	Continuous emission monitoring system to measure and record the concentration by volume (dry basis) of CO emissions from each catalyst regenerator vent.
3. During periods of startup, shutdown or hot standby electing to comply with the operating limit in §63.1565(a)(5)(ii)	Any	Continuous parameter monitoring system to measure and record the concentration by volume (wet or dry basis) of oxygen from each catalyst regenerator vent. If measurement is made on a wet basis, you must comply with the limit as measured (no moisture correction).

[80 FR 75300, Dec. 1, 2015, as amended at 83 FR 60727, Nov. 26, 2018]

**Table 11 to Subpart UUU of Part 63—Requirements for Performance Tests for Organic HAP Emissions From Catalytic Cracking Units Not Subject to New Source Performance Standard (NSPS) for Carbon Monoxide (CO)**

As stated in §63.1565(b)(2) and (3), you shall meet each requirement in the following table that applies to you.

<b>For . . .</b>	<b>You must . . .</b>	<b>Using . . .</b>	<b>According to these requirements . . .</b>

For . . .	You must . . .	Using . . .	According to these requirements . . .
1. Each new or existing catalytic cracking unit catalyst regenerator vent.	a. Select sampling port's location and the number of traverse ports.	Method 1 or 1A in appendix A to part 60 of this chapter.	Sampling sites must be located at the outlet of the control device or the outlet of the regenerator, as applicable, and prior to any releases to the atmosphere.
	b. Determine velocity and volumetric flow rate.	Method 2, 2A, 2D, 2F, or 2G in appendix A to part 60 of this chapter, as applicable.	
	c. Conduct gas molecular weight analysis.	Method 3, 3A, or 3B in appendix A to part 60 of this chapter, as applicable.	
	d. Measure moisture content of the stack gas.	Method 4 in appendix A to part 60 of this chapter.	
2. For each new or existing catalytic cracking unit catalyst regenerator vent if you use a continuous emission monitoring system.	Measure CO emissions	Data from your continuous emission monitoring system.	Collect CO monitoring data for each vent for 24 consecutive operating hours; and reduce the continuous emission monitoring data to 1-hour averages computed from four or more data points equally spaced over each 1-hour period.
3. Each catalytic cracking unit catalyst regenerator vent if you use continuous parameter monitoring systems	a. Measure the CO concentration (dry basis) of emissions exiting the control device	Method 10, 10A, or 10B in appendix A-4 to part 60 of this chapter, as applicable	
	b. Establish each operating limit in Table 9 of this subpart that applies to you	Data from the continuous parameter monitoring systems	
	c. Thermal incinerator combustion zone temperature	Data from the continuous parameter monitoring systems	Collect temperature monitoring data every 15 minutes during the entire period of the CO initial performance test; and determine and record the minimum hourly average combustion zone temperature from all the readings.
	d. Thermal incinerator: oxygen, content (percent, dry basis) in the incinerator vent stream	Data from the continuous parameter monitoring systems	Collect oxygen concentration (percent, dry basis) monitoring data every 15 minutes during the entire period of the CO initial performance test; and determine and record the minimum hourly average percent excess oxygen concentration from all the readings.

For . . .	You must . . .	Using . . .	According to these requirements . . .
	e. If you use a process heater or boiler with a design heat input capacity under 44 MW or process heater or boiler in which all vent streams are not introduced into the flame zone, establish operating limit for combustion zone temperature	Data from the continuous parameter monitoring systems	Collect the temperature monitoring data every 15 minutes during the entire period of the CO initial performance test; and determine and record the minimum hourly average combustion zone temperature from all the readings.
	f. If you use a flare, conduct visible emission observations	Method 22 (40 CFR part 60, appendix A-7)	On and after January 30, 2019, meet the requirements of §63.670. Prior to January 30, 2019, maintain a 2-hour observation period; and record the presence of a flame at the pilot light over the full period of the test or meet the requirements of §63.670.
	g. If you use a flare, determine that the flare meets the requirements for net heating value of the gas being combusted and exit velocity	40 CFR 63.11(b)(6) through (8)	On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare must meet the control device requirements in §63.11(b) or the requirements of §63.670.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6948, Feb. 9, 2005; 80 FR 75301, Dec. 1, 2015]

**Table 12 to Subpart UUU of Part 63—Initial Compliance With Organic HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1565(b)(4), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic cracking unit . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
1. Subject to the NSPS for carbon monoxide (CO) in 40 CFR 60.103, 60.100(e), or 60.102a(b)(4)	CO emissions from your catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis)	You have already conducted a performance test to demonstrate initial compliance with the NSPS and the measured CO emissions are less than or equal to 500 ppm (dry basis). As part of the Notification of Compliance Status, you must certify that your vent meets the CO limit. You are not required to conduct another performance test to demonstrate initial compliance. You have already conducted a performance evaluation to demonstrate initial compliance with the applicable performance specification. As part of your Notification of Compliance Status, you must certify that your continuous emission monitoring system meets the applicable requirements in §63.1572. You are not required to conduct another performance evaluation to demonstrate initial compliance.
2. Not subject to the NSPS for CO in 40 CFR 60.103 60.102a(b)(4)	a. CO emissions from your catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis)	i. If you use a continuous parameter monitoring system, the average CO emissions measured by Method 10 over the period of the initial performance test are less than or equal to 500 ppmv (dry basis).

For each new and existing catalytic cracking unit . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
		ii. If you use a continuous emission monitoring system, the hourly average CO emissions over the 24-hour period for the initial performance test are not more than 500 ppmv (dry basis); and your performance evaluation shows your continuous emission monitoring system meets the applicable requirements in §63.1572.
	b. If you use a flare, visible emissions must not exceed a total of 5 minutes during any 2 operating hours	On and after January 30, 2019, the flare meets the requirements of §63.670. Prior to January 30, 2019, visible emissions, measured by Method 22 during the 2-hour observation period during the initial performance test, are no higher than 5 minutes, or the flare meets the requirements of §63.670.

[80 FR 75302, Dec. 1, 2015]

**Table 13 to Subpart UUU of Part 63—Continuous Compliance With Organic HAP Emission Limits for Catalytic Cracking Units**

As stated in §63.1565(c)(1), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic cracking unit . . .	Subject to this emission limit for your catalyst regenerator vent . . .	If you must . . .	You shall demonstrate continuous compliance by . . .
1. Subject to the NSPS for carbon monoxide (CO) in 40 CFR 60.103, 60.100(e), or 60.102a(b)(4)	CO emissions from your catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis).	Continuous emission monitoring system	Collecting the hourly average CO monitoring data according to §63.1572; and maintaining the hourly average CO concentration at or below 500 ppmv (dry basis).
2. Not subject to the NSPS for CO in 40 CFR 60.103 or 60.102a(b)(4)	a. CO emissions from your catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis).	Continuous emission monitoring system.	Same as item 1.
	b. CO emissions from your catalyst regenerator vent or CO boiler serving the catalytic cracking unit must not exceed 500 ppmv (dry basis).	Continuous parameter monitoring system.	Maintaining the hourly average CO concentration below 500 ppmv (dry basis).
	c. Visible emissions from a flare must not exceed a total of 5 minutes during any 2-hour period.	Control device-flare	On and after January 30, 2019, meeting the requirements of §63.670. Prior to January 30, 2019, maintaining visible emissions below a total of 5 minutes during any 2-hour operating period, or meeting the requirements of §63.670.

[80 FR 75302, Dec. 1, 2015]

**Table 14 to Subpart UUU of Part 63—Continuous Compliance With Operating Limits for Organic HAP Emissions From Catalytic Cracking Units**

As stated in §63.1565(c)(1), you shall meet each requirement in the following table that applies to you.

For each new existing catalytic cracking unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
1. Subject to NSPS for carbon monoxide (CO) in 40 CFR 60.103, 60.100(e), 60.102a(b)(4)	Continuous emission monitoring system.	Not applicable	Complying with Table 13 of this subpart, item 1.
2. Not subject to the NSPS for CO in 40 CFR 60.103 or 60.102a(b)(4)	a. Continuous emission monitoring system	Not applicable	Complying with Table 13 of this subpart, item 2.a.
	b. Continuous parameter monitoring systems—thermal incinerator.	i. The daily average combustion zone temperature must not fall below the level established during the performance test.	Collecting the hourly and daily average temperature monitoring data according to §63.1572; and maintaining the daily average combustion zone temperature above the limit established during the performance test.
		ii. The daily average oxygen concentration in the vent stream (percent, dry basis) must not fall below the level established during the performance test.	Collecting the hourly and daily average oxygen concentration monitoring data according to §63.1572; and maintaining the daily average oxygen concentration above the limit established during the performance test.
	c. Continuous parameter monitoring systems—boiler or process heater with a design heat input capacity under 44 MW or boiler or process heater in which all vent streams are not introduced into the flame zone.	The daily combustion zone temperature must not fall below the level established in the performance test.	Collecting the average hourly and daily temperature monitoring data according to §63.1572; and maintaining the daily average combustion zone temperature above the limit established during the performance test.
	d. Continuous parameter monitoring system—flare.	The flare pilot light must be present at all times and the flare must be operating at all times that emissions may be vented to it.	On and after January 30, 2019, meeting the requirements of §63.670. Prior to January 30, 2019, collecting the flare monitoring data according to §63.1572 and recording for each 1-hour period whether the monitor was continuously operating and the pilot light was continuously present during each 1-hour period, or meeting the requirements of §63.670.
3. During periods of startup, shutdown or hot standby electing to comply with the operating limit in §63.1565(a)(5)(ii).	Any control device	The oxygen concentration limit in §63.1565(a)(5)(ii)	Collecting the hourly average oxygen concentration monitoring data according to §63.1572 and maintaining the hourly average oxygen concentration at or above 1 volume percent (dry basis).

[80 FR 75303, Dec. 1, 2015]

**Table 15 to Subpart UUU of Part 63—Organic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1566(a)(1), you shall meet each emission limitation in the following table that applies to you.

For each applicable process vent for a new or existing catalytic reforming unit . . .	You shall meet this emission limit during initial catalyst depressuring and catalyst purging operations . . .
1. Option 1	On and after January 30, 2019, vent emissions to a flare that meets the requirements of §63.670. Prior to January 30, 2019, vent emissions to a flare that meets the requirements for control devices in §63.11(b) and visible emissions from a flare must not exceed a total of 5 minutes during any 2-hour operating period, or vent emissions to a flare that meets the requirements of §63.670.
2. Option 2	Reduce uncontrolled emissions of total organic compounds (TOC) or nonmethane TOC from your process vent by 98 percent by weight using a control device or to a concentration of 20 ppmv (dry basis as hexane), corrected to 3 percent oxygen, whichever is less stringent. If you vent emissions to a boiler or process heater to comply with the percent reduction or concentration emission limitation, the vent stream must be introduced into the flame zone, or any other location that will achieve the percent reduction or concentration standard.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6951, Feb. 9, 2005; 80 FR 75304, Dec. 1, 2015]

**Table 16 to Subpart UUU of Part 63—Operating Limits for Organic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1566(a)(2), you shall meet each operating limit in the following table that applies to you.

For each new or existing catalytic reforming unit . . .	For this type of control device . . .	You shall meet this operating limit during initial catalyst depressuring and purging operations. . .
1. Option 1: Vent to flare	Flare	On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare pilot light must be present at all times and the flare must be operating at all times that emissions may be vented to it, or the flare must meet the requirements of §63.670.
2. Option 2: Percent reduction or concentration limit	a. Thermal incinerator, boiler or process heater with a design heat input capacity under 44 MW, or boiler or process heater in which all vent streams are not introduced into the flame zone	The daily average combustion zone temperature must not fall below the limit established during the performance test.
	b. No control device	Operate at all times according to your operation, maintenance, and monitoring plan regarding minimum catalyst purging conditions that must be met prior to allowing uncontrolled purge releases.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6951, Feb. 9, 2005; 80 FR 75304, Dec. 1, 2015]

**Table 17 to Subpart UUU of Part 63—Continuous Monitoring Systems for Organic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1566(b)(1), you shall meet each requirement in the following table that applies to you.

For each applicable process vent for a new or existing catalytic reforming unit . . .	If you use this type of control device . . .	You shall install and operate this type of continuous monitoring system . . .
1. Option 1: Vent to a flare	Flare	On and after January 30, 2019, the monitoring systems required in §§63.670 and 63.671. Prior to January 30, 2019, monitoring device such as a thermocouple, an ultraviolet beam sensor, or infrared sensor to continuously detect the presence of a pilot flame, or the monitoring systems required in §§63.670 and 63.671.
2. Option 2: percent reduction or concentration limit.	Thermal incinerator, process heater or boiler with a design heat input capacity under 44 MW, or process heater or boiler in which all vent streams are not introduced into the flame zone	Continuous parameter monitoring systems to measure and record the combustion zone temperature.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6952, Feb. 9, 2005; 80 FR 75304, Dec. 1, 2015]

**Table 18 to Subpart UUU of Part 63—Requirements for Performance Tests for Organic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1566(b)(2) and (3), you shall meet each requirement in the following table that applies to you.

For each new or existing catalytic reforming unit . . .	You must . . .	Using . . .	According to these requirements . . .
1. Option 1: Vent to a flare	a. Conduct visible emission observations	Method 22 (40 CFR part 60, appendix A-7)	On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, 2-hour observation period. Record the presence of a flame at the pilot light over the full period of the test, or the requirements of §63.670.
	b. Determine that the flare meets the requirements for net heating value of the gas being combusted and exit velocity	40 CFR 63.11(b)(6) through (8)	On and after January 30, 2019, the flare must meet the requirements of §63.670. Prior to January 30, 2019, the flare must meet the control device requirements in §63.11(b) or the requirements of §63.670.

For each new or existing catalytic reforming unit . . .	You must . . .	Using . . .	According to these requirements . . .
2. Option 2: Percent reduction or concentration limit	a. Select sampling site	Method 1 or 1A (40 CFR part 60, appendix A). No traverse site selection method is needed for vents smaller than 0.10 meter in diameter.	Sampling sites must be located at the inlet (if you elect the emission reduction standard) and outlet of the control device and prior to any releases to the atmosphere.
	b. Measure gas volumetric flow rate	Method 2, 2A, 2C, 2D, 2F, or 2G (40 CFR part 60, appendix A), as applicable	
	c. Measure TOC concentration (for percent reduction standard)	Method 25 (40 part 60, appendix A) to measure nonmethane TOC concentration (in carbon equivalents) at inlet and outlet of the control device. If the nonmethane TOC outlet concentration is expected to be less than 50 ppm (as carbon), you can use Method 25A to measure TOC concentration (as hexane) at the inlet and the outlet of the control device. If you use Method 25A, you may use Method 18 (40 CFR part 60, appendix A) to measure the methane concentration to determine the nonmethane TOC concentration	Take either an integrated sample or four grab samples during each run. If you use a grab sampling technique, take the samples at approximately equal intervals in time, such as 15-minute intervals during the run.
	d. Calculate TOC or nonmethane TOC emission rate and mass emission reduction		Calculate emission rate by Equation 1 of §63.1566 (if you use Method 25) or Equation 2 of §63.1566 (if you use Method 25A). Calculate mass emission reduction by Equation 3 of §63.1566.
	e. For concentration standard, measure TOC concentration. (Optional: Measure methane concentration.)	Method 25A (40 CFR part 60, appendix A) to measure TOC concentration (as hexane) at the outlet of the control device. You may elect to use Method 18 (40 CFR part 60, appendix A) to measure the methane concentration	
	f. Determine oxygen content in the gas stream at the outlet of the control device	Method 3A or 3B (40 CFR part 60, appendix A), as applicable	
	g. Calculate the TOC or nonmethane TOC concentration corrected for oxygen content (for concentration standard)	Equation 4 of §63.1566	

For each new or existing catalytic reforming unit . . .	You must . . .	Using . . .	According to these requirements . . .
	h. Establish each operating limit in Table 16 of this subpart that applies to you for a thermal incinerator, or process heater or boiler with a design heat input capacity under 44 MW, or process heater or boiler in which all vent streams are not introduced into flame zone	Data from the continuous parameter monitoring systems	Collect the temperature monitoring data every 15 minutes during the entire period of the initial TOC performance test. Determine and record the minimum hourly average combustion zone temperature.
	i. If you do not use a control device, document the purging conditions used prior to testing following the minimum requirements in the operation, maintenance, and monitoring plan.	Data from monitoring systems as identified in the operation, maintenance, and monitoring plan	Procedures in the operation, maintenance, and monitoring plan.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6952, Feb. 9, 2005; 80 FR 75305, Dec. 1, 2015]

**Table 19 to Subpart UUU of Part 63—Initial Compliance With Organic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1566(b)(7), you shall meet each requirement in the following table that applies to you.

For each applicable process vent for a new or existing catalytic reforming unit . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
Option 1	Visible emissions from a flare must not exceed a total of 5 minutes during any 2 consecutive hours	On and after January 30, 2019, the flare meets the requirements of §63.670. Prior to January 30, 2019, visible emissions, measured using Method 22 over the 2-hour observation period of the performance test, do not exceed a total of 5 minutes, or the flare meets the requirements of §63.670.

For each applicable process vent for a new or existing catalytic reforming unit . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
Option 2	Reduce uncontrolled emissions of total organic compounds (TOC) or nonmethane TOC from your process vent by 98 percent by weight using a control device or to a concentration of 20 ppmv (dry basis as hexane), corrected to 3 percent oxygen, whichever is less stringent	The mass emission reduction of nonmethane TOC measured by Method 25 over the period of the performance test is at least 98 percent by weight as calculated using Equations 1 and 3 of §63.1566; or the mass emission reduction of TOC measured by Method 25A (or nonmethane TOC measured by Methods 25A and 18) over the period of the performance test is at least 98 percent by weight as calculated using Equations 2 and 3 of §63.1566; or the TOC concentration measured by Method 25A (or the nonmethane TOC concentration measured by Methods 25A and 18) over the period of the performance test does not exceed 20 ppmv (dry basis as hexane) corrected to 3 percent oxygen as calculated using Equation 4 of §63.1566.

[70 FR 6953, Feb. 9, 2005, as amended at 80 FR 75305, Dec. 1, 2015]

**Table 20 to Subpart UUU of Part 63—Continuous Compliance With Organic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1566(c)(1), you shall meet each requirement in the following table that applies to you.

For each applicable process vent for a new or existing catalytic reforming unit . . .	For this emission limit . . .	You shall demonstrate continuous compliance during initial catalyst depressuring and catalyst purging operations by . . .
1. Option 1	Vent emissions from your process vent to a flare	On and after January 30, 2019, meeting the requirements of §63.670. Prior to January 30, 2019, maintaining visible emissions from a flare below a total of 5 minutes during any 2 consecutive hours, or meeting the requirements of §63.670.
2. Option 2	Reduce uncontrolled emissions of total organic compounds (TOC) or nonmethane TOC from your process vent by 98 percent by weight using a control device or to a concentration of 20 ppmv (dry basis as hexane), corrected to 3 percent oxygen, whichever is less stringent.	Maintaining a 98 percent by weight emission reduction of TOC or nonmethane TOC; or maintaining a TOC or nonmethane TOC concentration of not more than 20 ppmv (dry basis as hexane), corrected to 3 percent oxygen, whichever is less stringent.

[70 FR 6954, Feb. 9, 2005, as amended at 80 FR 75305, Dec. 1, 2015]

**Table 21 to Subpart UUU of Part 63—Continuous Compliance With Operating Limits for Organic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1566(c)(1), you shall meet each requirement in the following table that applies to you.

For each applicable process vent for a new or existing catalytic reforming unit . . .	If you use . . .	For this operating limit . . .	You shall demonstrate continuous compliance during initial catalyst depressuring and purging operations by . . .
1. Option 1	Flare	The flare pilot light must be present at all times and the flare must be operating at all times that emissions may be vented to it	On and after January 30, 2019, meeting the requirements of §63.670. Prior to January 30, 2019, collecting flare monitoring data according to §63.1572 and recording for each 1-hour period whether the monitor was continuously operating and the pilot light was continuously present during each 1-hour period, or meeting the requirements of §63.670.
2. Option 2	a. Thermal incinerator boiler or process heater with a design input capacity under 44 MW or boiler or process heater in which not all vent streams are not introduced into the flame zone	Maintain the daily average combustion zone temperature above the limit established during the performance test	Collecting, the hourly and daily temperature monitoring data according to §63.1572; and maintaining the daily average combustion zone temperature above the limit established during the performance test.
	b. No control device	Operate at all times according to your operation, maintenance, and monitoring plan regarding minimum purging conditions that must be met prior to allowing uncontrolled purge releases	Recording information to document compliance with the procedures in your operation, maintenance, and monitoring plan.

[70 FR 6954, Feb. 9, 2005, as amended at 80 FR 75306, Dec. 1, 2015]

**Table 22 to Subpart UUU of Part 63—Inorganic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1567(a)(1), you shall meet each emission limitation in the following table that applies to you.

For . . .	You shall meet this emission limit for each applicable catalytic reforming unit process vent during coke burn-off and catalyst rejuvenation . . .
1. Each existing semi-regenerative catalytic reforming unit	Reduce uncontrolled emissions of hydrogen chloride (HCl) by 92 percent by weight or to a concentration of 30 ppmv (dry basis), corrected to 3 percent oxygen.
2. Each existing cyclic or continuous catalytic reforming unit	Reduce uncontrolled emissions of HCl by 97 percent by weight or to a concentration of 10 ppmv (dry basis), corrected to 3 percent oxygen.
3. Each new semi-regenerative, cyclic, or continuous catalytic reforming unit	Reduce uncontrolled emissions of HCl by 97 percent by weight or to a concentration of 10 ppmv (dry basis), corrected to 3 percent oxygen.

[70 FR 6955, Feb. 9, 2005, as amended at 80 FR 75306, Dec. 1, 2015]

**Table 23 to Subpart UUU of Part 63—Operating Limits for Inorganic HAP Emission Limitations for Catalytic Reforming Units**

As stated in §63.1567(a)(2), you shall meet each operating limit in the following table that applies to you.

<b>For each applicable process vent for a new or existing catalytic reforming unit with this type of control device . . .</b>	<b>You shall meet this operating limit during coke burn-off and catalyst rejuvenation . . .</b>
1. Wet scrubber	The daily average pH or alkalinity of the water (or scrubbing liquid) exiting the scrubber must not fall below the limit established during the performance test; and the daily average liquid-to-gas ratio must not fall below the limit established during the performance test.
2. Internal scrubbing system or no control device (e.g., hot regen system) meeting outlet HCl concentration limit.	The daily average HCl concentration in the catalyst regenerator exhaust gas must not exceed the limit established during the performance test.
3. Internal scrubbing system meeting HCl percent reduction standard.	The daily average pH or alkalinity of the water (or scrubbing liquid) exiting the internal scrubbing system must not fall below the limit established during the performance test; and the daily average liquid-to-gas ratio must not fall below the limit established during the performance test.
4. Fixed-bed gas-solid adsorption system	The daily average temperature of the gas entering or exiting the adsorption system must not exceed the limit established during the performance test; and the HCl concentration in the adsorption system exhaust gas must not exceed the limit established during the performance test.
5. Moving-bed gas-solid adsorption system (e.g., Chlorsorb™ System).	The daily average temperature of the gas entering or exiting the adsorption system must not exceed the limit established during the performance test; and the weekly average chloride level on the sorbent entering the adsorption system must not exceed the design or manufacturer's recommended limit (1.35 weight percent for the Chlorsorb™ System); and the weekly average chloride level on the sorbent leaving the adsorption system must not exceed the design or manufacturer's recommended limit (1.8 weight percent for the Chlorsorb™ System).

[70 FR 6955, Feb. 9, 2005]

**Table 24 to Subpart UUU of Part 63—Continuous Monitoring Systems for Inorganic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1567(b)(1), you shall meet each requirement in the following table that applies to you.

<b>If you use this type of control device for your vent . . .</b>	<b>You shall install and operate this type of continuous monitoring system . . .</b>
1. Wet scrubber	Continuous parameter monitoring system to measure and record the total water (or scrubbing liquid) flow rate entering the scrubber during coke burn-off and catalyst rejuvenation; and continuous parameter monitoring system to measure and record gas flow rate entering or exiting the scrubber during coke burn-off and catalyst rejuvenation <sup>1</sup> ; and continuous parameter monitoring system to measure and record the pH or alkalinity of the water (or scrubbing liquid) exiting the scrubber during coke burn-off and catalyst rejuvenation. <sup>2</sup>
2. Internal scrubbing system or no control device (e.g., hot regen system) to meet HCl outlet concentration limit	Colormetric tube sampling system to measure the HCl concentration in the catalyst regenerator exhaust gas during coke burn-off and catalyst rejuvenation. The colormetric tube sampling system must meet the requirements in Table 41 of this subpart.

If you use this type of control device for your vent . . .	You shall install and operate this type of continuous monitoring system . . .
3. Internal scrubbing system to meet HCl percent reduction standard	Continuous parameter monitoring system to measure and record the gas flow rate entering or exiting the internal scrubbing system during coke burn-off and catalyst rejuvenation; and continuous parameter monitoring system to measure and record the total water (or scrubbing liquid) flow rate entering the internal scrubbing system during coke burn-off and catalyst rejuvenation; and continuous parameter monitoring system to measure and record the pH or alkalinity of the water (or scrubbing liquid) exiting the internal scrubbing system during coke burn-off and catalyst rejuvenation. <sup>2</sup>
4. Fixed-bed gas-solid adsorption system	Continuous parameter monitoring system to measure and record the temperature of the gas entering or exiting the adsorption system during coke burn-off and catalyst rejuvenation; and colormetric tube sampling system to measure the gaseous HCl concentration in the adsorption system exhaust and at a point within the absorbent bed not to exceed 90 percent of the total length of the absorbent bed during coke burn-off and catalyst rejuvenation. The colormetric tube sampling system must meet the requirements in Table 41 of this subpart.
5. Moving-bed gas-solid adsorption system (e.g., Chlorsorb™ System).	Continuous parameter monitoring system to measure and record the temperature of the gas entering or exiting the adsorption system during coke burn-off and catalyst rejuvenation.

<sup>1</sup>If applicable, you can use the alternative in §63.1573 (a)(1) instead of a continuous parameter monitoring system for gas flow rate or instead of a continuous parameter monitoring system for the cumulative volume of gas.

<sup>2</sup>If applicable, you can use the alternative in §63.1573(c)(1) instead of a continuous parameter monitoring system for pH of the water (or scrubbing liquid) or the alternative in §63.1573(c)(2) instead of a continuous parameter monitoring system for alkalinity of the water (or scrubbing liquid).

[70 FR 6956, Feb. 9, 2005, as amended at 80 FR 75306, Dec. 1, 2015]

**Table 25 to Subpart UUU of Part 63—Requirements for Performance Tests for Inorganic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1567(b)(2) and (3), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic reforming unit using . . .	You shall . . .	Using . . .	According to these requirements . . .
1. Any or no control system	a. Select sampling port location(s) and the number of traverse points	Method 1 or 1A (40 CFR part 60, appendix A), as applicable.	(1) If you operate a control device and you elect to meet an applicable HCl percent reduction standard, sampling sites must be located at the inlet of the control device or internal scrubbing system and at the outlet of the control device or internal scrubber system prior to any release to the atmosphere. For a series of fixed-bed systems, the outlet sampling site should be located at the outlet of the first fixed-bed, prior to entering the second fixed-bed in the series.

For each new and existing catalytic reforming unit using . . .	You shall . . .	Using . . .	According to these requirements . . .
			(2) If you elect to meet an applicable HCl outlet concentration limit, locate sampling sites at the outlet of the control device or internal scrubber system prior to any release to the atmosphere. For a series of fixed-bed systems, the outlet sampling site should be located at the outlet of the first fixed-bed, prior to entering the second fixed-bed in the series. If there is no control device, locate sampling sites at the outlet of the catalyst regenerator prior to any release to the atmosphere.
	b. Determine velocity and volumetric flow rate.	Method 2, 2A, 2C, 2D, 2F, or 2G (40 CFR part 60, appendix A), as applicable.	
	c. Conduct gas molecular weight analysis.	Method 3, 3A, or 3B (40 CFR part 60, appendix A), as applicable	
	d. Measure moisture content of the stack gas	Method 4 (40 CFR part 60, appendix A)	
	e. Measure the HCl concentration at the selected sampling locations	Method 26 or 26A (40 CFR part 60, appendix A). If your control device is a wet scrubber or internal scrubbing system, you must use Method 26A	(1) For semi-regenerative and cyclic regeneration units, conduct the test during the coke burn-off and catalyst rejuvenation cycle, but collect no samples during the first hour or the last 6 hours of the cycle (for semi-regenerative units) or during the first hour or the last 2 hours of the cycle (for cyclic regeneration units). For continuous regeneration units, the test should be conducted no sooner than 3 days after process unit or control system start up.
			(2) Determine and record the HCl concentration corrected to 3 percent oxygen (using Equation 1 of §63.1567) for each sampling location for each test run.
			(3) Determine and record the percent emission reduction, if applicable, using Equation 3 of §63.1567 for each test run.
			(4) Determine and record the average HCl concentration (corrected to 3 percent oxygen) and the average percent emission reduction, if applicable, for the overall source test from the recorded test run values.

For each new and existing catalytic reforming unit using . . .	You shall . . .	Using . . .	According to these requirements . . .
2. Wet scrubber	a. Establish operating limit for pH level or alkalinity	i. Data from continuous parameter monitoring systems	Measure and record the pH or alkalinity of the water (or scrubbing liquid) exiting scrubber every 15 minutes during the entire period of the performance test. Determine and record the minimum hourly average pH or alkalinity level from the recorded values.
		ii. Alternative pH procedure in §63.1573(b)(1)	Measure and record the pH of the water (or scrubbing liquid) exiting the scrubber during coke burn-off and catalyst rejuvenation using pH strips at least three times during each test run. Determine and record the average pH level for each test run. Determine and record the minimum test run average pH level.
		iii. Alternative alkalinity method in §63.1573(c)(2)	Measure and record the alkalinity of the water (or scrubbing liquid) exiting the scrubber during coke burn-off and catalyst rejuvenation using discrete titration at least three times during each test run. Determine and record the average alkalinity level for each test run. Determine and record the minimum test run average alkalinity level.
	b. Establish operating limit for liquid-to-gas ratio.	i. Data from continuous parameter monitoring systems	Measure and record the gas flow rate entering or exiting the scrubber and the total water (or scrubbing liquid) flow rate entering the scrubber every 15 minutes during the entire period of the performance test. Determine and record the hourly average gas flow rate and total water (or scrubbing liquid) flow rate. Determine and record the minimum liquid-to-gas ratio from the recorded, paired values.
		ii. Alternative procedure for gas flow rate in §63.1573(a)(1)	Collect air flow rate monitoring data or determine the air flow rate using control room instruments every 15 minutes during the entire period of the initial performance test. Determine and record the hourly average rate of all the readings. Determine and record the maximum gas flow rate using Equation 1 of §63.1573.

For each new and existing catalytic reforming unit using . . .	You shall . . .	Using . . .	According to these requirements . . .
3. Internal scrubbing system or no control device (e.g., hot regen system) meeting HCl outlet concentration limit.	Establish operating limit for HCl concentration.	Data from continuous parameter monitoring system.	Measure and record the HCl concentration in the catalyst regenerator exhaust gas using the colorimetric tube sampling system at least three times during each test run. Determine and record the average HCl concentration for each test run. Determine and record the average HCl concentration for the overall source test from the recorded test run averages. Determine and record the operating limit for HCl concentration using Equation 4 of §63.1567.
4. Internal scrubbing system meeting HCl percent reduction standard	a. Establish operating limit for pH level or alkalinity	i. Data from continuous parameter monitoring system	Measure and record the pH alkalinity of the water (or scrubbing liquid) exiting the internal scrubbing system every 15 minutes during the entire period of the performance test. Determine and record the minimum hourly average pH or alkalinity level from the recorded values.
		ii. Alternative pH method in §63.1573(c)(1)	Measure and in record pH of the water (or scrubbing liquid) exiting the internal scrubbing system during coke burn-off and catalyst rejuvenation using pH strips at least three times during each test run. Determine and record the average pH level for each test run. Determine and record the minimum test run average pH level.
		iii. Alternative alkalinity method in §63.1573(c)(2)	Measure and record the alkalinity water (or scrubbing liquid) exiting the internal scrubbing system during coke burn-off and catalyst rejuvenation using discrete titration at least three times during each test run. Determine and record the average alkalinity level for each test run. Determine and record the minimum test run average alkalinity level.
	b. Establish operating limit for liquid-to-gas ratio	Data from continuous parameter monitoring systems	Measure and record the gas entering or exiting the internal scrubbing system and the total water (or scrubbing liquid) flow rate entering the internal scrubbing system every 15 minutes during the entire period of the performance test. Determine and record the hourly average gas flow rate and total water (or scrubbing liquid) flow rate. Determine and record the minimum liquid-to-gas ratio from the recorded, paired values.

For each new and existing catalytic reforming unit using . . .	You shall . . .	Using . . .	According to these requirements . . .
5. Fixed-bed gas-solid adsorption system. Gas-solid	a. Establish operating limit for temperature	Data from continuous parameter monitoring system	Measure and record the temperature of gas entering or exiting the adsorption system every 15 minutes. Determine and record the maximum hourly average temperature.
	b. Establish operating limit for HCl concentration	i. Data from continuous parameter monitoring systems	(1) Measure and record the HCl concentration in the exhaust gas from the fixed-bed adsorption system using the colormetric tube sampling system at least three times during each test run. Determine and record the average HCl concentration for each test run. Determine and record the average HCl concentration for the overall source test from the recorded test run averages.
			(2) If you elect to comply with the HCl outlet concentration limit (Option 2), determine and record the operating limit for HCl concentration using Equation 4 of §63.1567. If you elect to comply with the HCl percent reduction standard (Option 1), determine and record the operating limit for HCl concentration using Equation 5 of §63.1567.
6. Moving-bed gas-solid adsorption system (e.g., Chlorsorb™ System)	a. Establish operating limit for temperature	Data from continuous parameter monitoring systems.	Measure and record the temperature of gas entering or exiting the adsorption system every 15 minutes. Determine and record the maximum hourly average temperature.
	b. Measure the chloride level on the sorbent entering and exiting the adsorption system.	Determination of Metal Concentration on Catalyst Particles (Instrumental Analyzer Procedure) in appendix A to subpart UUU; or EPA Method 5050 combined either with EPA Method 9056, or with EPA Method 9253; or EPA Method 9212 with the soil extraction procedures listed within the method. <sup>1</sup>	Measure and record the chloride concentration of the sorbent material entering and exiting the adsorption system at least three times during each test run. Determine and record the average weight percent chloride concentration of the sorbent entering the adsorption system for each test run. Determine and record the average weight percent chloride concentration of the sorbent exiting the adsorption system for each test run.

<sup>1</sup>The EPA Methods 5050, 9056, 9212 and 9253 are included in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, Revision 5 (April 1998). The SW-846 and Updates (document number 955-001-00000-1) are available for purchase from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 512-1800; and from the National Technical Information Services (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 487-4650. Copies may be inspected at the EPA Docket Center, William Jefferson Clinton (WJC) West Building (Air Docket), Room 3334, 1301 Constitution Ave. NW., Washington, DC; or at the Office of the Federal Register, 800 North Capitol Street NW., Suite 700, Washington, DC. These methods are also available at <http://www.epa.gov/epaoswer/hazwaste/test/main.htm>.

**Table 26 to Subpart UUU of Part 63—Initial Compliance With Inorganic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1567(b)(4), you shall meet each requirement in the following table that applies to you.

<b>For . . .</b>	<b>For the following emission limit . . .</b>	<b>You have demonstrated initial compliance if . . .</b>
1. Each existing semi-regenerative catalytic reforming unit	Reduce uncontrolled emissions of HCl by 92 percent by weight or to a concentration of 30 ppmv, (dry basis), corrected to 3 percent oxygen.	Average emissions HCl measured using Method 26 or 26A, as applicable, over the period of the performance test, are reduced by 92 percent or to a concentration less than or equal to 30 ppmv (dry basis) corrected to 3 percent oxygen.
2. Each existing cyclic or continuous catalytic reforming unit and each new semi-regenerative, cyclic, or continuous catalytic reforming unit.	Reduce uncontrolled emissions of HCl by 97 percent by weight or to a concentration of 10 ppmv (dry basis), corrected to 3 percent oxygen	Average emissions of HCl measured using Method 26 or 26A, as applicable, over the period of the performance test, are reduced by 97 percent or to a concentration less than or equal to 10 ppmv (dry basis) corrected to 3 percent oxygen.

[70 FR 6959, Feb. 9, 2005]

**Table 27 to Subpart UUU of Part 63—Continuous Compliance With Inorganic HAP Emission Limits for Catalytic Reforming Units**

As stated in §63.1567(c)(1), you shall meet each requirement in the following table that applies to you.

<b>For . . .</b>	<b>For this emission limit . . .</b>	<b>You shall demonstrate continuous compliance during coke burn-off and catalyst rejuvenation by . . .</b>
1. Each existing semi-regenerative catalytic reforming unit	Reduce uncontrolled emissions of HCl by 92 percent by weight or to a concentration of 30 ppmv (dry basis), corrected to 3 percent oxygen.	Maintaining a 92 percent HCl emission reduction or an HCl concentration no more than 30 ppmv (dry basis), corrected to 3 percent oxygen.
2. Each existing cyclic or continuous catalytic reforming unit	Reduce uncontrolled emissions of HCl by 97 percent by weight or to a concentration of 10 ppmv (dry basis), corrected to 3 percent oxygen	Maintaining a 97 percent HCl control efficiency or an HCl concentration no more than 10 ppmv (dry basis), corrected to 3 percent oxygen.
3. Each new semi-regenerative, cyclic, or continuous catalytic reforming unit	Reduce uncontrolled emissions of HCl by 97 percent by weight or to a concentration of 10 ppmv (dry basis), corrected to 3 percent oxygen	Maintaining a 97 percent HCl control efficiency or an HCl concentration no more than 10 ppmv (dry basis), corrected to 3 percent oxygen.

[70 FR 6960, Feb. 9, 2005]

**Table 28 to Subpart UUU of Part 63—Continuous Compliance With Operating Limits for Inorganic HAP Emissions From Catalytic Reforming Units**

As stated in §63.1567(c)(1), you shall meet each requirement in the following table that applies to you.

For each new and existing catalytic reforming unit using this type of control device or system . . .	For this operating limit . . .	You shall demonstrate continuous compliance during coke burn-off and catalyst rejuvenation by . . .
1. Wet scrubber	a. The daily average pH or alkalinity of the water (or scrubbing liquid) exiting the scrubber must not fall below the level established during the performance test	Collecting the hourly and daily average pH or alkalinity monitoring data according to §63.1572 <sup>1</sup> ; and maintaining the daily average pH or alkalinity above the operating limit established during the performance test.
	b. The daily average liquid-to-gas ratio must not fall below the level established during the performance test	Collecting the hourly average gas flow rate <sup>2</sup> and total water (or scrubbing liquid) flow rate monitoring data according to §63.1572; and determining and recording the hourly average liquid-to-gas ratio; and determining and recording the daily average liquid-to-gas ratio; and maintaining the daily average liquid-to-gas ratio above the limit established during the performance test.
2. Internal scrubbing system or no control device (e.g., hot regen system) meeting HCl concentration limit	The daily average HCl concentration in the catalyst regenerator exhaust gas must not exceed the limit established during the performance test	Measuring and recording the HCl concentration at least 4 times during a regeneration cycle (equally spaced in time) or every 4 hours, whichever is more frequent, using a colorimetric tube sampling system; calculating the daily average HCl concentration as an arithmetic average of all samples collected in each 24-hour period from the start of the coke burn-off cycle or for the entire duration of the coke burn-off cycle if the coke burn-off cycle is less than 24 hours; and maintaining the daily average HCl concentration below the applicable operating limit.
3. Internal scrubbing system meeting percent HCl reduction standard	a. The daily average pH or alkalinity of the water (or scrubbing liquid) exiting the internal scrubbing system must not fall below the limit established during the performance test	Collecting the hourly and daily average pH or alkalinity monitoring data according to §63.1572 <sup>1</sup> and maintaining the daily average pH or alkalinity above the operating limit established during the performance test.
	b. The daily average liquid-to-gas ratio must not fall below the level established during the performance test	Collecting the hourly average gas flow rate <sup>2</sup> and total water (or scrubbing liquid) flow rate monitoring data according to §63.1572; and determining and recording the hourly average liquid-to-gas ratio; and determining and recording the daily average liquid-to-gas ratio; and maintaining the daily average liquid-to-gas ratio above the limit established during the performance test.
4. Fixed-bed gas-solid adsorption systems	a. The daily average temperature of the gas entering or exiting the adsorption system must not exceed the limit established during the performance test	Collecting the hourly and daily average temperature monitoring data according to §63.1572; and maintaining the daily average temperature below the operating limit established during the performance test.

For each new and existing catalytic reforming unit using this type of control device or system . . .	For this operating limit . . .	You shall demonstrate continuous compliance during coke burn-off and catalyst rejuvenation by . . .
	b. The HCl concentration in the exhaust gas from the fixed-bed gas-solid adsorption system must not exceed the limit established during the performance test	Measuring and recording the concentration of HCl weekly or during each regeneration cycle, whichever is less frequent, using a colorimetric tube sampling system at a point within the adsorbent bed not to exceed 90 percent of the total length of the adsorption bed during coke-burn-off and catalyst rejuvenation; implementing procedures in the operating and maintenance plan if the HCl concentration at the sampling location within the adsorption bed exceeds the operating limit; and maintaining the HCl concentration in the gas from the adsorption system below the applicable operating limit.
5. Moving-bed gas-solid adsorption system (e.g., Chlorsorb™ System)	a. The daily average temperature of the gas entering or exiting the adsorption system must not exceed the limit established during the performance test	Collecting the hourly and daily average temperature monitoring data according to §63.1572; and maintaining the daily average temperature below the operating limit established during the performance test.
	b. The weekly average chloride level on the sorbent entering the adsorption system must not exceed the design or manufacturer's recommended limit (1.35 weight percent for the Chlorsorb™ System)	Collecting samples of the sorbent exiting the adsorption system three times per week (on non-consecutive days); and analyzing the samples for total chloride <sup>3</sup> ; and determining and recording the weekly average chloride concentration; and maintaining the chloride concentration below the design or manufacturer's recommended limit (1.35 weight percent for the Chlorsorb™ System).
	c. The weekly average chloride level on the sorbent exiting the adsorption system must not exceed the design or manufacturer's recommended limit (1.8 weight percent for the Chlorsorb™ System)	Collecting samples of the sorbent exiting the adsorption system three times per week (on non-consecutive days); and analyzing the samples for total chloride concentration; and determining and recording the weekly average chloride concentration; and maintaining the chloride concentration below the design or manufacturer's recommended limit (1.8 weight percent Chlorsorb™ System).

<sup>1</sup>If applicable, you can use either alternative in §63.1573(c) instead of a continuous parameter monitoring system for pH or alkalinity if you used the alternative method in the initial performance test.

<sup>2</sup>If applicable, you can use the alternative in §63.1573(a)(1) instead of a continuous parameter monitoring system for the gas flow rate or cumulative volume of gas entering or exiting the system if you used the alternative method in the initial performance test.

<sup>3</sup>The total chloride concentration of the sorbent material must be measured by the procedure, "Determination of Metal Concentration on Catalyst Particles (Instrumental Analyzer Procedure)" in appendix A to this subpart; or by using EPA Method 5050, Bomb Preparation Method for Solid Waste, combined either with EPA Method 9056, Determination of Inorganic Anions by Ion Chromatography, or with EPA Method 9253, Chloride (Titrimetric, Silver Nitrate); or by using EPA Method 9212, Potentiometric Determination of Chloride in Aqueous Samples with Ion-Selective Electrode, and using the soil extraction procedures listed within the method. The EPA Methods 5050, 9056, 9212 and 9253 are included in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846, Revision 5 (April 1998). The SW-846 and Updates (document number 955-001-00000-1) are available for purchase from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 512-1800; and from the National Technical Information Services (NTIS), 5285 Port Royal Road, Springfield, VA 22161, (703) 487-4650. Copies may be inspected at the EPA Docket Center, William Jefferson Clinton (WJC) West Building, (Air Docket), Room 3334, 1301 Constitution Ave. NW., Washington, DC; or at the Office

of the Federal Register, 800 North Capitol Street NW., Suite 700, Washington, DC. These methods are also available at <http://www.epa.gov/epaoswer/hazwaste/test/main.htm>.

[70 FR 6954, Feb. 9, 2005, as amended at 80 FR 75308, Dec. 1, 2015]

**Table 29 to Subpart UUU of Part 63—HAP Emission Limits for Sulfur Recovery Units**

As stated in §63.1568(a)(1), you shall meet each emission limitation in the following table that applies to you.

For . . .	You shall meet this emission limit for each process vent . . .
1. Subject to NSPS. Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 long tons per day (LTD) and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	a. 250 ppmv (dry basis) of sulfur dioxide (SO <sub>2</sub> ) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation control system or if you use a reduction control system followed by incineration.
	b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration.
2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	a. 250 ppmv (dry basis) of SO <sub>2</sub> at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation control system or if you use a reduction control system followed by incineration.
	b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration.
3. Option 2: TRS limit. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	300 ppmv of total reduced sulfur (TRS) compounds, expressed as an equivalent SO <sub>2</sub> concentration (dry basis) at zero percent oxygen.

[80 FR 75309, Dec. 1, 2015]

**Table 30 to Subpart UUU of Part 63—Operating Limits for HAP Emissions From Sulfur Recovery Units**

As stated in §63.1568(a)(2), you shall meet each operating limit in the following table that applies to you.

For . . .	If use this type of control device . . .	You shall meet this operating limit . . .
1. Subject to NSPS. Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 LTD and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Not applicable	Not applicable.

For . . .	If use this type of control device . . .	You shall meet this operating limit . . .
2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Not applicable	Not applicable.
3. Option 2: TRS limit, if using continuous emissions monitoring systems. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Not applicable	Not applicable.
4. Option 2: TRS limit, if using continuous parameter monitoring systems. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Thermal incinerator	Maintain the daily average combustion zone temperature above the limit established during the performance test; and maintain the daily average oxygen concentration in the vent stream (percent, dry basis) above the limit established during the performance test.
5. Startup or shutdown option 1: Electing to comply with §63.1568(a)(4)(ii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during periods of startup or shutdown	Flare	On and after January 30, 2019, meet the applicable requirements of §63.670. Prior to January 30, 2019, meet the applicable requirements of either §63.11(b) or §63.670.
6. Startup or shutdown option 2: Electing to comply with §63.1568(a)(4)(iii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during startup or shutdown events	Thermal incinerator or thermal oxidizer	Maintain the hourly average combustion zone temperature at or above 1,200 degrees Fahrenheit and maintain the hourly average oxygen concentration in the exhaust gas stream at or above 2 volume percent (dry basis).

[80 FR 75310, Dec. 1, 2015]

**Table 31 to Subpart UUU of Part 63—Continuous Monitoring Systems for HAP Emissions From Sulfur Recovery Units**

As stated in §63.1568(b)(1), you shall meet each requirement in the following table that applies to you.

For . . .	For this limit . . .	You shall install and operate this continuous monitoring system . . .
1. Subject to NSPS. Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 LTD and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1).	a. 250 ppmv (dry basis) of SO <sub>2</sub> at zero percent excess air if you use an oxidation or reduction control system followed by incineration	Continuous emission monitoring system to measure and record the hourly average concentration of SO <sub>2</sub> (dry basis) at zero percent excess air for each exhaust stack. This system must include an oxygen monitor for correcting the data for excess air.

For . . .	For this limit . . .	You shall install and operate this continuous monitoring system . . .
	b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air if you use a reduction control system without incineration	Continuous emission monitoring system to measure and record the hourly average concentration of reduced sulfur and oxygen (O <sub>2</sub> ) emissions. Calculate the reduced sulfur emissions as SO <sub>2</sub> (dry basis) at zero percent excess air. <i>Exception:</i> You can use an instrument having an air or SO <sub>2</sub> dilution and oxidation system to convert the reduced sulfur to SO <sub>2</sub> for continuously monitoring and recording the concentration (dry basis) at zero percent excess air of the resultant SO <sub>2</sub> instead of the reduced sulfur monitor. The monitor must include an oxygen monitor for correcting the data for excess oxygen.
	c. If you use Equation 1 of 40 CFR 60.102a(f)(1)(i) to set your emission limit	i. Complete either item 1.a or item 1.b; and ii. Either a continuous emission monitoring system to measure and record the O <sub>2</sub> concentration for the inlet air/oxygen supplied to the system or a continuous parameter monitoring system to measure and record the volumetric gas flow rate of ambient air and purchased oxygen-enriched gas.
2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1).	a. 250 ppmv (dry basis) of SO <sub>2</sub> at zero percent excess air if you use an oxidation or reduction control system followed by incineration	Continuous emission monitoring system to measure and record the hourly average concentration of SO <sub>2</sub> (dry basis), at zero percent excess air for each exhaust stack. This system must include an oxygen monitor for correcting the data for excess air.
	b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air if you use a reduction control system without incineration.	Continuous emission monitoring system to measure and record the hourly average concentration of reduced sulfur and O <sub>2</sub> emissions for each exhaust stack. Calculate the reduced sulfur emissions as SO <sub>2</sub> (dry basis), at zero percent excess air. <i>Exception:</i> You can use an instrument having an air or O <sub>2</sub> dilution and oxidation system to convert the reduced sulfur to SO <sub>2</sub> for continuously monitoring and recording the concentration (dry basis) at zero percent excess air of the resultant SO <sub>2</sub> instead of the reduced sulfur monitor. The monitor must include an oxygen monitor for correcting the data for excess oxygen.
	c. If you use Equation 1 of 40 CFR 60.102a(f)(1)(i) to set your emission limit	i. Complete either item 2.a or item 2.b; and ii. Either a continuous emission monitoring system to measure and record the O <sub>2</sub> concentration for the inlet air/oxygen supplied to the system, or a continuous parameter monitoring system to measure and record the volumetric gas flow rate of ambient air and purchased oxygen-enriched gas.

For . . .	For this limit . . .	You shall install and operate this continuous monitoring system . . .
3. Option 2: TRS limit. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1).	a. 300 ppmv of total reduced sulfur (TRS) compounds, expressed as an equivalent SO <sub>2</sub> concentration (dry basis) at zero percent oxygen	i. Continuous emission monitoring system to measure and record the hourly average concentration of TRS for each exhaust stack; this monitor must include an oxygen monitor for correcting the data for excess oxygen; or  ii. Continuous parameter monitoring systems to measure and record the combustion zone temperature of each thermal incinerator and the oxygen content (percent, dry basis) in the vent stream of the incinerator.
4. Startup or shutdown option 1: electing to comply with §63.1568(a)(4)(ii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during periods of startup or shutdown.	Any	On and after January 30, 2019, monitoring systems as specified in §§63.670 and 63.671. Prior to January 30, 2019, either continuous parameter monitoring systems following the requirements in §63.11 (to detect the presence of a flame; to measure and record the net heating value of the gas being combusted; and to measure and record the volumetric flow of the gas being combusted) or monitoring systems as specified in §§63.670 and 63.671.
5. Startup or shutdown option 2: electing to comply with §63.1568(a)(4)(iii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during periods of startup or shutdown.	Any	Continuous parameter monitoring systems to measure and record the firebox temperature of each thermal incinerator or oxidizer and the oxygen content (percent, dry basis) in the exhaust vent from the incinerator or oxidizer.

[80 FR 75310, Dec. 1, 2015]

**Table 32 to Subpart UUU of Part 63—Requirements for Performance Tests for HAP Emissions From Sulfur Recovery Units Not Subject to the New Source Performance Standards for Sulfur Oxides**

As stated in §63.1568(b)(2) and (3), you shall meet each requirement in the following table that applies to you.

For . . .	You must . . .	Using . . .	According to these requirements . . .
1. Option 1: Elect NSPS. Each new and existing sulfur recovery unit	a. Measure SO <sub>2</sub> concentration (for an oxidation or reduction system followed by incineration) or measure the concentration of reduced sulfur (or SO <sub>2</sub> if you use an instrument to convert the reduced sulfur to SO <sub>2</sub> ) for a reduction control system without incineration	Data from continuous emission monitoring system	Collect SO <sub>2</sub> monitoring data every 15 minutes for 24 consecutive operating hours. Reduce the data to 1-hour averages computed from four or more data points equally spaced over each 1-hour period.

For . . .	You must . . .	Using . . .	According to these requirements . . .
	b. Measure O <sub>2</sub> concentration for the inlet air/oxygen supplied to the system, if using Equation 1 of 40 CFR 60.102a(f)(1)(i) to set your emission limit. You may use either an O <sub>2</sub> CEMS method in item 1.b.i of this table or the flow monitor in item 1.b.ii of this table	i. Data from continuous emission monitoring system; or	Collect O <sub>2</sub> monitoring data every 15 minutes for 24 consecutive operating hours. Reduce the data to 1-hour averages computed from four or more data points equally spaced over each 1-hour period; and average over the 24-hour period for input to Equation 1 of 40 CFR 60.102a(f)(1)(i).
		ii. Data from flow monitor for ambient air and purchased oxygen-enriched gas	Collect gas flow rate monitoring data every 15 minutes for 24 consecutive operating hours. Reduce the data to 1-hour averages computed from 4 or more data points equally spaced over each 1-hour period; calculate the hourly O <sub>2</sub> percent using Equation 10 of 40 CFR 60.106a(a)(6)(iv); and average over the 24-hour period for input to Equation 1 of 40 CFR 60.102a(f)(1)(i).
2. Option 2: TRS limit, using CEMS. Each new and existing sulfur recovery unit	Measure the concentration of reduced sulfur (or SO <sub>2</sub> if you use an instrument to convert the reduced sulfur to SO <sub>2</sub> )	Data from continuous emission monitoring system	Collect TRS data every 15 minutes for 24 consecutive operating hours. Reduce the data to 1-hour averages computed from four or more data points equally spaced over each 1-hour period.
3. Option 2: TRS limit, if using continuous parameter monitoring systems. Each new and existing sulfur recovery unit	a. Select sampling port's location and the number of traverse ports	Method 1 or 1A in Appendix A-1 to part 60 of this chapter	Sampling sites must be located at the outlet of the control device and prior to any releases to the atmosphere.
	b. Determine velocity and volumetric flow rate	Method 2, 2A, 2C, 2D, or 2F in appendix A-1 to part 60 of this chapter, or Method 2G in appendix A-2 to part 60 of this chapter, as applicable	
	c. Conduct gas molecular weight analysis; obtain the oxygen concentration needed to correct the emission rate for excess air	Method 3, 3A, or 3B in appendix A-2 to part 60 of this chapter, as applicable	Take the samples simultaneously with reduced sulfur or moisture samples.
	d. Measure moisture content of the stack gas	Method 4 in appendix A-3 to part 60 of this chapter	Make your sampling time for each Method 4 sample equal to that for 4 Method 15 samples.

For . . .	You must . . .	Using . . .	According to these requirements . . .
	e. Measure the concentration of TRS	Method 15 or 15A in appendix A-5 to part 60 of this chapter, as applicable	If the cross-sectional area of the duct is less than 5 square meters (m <sup>2</sup> ) or 54 square feet, you must use the centroid of the cross section as the sampling point. If the cross-sectional area is 5 m <sup>2</sup> or more and the centroid is more than 1 meter (m) from the wall, your sampling point may be at a point no closer to the walls than 1 m or 39 inches. Your sampling rate must be at least 3 liters per minute or 0.10 cubic feet per minute to ensure minimum residence time for the sample inside the sample lines.
	f. Calculate the SO <sub>2</sub> equivalent for each run after correcting for moisture and oxygen	The arithmetic average of the SO <sub>2</sub> equivalent for each sample during the run	
	g. Correct the reduced sulfur samples to zero percent excess air	Equation 1 of §63.1568	
	h. Establish each operating limit in Table 30 of this subpart that applies to you	Data from the continuous parameter monitoring system	
	i. Measure thermal incinerator: combustion zone temperature	Data from the continuous parameter monitoring system	Collect temperature monitoring data every 15 minutes during the entire period of the performance test; and determine and record the minimum hourly average temperature from all the readings.
	j. Measure thermal incinerator: oxygen concentration (percent, dry basis) in the vent stream	Data from the continuous parameter monitoring system	Collect oxygen concentration (percent, dry basis) data every 15 minutes during the entire period of the performance test; and determine and record the minimum hourly average percent excess oxygen concentration.

[80 FR 75312, Dec. 1, 2015]

**Table 33 to Subpart UUU of Part 63—Initial Compliance With HAP Emission Limits for Sulfur Recovery Units**

As stated in §63.1568(b)(5), you shall meet each requirement in the following table that applies to you.

For . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
-----------	--	---

For . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
<p>1. Subject to NSPS: Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 LTD and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)</p>	<p>a. 250 ppmv (dry basis) SO<sub>2</sub> at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation or reduction control system followed by incineration</p>	<p>You have already conducted a performance test to demonstrate initial compliance with the NSPS and each 12-hour rolling average concentration of SO<sub>2</sub> emissions measured by the continuous emission monitoring system is less than or equal to 250 ppmv (dry basis) at zero percent excess air, or the concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i). As part of the Notification of Compliance Status, you must certify that your vent meets the SO<sub>2</sub> limit. You are not required to do another performance test to demonstrate initial compliance.</p>
		<p>You have already conducted a performance evaluation to demonstrate initial compliance with the applicable performance specification. As part of your Notification of Compliance Status, you must certify that your continuous emission monitoring system meets the applicable requirements in §63.1572. You are not required to do another performance evaluation to demonstrate initial compliance.</p>
	<p>b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO<sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration</p>	<p>You have already conducted a performance test to demonstrate initial compliance with the NSPS and each 12-hour rolling average concentration of reduced sulfur compounds measured by your continuous emission monitoring system is less than or equal to 300 ppmv, calculated as ppmv SO<sub>2</sub> (dry basis) at zero percent excess air, or the concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i). As part of the Notification of Compliance Status, you must certify that your vent meets the SO<sub>2</sub> limit. You are not required to do another performance test to demonstrate initial compliance.</p>
		<p>You have already conducted a performance evaluation to demonstrate initial compliance with the applicable performance specification. As part of your Notification of Compliance Status, you must certify that your continuous emission monitoring system meets the applicable requirements in §63.1572. You are not required to do another performance evaluation to demonstrate initial compliance.</p>
<p>2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)</p>	<p>a. 250 ppmv (dry basis) of SO<sub>2</sub> at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation or reduction control system followed by incineration</p>	<p>Each 12-hour rolling average concentration of SO<sub>2</sub> emissions measured by the continuous emission monitoring system during the initial performance test is less than or equal to 250 ppmv (dry basis) at zero percent excess air, or the concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i); and your performance evaluation shows the monitoring system meets the applicable requirements in §63.1572.</p>

For . . .	For the following emission limit . . .	You have demonstrated initial compliance if . . .
	b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration	Each 12-hour rolling average concentration of reduced sulfur compounds measured by the continuous emission monitoring system during the initial performance test is less than or equal to 300 ppmv, calculated as ppmv SO <sub>2</sub> (dry basis) at zero percent excess air, or the concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i); and your performance evaluation shows the continuous emission monitoring system meets the applicable requirements in §63.1572.
3. Option 2: TRS limit. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	300 ppmv of TRS compounds expressed as an equivalent SO <sub>2</sub> concentration (dry basis) at zero percent oxygen	If you use continuous parameter monitoring systems, the average concentration of TRS emissions measured using Method 15 during the initial performance test is less than or equal to 300 ppmv expressed as equivalent SO <sub>2</sub> concentration (dry basis) at zero percent oxygen. If you use a continuous emission monitoring system, each 12-hour rolling average concentration of TRS emissions measured by the continuous emission monitoring system during the initial performance test is less than or equal to 300 ppmv expressed as an equivalent SO <sub>2</sub> (dry basis) at zero percent oxygen; and your performance evaluation shows the continuous emission monitoring system meets the applicable requirements in §63.1572.

[80 FR 75313, Dec. 1, 2015]

**Table 34 to Subpart UUU of Part 63—Continuous Compliance With HAP Emission Limits for Sulfur Recovery Units**

As stated in §63.1568(c)(1), you shall meet each requirement in the following table that applies to you.

For . . .	For this emission limit . . .	You shall demonstrate continuous compliance by . . .
1. Subject to NSPS. Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 LTD and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	a. 250 ppmv (dry basis) of SO <sub>2</sub> at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation or reduction control system followed by incineration	Collecting the hourly average SO <sub>2</sub> monitoring data (dry basis, percent excess air) and, if using Equation 1 of 40 CFR 60.102a(f)(1)(i), collecting the hourly O <sub>2</sub> concentration or flow monitoring data according to §63.1572; determining and recording each 12-hour rolling average concentration of SO <sub>2</sub> ; maintaining each 12-hour rolling average concentration of SO <sub>2</sub> at or below the applicable emission limitation; and reporting any 12-hour rolling average concentration of SO <sub>2</sub> greater than the applicable emission limitation in the semiannual compliance report required by §63.1575.

For . . .	For this emission limit . . .	You shall demonstrate continuous compliance by . . .
	<p>b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO<sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration</p>	<p>Collecting the hourly average reduced sulfur (and air or O<sub>2</sub> dilution and oxidation) monitoring data and, if using Equation 1 of 40 CFR 60.102a(f)(1)(i), collecting the hourly O<sub>2</sub> concentration or flow monitoring data according to §63.1572; determining and recording each 12-hour rolling average concentration of reduced sulfur; maintaining each 12-hour rolling average concentration of reduced sulfur at or below the applicable emission limitation; and reporting any 12-hour rolling average concentration of reduced sulfur greater than the applicable emission limitation in the semiannual compliance report required by §63.1575.</p>
<p>2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)</p>	<p>a. 250 ppmv (dry basis) of SO<sub>2</sub> at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use an oxidation or reduction control system followed by incineration</p>	<p>Collecting the hourly average SO<sub>2</sub> data (dry basis, percent excess air) and, if using Equation 1 of 40 CFR 60.102a(f)(1)(i), collecting the hourly O<sub>2</sub> concentration or flow monitoring data according to §63.1572; determining and recording each 12-hour rolling average concentration of SO<sub>2</sub>; maintaining each 12-hour rolling average concentration of SO<sub>2</sub> at or below the applicable emission limitation; and reporting any 12-hour rolling average concentration of SO<sub>2</sub> greater than the applicable emission limitation in the semiannual compliance report required by §63.1575.</p>
	<p>b. 300 ppmv of reduced sulfur compounds calculated as ppmv SO<sub>2</sub> (dry basis) at zero percent excess air, or concentration determined using Equation 1 of 40 CFR 60.102a(f)(1)(i), if you use a reduction control system without incineration</p>	<p>Collecting the hourly average reduced sulfur (and air or O<sub>2</sub> dilution and oxidation) monitoring data and, if using Equation 1 of 40 CFR 60.102a(f)(1)(i), collecting the hourly O<sub>2</sub> concentration or flow monitoring data according to §63.1572; determining and recording each 12-hour rolling average concentration of reduced sulfur; maintaining each 12-hour rolling average concentration of reduced sulfur at or below the applicable emission limitation; and reporting any 12-hour rolling average concentration of reduced sulfur greater than the applicable emission limitation in the semiannual compliance report required by §63.1575.</p>
<p>3. Option 2: TRS limit. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)</p>	<p>300 ppmv of TRS compounds, expressed as an SO<sub>2</sub> concentration (dry basis) at zero percent oxygen or reduced sulfur compounds calculated as ppmv SO<sub>2</sub> (dry basis) at zero percent excess air</p>	<p>i. If you use continuous parameter monitoring systems, collecting the hourly average TRS monitoring data according to §63.1572 and maintaining each 12-hour average concentration of TRS at or below the applicable emission limitation; or</p>

For . . .	For this emission limit . . .	You shall demonstrate continuous compliance by . . .
		ii. If you use a continuous emission monitoring system, collecting the hourly average TRS monitoring data according to §63.1572, determining and recording each 12-hour rolling average concentration of TRS; maintaining each 12-hour rolling average concentration of TRS at or below the applicable emission limitation; and reporting any 12-hour rolling average TRS concentration greater than the applicable emission limitation in the semiannual compliance report required by §63.1575.

[80 FR 75315, Dec. 1, 2015]

**Table 35 to Subpart UUU of Part 63—Continuous Compliance With Operating Limits for HAP Emissions From Sulfur Recovery Units**

As stated in §63.1568(c)(1), you shall meet each requirement in the following table that applies to you.

For . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
1. Subject to NSPS. Each new or existing Claus sulfur recovery unit part of a sulfur recovery plant with design capacity greater than 20 LTD and subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Not applicable	Meeting the requirements of Table 34 of this subpart.
2. Option 1: Elect NSPS. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	Not applicable	Meeting the requirements of Table 34 of this subpart.
3. Option 2: TRS limit. Each new or existing sulfur recovery unit (Claus or other type, regardless of size) not subject to the NSPS for sulfur oxides in 40 CFR 60.104(a)(2) or 60.102a(f)(1)	a. Maintain the daily average combustion zone temperature above the level established during the performance test	Collecting the hourly and daily average temperature monitoring data according to §63.1572; and maintaining the daily average combustion zone temperature at or above the limit established during the performance test
	b. The daily average oxygen concentration in the vent stream (percent, dry basis) must not fall below the level established during the performance test.	Collecting the hourly and daily average O <sub>2</sub> monitoring data according to §63.1572; and maintaining the average O <sub>2</sub> concentration above the level established during the performance test.
4. Startup or shutdown option 1: Electing to comply with §63.1568(a)(4)(ii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during periods of startup or shutdown	Using a flare meeting the requirements in §63.11(b) or §63.670	On and after January 30, 2019, complying with the applicable requirements of §63.670. Prior to January 30, 2019, complying with the applicable requirements of either §63.11(b) or §63.670.

For . . .	For this operating limit . . .	You shall demonstrate continuous compliance by . . .
5. Startup or shutdown option 2: Electing to comply with §63.1568(a)(4)(iii). Each new or existing sulfur recovery unit (Claus or other type, regardless of size) during periods of startup or shutdown	a. Minimum hourly average temperature of 1,200 degrees Fahrenheit	Collecting continuous (at least once every 15 minutes) and hourly average temperature monitoring data according to §63.1572; and maintaining the daily average firebox temperature at or above 1,200 degrees Fahrenheit.
	b. Minimum hourly average outlet oxygen concentration of 2 volume percent (dry basis)	Collecting continuous (at least once every 15 minutes) and hourly average O <sub>2</sub> monitoring data according to §63.1572; and maintaining the average O <sub>2</sub> concentration at or above 2 volume percent (dry basis).

[80 FR 75316, Dec. 1, 2015]

**Table 36 to Subpart UUU of Part 63—Work Practice Standards for HAP Emissions From Bypass Lines**

As stated in §63.1569(a)(1), you shall meet each work practice standard in the following table that applies to you.

Option	You shall meet one of these equipment standards . . .
1. Option 1	Install and operate a device (including a flow indicator, level recorder, or electronic valve position monitor) to demonstrate, either continuously or at least every hour, whether flow is present in the by bypass line. Install the device at or as near as practical to the entrance to any bypass line that could divert the vent stream away from the control device to the atmosphere.
2. Option 2	Install a car-seal or lock-and-key device placed on the mechanism by which the bypass device flow position is controlled (e.g., valve handle, damper level) when the bypass device is in the closed position such that the bypass line valve cannot be opened without breaking the seal or removing the device.
3. Option 3	Seal the bypass line by installing a solid blind between piping flanges.
4. Option 4	Vent the bypass line to a control device that meets the appropriate requirements in this subpart.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6964, Feb. 9, 2005]

**Table 37 to Subpart UUU of Part 63—Requirements for Performance Tests for Bypass Lines**

As stated in §63.1569(b)(1), you shall meet each requirement in the following table that applies to you.

For this standard . . .	You shall . . .
1. Option 1: Install and operate a flow indicator, level recorder, or electronic valve position monitor.	Record during the performance test for each type of control device whether the flow indicator, level recorder, or electronic valve position monitor was operating and whether flow was detected at any time during each hour of level the three runs comprising the performance test.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, Feb. 9, 2005]

**Table 38 to Subpart UUU of Part 63—Initial Compliance With Work Practice Standards for HAP Emissions From Bypass Lines**

As stated in §63.1569(b)(2), you shall meet each requirement in the following table that applies to you.

Option . . .	For this work practice standard . . .	You have demonstrated initial compliance if . . .
1. Each new or existing bypass line associated with a catalytic cracking unit, catalytic reforming unit, or sulfur recovery unit	a. Option 1: Install and operate a device (including a flow indicator, level recorder, or electronic valve position monitor) to demonstrate, either continuously or at least every hour, whether flow is present in bypass line. Install the device at or as near as practical to the entrance to any bypass line that could divert the vent stream away from the control device to the atmosphere	The installed equipment operates properly during each run of the performance test and no flow is present in the line during the test.
	b. Option 2: Install a car-seal or lock-and-key device placed on the mechanism by which the bypass device flow position is controlled (e.g., valve handle, damper level) when the bypass device is in the closed position such that the bypass line valve cannot be opened without breaking the seal or removing the device	As part of the notification of compliance status, you certify that you installed the equipment, the equipment was operational by your compliance date, and you identify what equipment was installed.
	c. Option 3: Seal the bypass line by installing a solid blind between piping flanges	See item 1.b of this table.
	d. Option 4: Vent the bypass line to a control device that meets the appropriate requirements in this subpart	See item 1.b of this table.

[70 FR 6965, Feb. 9, 2005]

**Table 39 to Subpart UUU of Part 63—Continuous Compliance With Work Practice Standards for HAP Emissions From Bypass Lines**

As stated in §63.1569(c)(1), you shall meet each requirement in the following table that applies to you.

If you elect this standard . . .	You shall demonstrate continuous compliance by . . .
1. Option 1: Flow indicator, level recorder, or electronic valve position monitor.	Monitoring and recording on a continuous basis or at least every hour whether flow is present in the bypass line; visually inspecting the device at least once every hour if the device is not equipped with a recording system that provides a continuous record; and recording whether the device is operating properly and whether flow is present in the bypass line.
2. Option 2: Car-seal or lock-and-key device	Visually inspecting the seal or closure mechanism at least once every month; and recording whether the bypass line valve is maintained in the closed position and whether flow is present in the line.
3. Option 3: Solid blind flange	Visually inspecting the blind at least once a month; and recording whether the blind is maintained in the correct position such that the vent stream cannot be diverted through the bypass line.
4. Option 4: Vent to control device	Monitoring the control device according to appropriate subpart requirements.
5. Option 1, 2, 3, or 4	Recording and reporting the time and duration of any bypass.

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, 6965, Feb. 9, 2005]

**Table 40 to Subpart UUU of Part 63—Requirements for Installation, Operation, and Maintenance of Continuous Opacity Monitoring Systems and Continuous Emission Monitoring Systems**

As stated in §63.1572(a)(1) and (b)(1), you shall meet each requirement in the following table that applies to you.

This type of continuous opacity or emission monitoring system . . .	Must meet these requirements . . .
1. Continuous opacity monitoring system	Performance specification 1 (40 CFR part 60, appendix B).
2. PM CEMS; this monitor must include an O <sub>2</sub> monitor for correcting the data for excess air	The requirements in 40 CFR 60.105a(d).
3. CO continuous emission monitoring system	Performance specification 4 (40 CFR part 60, appendix B); span value of 1,000 ppm; and procedure 1 (40 CFR part 60, appendix F) except relative accuracy test audits are required annually instead of quarterly.
4. CO continuous emission monitoring system used to demonstrate emissions average under 50 ppm (dry basis)	Performance specification 4 (40 CFR part 60, appendix B); and span value of 100 ppm.
5. SO <sub>2</sub> continuous emission monitoring system for sulfur recovery unit with oxidation control system or reduction control system; this monitor must include an O <sub>2</sub> monitor for correcting the data for excess air	Performance specification 2 (40 CFR part 60, appendix B); span value of 500 ppm SO <sub>2</sub> , or if using Equation 1 of 40 CFR 60.102a(f)(1)(i), span value of two times the limit at the highest O <sub>2</sub> concentration; use Methods 6 or 6C (40 CFR part 60, appendix A-4) for certifying the SO <sub>2</sub> monitor and Methods 3A or 3B (40 CFR part 60, appendix A-2) for certifying the O <sub>2</sub> monitor; and procedure 1 (40 CFR part 60, appendix F) except relative accuracy test audits are required annually instead of quarterly.
6. Reduced sulfur and O <sub>2</sub> continuous emission monitoring system for sulfur recovery unit with reduction control system not followed by incineration; this monitor must include an O <sub>2</sub> monitor for correcting the data for excess air unless exempted	Performance specification 5 (40 CFR part 60, appendix B), except calibration drift specification is 2.5 percent of the span value instead of 5 percent; span value is 450 ppm reduced sulfur, or if using Equation 1 of 40 CFR 60.102a(f)(1)(i), span value of two times the limit at the highest O <sub>2</sub> concentration; use Methods 15 or 15A (40 CFR part 60, appendix A-5) for certifying the reduced sulfur monitor and Methods 3A or 3B (40 CFR part 60, appendix A-2) for certifying the O <sub>2</sub> monitor; if Method 3A or 3B yields O <sub>2</sub> concentrations below 0.25 percent during the performance evaluation, the O <sub>2</sub> concentration can be assumed to be zero and the O <sub>2</sub> monitor is not required; and procedure 1 (40 CFR part 60, appendix F), except relative accuracy test audits, are required annually instead of quarterly.
7. Instrument with an air or O <sub>2</sub> dilution and oxidation system to convert reduced sulfur to SO <sub>2</sub> for continuously monitoring the concentration of SO <sub>2</sub> instead of reduced sulfur monitor and O <sub>2</sub> monitor	Performance specification 5 (40 CFR part 60, appendix B); span value of 375 ppm SO <sub>2</sub> or if using Equation 1 of 40 CFR 60.102a(f)(1)(i), span value of two times the limit at the highest O <sub>2</sub> concentration; use Methods 15 or 15A (40 CFR part 60, appendix A-5) for certifying the reduced sulfur monitor and 3A or 3B (40 CFR part 60, appendix A-2) for certifying the O <sub>2</sub> monitor; and procedure 1 (40 CFR part 60, appendix F), except relative accuracy test audits, are required annually instead of quarterly.
8. TRS continuous emission monitoring system for sulfur recovery unit; this monitor must include an O <sub>2</sub> monitor for correcting the data for excess air	Performance specification 5 (40 CFR part 60, appendix B).

This type of continuous opacity or emission monitoring system . . .	Must meet these requirements . . .
9. O <sub>2</sub> monitor for oxygen concentration	If necessary due to interferences, locate the oxygen sensor prior to the introduction of any outside gas stream; performance specification 3 (40 CFR part 60, appendix B; and procedure 1 (40 CFR part 60, appendix F), except relative accuracy test audits, are required annually instead of quarterly.

[80 FR 75317, Dec. 1, 2015]

**Table 41 to Subpart UUU of Part 63—Requirements for Installation, Operation, and Maintenance of Continuous Parameter Monitoring Systems**

As stated in §63.1572(c)(1), you shall meet each requirement in the following table that applies to you.

If you use . . .	You shall . . .
1. pH strips	Use pH strips with an accuracy of ±10 percent.
2. pH meter	Locate the pH sensor in a position that provides a representative measurement of pH; ensure the sample is properly mixed and representative of the fluid to be measured.
	Use a pH sensor with an accuracy of at least ±0.2 pH units.
	Check the pH meter's calibration on at least one point at least once daily; check the pH meter's calibration on at least two points at least once quarterly; at least monthly, inspect all components for integrity and all electrical components for continuity; record the results of each calibration check and inspection.
3. Colormetric tube sampling system	Use a colormetric tube sampling system with a printed numerical scale in ppmv, a standard measurement range of 1 to 10 ppmv (or 1 to 30 ppmv if applicable), and a standard deviation for measured values of no more than ±15 percent. System must include a gas detection pump and hot air probe if needed for the measurement range.
4. CO <sub>2</sub> , O <sub>2</sub> , and CO monitors for coke burn-off rate	a. Locate the concentration sensor so that it provides a representative measurement of the content of the exit gas stream; ensure the sample is properly mixed and representative of the gas to be measured.
	Use a sensor with an accuracy of at least ±1 percent of the range of the sensor or to a nominal gas concentration of ±0.5 percent, whichever is greater.
	Use a monitor that is able to measure concentration on a dry basis or is able to correct for moisture content and record on a dry basis.
	Conduct calibration checks at least annually; conduct calibration checks following any period of more than 24 hours throughout which the sensor reading exceeds the manufacturer's specified maximum operating range or install a new sensor; at least quarterly, inspect all components for integrity and all electrical connections for continuity; record the results of each calibration and inspection.
	b. As an alternative, the requirements in 40 CFR 60.105a(b)(2) may be used.
5. BLD	Follow the requirements in 40 CFR 60.105a(c).
6. Voltage, secondary current, or total power input sensors	Use meters with an accuracy of at least ±5 percent over the operating range.

If you use . . .	You shall . . .
	Each time that the unit is not operating, confirm that the meters read zero. Conduct a calibration check at least annually; conduct calibration checks following any period of more than 24 hours throughout which the meter reading exceeds the manufacturer's specified maximum operating range; at least monthly, inspect all components of the continuous parameter monitoring system for integrity and all electrical connections for continuity; record the results of each calibration check and inspection.
7. Pressure/Pressure drop <sup>1</sup> sensors	Locate the pressure sensor(s) in a position that provides a representative measurement of the pressure and minimizes or eliminates pulsating pressure, vibration, and internal and external corrosion.
	Use a gauge with an accuracy of at least $\pm 5$ percent over the normal operating range or 0.12 kilopascals (0.5 inches of water column), whichever is greater.
	Review pressure sensor readings at least once a week for straightline (unchanging) pressure and perform corrective action to ensure proper pressure sensor operation if blockage is indicated; using an instrument recommended by the sensor's manufacturer, check gauge calibration and transducer calibration annually; conduct calibration checks following any period of more than 24 hours throughout which the pressure exceeded the manufacturer's specified maximum rated pressure or install a new pressure sensor; at least quarterly, inspect all components for integrity, all electrical connections for continuity, and all mechanical connections for leakage, unless the CPMS has a redundant pressure sensor; record the results of each calibration check and inspection.
8. Air flow rate, gas flow rate, or total water (or scrubbing liquid) flow rate sensors	Locate the flow sensor(s) and other necessary equipment (such as straightening vanes) in a position that provides representative flow; reduce swirling flow or abnormal velocity distributions due to upstream and downstream disturbances. If you elect to comply with Option 3 (Ni lb/hr) or Option 4 (Ni lb/1,000 lb of coke burn-off) for the HAP metal emission limitations in §63.1564, install the continuous parameter monitoring system for gas flow rate as close as practical to the continuous opacity monitoring system; and if you don't use a continuous opacity monitoring system, install the continuous parameter monitoring system for gas flow rate as close as practical to the control device.
	Use a flow rate sensor with an accuracy of at least $\pm 5$ percent over the normal range of flow measured, or 1.9 liter per minute (0.5 gallons per minute), whichever is greater, for liquid flow.
	Use a flow rate sensor with an accuracy of at least $\pm 5$ percent over the normal range of flow measured, or 280 liters per minute (10 cubic feet per minute), whichever is greater, for gas flow.
	Conduct a flow sensor calibration check at least biennially (every two years); conduct a calibration check following any period of more than 24 hours throughout which the flow rate exceeded the manufacturer's specified maximum rated flow rate or install a new flow sensor; at least quarterly, inspect all components for leakage, unless the CPMS has a redundant flow sensor; record the results of each calibration check and inspection.
9. Temperature sensors	Locate the temperature sensor in the combustion zone, or in the ductwork immediately downstream of the combustion zone before any substantial heat exchange occurs or in the ductwork immediately downstream of the regenerator; locate the temperature sensor in a position that provides a representative temperature; shield the temperature sensor system from electromagnetic interference and chemical contaminants.
	Use a temperature sensor with an accuracy of at least $\pm 1$ percent over the normal range of temperature measured, expressed in degrees Celsius (C), or 2.8 degrees C, whichever is greater.

If you use . . .	You shall . . .
	Conduct calibration checks at least annually; conduct calibration checks following any period of more than 24 hours throughout which the temperature exceeded the manufacturer's specified maximum rated temperature or install a new temperature sensor; at least quarterly, inspect all components for integrity and all electrical connections for continuity, oxidation, and galvanic corrosion, unless the CPMS has a redundant temperature sensor; record the results of each calibration check and inspection.
10. Oxygen content sensors <sup>2</sup>	Locate the oxygen sensor so that it provides a representative measurement of the oxygen content of the exit gas stream; ensure the sample is properly mixed and representative of the gas to be measured.
	Use an oxygen sensor with an accuracy of at least $\pm 1$ percent of the range of the sensor or to a nominal gas concentration of $\pm 0.5$ percent, whichever is greater.
	Conduct calibration checks at least annually; conduct calibration checks following any period of more than 24 hours throughout which the sensor reading exceeds the manufacturer's specified maximum operating range or install a new oxygen sensor; at least quarterly, inspect all components for integrity and all electrical connections for continuity; record the results of each calibration and inspection.

<sup>1</sup>Not applicable to non-venturi wet scrubbers of the jet-ejector design.

<sup>2</sup>This does not replace the requirements for oxygen monitors that are required to use continuous emissions monitoring systems. The requirements in this table apply to oxygen sensors that are continuous parameter monitors, such as those that monitor combustion zone oxygen concentration and regenerator exit oxygen concentration.

[80 FR 75318, Dec. 1, 2015]

**Table 42 to Subpart UUU of Part 63—Additional Information for Initial Notification of Compliance Status**

As stated in §63.1574(d), you shall meet each requirement in the following table that applies to you.

For . . .	You shall provide this additional information . . .
1. Identification of affected sources and emission points.	Nature, size, design, method of operation, operating design capacity of each affected source; identify each emission point for each HAP; identify any affected source or vent associated with an affected source not subject to the requirements of subpart UUU.
2. Initial compliance	Identification of each emission limitation you will meet for each affected source, including any option you select (i.e., NSPS, PM or Ni, flare, percent reduction, concentration, options for bypass lines); if applicable, certification that you have already conducted a performance test to demonstrate initial compliance with the NSPS for an affected source; certification that the vents meet the applicable emission limit and the continuous opacity or that the emission monitoring system meets the applicable performance specification; if applicable, certification that you have installed and verified the operational status of equipment by your compliance date for each bypass line that meets the requirements of Option 2, 3, or 4 in §63.1569 and what equipment you installed; identification of the operating limit for each affected source, including supporting documentation; if your affected source is subject to the NSPS, certification of compliance with NSPS emission limitations and performance specifications; a brief description of performance test conditions (capacity, feed quality, catalyst, etc.); an engineering assessment (if applicable); and if applicable, the flare design (e.g., steam-assisted, air-assisted, or non-assisted), all visible emission readings, heat content determinations, flow rate measurements, and exit velocity determinations made during the Method 22 test.

For . . .	You shall provide this additional information . . .
3. Continuous compliance	Each monitoring option you elect; and identification of any unit or vent for which monitoring is not required; and the definition of "operating day." (This definition, subject to approval by the applicable permitting authority, must specify the times at which a 24-hr operating day begins and ends.)

[67 FR 17773, Apr. 11, 2002, as amended at 70 FR 6942, Feb. 9, 2005]

**Table 43 to Subpart UUU of Part 63—Requirements for Reports**

As stated in §63.1575(a), you shall meet each requirement in the following table that applies to you.

You must submit . . .	The report must contain . . .	You shall submit the report . . .
1. A compliance report	If there are no deviations from any emission limitation or work practice standard that applies to you, a statement that there were no deviations from the standards during the reporting period and that no continuous opacity monitoring system or continuous emission monitoring system was inoperative, inactive, out-of-control, repaired, or adjusted; if you have a deviation from any emission limitation or work practice standard during the reporting period, the report must contain the information in §63.1575(c) through (e)	Semiannually according to the requirements in §63.1575(b).
2. Performance test and CEMS performance evaluation data	On and after February 1, 2016, the information specified in §63.1575(k)(1)	Semiannually according to the requirements in §63.1575(b) and (f).

[80 FR 75319, Dec. 1, 2015, as amended at 83 FR 60727, Nov. 26, 2018]

**Table 44 to Subpart UUU of Part 63—Applicability of NESHAP General Provisions to Subpart UUU**

As stated in §63.1577, you shall meet each requirement in the following table that applies to you.

Citation	Subject	Applies to subpart UUU	Explanation
§63.1(a)(1)-(4)	General Applicability	Yes	
§63.1(a)(5)	[Reserved]	Not applicable	
§63.1(a)(6)		Yes	Except the correct mail drop (MD) number is C404-04.
§63.1(a)(7)-(9)	[Reserved]	Not applicable	
§63.1(a)(10)-(12)		Yes	Except that this subpart specifies calendar or operating day.
§63.1(b)(1)	Initial Applicability Determination for this part	Yes	
§63.1(b)(2)	[Reserved]	Not applicable	

Citation	Subject	Applies to subpart UUU	Explanation
§63.1(b)(3)		Yes	
§63.1(c)(1)	Applicability of this part after a Relevant Standard has been set under this part	Yes	
§63.1(c)(2)		No	Area sources are not subject to this subpart.
§63.1(c)(3)-(4)	[Reserved]	Not applicable	
§63.1(c)(5)		Yes	
§63.1(d)	[Reserved]	Not applicable	
§63.1(e)	Applicability of Permit Program	Yes	
§63.2	Definitions	Yes	§63.1579 specifies that if the same term is defined in subparts A and UUU of this part, it shall have the meaning given in this subpart.
§63.3	Units and Abbreviations	Yes	
§63.4(a)(1)-(2)	Prohibited Activities	Yes	
§63.4(a)(3)-(5)	[Reserved]	Not applicable	
§63.4(b)-(c)	Circumvention and Fragmentation	Yes	
§63.5(a)	Construction and Reconstruction	Yes	
§63.5(b)(1)		Yes	
§63.5(b)(2)	[Reserved]	Not applicable	
§63.5(b)(3)-(4)		Yes	In §63.5(b)(4), replace the reference to §63.9(b) with §63.9(b)(4) and (5).
§63.5(b)(5)	[Reserved]	Not applicable	
§63.5(b)(6)		Yes	
§63.5(c)	[Reserved]	Not applicable	
§63.5(d)(1)(i)	Application for Approval of Construction or Reconstruction—General Application Requirements	Yes	Except this subpart specifies the application is submitted as soon as practicable before startup but not later than 90 days after the promulgation date if construction or reconstruction had commenced and initial startup had not occurred before promulgation.
§63.5(d)(1)(ii)		Yes	Except that emission estimates specified in §63.5(d)(1)(ii)(H) are not required, and §63.5(d)(1)(ii)(G) and (I) are Reserved and do not apply.
§63.5(d)(1)(iii)		No	This subpart specifies submission of notification of compliance status.

Citation	Subject	Applies to subpart UUU	Explanation
§63.5(d)(2)		Yes	
§63.5(d)(3)		Yes	
§63.5(d)(4)		Yes	
§63.5(e)	Approval of Construction or Reconstruction	Yes	
§63.5(f)(1)	Approval of Construction or Reconstruction Based on State Review	Yes	
§63.5(f)(2)		Yes	Except that the cross-reference to §63.9(b)(2) does not apply.
§63.6(a)	Compliance with Standards and Maintenance—Applicability	Yes	
§63.6(b)(1)-(4)	Compliance Dates for New and Reconstructed Sources	Yes	
§63.6(b)(5)		Yes	Except that this subpart specifies different compliance dates for sources.
§63.6(b)(6)	[Reserved]	Not applicable	
§63.6(b)(7)	Compliance Dates for New and Reconstructed Area Sources That Become Major	Yes	
§63.6(c)(1)-(2)	Compliance Dates for Existing Sources	Yes	Except that this subpart specifies different compliance dates for sources subject to Tier II gasoline sulfur control requirements.
§63.6(c)(3)-(4)	[Reserved]	Not applicable	
§63.6(c)(5)	Compliance Dates for Existing Area Sources That Become Major	Yes	
§63.6(d)	[Reserved]	Not applicable	
§63.6(e)(1)(i)	General Duty to Minimize Emissions	No	See §63.1570(c) for general duty requirement.
§63.6(e)(1)(ii)	Requirement to Correct Malfunctions as Soon as Possible	No	
§63.6(e)(1)(iii)	Compliance with Standards and Maintenance Requirements	Yes	
§63.6(e)(2)	[Reserved]	Not Applicable	
§63.6(e)(3)(i)	Startup, Shutdown, and Malfunction Plan Requirements	No	
§63.6(e)(3)(ii)	[Reserved]	Not applicable	

Citation	Subject	Applies to subpart UUU	Explanation
§63.6(e)(3)(iii)-(ix)		No	
§63.6(f)(1)	SSM Exemption	No	
§63.6(f)(2)(i)-(iii)(C)	Compliance with Standards and Maintenance Requirements	Yes	
§63.6(f)(2)(iii)(D)		Yes	
§63.6(f)(2)(iv)-(v)		Yes	
§63.6(f)(3)		Yes	Except the cross-references to §63.6(f)(1) and (e)(1)(i) are changed to §63.1570(c) and this subpart specifies how and when the performance test results are reported.
§63.6(g)	Alternative Standard	Yes	
§63.6(h)(1)	SSM Exemption for Opacity/VE Standards	No	
§63.6(h)(2)(i)	Determining Compliance with Opacity/VE Standards	No	This subpart specifies methods.
§63.6(h)(2)(ii)	[Reserved]	Not applicable	
§63.6(h)(2)(iii)		Yes	
§63.6(h)(3)	[Reserved]	Not applicable	
§63.6(h)(4)	Notification of Opacity/VE Observation Date	Yes	Applies to Method 22 (40 CFR part 60, appendix A-7) tests.
§63.6(h)(5)	Conducting Opacity/VE Observations	No	
§63.6(h)(6)	Records of Conditions During Opacity/VE Observations	Yes	Applies to Method 22 (40 CFR part 60, appendix A-7) observations.
§63.6(h)(7)(i)	Report COM Monitoring Data from Performance Test	Yes	Except this subpart specifies how and when the performance test results are reported.
§63.6(h)(7)(ii)	Using COM Instead of Method 9	No	
§63.6(h)(7)(iii)	Averaging Time for COM during Performance Test	Yes	
§63.6(h)(7)(iv)	COM Requirements	Yes	
§63.6(h)(7)(v)	COMS Results and Visual Observations	Yes	
§63.6(h)(8)	Determining Compliance with Opacity/VE Standards	Yes	Except this subpart specifies how and when the performance test results are reported.
§63.6(h)(9)	Adjusted Opacity Standard	Yes	
§63.6(i)(1)-(14)	Extension of Compliance	Yes	Extension of compliance under §63.6(i)(4) not applicable to a facility that installs catalytic cracking feed hydrotreating and receives an extended compliance date under §63.1563(c).

Citation	Subject	Applies to subpart UUU	Explanation
§63.6(i)(15)	[Reserved]	Not applicable	
§63.6(i)(16)		Yes	
§63.6(j)	Presidential Compliance Exemption	Yes	
§63.7(a)(1)	Performance Test Requirements Applicability	Yes	Except that this subpart specifies the applicable test and demonstration procedures.
§63.7(a)(2)	Performance Test Dates	Yes	Except this subpart specifies that the results of initial performance tests must be submitted within 150 days after the compliance date.
§63.7(a)(3)	Section 114 Authority	Yes	
§63.7(a)(4)	Force Majeure	Yes	
§63.7(b)	Notifications	Yes	Except that this subpart specifies notification at least 30 days prior to the scheduled test date rather than 60 days.
§63.7(c)	Quality Assurance Program/Site-Specific Test Plan	Yes	Except that when this subpart specifies to use 40 CFR part 60, appendix F, out of control periods are to be defined as specified in part 60, appendix F.
§63.7(d)	Performance Test Facilities	Yes	
§63.7(e)(1)	Performance Testing	No	See §63.1571(b)(1).
§63.7(e)(2)-(4)	Conduct of Tests	Yes	
§63.7(f)	Alternative Test Method	Yes	
§63.7(g)	Data Analysis, Recordkeeping, Reporting	Yes	Except this subpart specifies how and when the performance test or performance evaluation results are reported and §63.7(g)(2) is reserved and does not apply.
§63.7(h)	Waiver of Tests	Yes	
§63.8(a)(1)	Monitoring Requirements-Applicability	Yes	
§63.8(a)(2)	Performance Specifications	Yes	
§63.8(a)(3)	[Reserved]	Not applicable	
§63.8(a)(4)	Monitoring with Flares	Yes	Except that for a flare complying with §63.670, the cross-reference to §63.11 in this paragraph does not include §63.11(b).
§63.8(b)(1)	Conduct of Monitoring	Yes	
§63.8(b)(2)-(3)	Multiple Effluents and Multiple Monitoring Systems	Yes	This subpart specifies the required monitoring locations.
§63.8(c)(1)	Monitoring System Operation and Maintenance	Yes	

Citation	Subject	Applies to subpart UUU	Explanation
§63.8(c)(1)(i)	General Duty to Minimize Emissions and CMS Operation	No	See §63.1570(c).
§63.8(c)(1)(ii)	Keep Necessary Parts for CMS	Yes	
§63.8(c)(1)(iii)	Requirement to Develop SSM Plan for CMS	No	
§63.8(c)(2)-(3)	Monitoring System Installation	Yes	Except that this subpart specifies that for continuous parameter monitoring systems, operational status verification includes completion of manufacturer written specifications or installation, operation, and calibration of the system or other written procedures that provide adequate assurance that the equipment will monitor accurately.
§63.8(c)(4)	Continuous Monitoring System Requirements	Yes	
§63.8(c)(5)	COMS Minimum Procedures	Yes	
§63.8(c)(6)	CMS Requirements	Yes	
§63.8(c)(7)-(8)	CMS Requirements	Yes	
§63.8(d)(1)-(2)	Quality Control Program for CMS	Yes	
§63.8(d)(3)	Written Procedures for CMS	No	
§63.8(e)	CMS Performance Evaluation	Yes	Except this subpart specifies how and when the performance evaluation results are reported.
§63.8(f)(1)-(5)	Alternative Monitoring Methods	Yes	Except that this subpart specifies procedures for requesting alternative monitoring systems and alternative parameters.
§63.8(f)(6)	Alternative to Relative Accuracy Test	Yes	Applicable to continuous emission monitoring systems if performance specification requires a relative accuracy test audit.
§63.8(g)(1)-(4)	Reduction of Monitoring Data	Yes	Applies to continuous opacity monitoring system or continuous emission monitoring system.
§63.8(g)(5)	Data Reduction	No	This subpart specifies requirements.
§63.9(a)	Notification Requirements—Applicability	Yes	Duplicate Notification of Compliance Status report to the Regional Administrator may be required.
§63.9(b)(1)-(2)	Initial Notifications	Yes	Except that notification of construction or reconstruction is to be submitted as soon as practicable before startup but no later than 30 days after the effective date if construction or reconstruction had commenced but startup had not occurred before the effective date.
§63.9(b)(3)	[Reserved]	Not applicable	
§63.9(b)(4)-(5)	Initial Notification Information	Yes	Except §63.9(b)(4)(ii)-(iv), which are reserved and do not apply.

Citation	Subject	Applies to subpart UUU	Explanation
§63.9(c)	Request for Extension of Compliance	Yes	
§63.9(d)	New Source Notification for Special Compliance Requirements	Yes	
§63.9(e)	Notification of Performance Test	Yes	Except that notification is required at least 30 days before test.
§63.9(f)	Notification of VE/Opacity Test	Yes	
§63.9(g)	Additional Notification Requirements for Sources with Continuous Monitoring Systems	Yes	
§63.9(h)	Notification of Compliance Status	Yes	Except that this subpart specifies the notification is due no later than 150 days after compliance date, and except that the reference to §63.5(d)(1)(ii)(H) in §63.9(h)(5) does not apply.
§63.9(i)	Adjustment of Deadlines	Yes	
§63.9(j)	Change in Previous Information	Yes	
63.10(a)	Recordkeeping and Reporting Applicability	Yes	
§63.10(b)(1)	General Recordkeeping Requirements	Yes	
§63.10(b)(2)(i)	Recordkeeping of Occurrence and Duration of Startups and Shutdowns	No	
§63.10(b)(2)(ii)	Recordkeeping of Malfunctions	No	See §63.1576(a)(2) for recordkeeping of (1) date, time and duration; (2) listing of affected source or equipment, and an estimate of the volume of each regulated pollutant emitted over the standard; and (3) actions taken to minimize emissions and correct the failure.
§63.10(b)(2)(iii)	Maintenance Records	Yes	
§63.10(b)(2)(iv)-(v)	Actions Taken to Minimize Emissions During SSM	No	
§63.10(b)(2)(vi)	Recordkeeping for CMS Malfunctions	Yes	
§63.10(b)(2)(vii)-(xiv)	Other CMS Requirements	Yes	
§63.10(b)(3)	Recordkeeping for Applicability Determinations.	Yes	
§63.10(c)(1)-(6)	Additional Records for Continuous Monitoring Systems	Yes	Except §63.10(c)(2)-(4), which are Reserved and do not apply.
§63.10(c)(7)-(8)	Additional Recordkeeping Requirements for CMS— Identifying Exceedances and Excess Emissions	Yes	

Citation	Subject	Applies to subpart UUU	Explanation
§63.10(c)(9)	[Reserved]	Not applicable	
§63.10(c)(10)	Recording Nature and Cause of Malfunctions	No	See §63.1576(a)(2) for malfunctions recordkeeping requirements.
§63.10(c)(11)	Recording Corrective Actions	No	See §63.1576(a)(2) for malfunctions recordkeeping requirements.
§63.10(c)(12)-(14)	Additional CMS Recordkeeping Requirements	Yes	
§63.10(c)(15)	Use of SSM Plan	No	
§63.10(d)(1)	General Reporting Requirements	Yes	
§63.10(d)(2)	Performance Test Results	No	This subpart specifies how and when the performance test results are reported.
§63.10(d)(3)	Opacity or VE Observations	Yes	
§63.10(d)(4)	Progress Reports	Yes	
§63.10(d)(5)	SSM Reports	No	See §63.1575(d) for CPMS malfunction reporting and §63.1575(e) for COMS and CEMS malfunction reporting.
§63.10(e)(1)-(2)	Additional CMS Reports	Yes	Except this subpart specifies how and when the performance evaluation results are reported.
§63.10(e)(3)	Excess Emissions/CMS Performance Reports	No	This subpart specifies the applicable requirements.
§63.10(e)(4)	COMS Data Reports	Yes	Except this subpart specifies how and when the performance test results are reported.
§63.10(f)	Recordkeeping/Reporting Waiver	Yes	
§63.11(a)	Control Device and Work Practice Requirements Applicability	Yes	
§63.11(b)	Flares	Yes	Except that flares complying with §63.670 are not subject to the requirements of §63.11(b).
§63.11(c)-(e)	Alternative Work Practice for Monitoring Equipment for Leaks	Yes	
§63.12	State Authority and Delegations	Yes	
§63.13	Addresses	Yes	
§63.14	Incorporation by Reference	Yes	
§63.15	Availability of Information and Confidentiality	Yes	
§63.16	Performance Track Provisions	Yes	

**Appendix A to Subpart UUU of Part 63—Determination of Metal Concentration on Catalyst Particles (Instrumental Analyzer Procedure)**

1.0 Scope and Application.

1.1 Analytes. The analytes for which this method is applicable include any elements with an atomic number between 11 (sodium) and 92 (uranium), inclusive. Specific analytes for which this method was developed include:

Analyte	CAS No.	Minimum detectable limit
Nickel compounds	7440-02-0	<2 % of span.
Total chlorides	16887-00-6	<2 % of span.

1.2 Applicability. This method is applicable to the determination of analyte concentrations on catalyst particles. This method is applicable for catalyst particles obtained from the fluid catalytic cracking unit (FCCU) regenerator (*i.e.*, equilibrium catalyst), from air pollution control systems operated for the FCCU catalyst regenerator vent (FCCU fines), from catalytic reforming units (CRU), and other processes as specified within an applicable regulation. This method is applicable only when specified within the regulation.

1.3 Data Quality Objectives. Adherence to the requirements of this method will enhance the quality of the data obtained from the analytical method.

**2.0 Summary of Method.**

2.1 A representative sample of catalyst particles is collected, prepared, and analyzed for analyte concentration using either energy or wavelength dispersive X-ray fluorescent (XRF) spectrometry instrumental analyzers. In both types of XRF spectrometers, the instrument irradiates the sample with high energy (primary) x-rays and the elements in the sample absorb the x-rays and then re-emit secondary (fluorescent) x-rays of characteristic wavelengths for each element present. In energy dispersive XRF spectrometers, all secondary x-rays (of all wavelengths) enter the detector at once. The detector registers an electric current having a height proportional to the photon energy, and these pulses are then separated electronically, using a pulse analyzer. In wavelength dispersive XRF spectrometers, the secondary x-rays are dispersed spatially by crystal diffraction on the basis of wavelength. The crystal and detector are made to synchronously rotate and the detector then receives only one wavelength at a time. The intensity of the x-rays emitted by each element is proportional to its concentration, after correcting for matrix effects. For nickel compounds and total chlorides, the XRF instrument response is expected to be linear to analyte concentration. Performance specifications and test procedures are provided to ensure reliable data.

**3.0 Definitions.**

3.1 Measurement System. The total equipment required for the determination of analyte concentration. The measurement system consists of the following major subsystems:

3.1.1 Sample Preparation. That portion of a system used for one or more of the following: sample acquisition, sample transport, sample conditioning, or sample preparation prior to introducing the sample into the analyzer.

3.1.2 Analyzer. That portion of the system that senses the analyte to be measured and generates an output proportional to its concentration.

3.1.3 Data Recorder. A digital recorder or personal computer used for recording measurement data from the analyzer output.

3.2 Span. The upper limit of the gas concentration measurement range displayed on the data recorder.

3.3 Calibration Standards. Prepared catalyst samples or other samples of known analyte concentrations used to calibrate the analyzer and to assess calibration drift.

3.4 Energy Calibration Standard. Calibration standard, generally provided by the XRF instrument manufacturer, used for assuring accuracy of the energy scale.

3.5 Accuracy Assessment Standard. Prepared catalyst sample or other sample of known analyte concentrations used to assess analyzer accuracy error.

3.6 Zero Drift. The difference in the measurement system output reading from the initial value for zero concentration level calibration standard after a stated period of operation during which no unscheduled maintenance, repair, or adjustment took place.

3.7 Calibration Drift. The difference in the measurement system output reading from the initial value for the mid-range calibration standard after a stated period of operation during which no unscheduled maintenance, repair, or adjustment took place.

3.8 Spectral Interferences. Analytical interferences and excessive biases caused by elemental peak overlap, escape peak, and sum peak interferences between elements in the samples.

3.9 Calibration Curve. A graph or other systematic method of establishing the relationship between the analyzer response and the actual analyte concentration introduced to the analyzer.

3.10 Analyzer Accuracy Error. The difference in the measurement system output reading and the ideal value for the accuracy assessment standard.

#### **4.0 Interferences.**

4.1 Spectral interferences with analyte line intensity determination are accounted for within the method program. No action is required by the XRF operator once these interferences have been addressed within the method.

4.2 The X-ray production efficiency is affected by particle size for the very lightest elements. However, particulate matter (PM) 2.5 particle size effects are substantially < 1 percent for most elements. The calibration standards should be prepared with material of similar particle size or be processed (ground) to produce material of similar particle size as the catalyst samples to be analyzed. No additional correction for particle size is performed. Alternatively, the sample can be fused in order to eliminate any potential particle size effects.

#### **5.0 Safety.**

5.1 Disclaimer. This method may involve hazardous materials, operations, and equipment. This test method may not address all of the safety problems associated with its use. It is the responsibility of the user of this test method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to performing this test method.

5.2 X-ray Exposure. The XRF uses X-rays; XRF operators should follow instrument manufacturer's guidelines to protect from accidental exposure to X-rays when the instrument is in operation.

5.3 Beryllium Window. In most XRF units, a beryllium (Be) window is present to separate the sample chamber from the X-ray tube and detector. The window is very fragile and brittle. Do not allow sample or debris to fall onto the window, and avoid using compressed air to clean the window because it will cause the window to rupture. If the window should rupture, note that Be metal is poisonous. Use extreme caution when collecting pieces of Be and consult the instrument manufacturer for advice on cleanup of the broken window and replacement.

#### **6.0 Equipment and Supplies.**

6.1 Measurement System. Use any measurement system that meets the specifications of this method listed in section 13. The typical components of the measurement system are described below.

6.1.1 Sample Mixer/Mill. Stainless steel, or equivalent to grind/mix catalyst and binders, if used, to produce uniform particle samples.

6.1.2 Sample Press/Fluxer. Stainless steel, or equivalent to produce pellets of sufficient size to fill analyzer sample window, or alternatively, a fusion device capable of preparing a fused disk of sufficient size to fill analyzer sample window.

6.1.3 Analytical Balance.  $\pm 0.0001$  gram accuracy for weighing prepared samples (pellets).

6.1.4 Analyzer. An XRF spectrometer to determine the analyte concentration in the prepared sample. The analyzer must meet the applicable performance specifications in section 13.

6.1.5 Data Recorder. A digital recorder or personal computer for recording measurement data. The data recorder resolution (*i.e.*, readability) must be 0.5 percent of span. Alternatively, a digital or analog meter having a resolution of 0.5 percent of span may be used to obtain the analyzer responses and the readings may be recorded manually.

## **7.0 Reagents and Standards.**

7.1 Calibration Standards. The calibration standards for the analyzer must be prepared catalyst samples or other material of similar particle size and matrix as the catalyst samples to be tested that have known concentrations of the analytes of interest. Preparation (grinding/milling/fusion) of the calibration standards should follow the same processes used to prepare the catalyst samples to be tested. The calibration standards values must be established as the average of a minimum of three analyses using an approved EPA or ASTM method with instrument analyzer calibrations traceable to the U.S. National Institute of Standards and Technology (NIST), if available. The maximum percent deviation of the triplicate calibration standard analyses should agree within 10 percent of the average value for the triplicate analysis (see Figure 1). If the calibration analyses do not meet this criteria, the calibration standards must be re-analyzed. If unacceptable variability persists, new calibration standards must be prepared. Approved methods for the calibration standard analyses include, but are not limited to, EPA Methods 6010B, 6020, 7520, or 7521 of SW-846.<sup>1</sup> Use a minimum of four calibration standards as specified below (see Figure 1):

7.1.1 High-Range Calibration Standard. Concentration equivalent to 80 to 100 percent of the span. The concentration of the high-range calibration standard should exceed the maximum concentration anticipated in the catalyst samples.

7.1.2 Mid-Range Calibration Standard. Concentration equivalent to 40 to 60 percent of the span.

7.1.3 Low-Range Calibration Standard. Concentration equivalent to 1 to 20 percent of the span. The concentration of the low-range calibration standard should be selected so that it is less than either one-fourth of the applicable concentration limit or of the lowest concentration anticipated in the catalyst samples.

7.1.4 Zero Calibration Standard. Concentration of less than 0.25 percent of the span.

7.2 Accuracy Assessment Standard. Prepare an accuracy assessment standard and determine the ideal value for the accuracy assessment standard following the same procedures used to prepare and analyze the calibration standards as described in section 7.1. The maximum percent deviation of the triplicate accuracy assessment standard analyses should agree within 10 percent of the average value for the triplicate analysis (see Figure 1). The concentration equivalent of the accuracy assessment standard must be between 20 and 80 percent of the span.

7.3 Energy Calibration Standard. Generally, the energy calibration standard will be provided by the XRF instrument manufacturer for energy dispersive spectrometers. Energy calibration is performed using the manufacturer's recommended calibration standard and involves measurement of a specific energy line (based on the metal in the energy calibration standard). This is generally an automated procedure used to assure the accuracy of the energy scale. This calibration standard may not be applicable to all models of XRF spectrometers (particularly wavelength dispersive XRF spectrometers).

## **8.0 Sample Collection, Preservation, Transport, and Storage. [Reserved]**

## **9.0 Quality Control.**

9.1 Energy Calibration. For energy dispersive spectrometers, conduct the energy calibration by analyzing the energy calibration standard provided by the manufacturer. The energy calibration involves measurement of a specific energy line (based on the metal in the energy calibration standard) and then determination of the difference between the measured peak energy value and the ideal value. This analysis, if applicable, should be performed daily prior to any sample analyses to check the instrument's energy scale. This is generally an automated procedure and assures the accuracy of the energy scale. If the energy scale calibration process is not automated, follow the manufacturer's procedures to manually adjust the instrument, as necessary.

9.2 Zero Drift Test. Conduct the zero drift test by analyzing the analyte concentration output by the measurement system with the initial calibration value for the zero calibration standard (see Figure 2). This analysis should be performed with each set of samples analyzed.

9.3 Calibration Drift Test. Conduct the calibration drift test by analyzing the analyte concentration output by the measurement system with the initial calibration value for the mid-range calibration standard (see Figure 2). This analysis should be performed with each set of samples analyzed.

9.4 Analyzer Accuracy Test. Conduct the analyzer accuracy test by analyzing the accuracy assessment standard and comparing the value output by the measurement system with the ideal value for the accuracy assessment standard (see Figure 2). This analysis should be performed with each set of samples analyzed.

## **10.0 Calibration and Standardization.**

10.1 Perform the initial calibration and set-up following the instrument manufacturer's instructions. These procedures should include, at a minimum, the major steps listed in sections 10.2 and 10.3. Subsequent calibrations are to be performed when either a quality assurance/quality control (QA/QC) limit listed in section 13 is exceeded or when there is a change in the excitation conditions, such as a change in the tube, detector, X-ray filters, or signal processor. Calibrations are typically valid for 6 months to 1 year.

10.2 Instrument Calibration. Calibration is performed initially with calibration standards of similar matrix and binders, if used, as the samples to be analyzed (see Figure 1).

10.3 Reference Peak Spectra. Acquisition of reference spectra is required only during the initial calibration. As long as no processing methods have changed, these peak shape references remain valid. This procedure consists of placing the standards in the instrument and acquiring individual elemental spectra that are stored in the method file with each of the analytical conditions. These reference spectra are used in the standard deconvolution of the unknown spectra.

## **11.0 Analytical Procedure.**

11.1 Sample Preparation. Prepare catalyst samples using the same procedure used to prepare the calibration standards. Measure and record the weight of sample used. Measure and record the amount of binder, if any, used. Pellets or films must be of sufficient size to cover the analyzer sample window.

11.2 Sample Analyses. Place the prepared catalyst samples into the analyzer. Follow the manufacturer's instructions for analyzing the samples.

11.3 Record and Store Data. Use a digital recorder or personal computer to record and store results for each sample. Record any mechanical or software problems encountered during the analysis.

## **12.0 Data Analysis and Calculations.**

Carry out the following calculations, retaining at least one extra significant figure beyond that of the acquired data. Round off figures after final calculation.

12.1 Drift. Calculate the zero and calibration drift for the tests described in sections 9.2 and 9.3 (see also Figure 2) as follows:

$$\text{QC Value} = \frac{\text{CurrentAnalyzerCal.Response} - \text{InitialCal.Response}}{\text{Span}} \times 100 \quad (\text{Eq. A-1})$$

Where:

CurrentAnalyzerCal.Response = Instrument response for current QC sample analyses;

InitialCal.Response = Initial instrument response for calibration standard;

QC Value = QC metric (zero drift or calibration drift), percent of span;

Span = Span of the monitoring system.

12.2 Analyzer Accuracy. Calculate the analyzer accuracy error for the tests described in section 9.4 (see also Figure 2) as follows:

$$\text{Accuracy Value} = \frac{\text{CurrentAnalyzerCal.Response} - \text{IdealCal.Response}}{\text{IdealCal.Response}} \times 100 \quad (\text{Eq. A-2})$$

Where:

Accuracy Value = Percent difference of instrument response to the ideal response for the accuracy assessment standard;

CurrentAnalyzerCal.Response = Instrument response for current QC sample analyses;

IdealCal.Response = Ideal instrument response for the accuracy assessment standard.

### **13.0 Method Performance.**

13.1 Analytical Range. The analytical range is determined by the instrument design. For this method, a portion of the analytical range is selected by choosing the span of the monitoring system. The span of the monitoring system must be selected such that it encompasses the range of concentrations anticipated to occur in the catalyst sample. If applicable, the span must be selected such that the analyte concentration equivalent to the emission standard is not less than 30 percent of the span. If the measured analyte concentration exceeds the concentration of the high-range calibration standard, the sample analysis is considered invalid. Additionally, if the measured analyte concentration is less than the concentration of the low-range calibration standard but above the detectable limit, the sample analysis results must be flagged with a footnote stating, in effect, that the analyte was detected but that the reported concentration is below the lower quantitation limit.

13.2 Minimum Detectable Limit. The minimum detectable limit depends on the signal-to-noise ratio of the measurement system. For a well-designed system, the minimum detectable limit should be less than 2 percent of the span.

13.3 Zero Drift. Less than  $\pm 2$  percent of the span.

13.4 Calibration Drift. Less than  $\pm 5$  percent of the span.

13.5 Analyzer Accuracy Error. Less than  $\pm 10$  percent.

## Attachment Q

### Part 70 Operating Permit No: 147-39554-00065

[Downloaded from the eCFR on July 23, 2014]

#### Electronic Code of Federal Regulations

#### Title 40: Protection of Environment

#### PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

#### Subpart ZZZZ—National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines

Source: 69 FR 33506, June 15, 2004, unless otherwise noted.

#### What This Subpart Covers

#### §63.6580 What is the purpose of subpart ZZZZ?

Subpart ZZZZ establishes national emission limitations and operating limitations for hazardous air pollutants (HAP) emitted from stationary reciprocating internal combustion engines (RICE) located at major and area sources of HAP emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations and operating limitations.

[73 FR 3603, Jan. 18, 2008]

#### §63.6585 Am I subject to this subpart?

You are subject to this subpart if you own or operate a stationary RICE at a major or area source of HAP emissions, except if the stationary RICE is being tested at a stationary RICE test cell/stand.

(a) A stationary RICE is any internal combustion engine which uses reciprocating motion to convert heat energy into mechanical work and which is not mobile. Stationary RICE differ from mobile RICE in that a stationary RICE is not a non-road engine as defined at 40 CFR 1068.30, and is not used to propel a motor vehicle or a vehicle used solely for competition.

(b) A major source of HAP emissions is a plant site that emits or has the potential to emit any single HAP at a rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year, except that for oil and gas production facilities, a major source of HAP emissions is determined for each surface site.

(c) An area source of HAP emissions is a source that is not a major source.

(d) If you are an owner or operator of an area source subject to this subpart, your status as an entity subject to a standard or other requirements under this subpart does not subject you to the obligation to obtain a permit under 40 CFR part 70 or 71, provided you are not required to obtain a permit under 40 CFR 70.3(a) or 40 CFR 71.3(a) for a reason other than your status as an area source under this subpart. Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart as applicable.

(e) If you are an owner or operator of a stationary RICE used for national security purposes, you may be eligible to request an exemption from the requirements of this subpart as described in 40 CFR part 1068, subpart C.

(f) The emergency stationary RICE listed in paragraphs (f)(1) through (3) of this section are not subject to this subpart. The stationary RICE must meet the definition of an emergency stationary RICE in §63.6675, which includes operating according to the provisions specified in §63.6640(f).

(1) Existing residential emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

(2) Existing commercial emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

(3) Existing institutional emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

[69 FR 33506, June 15, 2004, as amended at 73 FR 3603, Jan. 18, 2008; 78 FR 6700, Jan. 30, 2013]

**§63.6590 What parts of my plant does this subpart cover?**

This subpart applies to each affected source.

(a) *Affected source.* An affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

(1) *Existing stationary RICE.*

(i) For stationary RICE with a site rating of more than 500 brake horsepower (HP) located at a major source of HAP emissions, a stationary RICE is existing if you commenced construction or reconstruction of the stationary RICE before December 19, 2002.

(ii) For stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, a stationary RICE is existing if you commenced construction or reconstruction of the stationary RICE before June 12, 2006.

(iii) For stationary RICE located at an area source of HAP emissions, a stationary RICE is existing if you commenced construction or reconstruction of the stationary RICE before June 12, 2006.

(iv) A change in ownership of an existing stationary RICE does not make that stationary RICE a new or reconstructed stationary RICE.

(2) *New stationary RICE.* (i) A stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions is new if you commenced construction of the stationary RICE on or after December 19, 2002.

(ii) A stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions is new if you commenced construction of the stationary RICE on or after June 12, 2006.

(iii) A stationary RICE located at an area source of HAP emissions is new if you commenced construction of the stationary RICE on or after June 12, 2006.

(3) *Reconstructed stationary RICE.* (i) A stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions is reconstructed if you meet the definition of reconstruction in §63.2 and reconstruction is commenced on or after December 19, 2002.

(ii) A stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions is reconstructed if you meet the definition of reconstruction in §63.2 and reconstruction is commenced on or after June 12, 2006.

(iii) A stationary RICE located at an area source of HAP emissions is reconstructed if you meet the definition of reconstruction in §63.2 and reconstruction is commenced on or after June 12, 2006.

(b) *Stationary RICE subject to limited requirements.* (1) An affected source which meets either of the criteria in paragraphs (b)(1)(i) through (ii) of this section does not have to meet the requirements of this subpart and of subpart A of this part except for the initial notification requirements of §63.6645(f).

(i) The stationary RICE is a new or reconstructed emergency stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions that does not operate or is not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii).

(ii) The stationary RICE is a new or reconstructed limited use stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions.

(2) A new or reconstructed stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis must meet the initial notification requirements of §63.6645(f) and the requirements of §§63.6625(c), 63.6650(g), and 63.6655(c). These stationary RICE do not have to meet the emission limitations and operating limitations of this subpart.

(3) The following stationary RICE do not have to meet the requirements of this subpart and of subpart A of this part, including initial notification requirements:

(i) Existing spark ignition 2 stroke lean burn (2SLB) stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions;

(ii) Existing spark ignition 4 stroke lean burn (4SLB) stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions;

(iii) Existing emergency stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions that does not operate or is not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii).

(iv) Existing limited use stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions;

(v) Existing stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis;

(c) *Stationary RICE subject to Regulations under 40 CFR Part 60.* An affected source that meets any of the criteria in paragraphs (c)(1) through (7) of this section must meet the requirements of this part by meeting the requirements of 40 CFR part 60 subpart IIII, for compression ignition engines or 40 CFR part 60 subpart JJJJ, for spark ignition engines. No further requirements apply for such engines under this part.

(1) A new or reconstructed stationary RICE located at an area source;

(2) A new or reconstructed 2SLB stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions;

(3) A new or reconstructed 4SLB stationary RICE with a site rating of less than 250 brake HP located at a major source of HAP emissions;

(4) A new or reconstructed spark ignition 4 stroke rich burn (4SRB) stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions;

(5) A new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis;

(6) A new or reconstructed emergency or limited use stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions;

(7) A new or reconstructed compression ignition (CI) stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions.

[69 FR 33506, June 15, 2004, as amended at 73 FR 3604, Jan. 18, 2008; 75 FR 9674, Mar. 3, 2010; 75 FR 37733, June 30, 2010; 75 FR 51588, Aug. 20, 2010; 78 FR 6700, Jan. 30, 2013]

### **§63.6595 When do I have to comply with this subpart?**

(a) *Affected sources.* (1) If you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

(2) If you start up your new or reconstructed stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions before August 16, 2004, you must comply with the applicable emission limitations and operating limitations in this subpart no later than August 16, 2004.

(3) If you start up your new or reconstructed stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions after August 16, 2004, you must comply with the applicable emission limitations and operating limitations in this subpart upon startup of your affected source.

(4) If you start up your new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions before January 18, 2008, you must comply with the applicable emission limitations and operating limitations in this subpart no later than January 18, 2008.

(5) If you start up your new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions after January 18, 2008, you must comply with the applicable emission limitations and operating limitations in this subpart upon startup of your affected source.

(6) If you start up your new or reconstructed stationary RICE located at an area source of HAP emissions before January 18, 2008, you must comply with the applicable emission limitations and operating limitations in this subpart no later than January 18, 2008.

(7) If you start up your new or reconstructed stationary RICE located at an area source of HAP emissions after January 18, 2008, you must comply with the applicable emission limitations and operating limitations in this subpart upon startup of your affected source.

(b) *Area sources that become major sources.* If you have an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP, the compliance dates in paragraphs (b)(1) and (2) of this section apply to you.

(1) Any stationary RICE for which construction or reconstruction is commenced after the date when your area source becomes a major source of HAP must be in compliance with this subpart upon startup of your affected source.

(2) Any stationary RICE for which construction or reconstruction is commenced before your area source becomes a major source of HAP must be in compliance with the provisions of this subpart that are applicable to RICE located at major sources within 3 years after your area source becomes a major source of HAP.

(c) If you own or operate an affected source, you must meet the applicable notification requirements in §63.6645 and in 40 CFR part 63, subpart A.

[69 FR 33506, June 15, 2004, as amended at 73 FR 3604, Jan. 18, 2008; 75 FR 9675, Mar. 3, 2010; 75 FR 51589, Aug. 20, 2010; 78 FR 6701, Jan. 30, 2013]

### **Emission and Operating Limitations**

#### **§63.6600 What emission limitations and operating limitations must I meet if I own or operate a stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions?**

Compliance with the numerical emission limitations established in this subpart is based on the results of testing the average of three 1-hour runs using the testing requirements and procedures in §63.6620 and Table 4 to this subpart.

(a) If you own or operate an existing, new, or reconstructed spark ignition 4SRB stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the emission limitations in Table 1a to this subpart and the operating limitations in Table 1b to this subpart which apply to you.

(b) If you own or operate a new or reconstructed 2SLB stationary RICE with a site rating of more than 500 brake HP located at major source of HAP emissions, a new or reconstructed 4SLB stationary RICE with a site rating of more than 500 brake HP located at major source of HAP emissions, or a new or reconstructed CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the emission limitations in Table 2a to this subpart and the operating limitations in Table 2b to this subpart which apply to you.

(c) If you own or operate any of the following stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the emission limitations in Tables 1a, 2a, 2c, and 2d to this subpart or operating limitations in Tables 1b and 2b to this subpart: an existing 2SLB stationary RICE; an existing 4SLB stationary RICE; a stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis; an emergency stationary RICE; or a limited use stationary RICE.

(d) If you own or operate an existing non-emergency stationary CI RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the emission limitations in Table 2c to this subpart and the operating limitations in Table 2b to this subpart which apply to you.

[73 FR 3605, Jan. 18, 2008, as amended at 75 FR 9675, Mar. 3, 2010]

#### **§63.6601 What emission limitations must I meet if I own or operate a new or reconstructed 4SLB stationary RICE with a site rating of greater than or equal to 250 brake HP and less than or equal to 500 brake HP located at a major source of HAP emissions?**

Compliance with the numerical emission limitations established in this subpart is based on the results of testing the average of three 1-hour runs using the testing requirements and procedures in §63.6620 and Table 4 to this subpart. If you own or operate a new or reconstructed 4SLB stationary RICE with a site rating of greater than or equal to 250 and less than or equal to 500 brake HP located at major source of HAP emissions manufactured on or after January 1, 2008, you must comply with the emission limitations in Table 2a to this subpart and the operating limitations in Table 2b to this subpart which apply to you.

[73 FR 3605, Jan. 18, 2008, as amended at 75 FR 9675, Mar. 3, 2010; 75 FR 51589, Aug. 20, 2010]

**§63.6602 What emission limitations and other requirements must I meet if I own or operate an existing stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions?**

If you own or operate an existing stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions, you must comply with the emission limitations and other requirements in Table 2c to this subpart which apply to you. Compliance with the numerical emission limitations established in this subpart is based on the results of testing the average of three 1-hour runs using the testing requirements and procedures in §63.6620 and Table 4 to this subpart.

[78 FR 6701, Jan. 30, 2013]

**§63.6603 What emission limitations, operating limitations, and other requirements must I meet if I own or operate an existing stationary RICE located at an area source of HAP emissions?**

Compliance with the numerical emission limitations established in this subpart is based on the results of testing the average of three 1-hour runs using the testing requirements and procedures in §63.6620 and Table 4 to this subpart.

(a) If you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to this subpart and the operating limitations in Table 2b to this subpart that apply to you.

(b) If you own or operate an existing stationary non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP that meets either paragraph (b)(1) or (2) of this section, you do not have to meet the numerical CO emission limitations specified in Table 2d of this subpart. Existing stationary non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP that meet either paragraph (b)(1) or (2) of this section must meet the management practices that are shown for stationary non-emergency CI RICE with a site rating of less than or equal to 300 HP in Table 2d of this subpart.

(1) The area source is located in an area of Alaska that is not accessible by the Federal Aid Highway System (FAHS).

(2) The stationary RICE is located at an area source that meets paragraphs (b)(2)(i), (ii), and (iii) of this section.

(i) The only connection to the FAHS is through the Alaska Marine Highway System (AMHS), or the stationary RICE operation is within an isolated grid in Alaska that is not connected to the statewide electrical grid referred to as the Alaska Railbelt Grid.

(ii) At least 10 percent of the power generated by the stationary RICE on an annual basis is used for residential purposes.

(iii) The generating capacity of the area source is less than 12 megawatts, or the stationary RICE is used exclusively for backup power for renewable energy.

(c) If you own or operate an existing stationary non-emergency CI RICE with a site rating of more than 300 HP located on an offshore vessel that is an area source of HAP and is a nonroad vehicle that is an Outer Continental Shelf (OCS) source as defined in 40 CFR 55.2, you do not have to meet the numerical CO emission limitations specified in Table 2d of this subpart. You must meet all of the following management practices:

(1) Change oil every 1,000 hours of operation or annually, whichever comes first. Sources have the option to utilize an oil analysis program as described in §63.6625(i) in order to extend the specified oil change requirement.

(2) Inspect and clean air filters every 750 hours of operation or annually, whichever comes first, and replace as necessary.

(3) Inspect fuel filters and belts, if installed, every 750 hours of operation or annually, whichever comes first, and replace as necessary.

(4) Inspect all flexible hoses every 1,000 hours of operation or annually, whichever comes first, and replace as necessary.

(d) If you own or operate an existing non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP emissions that is certified to the Tier 1 or Tier 2 emission standards in Table 1 of 40 CFR 89.112 and that is subject to an enforceable state or local standard that requires the engine to be replaced no later than June 1, 2018, you may until January 1, 2015, or 12 years after the installation date of the engine (whichever is later), but not later than June 1, 2018, choose to comply with the management practices that are shown for stationary non-emergency CI RICE with a site rating of less than or equal to 300 HP in Table 2d of this subpart instead of the applicable emission limitations in Table 2d, operating limitations in Table 2b, and crankcase ventilation system requirements in §63.6625(g). You must comply with the emission limitations in Table 2d and operating limitations in Table 2b that apply for non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP emissions by January 1, 2015, or 12 years after the installation date of the engine (whichever is later), but not later than June 1, 2018. You must also comply with the crankcase ventilation system requirements in §63.6625(g) by January 1, 2015, or 12 years after the installation date of the engine (whichever is later), but not later than June 1, 2018.

(e) If you own or operate an existing non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP emissions that is certified to the Tier 3 (Tier 2 for engines above 560 kilowatt (kW)) emission standards in Table 1 of 40 CFR 89.112, you may comply with the requirements under this part by meeting the requirements for Tier 3 engines (Tier 2 for engines above 560 kW) in 40 CFR part 60 subpart IIII instead of the emission limitations and other requirements that would otherwise apply under this part for existing non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP emissions.

(f) An existing non-emergency SI 4SLB and 4SRB stationary RICE with a site rating of more than 500 HP located at area sources of HAP must meet the definition of remote stationary RICE in §63.6675 on the initial compliance date for the engine, October 19, 2013, in order to be considered a remote stationary RICE under this subpart. Owners and operators of existing non-emergency SI 4SLB and 4SRB stationary RICE with a site rating of more than 500 HP located at area sources of HAP that meet the definition of remote stationary RICE in §63.6675 of this subpart as of October 19, 2013 must evaluate the status of their stationary RICE every 12 months. Owners and operators must keep records of the initial and annual evaluation of the status of the engine. If the evaluation indicates that the stationary RICE no longer meets the definition of remote stationary RICE in §63.6675 of this subpart, the owner or operator must comply with all of the requirements for existing non-emergency SI 4SLB and 4SRB stationary RICE with a site rating of more than 500 HP located at area sources of HAP that are not remote stationary RICE within 1 year of the evaluation.

[75 FR 9675, Mar. 3, 2010, as amended at 75 FR 51589, Aug. 20, 2010; 76 FR 12866, Mar. 9, 2011; 78 FR 6701, Jan. 30, 2013]

#### **§63.6604 What fuel requirements must I meet if I own or operate a stationary CI RICE?**

(a) If you own or operate an existing non-emergency, non-black start CI stationary RICE with a site rating of more than 300 brake HP with a displacement of less than 30 liters per cylinder that uses diesel fuel, you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel.

(b) Beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates or is contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) or that operates for the purpose specified in §63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

(c) Beginning January 1, 2015, if you own or operate a new emergency CI stationary RICE with a site rating of more than 500 brake HP and a displacement of less than 30 liters per cylinder located at a major source of HAP that uses diesel fuel and operates or is contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

(d) Existing CI stationary RICE located in Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, at area sources in areas of Alaska that meet either §63.6603(b)(1) or §63.6603(b)(2), or are on offshore vessels that meet §63.6603(c) are exempt from the requirements of this section.

[78 FR 6702, Jan. 30, 2013]

### **General Compliance Requirements**

#### **§63.6605 What are my general requirements for complying with this subpart?**

(a) You must be in compliance with the emission limitations, operating limitations, and other requirements in this subpart that apply to you at all times.

(b) At all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by this standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

[75 FR 9675, Mar. 3, 2010, as amended at 78 FR 6702, Jan. 30, 2013]

### **Testing and Initial Compliance Requirements**

#### **§63.6610 By what date must I conduct the initial performance tests or other initial compliance demonstrations if I own or operate a stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions?**

If you own or operate a stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions you are subject to the requirements of this section.

(a) You must conduct the initial performance test or other initial compliance demonstrations in Table 4 to this subpart that apply to you within 180 days after the compliance date that is specified for your stationary RICE in §63.6595 and according to the provisions in §63.7(a)(2).

(b) If you commenced construction or reconstruction between December 19, 2002 and June 15, 2004 and own or operate stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must demonstrate initial compliance with either the proposed emission limitations or the promulgated emission limitations no later than February 10, 2005 or no later than 180 days after startup of the source, whichever is later, according to §63.7(a)(2)(ix).

(c) If you commenced construction or reconstruction between December 19, 2002 and June 15, 2004 and own or operate stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, and you chose to comply with the proposed emission limitations when demonstrating initial compliance, you must conduct a second performance test to demonstrate compliance with the promulgated emission limitations by December 13, 2007 or after startup of the source, whichever is later, according to §63.7(a)(2)(ix).

(d) An owner or operator is not required to conduct an initial performance test on units for which a performance test has been previously conducted, but the test must meet all of the conditions described in paragraphs (d)(1) through (5) of this section.

(1) The test must have been conducted using the same methods specified in this subpart, and these methods must have been followed correctly.

(2) The test must not be older than 2 years.

- (3) The test must be reviewed and accepted by the Administrator.
- (4) Either no process or equipment changes must have been made since the test was performed, or the owner or operator must be able to demonstrate that the results of the performance test, with or without adjustments, reliably demonstrate compliance despite process or equipment changes.
- (5) The test must be conducted at any load condition within plus or minus 10 percent of 100 percent load.

[69 FR 33506, June 15, 2004, as amended at 73 FR 3605, Jan. 18, 2008]

**§63.6611 By what date must I conduct the initial performance tests or other initial compliance demonstrations if I own or operate a new or reconstructed 4SLB SI stationary RICE with a site rating of greater than or equal to 250 and less than or equal to 500 brake HP located at a major source of HAP emissions?**

If you own or operate a new or reconstructed 4SLB stationary RICE with a site rating of greater than or equal to 250 and less than or equal to 500 brake HP located at a major source of HAP emissions, you must conduct an initial performance test within 240 days after the compliance date that is specified for your stationary RICE in §63.6595 and according to the provisions specified in Table 4 to this subpart, as appropriate.

[73 FR 3605, Jan. 18, 2008, as amended at 75 FR 51589, Aug. 20, 2010]

**§63.6612 By what date must I conduct the initial performance tests or other initial compliance demonstrations if I own or operate an existing stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing stationary RICE located at an area source of HAP emissions?**

If you own or operate an existing stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing stationary RICE located at an area source of HAP emissions you are subject to the requirements of this section.

- (a) You must conduct any initial performance test or other initial compliance demonstration according to Tables 4 and 5 to this subpart that apply to you within 180 days after the compliance date that is specified for your stationary RICE in §63.6595 and according to the provisions in §63.7(a)(2).
- (b) An owner or operator is not required to conduct an initial performance test on a unit for which a performance test has been previously conducted, but the test must meet all of the conditions described in paragraphs (b)(1) through (4) of this section.

- (1) The test must have been conducted using the same methods specified in this subpart, and these methods must have been followed correctly.
- (2) The test must not be older than 2 years.
- (3) The test must be reviewed and accepted by the Administrator.
- (4) Either no process or equipment changes must have been made since the test was performed, or the owner or operator must be able to demonstrate that the results of the performance test, with or without adjustments, reliably demonstrate compliance despite process or equipment changes.

[75 FR 9676, Mar. 3, 2010, as amended at 75 FR 51589, Aug. 20, 2010]

**§63.6615 When must I conduct subsequent performance tests?**

If you must comply with the emission limitations and operating limitations, you must conduct subsequent performance tests as specified in Table 3 of this subpart.

**§63.6620 What performance tests and other procedures must I use?**

(a) You must conduct each performance test in Tables 3 and 4 of this subpart that applies to you.

(b) Each performance test must be conducted according to the requirements that this subpart specifies in Table 4 to this subpart. If you own or operate a non-operational stationary RICE that is subject to performance testing, you do not need to start up the engine solely to conduct the performance test. Owners and operators of a non-operational engine can conduct the performance test when the engine is started up again. The test must be conducted at any load condition within plus or minus 10 percent of 100 percent load for the stationary RICE listed in paragraphs (b)(1) through (4) of this section.

(1) Non-emergency 4SRB stationary RICE with a site rating of greater than 500 brake HP located at a major source of HAP emissions.

(2) New non-emergency 4SLB stationary RICE with a site rating of greater than or equal to 250 brake HP located at a major source of HAP emissions.

(3) New non-emergency 2SLB stationary RICE with a site rating of greater than 500 brake HP located at a major source of HAP emissions.

(4) New non-emergency CI stationary RICE with a site rating of greater than 500 brake HP located at a major source of HAP emissions.

(c) [Reserved]

(d) You must conduct three separate test runs for each performance test required in this section, as specified in §63.7(e)(3). Each test run must last at least 1 hour, unless otherwise specified in this subpart.

(e)(1) You must use Equation 1 of this section to determine compliance with the percent reduction requirement:

$$\frac{C_i - C_o}{C_i} \times 100 = R \quad (\text{Eq. 1})$$

Where:

$C_i$  = concentration of carbon monoxide (CO), total hydrocarbons (THC), or formaldehyde at the control device inlet,

$C_o$  = concentration of CO, THC, or formaldehyde at the control device outlet, and

R = percent reduction of CO, THC, or formaldehyde emissions.

(2) You must normalize the CO, THC, or formaldehyde concentrations at the inlet and outlet of the control device to a dry basis and to 15 percent oxygen, or an equivalent percent carbon dioxide (CO<sub>2</sub>). If pollutant concentrations are to be corrected to 15 percent oxygen and CO<sub>2</sub> concentration is measured in lieu of oxygen concentration measurement, a CO<sub>2</sub> correction factor is needed. Calculate the CO<sub>2</sub> correction factor as described in paragraphs (e)(2)(i) through (iii) of this section.

(i) Calculate the fuel-specific  $F_o$  value for the fuel burned during the test using values obtained from Method 19, Section 5.2, and the following equation:

$$F_o = \frac{0.209 F_d}{F_c} \quad (\text{Eq. 2})$$

Where:

$F_o$  = Fuel factor based on the ratio of oxygen volume to the ultimate  $CO_2$  volume produced by the fuel at zero percent excess air.

0.209 = Fraction of air that is oxygen, percent/100.

$F_d$  = Ratio of the volume of dry effluent gas to the gross calorific value of the fuel from Method 19, dsm<sup>3</sup>/J (dscf/106 Btu).

$F_c$  = Ratio of the volume of  $CO_2$  produced to the gross calorific value of the fuel from Method 19, dsm<sup>3</sup>/J (dscf/106 Btu)

(ii) Calculate the  $CO_2$  correction factor for correcting measurement data to 15 percent  $O_2$ , as follows:

$$X_{CO_2} = \frac{5.9}{F_o} \quad (\text{Eq. 3})$$

Where:

$X_{CO_2}$  =  $CO_2$  correction factor, percent.

5.9 = 20.9 percent  $O_2$ —15 percent  $O_2$ , the defined  $O_2$  correction value, percent.

(iii) Calculate the CO, THC, and formaldehyde gas concentrations adjusted to 15 percent  $O_2$  using  $CO_2$  as follows:

$$C_{adj} = C_d \frac{X_{CO_2}}{\%CO_2} \quad (\text{Eq. 4})$$

Where:

$C_{adj}$  = Calculated concentration of CO, THC, or formaldehyde adjusted to 15 percent  $O_2$ .

$C_d$  = Measured concentration of CO, THC, or formaldehyde, uncorrected.

$X_{CO_2}$  =  $CO_2$  correction factor, percent.

$\%CO_2$  = Measured  $CO_2$  concentration measured, dry basis, percent.

(f) If you comply with the emission limitation to reduce CO and you are not using an oxidation catalyst, if you comply with the emission limitation to reduce formaldehyde and you are not using NSCR, or if you comply with the emission limitation to limit the concentration of formaldehyde in the stationary RICE exhaust and you are not using an oxidation catalyst or NSCR, you must petition the Administrator for operating limitations to be established during the initial performance test and continuously monitored thereafter; or for approval of no operating limitations. You must not conduct the initial performance test until after the petition has been approved by the Administrator.

(g) If you petition the Administrator for approval of operating limitations, your petition must include the information described in paragraphs (g)(1) through (5) of this section.

(1) Identification of the specific parameters you propose to use as operating limitations;

(2) A discussion of the relationship between these parameters and HAP emissions, identifying how HAP emissions change with changes in these parameters, and how limitations on these parameters will serve to limit HAP emissions;

(3) A discussion of how you will establish the upper and/or lower values for these parameters which will establish the limits on these parameters in the operating limitations;

(4) A discussion identifying the methods you will use to measure and the instruments you will use to monitor these parameters, as well as the relative accuracy and precision of these methods and instruments; and

(5) A discussion identifying the frequency and methods for recalibrating the instruments you will use for monitoring these parameters.

(h) If you petition the Administrator for approval of no operating limitations, your petition must include the information described in paragraphs (h)(1) through (7) of this section.

(1) Identification of the parameters associated with operation of the stationary RICE and any emission control device which could change intentionally (e.g., operator adjustment, automatic controller adjustment, etc.) or unintentionally (e.g., wear and tear, error, etc.) on a routine basis or over time;

(2) A discussion of the relationship, if any, between changes in the parameters and changes in HAP emissions;

(3) For the parameters which could change in such a way as to increase HAP emissions, a discussion of whether establishing limitations on the parameters would serve to limit HAP emissions;

(4) For the parameters which could change in such a way as to increase HAP emissions, a discussion of how you could establish upper and/or lower values for the parameters which would establish limits on the parameters in operating limitations;

(5) For the parameters, a discussion identifying the methods you could use to measure them and the instruments you could use to monitor them, as well as the relative accuracy and precision of the methods and instruments;

(6) For the parameters, a discussion identifying the frequency and methods for recalibrating the instruments you could use to monitor them; and

(7) A discussion of why, from your point of view, it is infeasible or unreasonable to adopt the parameters as operating limitations.

(i) The engine percent load during a performance test must be determined by documenting the calculations, assumptions, and measurement devices used to measure or estimate the percent load in a specific application. A written report of the average percent load determination must be included in the notification of compliance status. The following information must be included in the written report: the engine model number, the engine manufacturer, the year of purchase, the manufacturer's site-rated brake horsepower, the ambient temperature, pressure, and humidity during the performance test, and all assumptions that were made to estimate or calculate percent load during the performance test must be clearly explained. If measurement devices such as flow meters, kilowatt meters, beta analyzers, stain gauges, etc. are used, the model number of the measurement device, and an estimate of its accurate in percentage of true value must be provided.

[69 FR 33506, June 15, 2004, as amended at 75 FR 9676, Mar. 3, 2010; 78 FR 6702, Jan. 30, 2013]

**§63.6625 What are my monitoring, installation, collection, operation, and maintenance requirements?**

(a) If you elect to install a CEMS as specified in Table 5 of this subpart, you must install, operate, and maintain a CEMS to monitor CO and either O<sub>2</sub> or CO<sub>2</sub> according to the requirements in paragraphs (a)(1) through (4) of this section. If you are meeting a requirement to reduce CO emissions, the CEMS must be installed at both the inlet and outlet of the control device. If you are meeting a requirement to limit the concentration of CO, the CEMS must be installed at the outlet of the control device.

(1) Each CEMS must be installed, operated, and maintained according to the applicable performance specifications of 40 CFR part 60, appendix B.

(2) You must conduct an initial performance evaluation and an annual relative accuracy test audit (RATA) of each CEMS according to the requirements in §63.8 and according to the applicable performance specifications of 40 CFR

part 60, appendix B as well as daily and periodic data quality checks in accordance with 40 CFR part 60, appendix F, procedure 1.

(3) As specified in §63.8(c)(4)(ii), each CEMS must complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period. You must have at least two data points, with each representing a different 15-minute period, to have a valid hour of data.

(4) The CEMS data must be reduced as specified in §63.8(g)(2) and recorded in parts per million or parts per billion (as appropriate for the applicable limitation) at 15 percent oxygen or the equivalent CO<sub>2</sub> concentration.

(b) If you are required to install a continuous parameter monitoring system (CPMS) as specified in Table 5 of this subpart, you must install, operate, and maintain each CPMS according to the requirements in paragraphs (b)(1) through (6) of this section. For an affected source that is complying with the emission limitations and operating limitations on March 9, 2011, the requirements in paragraph (b) of this section are applicable September 6, 2011.

(1) You must prepare a site-specific monitoring plan that addresses the monitoring system design, data collection, and the quality assurance and quality control elements outlined in paragraphs (b)(1)(i) through (v) of this section and in §63.8(d). As specified in §63.8(f)(4), you may request approval of monitoring system quality assurance and quality control procedures alternative to those specified in paragraphs (b)(1) through (5) of this section in your site-specific monitoring plan.

(i) The performance criteria and design specifications for the monitoring system equipment, including the sample interface, detector signal analyzer, and data acquisition and calculations;

(ii) Sampling interface (e.g., thermocouple) location such that the monitoring system will provide representative measurements;

(iii) Equipment performance evaluations, system accuracy audits, or other audit procedures;

(iv) Ongoing operation and maintenance procedures in accordance with provisions in §63.8(c)(1)(ii) and (c)(3); and

(v) Ongoing reporting and recordkeeping procedures in accordance with provisions in §63.10(c), (e)(1), and (e)(2)(i).

(2) You must install, operate, and maintain each CPMS in continuous operation according to the procedures in your site-specific monitoring plan.

(3) The CPMS must collect data at least once every 15 minutes (see also §63.6635).

(4) For a CPMS for measuring temperature range, the temperature sensor must have a minimum tolerance of 2.8 degrees Celsius (5 degrees Fahrenheit) or 1 percent of the measurement range, whichever is larger.

(5) You must conduct the CPMS equipment performance evaluation, system accuracy audits, or other audit procedures specified in your site-specific monitoring plan at least annually.

(6) You must conduct a performance evaluation of each CPMS in accordance with your site-specific monitoring plan.

(c) If you are operating a new or reconstructed stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, you must monitor and record your fuel usage daily with separate fuel meters to measure the volumetric flow rate of each fuel. In addition, you must operate your stationary RICE in a manner which reasonably minimizes HAP emissions.

(d) If you are operating a new or reconstructed emergency 4SLB stationary RICE with a site rating of greater than or equal to 250 and less than or equal to 500 brake HP located at a major source of HAP emissions, you must install a non-resettable hour meter prior to the startup of the engine.

(e) If you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

- (1) An existing stationary RICE with a site rating of less than 100 HP located at a major source of HAP emissions;
- (2) An existing emergency or black start stationary RICE with a site rating of less than or equal to 500 HP located at a major source of HAP emissions;
- (3) An existing emergency or black start stationary RICE located at an area source of HAP emissions;
- (4) An existing non-emergency, non-black start stationary CI RICE with a site rating less than or equal to 300 HP located at an area source of HAP emissions;
- (5) An existing non-emergency, non-black start 2SLB stationary RICE located at an area source of HAP emissions;
- (6) An existing non-emergency, non-black start stationary RICE located at an area source of HAP emissions which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis.
- (7) An existing non-emergency, non-black start 4SLB stationary RICE with a site rating less than or equal to 500 HP located at an area source of HAP emissions;
- (8) An existing non-emergency, non-black start 4SRB stationary RICE with a site rating less than or equal to 500 HP located at an area source of HAP emissions;
- (9) An existing, non-emergency, non-black start 4SLB stationary RICE with a site rating greater than 500 HP located at an area source of HAP emissions that is operated 24 hours or less per calendar year; and
- (10) An existing, non-emergency, non-black start 4SRB stationary RICE with a site rating greater than 500 HP located at an area source of HAP emissions that is operated 24 hours or less per calendar year.

(f) If you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

(g) If you own or operate an existing non-emergency, non-black start CI engine greater than or equal to 300 HP that is not equipped with a closed crankcase ventilation system, you must comply with either paragraph (g)(1) or paragraph (2) of this section. Owners and operators must follow the manufacturer's specified maintenance requirements for operating and maintaining the open or closed crankcase ventilation systems and replacing the crankcase filters, or can request the Administrator to approve different maintenance requirements that are as protective as manufacturer requirements. Existing CI engines located at area sources in areas of Alaska that meet either §63.6603(b)(1) or §63.6603(b)(2) do not have to meet the requirements of this paragraph (g). Existing CI engines located on offshore vessels that meet §63.6603(c) do not have to meet the requirements of this paragraph (g).

- (1) Install a closed crankcase ventilation system that prevents crankcase emissions from being emitted to the atmosphere, or
- (2) Install an open crankcase filtration emission control system that reduces emissions from the crankcase by filtering the exhaust stream to remove oil mist, particulates and metals.

(h) If you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to this subpart apply.

(i) If you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to this subpart or in items 1 or 4 of Table 2d to this subpart, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to this subpart. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to this subpart. The analysis program must at a minimum analyze the following three parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

(j) If you own or operate a stationary SI engine that is subject to the work, operation or management practices in items 6, 7, or 8 of Table 2c to this subpart or in items 5, 6, 7, 9, or 11 of Table 2d to this subpart, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to this subpart. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to this subpart. The analysis program must at a minimum analyze the following three parameters: Total Acid Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Acid Number increases by more than 3.0 milligrams of potassium hydroxide (KOH) per gram from Total Acid Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

[69 FR 33506, June 15, 2004, as amended at 73 FR 3606, Jan. 18, 2008; 75 FR 9676, Mar. 3, 2010; 75 FR 51589, Aug. 20, 2010; 76 FR 12866, Mar. 9, 2011; 78 FR 6703, Jan. 30, 2013]

**§63.6630 How do I demonstrate initial compliance with the emission limitations, operating limitations, and other requirements?**

(a) You must demonstrate initial compliance with each emission limitation, operating limitation, and other requirement that applies to you according to Table 5 of this subpart.

(b) During the initial performance test, you must establish each operating limitation in Tables 1b and 2b of this subpart that applies to you.

(c) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.6645.

(d) Non-emergency 4SRB stationary RICE complying with the requirement to reduce formaldehyde emissions by 76 percent or more can demonstrate initial compliance with the formaldehyde emission limit by testing for THC instead of formaldehyde. The testing must be conducted according to the requirements in Table 4 of this subpart. The average reduction of emissions of THC determined from the performance test must be equal to or greater than 30 percent.

(e) The initial compliance demonstration required for existing non-emergency 4SLB and 4SRB stationary RICE with a site rating of more than 500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year must be conducted according to the following requirements:

(1) The compliance demonstration must consist of at least three test runs.

(2) Each test run must be of at least 15 minute duration, except that each test conducted using the method in appendix A to this subpart must consist of at least one measurement cycle and include at least 2 minutes of test data phase measurement.

(3) If you are demonstrating compliance with the CO concentration or CO percent reduction requirement, you must measure CO emissions using one of the CO measurement methods specified in Table 4 of this subpart, or using appendix A to this subpart.

(4) If you are demonstrating compliance with the THC percent reduction requirement, you must measure THC emissions using Method 25A, reported as propane, of 40 CFR part 60, appendix A.

(5) You must measure O<sub>2</sub> using one of the O<sub>2</sub> measurement methods specified in Table 4 of this subpart. Measurements to determine O<sub>2</sub> concentration must be made at the same time as the measurements for CO or THC concentration.

(6) If you are demonstrating compliance with the CO or THC percent reduction requirement, you must measure CO or THC emissions and O<sub>2</sub> emissions simultaneously at the inlet and outlet of the control device.

[69 FR 33506, June 15, 2004, as amended at 78 FR 6704, Jan. 30, 2013]

### **Continuous Compliance Requirements**

#### **§63.6635 How do I monitor and collect data to demonstrate continuous compliance?**

(a) If you must comply with emission and operating limitations, you must monitor and collect data according to this section.

(b) Except for monitor malfunctions, associated repairs, required performance evaluations, and required quality assurance or control activities, you must monitor continuously at all times that the stationary RICE is operating. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

(c) You may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels. You must, however, use all the valid data collected during all other periods.

[69 FR 33506, June 15, 2004, as amended at 76 FR 12867, Mar. 9, 2011]

#### **§63.6640 How do I demonstrate continuous compliance with the emission limitations, operating limitations, and other requirements?**

(a) You must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to this subpart that apply to you according to methods specified in Table 6 to this subpart.

(b) You must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to this subpart that apply to you. These instances are deviations from the emission and operating limitations in this subpart. These deviations must be reported according to the requirements in §63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

(c) The annual compliance demonstration required for existing non-emergency 4SLB and 4SRB stationary RICE with a site rating of more than 500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year must be conducted according to the following requirements:

- (1) The compliance demonstration must consist of at least one test run.
  - (2) Each test run must be of at least 15 minute duration, except that each test conducted using the method in appendix A to this subpart must consist of at least one measurement cycle and include at least 2 minutes of test data phase measurement.
  - (3) If you are demonstrating compliance with the CO concentration or CO percent reduction requirement, you must measure CO emissions using one of the CO measurement methods specified in Table 4 of this subpart, or using appendix A to this subpart.
  - (4) If you are demonstrating compliance with the THC percent reduction requirement, you must measure THC emissions using Method 25A, reported as propane, of 40 CFR part 60, appendix A.
  - (5) You must measure O<sub>2</sub> using one of the O<sub>2</sub> measurement methods specified in Table 4 of this subpart. Measurements to determine O<sub>2</sub> concentration must be made at the same time as the measurements for CO or THC concentration.
  - (6) If you are demonstrating compliance with the CO or THC percent reduction requirement, you must measure CO or THC emissions and O<sub>2</sub> emissions simultaneously at the inlet and outlet of the control device.
  - (7) If the results of the annual compliance demonstration show that the emissions exceed the levels specified in Table 6 of this subpart, the stationary RICE must be shut down as soon as safely possible, and appropriate corrective action must be taken (e.g., repairs, catalyst cleaning, catalyst replacement). The stationary RICE must be retested within 7 days of being restarted and the emissions must meet the levels specified in Table 6 of this subpart. If the retest shows that the emissions continue to exceed the specified levels, the stationary RICE must again be shut down as soon as safely possible, and the stationary RICE may not operate, except for purposes of startup and testing, until the owner/operator demonstrates through testing that the emissions do not exceed the levels specified in Table 6 of this subpart.
- (d) For new, reconstructed, and rebuilt stationary RICE, deviations from the emission or operating limitations that occur during the first 200 hours of operation from engine startup (engine burn-in period) are not violations. Rebuilt stationary RICE means a stationary RICE that has been rebuilt as that term is defined in 40 CFR 94.11(a).
- (e) You must also report each instance in which you did not meet the requirements in Table 8 to this subpart that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to this subpart: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to this subpart, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.
- (f) If you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in paragraphs (f)(1) through (4) of this section. In order for the engine to be considered an emergency stationary RICE under this subpart, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as described in paragraphs (f)(1) through (4) of this section, is prohibited. If you do not operate the engine according to the requirements in paragraphs (f)(1) through (4) of this section, the engine will not be considered an emergency engine under this subpart and must meet all requirements for non-emergency engines.
- (1) There is no time limit on the use of emergency stationary RICE in emergency situations.

(2) You may operate your emergency stationary RICE for any combination of the purposes specified in paragraphs (f)(2)(i) through (iii) of this section for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by paragraphs (f)(3) and (4) of this section counts as part of the 100 hours per calendar year allowed by this paragraph (f)(2).

(i) Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by federal, state or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Administrator for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that federal, state, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

(ii) Emergency stationary RICE may be operated for emergency demand response for periods in which the Reliability Coordinator under the North American Electric Reliability Corporation (NERC) Reliability Standard EOP-002-3, Capacity and Energy Emergencies (incorporated by reference, see §63.14), or other authorized entity as determined by the Reliability Coordinator, has declared an Energy Emergency Alert Level 2 as defined in the NERC Reliability Standard EOP-002-3.

(iii) Emergency stationary RICE may be operated for periods where there is a deviation of voltage or frequency of 5 percent or greater below standard voltage or frequency.

(3) Emergency stationary RICE located at major sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted as part of the 100 hours per calendar year for maintenance and testing and emergency demand response provided in paragraph (f)(2) of this section. The 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to supply power to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

(4) Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted as part of the 100 hours per calendar year for maintenance and testing and emergency demand response provided in paragraph (f)(2) of this section. Except as provided in paragraphs (f)(4)(i) and (ii) of this section, the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

(i) Prior to May 3, 2014, the 50 hours per year for non-emergency situations can be used for peak shaving or non-emergency demand response to generate income for a facility, or to otherwise supply power as part of a financial arrangement with another entity if the engine is operated as part of a peak shaving (load management program) with the local distribution system operator and the power is provided only to the facility itself or to support the local distribution system.

(ii) The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

(A) The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

(B) The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

(C) The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

(D) The power is provided only to the facility itself or to support the local transmission and distribution system.

(E) The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the

engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

[69 FR 33506, June 15, 2004, as amended at 71 FR 20467, Apr. 20, 2006; 73 FR 3606, Jan. 18, 2008; 75 FR 9676, Mar. 3, 2010; 75 FR 51591, Aug. 20, 2010; 78 FR 6704, Jan. 30, 2013]

### **Notifications, Reports, and Records**

#### **§63.6645 What notifications must I submit and when?**

(a) You must submit all of the notifications in §§63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

(1) An existing stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions.

(2) An existing stationary RICE located at an area source of HAP emissions.

(3) A stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions.

(4) A new or reconstructed 4SLB stationary RICE with a site rating of greater than or equal to 250 HP located at a major source of HAP emissions.

(5) This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

(b) As specified in §63.9(b)(2), if you start up your stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions before the effective date of this subpart, you must submit an Initial Notification not later than December 13, 2004.

(c) If you start up your new or reconstructed stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions on or after August 16, 2004, you must submit an Initial Notification not later than 120 days after you become subject to this subpart.

(d) As specified in §63.9(b)(2), if you start up your stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions before the effective date of this subpart and you are required to submit an initial notification, you must submit an Initial Notification not later than July 16, 2008.

(e) If you start up your new or reconstructed stationary RICE with a site rating of equal to or less than 500 brake HP located at a major source of HAP emissions on or after March 18, 2008 and you are required to submit an initial notification, you must submit an Initial Notification not later than 120 days after you become subject to this subpart.

(f) If you are required to submit an Initial Notification but are otherwise not affected by the requirements of this subpart, in accordance with §63.6590(b), your notification should include the information in §63.9(b)(2)(i) through (v), and a statement that your stationary RICE has no additional requirements and explain the basis of the exclusion (for example, that it operates exclusively as an emergency stationary RICE if it has a site rating of more than 500 brake HP located at a major source of HAP emissions).

(g) If you are required to conduct a performance test, you must submit a Notification of Intent to conduct a performance test at least 60 days before the performance test is scheduled to begin as required in §63.7(b)(1).

(h) If you are required to conduct a performance test or other initial compliance demonstration as specified in Tables 4 and 5 to this subpart, you must submit a Notification of Compliance Status according to §63.9(h)(2)(ii).

(1) For each initial compliance demonstration required in Table 5 to this subpart that does not include a performance test, you must submit the Notification of Compliance Status before the close of business on the 30th day following the completion of the initial compliance demonstration.

(2) For each initial compliance demonstration required in Table 5 to this subpart that includes a performance test conducted according to the requirements in Table 3 to this subpart, you must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th day following the completion of the performance test according to §63.10(d)(2).

(i) If you own or operate an existing non-emergency CI RICE with a site rating of more than 300 HP located at an area source of HAP emissions that is certified to the Tier 1 or Tier 2 emission standards in Table 1 of 40 CFR 89.112 and subject to an enforceable state or local standard requiring engine replacement and you intend to meet management practices rather than emission limits, as specified in §63.6603(d), you must submit a notification by March 3, 2013, stating that you intend to use the provision in §63.6603(d) and identifying the state or local regulation that the engine is subject to.

[73 FR 3606, Jan. 18, 2008, as amended at 75 FR 9677, Mar. 3, 2010; 75 FR 51591, Aug. 20, 2010; 78 FR 6705, Jan. 30, 2013]

**§63.6650 What reports must I submit and when?**

(a) You must submit each report in Table 7 of this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under §63.10(a), you must submit each report by the date in Table 7 of this subpart and according to the requirements in paragraphs (b)(1) through (b)(9) of this section.

(1) For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in §63.6595.

(2) For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in §63.6595.

(3) For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(4) For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each stationary RICE that is subject to permitting regulations pursuant to 40 CFR part 70 or 71, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6 (a)(3)(iii)(A), you may submit the first and subsequent Compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (b)(4) of this section.

(6) For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in §63.6595 and ending on December 31.

(7) For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in §63.6595.

(8) For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

(9) For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

(c) The Compliance report must contain the information in paragraphs (c)(1) through (6) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with §63.6605(b), including actions taken to correct a malfunction.

(5) If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

(6) If there were no periods during which the continuous monitoring system (CMS), including CEMS and CPMS, was out-of-control, as specified in §63.8(c)(7), a statement that there were no periods during which the CMS was out-of-control during the reporting period.

(d) For each deviation from an emission or operating limitation that occurs for a stationary RICE where you are not using a CMS to comply with the emission or operating limitations in this subpart, the Compliance report must contain the information in paragraphs (c)(1) through (4) of this section and the information in paragraphs (d)(1) and (2) of this section.

(1) The total operating time of the stationary RICE at which the deviation occurred during the reporting period.

(2) Information on the number, duration, and cause of deviations (including unknown cause, if applicable), as applicable, and the corrective action taken.

(e) For each deviation from an emission or operating limitation occurring for a stationary RICE where you are using a CMS to comply with the emission and operating limitations in this subpart, you must include information in paragraphs (c)(1) through (4) and (e)(1) through (12) of this section.

(1) The date and time that each malfunction started and stopped.

(2) The date, time, and duration that each CMS was inoperative, except for zero (low-level) and high-level checks.

(3) The date, time, and duration that each CMS was out-of-control, including the information in §63.8(c)(8).

(4) The date and time that each deviation started and stopped, and whether each deviation occurred during a period of malfunction or during another period.

(5) A summary of the total duration of the deviation during the reporting period, and the total duration as a percent of the total source operating time during that reporting period.

(6) A breakdown of the total duration of the deviations during the reporting period into those that are due to control equipment problems, process problems, other known causes, and other unknown causes.

(7) A summary of the total duration of CMS downtime during the reporting period, and the total duration of CMS downtime as a percent of the total operating time of the stationary RICE at which the CMS downtime occurred during that reporting period.

(8) An identification of each parameter and pollutant (CO or formaldehyde) that was monitored at the stationary RICE.

(9) A brief description of the stationary RICE.

(10) A brief description of the CMS.

(11) The date of the latest CMS certification or audit.

(12) A description of any changes in CMS, processes, or controls since the last reporting period.

(f) Each affected source that has obtained a title V operating permit pursuant to 40 CFR part 70 or 71 must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6 (a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a Compliance report pursuant to Table 7 of this subpart along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the Compliance report includes all required information concerning deviations from any emission or operating limitation in this subpart, submission of the Compliance report shall be deemed to satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submission of a Compliance report shall not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permit authority.

(g) If you are operating as a new or reconstructed stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, you must submit an annual report according to Table 7 of this subpart by the date specified unless the Administrator has approved a different schedule, according to the information described in paragraphs (b)(1) through (b)(5) of this section. You must report the data specified in (g)(1) through (g)(3) of this section.

(1) Fuel flow rate of each fuel and the heating values that were used in your calculations. You must also demonstrate that the percentage of heat input provided by landfill gas or digester gas is equivalent to 10 percent or more of the total fuel consumption on an annual basis.

(2) The operating limits provided in your federally enforceable permit, and any deviations from these limits.

(3) Any problems or errors suspected with the meters.

(h) If you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates or is contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) or that operates for the purpose specified in §63.6640(f)(4)(ii), you must submit an annual report according to the requirements in paragraphs (h)(1) through (3) of this section.

(1) The report must contain the following information:

(i) Company name and address where the engine is located.

(ii) Date of the report and beginning and ending dates of the reporting period.

(iii) Engine site rating and model year.

(iv) Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

(v) Hours operated for the purposes specified in §63.6640(f)(2)(ii) and (iii), including the date, start time, and end time for engine operation for the purposes specified in §63.6640(f)(2)(ii) and (iii).

(vi) Number of hours the engine is contractually obligated to be available for the purposes specified in §63.6640(f)(2)(ii) and (iii).

(vii) Hours spent for operation for the purpose specified in §63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in §63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

(viii) If there were no deviations from the fuel requirements in §63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

(ix) If there were deviations from the fuel requirements in §63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

(2) The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

(3) The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) ([www.epa.gov/cdx](http://www.epa.gov/cdx)). However, if the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, the written report must be submitted to the Administrator at the appropriate address listed in §63.13.

[69 FR 33506, June 15, 2004, as amended at 75 FR 9677, Mar. 3, 2010; 78 FR 6705, Jan. 30, 2013]

#### **§63.6655 What records must I keep?**

(a) If you must comply with the emission and operating limitations, you must keep the records described in paragraphs (a)(1) through (a)(5), (b)(1) through (b)(3) and (c) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirement in §63.10(b)(2)(xiv).

(2) Records of the occurrence and duration of each malfunction of operation (*i.e.*, process equipment) or the air pollution control and monitoring equipment.

(3) Records of performance tests and performance evaluations as required in §63.10(b)(2)(viii).

(4) Records of all required maintenance performed on the air pollution control and monitoring equipment.

(5) Records of actions taken during periods of malfunction to minimize emissions in accordance with §63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

(b) For each CEMS or CPMS, you must keep the records listed in paragraphs (b)(1) through (3) of this section.

(1) Records described in §63.10(b)(2)(vi) through (xi).

(2) Previous (*i.e.*, superseded) versions of the performance evaluation plan as required in §63.8(d)(3).

(3) Requests for alternatives to the relative accuracy test for CEMS or CPMS as required in §63.8(f)(6)(i), if applicable.

(c) If you are operating a new or reconstructed stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, you must keep the records of your daily fuel usage monitors.

(d) You must keep the records required in Table 6 of this subpart to show continuous compliance with each emission or operating limitation that applies to you.

(e) You must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE;

(1) An existing stationary RICE with a site rating of less than 100 brake HP located at a major source of HAP emissions.

(2) An existing stationary emergency RICE.

(3) An existing stationary RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to this subpart.

(f) If you own or operate any of the stationary RICE in paragraphs (f)(1) through (2) of this section, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engine is used for the purposes specified in §63.6640(f)(2)(ii) or (iii) or §63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

(1) An existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions that does not meet the standards applicable to non-emergency engines.

(2) An existing emergency stationary RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines.

[69 FR 33506, June 15, 2004, as amended at 75 FR 9678, Mar. 3, 2010; 75 FR 51592, Aug. 20, 2010; 78 FR 6706, Jan. 30, 2013]

**§63.6660 In what form and how long must I keep my records?**

(a) Your records must be in a form suitable and readily available for expeditious review according to §63.10(b)(1).

(b) As specified in §63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1).

[69 FR 33506, June 15, 2004, as amended at 75 FR 9678, Mar. 3, 2010]

**Other Requirements and Information**

**§63.6665 What parts of the General Provisions apply to me?**

Table 8 to this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a

site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

[75 FR 9678, Mar. 3, 2010]

**§63.6670 Who implements and enforces this subpart?**

(a) This subpart is implemented and enforced by the U.S. EPA, or a delegated authority such as your State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your State, local, or tribal agency, then that agency (as well as the U.S. EPA) has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out whether this subpart is delegated to your State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the State, local, or tribal agency.

(c) The authorities that will not be delegated to State, local, or tribal agencies are:

(1) Approval of alternatives to the non-opacity emission limitations and operating limitations in §63.6600 under §63.6(g).

(2) Approval of major alternatives to test methods under §63.7(e)(2)(ii) and (f) and as defined in §63.90.

(3) Approval of major alternatives to monitoring under §63.8(f) and as defined in §63.90.

(4) Approval of major alternatives to recordkeeping and reporting under §63.10(f) and as defined in §63.90.

(5) Approval of a performance test which was conducted prior to the effective date of the rule, as specified in §63.6610(b).

**§63.6675 What definitions apply to this subpart?**

Terms used in this subpart are defined in the Clean Air Act (CAA); in 40 CFR 63.2, the General Provisions of this part; and in this section as follows:

*Alaska Railbelt Grid* means the service areas of the six regulated public utilities that extend from Fairbanks to Anchorage and the Kenai Peninsula. These utilities are Golden Valley Electric Association; Chugach Electric Association; Matanuska Electric Association; Homer Electric Association; Anchorage Municipal Light & Power; and the City of Seward Electric System.

*Area source* means any stationary source of HAP that is not a major source as defined in part 63.

*Associated equipment* as used in this subpart and as referred to in section 112(n)(4) of the CAA, means equipment associated with an oil or natural gas exploration or production well, and includes all equipment from the well bore to the point of custody transfer, except glycol dehydration units, storage vessels with potential for flash emissions, combustion turbines, and stationary RICE.

*Backup power for renewable energy* means an engine that provides backup power to a facility that generates electricity from renewable energy resources, as that term is defined in Alaska Statute 42.45.045(l)(5) (incorporated by reference, see §63.14).

*Black start engine* means an engine whose only purpose is to start up a combustion turbine.

CAA means the Clean Air Act (42 U.S.C. 7401 *et seq.*, as amended by Public Law 101-549, 104 Stat. 2399).

*Commercial emergency stationary RICE* means an emergency stationary RICE used in commercial establishments such as office buildings, hotels, stores, telecommunications facilities, restaurants, financial institutions such as banks, doctor's offices, and sports and performing arts facilities.

*Compression ignition* means relating to a type of stationary internal combustion engine that is not a spark ignition engine.

*Custody transfer* means the transfer of hydrocarbon liquids or natural gas: After processing and/or treatment in the producing operations, or from storage vessels or automatic transfer facilities or other such equipment, including product loading racks, to pipelines or any other forms of transportation. For the purposes of this subpart, the point at which such liquids or natural gas enters a natural gas processing plant is a point of custody transfer.

*Deviation* means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

- (1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limitation or operating limitation;
- (2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or
- (3) Fails to meet any emission limitation or operating limitation in this subpart during malfunction, regardless or whether or not such failure is permitted by this subpart.
- (4) Fails to satisfy the general duty to minimize emissions established by §63.6(e)(1)(i).

*Diesel engine* means any stationary RICE in which a high boiling point liquid fuel injected into the combustion chamber ignites when the air charge has been compressed to a temperature sufficiently high for auto-ignition. This process is also known as compression ignition.

*Diesel fuel* means any liquid obtained from the distillation of petroleum with a boiling point of approximately 150 to 360 degrees Celsius. One commonly used form is fuel oil number 2. Diesel fuel also includes any non-distillate fuel with comparable physical and chemical properties (e.g. biodiesel) that is suitable for use in compression ignition engines.

*Digester gas* means any gaseous by-product of wastewater treatment typically formed through the anaerobic decomposition of organic waste materials and composed principally of methane and CO<sub>2</sub>.

*Dual-fuel engine* means any stationary RICE in which a liquid fuel (typically diesel fuel) is used for compression ignition and gaseous fuel (typically natural gas) is used as the primary fuel.

*Emergency stationary RICE* means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in §63.6640(f) in order to be considered emergency stationary RICE. If the engine does not comply with the requirements specified in §63.6640(f), then it is not considered to be an emergency stationary RICE under this subpart.

- (1) The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary RICE used to pump water in the case of fire or flood, etc.
- (2) The stationary RICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in §63.6640(f).

(3) The stationary RICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in §63.6640(f)(2)(ii) or (iii) and §63.6640(f)(4)(i) or (ii).

*Engine startup* means the time from initial start until applied load and engine and associated equipment reaches steady state or normal operation. For stationary engine with catalytic controls, engine startup means the time from initial start until applied load and engine and associated equipment, including the catalyst, reaches steady state or normal operation.

*Four-stroke engine* means any type of engine which completes the power cycle in two crankshaft revolutions, with intake and compression strokes in the first revolution and power and exhaust strokes in the second revolution.

*Gaseous fuel* means a material used for combustion which is in the gaseous state at standard atmospheric temperature and pressure conditions.

*Gasoline* means any fuel sold in any State for use in motor vehicles and motor vehicle engines, or nonroad or stationary engines, and commonly or commercially known or sold as gasoline.

*Glycol dehydration unit* means a device in which a liquid glycol (including, but not limited to, ethylene glycol, diethylene glycol, or triethylene glycol) absorbent directly contacts a natural gas stream and absorbs water in a contact tower or absorption column (absorber). The glycol contacts and absorbs water vapor and other gas stream constituents from the natural gas and becomes "rich" glycol. This glycol is then regenerated in the glycol dehydration unit reboiler. The "lean" glycol is then recycled.

*Hazardous air pollutants (HAP)* means any air pollutants listed in or pursuant to section 112(b) of the CAA.

*Institutional emergency stationary RICE* means an emergency stationary RICE used in institutional establishments such as medical centers, nursing homes, research centers, institutions of higher education, correctional facilities, elementary and secondary schools, libraries, religious establishments, police stations, and fire stations.

*ISO standard day conditions* means 288 degrees Kelvin (15 degrees Celsius), 60 percent relative humidity and 101.3 kilopascals pressure.

*Landfill gas* means a gaseous by-product of the land application of municipal refuse typically formed through the anaerobic decomposition of waste materials and composed principally of methane and CO<sub>2</sub>.

*Lean burn engine* means any two-stroke or four-stroke spark ignited engine that does not meet the definition of a rich burn engine.

*Limited use stationary RICE* means any stationary RICE that operates less than 100 hours per year.

*Liquefied petroleum gas* means any liquefied hydrocarbon gas obtained as a by-product in petroleum refining of natural gas production.

*Liquid fuel* means any fuel in liquid form at standard temperature and pressure, including but not limited to diesel, residual/crude oil, kerosene/naphtha (jet fuel), and gasoline.

*Major Source*, as used in this subpart, shall have the same meaning as in §63.2, except that:

(1) Emissions from any oil or gas exploration or production well (with its associated equipment (as defined in this section)) and emissions from any pipeline compressor station or pump station shall not be aggregated with emissions from other similar units, to determine whether such emission points or stations are major sources, even when emission points are in a contiguous area or under common control;

(2) For oil and gas production facilities, emissions from processes, operations, or equipment that are not part of the same oil and gas production facility, as defined in §63.1271 of subpart HHH of this part, shall not be aggregated;

(3) For production field facilities, only HAP emissions from glycol dehydration units, storage vessel with the potential for flash emissions, combustion turbines and reciprocating internal combustion engines shall be aggregated for a major source determination; and

(4) Emissions from processes, operations, and equipment that are not part of the same natural gas transmission and storage facility, as defined in §63.1271 of subpart HHH of this part, shall not be aggregated.

*Malfunction* means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner which causes, or has the potential to cause, the emission limitations in an applicable standard to be exceeded. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

*Natural gas* means a naturally occurring mixture of hydrocarbon and non-hydrocarbon gases found in geologic formations beneath the Earth's surface, of which the principal constituent is methane. Natural gas may be field or pipeline quality.

*Non-selective catalytic reduction (NSCR)* means an add-on catalytic nitrogen oxides (NO<sub>x</sub>) control device for rich burn engines that, in a two-step reaction, promotes the conversion of excess oxygen, NO<sub>x</sub>, CO, and volatile organic compounds (VOC) into CO<sub>2</sub>, nitrogen, and water.

*Oil and gas production facility* as used in this subpart means any grouping of equipment where hydrocarbon liquids are processed, upgraded (*i.e.*, remove impurities or other constituents to meet contract specifications), or stored prior to the point of custody transfer; or where natural gas is processed, upgraded, or stored prior to entering the natural gas transmission and storage source category. For purposes of a major source determination, facility (including a building, structure, or installation) means oil and natural gas production and processing equipment that is located within the boundaries of an individual surface site as defined in this section. Equipment that is part of a facility will typically be located within close proximity to other equipment located at the same facility. Pieces of production equipment or groupings of equipment located on different oil and gas leases, mineral fee tracts, lease tracts, subsurface or surface unit areas, surface fee tracts, surface lease tracts, or separate surface sites, whether or not connected by a road, waterway, power line or pipeline, shall not be considered part of the same facility. Examples of facilities in the oil and natural gas production source category include, but are not limited to, well sites, satellite tank batteries, central tank batteries, a compressor station that transports natural gas to a natural gas processing plant, and natural gas processing plants.

*Oxidation catalyst* means an add-on catalytic control device that controls CO and VOC by oxidation.

*Peaking unit or engine* means any standby engine intended for use during periods of high demand that are not emergencies.

*Percent load* means the fractional power of an engine compared to its maximum manufacturer's design capacity at engine site conditions. Percent load may range between 0 percent to above 100 percent.

*Potential to emit* means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the stationary source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable. For oil and natural gas production facilities subject to subpart HH of this part, the potential to emit provisions in §63.760(a) may be used. For natural gas transmission and storage facilities subject to subpart HHH of this part, the maximum annual facility gas throughput for storage facilities may be determined according to §63.1270(a)(1) and the maximum annual throughput for transmission facilities may be determined according to §63.1270(a)(2).

*Production field facility* means those oil and gas production facilities located prior to the point of custody transfer.

*Production well* means any hole drilled in the earth from which crude oil, condensate, or field natural gas is extracted.

*Propane* means a colorless gas derived from petroleum and natural gas, with the molecular structure C<sub>3</sub>H<sub>8</sub>.

*Remote stationary RICE* means stationary RICE meeting any of the following criteria:

(1) Stationary RICE located in an offshore area that is beyond the line of ordinary low water along that portion of the coast of the United States that is in direct contact with the open seas and beyond the line marking the seaward limit of inland waters.

(2) Stationary RICE located on a pipeline segment that meets both of the criteria in paragraphs (2)(i) and (ii) of this definition.

(i) A pipeline segment with 10 or fewer buildings intended for human occupancy and no buildings with four or more stories within 220 yards (200 meters) on either side of the centerline of any continuous 1-mile (1.6 kilometers) length of pipeline. Each separate dwelling unit in a multiple dwelling unit building is counted as a separate building intended for human occupancy.

(ii) The pipeline segment does not lie within 100 yards (91 meters) of either a building or a small, well-defined outside area (such as a playground, recreation area, outdoor theater, or other place of public assembly) that is occupied by 20 or more persons on at least 5 days a week for 10 weeks in any 12-month period. The days and weeks need not be consecutive. The building or area is considered occupied for a full day if it is occupied for any portion of the day.

(iii) For purposes of this paragraph (2), the term pipeline segment means all parts of those physical facilities through which gas moves in transportation, including but not limited to pipe, valves, and other appurtenance attached to pipe, compressor units, metering stations, regulator stations, delivery stations, holders, and fabricated assemblies. Stationary RICE located within 50 yards (46 meters) of the pipeline segment providing power for equipment on a pipeline segment are part of the pipeline segment. Transportation of gas means the gathering, transmission, or distribution of gas by pipeline, or the storage of gas. A building is intended for human occupancy if its primary use is for a purpose involving the presence of humans.

(3) Stationary RICE that are not located on gas pipelines and that have 5 or fewer buildings intended for human occupancy and no buildings with four or more stories within a 0.25 mile radius around the engine. A building is intended for human occupancy if its primary use is for a purpose involving the presence of humans.

*Residential emergency stationary RICE* means an emergency stationary RICE used in residential establishments such as homes or apartment buildings.

*Responsible official* means responsible official as defined in 40 CFR 70.2.

*Rich burn engine* means any four-stroke spark ignited engine where the manufacturer's recommended operating air/fuel ratio divided by the stoichiometric air/fuel ratio at full load conditions is less than or equal to 1.1. Engines originally manufactured as rich burn engines, but modified prior to December 19, 2002 with passive emission control technology for NO<sub>x</sub> (such as pre-combustion chambers) will be considered lean burn engines. Also, existing engines where there are no manufacturer's recommendations regarding air/fuel ratio will be considered a rich burn engine if the excess oxygen content of the exhaust at full load conditions is less than or equal to 2 percent.

*Site-rated HP* means the maximum manufacturer's design capacity at engine site conditions.

*Spark ignition* means relating to either: A gasoline-fueled engine; or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Dual-fuel engines in which a liquid fuel (typically diesel fuel) is used for CI and gaseous fuel (typically natural gas) is used as the primary fuel at an annual average ratio of less than 2 parts diesel fuel to 100 parts total fuel on an energy equivalent basis are spark ignition engines.

*Stationary reciprocating internal combustion engine (RICE)* means any reciprocating internal combustion engine which uses reciprocating motion to convert heat energy into mechanical work and which is not mobile. Stationary RICE differ from mobile RICE in that a stationary RICE is not a non-road engine as defined at 40 CFR 1068.30, and is not used to propel a motor vehicle or a vehicle used solely for competition.

*Stationary RICE test cell/stand* means an engine test cell/stand, as defined in subpart PPPPP of this part, that tests stationary RICE.

*Stoichiometric* means the theoretical air-to-fuel ratio required for complete combustion.

*Storage vessel with the potential for flash emissions* means any storage vessel that contains a hydrocarbon liquid with a stock tank gas-to-oil ratio equal to or greater than 0.31 cubic meters per liter and an American Petroleum Institute gravity equal to or greater than 40 degrees and an actual annual average hydrocarbon liquid throughput equal to or greater than 79,500 liters per day. Flash emissions occur when dissolved hydrocarbons in the fluid evolve from solution when the fluid pressure is reduced.

*Subpart* means 40 CFR part 63, subpart ZZZZ.

*Surface site* means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

*Two-stroke engine* means a type of engine which completes the power cycle in single crankshaft revolution by combining the intake and compression operations into one stroke and the power and exhaust operations into a second stroke. This system requires auxiliary scavenging and inherently runs lean of stoichiometric.

[69 FR 33506, June 15, 2004, as amended at 71 FR 20467, Apr. 20, 2006; 73 FR 3607, Jan. 18, 2008; 75 FR 9679, Mar. 3, 2010; 75 FR 51592, Aug. 20, 2010; 76 FR 12867, Mar. 9, 2011; 78 FR 6706, Jan. 30, 2013]

**Table 1a to Subpart ZZZZ of Part 63—Emission Limitations for Existing, New, and Reconstructed Spark Ignition, 4SRB Stationary RICE >500 HP Located at a Major Source of HAP Emissions**

As stated in §§63.6600 and 63.6640, you must comply with the following emission limitations at 100 percent load plus or minus 10 percent for existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions:

For each . . .	You must meet the following emission limitation, except during periods of startup . . .	During periods of startup you must . . .
1. 4SRB stationary RICE	a. Reduce formaldehyde emissions by 76 percent or more. If you commenced construction or reconstruction between December 19, 2002 and June 15, 2004, you may reduce formaldehyde emissions by 75 percent or more until June 15, 2007 or	Minimize the engine's time spent at idle and minimize the engine's startup time at startup to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the non-startup emission limitations apply. <sup>1</sup>
	b. Limit the concentration of formaldehyde in the stationary RICE exhaust to 350 ppbvd or less at 15 percent O <sub>2</sub>	

<sup>1</sup> Sources can petition the Administrator pursuant to the requirements of 40 CFR 63.6(g) for alternative work practices.

[75 FR 9679, Mar. 3, 2010, as amended at 75 FR 51592, Aug. 20, 2010]

**Table 1b to Subpart ZZZZ of Part 63—Operating Limitations for Existing, New, and Reconstructed SI 4SRB Stationary RICE >500 HP Located at a Major Source of HAP Emissions**

As stated in §§63.6600, 63.6603, 63.6630 and 63.6640, you must comply with the following operating limitations for existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions:

For each . . .	You must meet the following operating limitation, except during periods of startup . . .
1. existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions complying with the requirement to reduce formaldehyde emissions by 76 percent or more (or by 75 percent or more, if applicable) and using NSCR; or existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions complying with the requirement to limit the concentration of formaldehyde in the stationary RICE exhaust to 350 ppbvd or less at 15 percent O <sub>2</sub> and using NSCR;	a. maintain your catalyst so that the pressure drop across the catalyst does not change by more than 2 inches of water at 100 percent load plus or minus 10 percent from the pressure drop across the catalyst measured during the initial performance test; and b. maintain the temperature of your stationary RICE exhaust so that the catalyst inlet temperature is greater than or equal to 750 °F and less than or equal to 1250 °F. <sup>1</sup>
2. existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions complying with the requirement to reduce formaldehyde emissions by 76 percent or more (or by 75 percent or more, if applicable) and not using NSCR; or	Comply with any operating limitations approved by the Administrator.
existing, new and reconstructed 4SRB stationary RICE >500 HP located at a major source of HAP emissions complying with the requirement to limit the concentration of formaldehyde in the stationary RICE exhaust to 350 ppbvd or less at 15 percent O <sub>2</sub> and not using NSCR.	

<sup>1</sup>Sources can petition the Administrator pursuant to the requirements of 40 CFR 63.8(f) for a different temperature range.

[78 FR 6706, Jan. 30, 2013]

**Table 2a to Subpart ZZZZ of Part 63—Emission Limitations for New and Reconstructed 2SLB and Compression Ignition Stationary RICE >500 HP and New and Reconstructed 4SLB Stationary RICE ≥250 HP Located at a Major Source of HAP Emissions**

As stated in §§63.6600 and 63.6640, you must comply with the following emission limitations for new and reconstructed lean burn and new and reconstructed compression ignition stationary RICE at 100 percent load plus or minus 10 percent:

For each . . .	You must meet the following emission limitation, except during periods of startup . . .	During periods of startup you must . . .
1. 2SLB stationary RICE	a. Reduce CO emissions by 58 percent or more; or b. Limit concentration of formaldehyde in the stationary RICE exhaust to 12 ppmvd or less at 15 percent O <sub>2</sub> . If you commenced construction or reconstruction between December 19, 2002 and June 15, 2004, you may limit concentration of formaldehyde to 17 ppmvd or less at 15 percent O <sub>2</sub> until June 15, 2007	Minimize the engine's time spent at idle and minimize the engine's startup time at startup to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the non-startup emission limitations apply. <sup>1</sup>
2. 4SLB stationary RICE	a. Reduce CO emissions by 93 percent or more; or	
	b. Limit concentration of formaldehyde in the stationary RICE exhaust to 14 ppmvd or less at 15 percent O <sub>2</sub>	

For each . . .	You must meet the following emission limitation, except during periods of startup . . .	During periods of startup you must . . .
3. CI stationary RICE	a. Reduce CO emissions by 70 percent or more; or	
	b. Limit concentration of formaldehyde in the stationary RICE exhaust to 580 ppbvd or less at 15 percent O <sub>2</sub>	

<sup>1</sup>Sources can petition the Administrator pursuant to the requirements of 40 CFR 63.6(g) for alternative work practices.

[75 FR 9680, Mar. 3, 2010]

**Table 2b to Subpart ZZZZ of Part 63—Operating Limitations for New and Reconstructed 2SLB and CI Stationary RICE >500 HP Located at a Major Source of HAP Emissions, New and Reconstructed 4SLB Stationary RICE ≥250 HP Located at a Major Source of HAP Emissions, Existing CI Stationary RICE >500 HP**

As stated in §§63.6600, 63.6601, 63.6603, 63.6630, and 63.6640, you must comply with the following operating limitations for new and reconstructed 2SLB and CI stationary RICE >500 HP located at a major source of HAP emissions; new and reconstructed 4SLB stationary RICE ≥250 HP located at a major source of HAP emissions; and existing CI stationary RICE >500 HP:

For each . . .	You must meet the following operating limitation, except during periods of startup . . .
1. New and reconstructed 2SLB and CI stationary RICE >500 HP located at a major source of HAP emissions and new and reconstructed 4SLB stationary RICE ≥250 HP located at a major source of HAP emissions complying with the requirement to reduce CO emissions and using an oxidation catalyst; and New and reconstructed 2SLB and CI stationary RICE >500 HP located at a major source of HAP emissions and new and reconstructed 4SLB stationary RICE ≥250 HP located at a major source of HAP emissions complying with the requirement to limit the concentration of formaldehyde in the stationary RICE exhaust and using an oxidation catalyst.	a. maintain your catalyst so that the pressure drop across the catalyst does not change by more than 2 inches of water at 100 percent load plus or minus 10 percent from the pressure drop across the catalyst that was measured during the initial performance test; and b. maintain the temperature of your stationary RICE exhaust so that the catalyst inlet temperature is greater than or equal to 450 °F and less than or equal to 1350 °F. <sup>1</sup>
2. Existing CI stationary RICE >500 HP complying with the requirement to limit or reduce the concentration of CO in the stationary RICE exhaust and using an oxidation catalyst	a. maintain your catalyst so that the pressure drop across the catalyst does not change by more than 2 inches of water from the pressure drop across the catalyst that was measured during the initial performance test; and b. maintain the temperature of your stationary RICE exhaust so that the catalyst inlet temperature is greater than or equal to 450 °F and less than or equal to 1350 °F. <sup>1</sup>
3. New and reconstructed 2SLB and CI stationary RICE >500 HP located at a major source of HAP emissions and new and reconstructed 4SLB stationary RICE ≥250 HP located at a major source of HAP emissions complying with the requirement to reduce CO emissions and not using an oxidation catalyst; and	Comply with any operating limitations approved by the Administrator.
New and reconstructed 2SLB and CI stationary RICE >500 HP located at a major source of HAP emissions and new and reconstructed 4SLB stationary RICE ≥250 HP located at a major source of HAP emissions complying with the requirement to limit the concentration of formaldehyde in the stationary RICE exhaust and not using an oxidation catalyst; and	

For each . . .	You must meet the following operating limitation, except during periods of startup . . .
existing CI stationary RICE >500 HP complying with the requirement to limit or reduce the concentration of CO in the stationary RICE exhaust and not using an oxidation catalyst.	

<sup>1</sup>Sources can petition the Administrator pursuant to the requirements of 40 CFR 63.8(f) for a different temperature range.

[78 FR 6707, Jan. 30, 2013]

**Table 2c to Subpart ZZZZ of Part 63—Requirements for Existing Compression Ignition Stationary RICE Located at a Major Source of HAP Emissions and Existing Spark Ignition Stationary RICE ≤500 HP Located at a Major Source of HAP Emissions**

As stated in §§63.6600, 63.6602, and 63.6640, you must comply with the following requirements for existing compression ignition stationary RICE located at a major source of HAP emissions and existing spark ignition stationary RICE ≤500 HP located at a major source of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
1. Emergency stationary CI RICE and black start stationary CI RICE <sup>1</sup>	a. Change oil and filter every 500 hours of operation or annually, whichever comes first. <sup>2</sup> b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary. <sup>3</sup>	Minimize the engine's time spent at idle and minimize the engine's startup time at startup to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the non-startup emission limitations apply. <sup>3</sup>
2. Non-Emergency, non-black start stationary CI RICE <100 HP	a. Change oil and filter every 1,000 hours of operation or annually, whichever comes first. <sup>2</sup> b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary. <sup>3</sup>	
3. Non-Emergency, non-black start CI stationary RICE 100≤HP≤300 HP	Limit concentration of CO in the stationary RICE exhaust to 230 ppmvd or less at 15 percent O <sub>2</sub> .	

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Non-Emergency, non-black start CI stationary RICE 300<HP≤500	a. Limit concentration of CO in the stationary RICE exhaust to 49 ppmvd or less at 15 percent O <sub>2</sub> ; or b. Reduce CO emissions by 70 percent or more.	
5. Non-Emergency, non-black start stationary CI RICE >500 HP	a. Limit concentration of CO in the stationary RICE exhaust to 23 ppmvd or less at 15 percent O <sub>2</sub> ; or b. Reduce CO emissions by 70 percent or more.	
6. Emergency stationary SI RICE and black start stationary SI RICE. <sup>1</sup>	a. Change oil and filter every 500 hours of operation or annually, whichever comes first; <sup>2</sup> b. Inspect spark plugs every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary. <sup>3</sup>	
7. Non-Emergency, non-black start stationary SI RICE <100 HP that are not 2SLB stationary RICE	a. Change oil and filter every 1,440 hours of operation or annually, whichever comes first; <sup>2</sup> b. Inspect spark plugs every 1,440 hours of operation or annually, whichever comes first, and replace as necessary;	
	c. Inspect all hoses and belts every 1,440 hours of operation or annually, whichever comes first, and replace as necessary. <sup>3</sup>	
8. Non-Emergency, non-black start 2SLB stationary SI RICE <100 HP	a. Change oil and filter every 4,320 hours of operation or annually, whichever comes first; <sup>2</sup> b. Inspect spark plugs every 4,320 hours of operation or annually, whichever comes first, and replace as necessary;	
	c. Inspect all hoses and belts every 4,320 hours of operation or annually, whichever comes first, and replace as necessary. <sup>3</sup>	

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
9. Non-emergency, non-black start 2SLB stationary RICE 100≤HP≤500	Limit concentration of CO in the stationary RICE exhaust to 225 ppmvd or less at 15 percent O <sub>2</sub> .	
10. Non-emergency, non-black start 4SLB stationary RICE 100≤HP≤500	Limit concentration of CO in the stationary RICE exhaust to 47 ppmvd or less at 15 percent O <sub>2</sub> .	
11. Non-emergency, non-black start 4SRB stationary RICE 100≤HP≤500	Limit concentration of formaldehyde in the stationary RICE exhaust to 10.3 ppmvd or less at 15 percent O <sub>2</sub> .	
12. Non-emergency, non-black start stationary RICE 100≤HP≤500 which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis	Limit concentration of CO in the stationary RICE exhaust to 177 ppmvd or less at 15 percent O <sub>2</sub> .	

<sup>1</sup>If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the work practice requirements on the schedule required in Table 2c of this subpart, or if performing the work practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the work practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The work practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under federal, state, or local law has abated. Sources must report any failure to perform the work practice on the schedule required and the federal, state or local law under which the risk was deemed unacceptable.

<sup>2</sup>Sources have the option to utilize an oil analysis program as described in §63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2c of this subpart.

<sup>3</sup>Sources can petition the Administrator pursuant to the requirements of 40 CFR 63.6(g) for alternative work practices.

[78 FR 6708, Jan. 30, 2013, as amended at 78 FR 14457, Mar. 6, 2013]

**Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions**

As stated in §§63.6603 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
1. Non-Emergency, non-black start CI stationary RICE ≤300 HP	a. Change oil and filter every 1,000 hours of operation or annually, whichever comes first; <sup>1</sup> b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	Minimize the engine's time spent at idle and minimize the engine's startup time at startup to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the non-startup emission limitations apply.
2. Non-Emergency, non-black start CI stationary RICE 300<HP≤500	a. Limit concentration of CO in the stationary RICE exhaust to 49 ppmvd at 15 percent O <sub>2</sub> ; or	
	b. Reduce CO emissions by 70 percent or more.	
3. Non-Emergency, non-black start CI stationary RICE >500 HP	a. Limit concentration of CO in the stationary RICE exhaust to 23 ppmvd at 15 percent O <sub>2</sub> ; or	
	b. Reduce CO emissions by 70 percent or more.	
4. Emergency stationary CI RICE and black start stationary CI RICE. <sup>2</sup>	a. Change oil and filter every 500 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
5. Emergency stationary SI RICE; black start stationary SI RICE; non-emergency, non-black start 4SLB stationary RICE >500 HP that operate 24 hours or less per calendar year; non-emergency, non-black start 4SRB stationary RICE >500 HP that operate 24 hours or less per calendar year. <sup>2</sup>	a. Change oil and filter every 500 hours of operation or annually, whichever comes first; <sup>1</sup> ; b. Inspect spark plugs every 1,000 hours of operation or annually, whichever comes first, and replace as necessary; and c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	
6. Non-emergency, non-black start 2SLB stationary RICE	a. Change oil and filter every 4,320 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect spark plugs every 4,320 hours of operation or annually, whichever comes first, and replace as necessary; and	
	c. Inspect all hoses and belts every 4,320 hours of operation or annually, whichever comes first, and replace as necessary.	
7. Non-emergency, non-black start 4SLB stationary RICE ≤500 HP	a. Change oil and filter every 1,440 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect spark plugs every 1,440 hours of operation or annually, whichever comes first, and replace as necessary; and	
	c. Inspect all hoses and belts every 1,440 hours of operation or annually, whichever comes first, and replace as necessary.	
8. Non-emergency, non-black start 4SLB remote stationary RICE >500 HP	a. Change oil and filter every 2,160 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect spark plugs every 2,160 hours of operation or annually, whichever comes first, and replace as necessary; and	

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
	c. Inspect all hoses and belts every 2,160 hours of operation or annually, whichever comes first, and replace as necessary.	
9. Non-emergency, non-black start 4SLB stationary RICE >500 HP that are not remote stationary RICE and that operate more than 24 hours per calendar year	Install an oxidation catalyst to reduce HAP emissions from the stationary RICE.	
10. Non-emergency, non-black start 4SRB stationary RICE ≤500 HP	a. Change oil and filter every 1,440 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect spark plugs every 1,440 hours of operation or annually, whichever comes first, and replace as necessary; and	
	c. Inspect all hoses and belts every 1,440 hours of operation or annually, whichever comes first, and replace as necessary.	
11. Non-emergency, non-black start 4SRB remote stationary RICE >500 HP	a. Change oil and filter every 2,160 hours of operation or annually, whichever comes first; <sup>1</sup>	
	b. Inspect spark plugs every 2,160 hours of operation or annually, whichever comes first, and replace as necessary; and	
	c. Inspect all hoses and belts every 2,160 hours of operation or annually, whichever comes first, and replace as necessary.	
12. Non-emergency, non-black start 4SRB stationary RICE >500 HP that are not remote stationary RICE and that operate more than 24 hours per calendar year	Install NSCR to reduce HAP emissions from the stationary RICE.	
13. Non-emergency, non-black start stationary RICE which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis	a. Change oil and filter every 1,440 hours of operation or annually, whichever comes first; <sup>1</sup> b. Inspect spark plugs every 1,440 hours of operation or annually, whichever comes first, and replace as necessary; and	

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
	c. Inspect all hoses and belts every 1,440 hours of operation or annually, whichever comes first, and replace as necessary.	

<sup>1</sup>Sources have the option to utilize an oil analysis program as described in §63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of this subpart.

<sup>2</sup>If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice requirements on the schedule required in Table 2d of this subpart, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under federal, state, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the federal, state or local law under which the risk was deemed unacceptable.

[78 FR 6709, Jan. 30, 2013]

**Table 3 to Subpart ZZZZ of Part 63—Subsequent Performance Tests**

As stated in §§63.6615 and 63.6620, you must comply with the following subsequent performance test requirements:

For each . . .	Complying with the requirement to . . .	You must . . .
1. New or reconstructed 2SLB stationary RICE >500 HP located at major sources; new or reconstructed 4SLB stationary RICE ≥250 HP located at major sources; and new or reconstructed CI stationary RICE >500 HP located at major sources	Reduce CO emissions and not using a CEMS	Conduct subsequent performance tests semiannually. <sup>1</sup>
2. 4SRB stationary RICE ≥5,000 HP located at major sources	Reduce formaldehyde emissions	Conduct subsequent performance tests semiannually. <sup>1</sup>
3. Stationary RICE >500 HP located at major sources and new or reconstructed 4SLB stationary RICE 250≤HP≤500 located at major sources	Limit the concentration of formaldehyde in the stationary RICE exhaust	Conduct subsequent performance tests semiannually. <sup>1</sup>
4. Existing non-emergency, non-black start CI stationary RICE >500 HP that are not limited use stationary RICE	Limit or reduce CO emissions and not using a CEMS	Conduct subsequent performance tests every 8,760 hours or 3 years, whichever comes first.
5. Existing non-emergency, non-black start CI stationary RICE >500 HP that are limited use stationary RICE	Limit or reduce CO emissions and not using a CEMS	Conduct subsequent performance tests every 8,760 hours or 5 years, whichever comes first.

<sup>1</sup>After you have demonstrated compliance for two consecutive tests, you may reduce the frequency of subsequent performance tests to annually. If the results of any subsequent annual performance test indicate the stationary RICE is not in compliance with the CO or formaldehyde emission limitation, or you deviate from any of your operating limitations, you must resume semiannual performance tests.

[78 FR 6711, Jan. 30, 2013]

**Table 4 to Subpart ZZZZ of Part 63—Requirements for Performance Tests**

As stated in §§63.6610, 63.6611, 63.6620, and 63.6640, you must comply with the following requirements for performance tests for stationary RICE:

Table 4 to Subpart ZZZZ of Part 63—Requirements for Performance Tests

For each . . .	Complying with the requirement to . . .	You must . . .	Using . . .	According to the following requirements . . .
1. 2SLB, 4SLB, and CI stationary RICE	a. reduce CO emissions	i. Select the sampling port location and the number/location of traverse points at the inlet and outlet of the control device; and		(a) For CO and O <sub>2</sub> measurement, ducts ≤6 inches in diameter may be sampled at a single point located at the duct centroid and ducts >6 and ≤12 inches in diameter may be sampled at 3 traverse points located at 16.7, 50.0, and 83.3% of the measurement line ('3-point long line'). If the duct is >12 inches in diameter <i>and</i> the sampling port location meets the two and half-diameter criterion of Section 11.1.1 of Method 1 of 40 CFR part 60, appendix A-1, the duct may be sampled at '3-point long line'; otherwise, conduct the stratification testing and select sampling points according to Section 8.1.2 of Method 7E of 40 CFR part 60, appendix A-4.
		ii. Measure the O <sub>2</sub> at the inlet and outlet of the control device; and	(1) Method 3 or 3A or 3B of 40 CFR part 60, appendix A-2, or ASTM Method D6522-00 (Reapproved 2005) <sup>ac</sup> (heated probe not necessary)	(b) Measurements to determine O <sub>2</sub> must be made at the same time as the measurements for CO concentration.
		iii. Measure the CO at the inlet and the outlet of the control device	(1) ASTM D6522-00 (Reapproved 2005) <sup>abc</sup> (heated probe not necessary) or Method 10 of 40 CFR part 60, appendix A-4	(c) The CO concentration must be at 15 percent O <sub>2</sub> , dry basis.

For each . . .	Complying with the requirement to . . .	You must . . .	Using . . .	According to the following requirements . . .
2. 4SRB stationary RICE	a. reduce formaldehyde emissions	i. Select the sampling port location and the number/location of traverse points at the inlet and outlet of the control device; and		(a) For formaldehyde, O <sub>2</sub> , and moisture measurement, ducts ≤6 inches in diameter may be sampled at a single point located at the duct centroid and ducts >6 and ≤12 inches in diameter may be sampled at 3 traverse points located at 16.7, 50.0, and 83.3% of the measurement line (‘3-point long line’). If the duct is >12 inches in diameter <i>and</i> the sampling port location meets the two and half-diameter criterion of Section 11.1.1 of Method 1 of 40 CFR part 60, appendix A, the duct may be sampled at ‘3-point long line’; otherwise, conduct the stratification testing and select sampling points according to Section 8.1.2 of Method 7E of 40 CFR part 60, appendix A.
		ii. Measure O <sub>2</sub> at the inlet and outlet of the control device; and	(1) Method 3 or 3A or 3B of 40 CFR part 60, appendix A-2, or ASTM Method D6522-00 (Reapproved 2005) <sup>a</sup> (heated probe not necessary)	(a) Measurements to determine O <sub>2</sub> concentration must be made at the same time as the measurements for formaldehyde or THC concentration.
		iii. Measure moisture content at the inlet and outlet of the control device; and	(1) Method 4 of 40 CFR part 60, appendix A-3, or Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 <sup>a</sup>	(a) Measurements to determine moisture content must be made at the same time and location as the measurements for formaldehyde or THC concentration.
		iv. If demonstrating compliance with the formaldehyde percent reduction requirement, measure formaldehyde at the inlet and the outlet of the control device	(1) Method 320 or 323 of 40 CFR part 63, appendix A; or ASTM D6348-03 <sup>a</sup> , provided in ASTM D6348-03 Annex A5 (Analyte Spiking Technique), the percent R must be greater than or equal to 70 and less than or equal to 130	(a) Formaldehyde concentration must be at 15 percent O <sub>2</sub> , dry basis. Results of this test consist of the average of the three 1-hour or longer runs.
		v. If demonstrating compliance with the THC percent reduction requirement, measure THC at the inlet and the outlet of the control device	(1) Method 25A, reported as propane, of 40 CFR part 60, appendix A-7	(a) THC concentration must be at 15 percent O <sub>2</sub> , dry basis. Results of this test consist of the average of the three 1-hour or longer runs.

For each . . .	Complying with the requirement to . . .	You must . . .	Using . . .	According to the following requirements . . .
3. Stationary RICE	a. limit the concentration of formaldehyde or CO in the stationary RICE exhaust	i. Select the sampling port location and the number/location of traverse points at the exhaust of the stationary RICE; and		(a) For formaldehyde, CO, O <sub>2</sub> , and moisture measurement, ducts ≤6 inches in diameter may be sampled at a single point located at the duct centroid and ducts >6 and ≤12 inches in diameter may be sampled at 3 traverse points located at 16.7, 50.0, and 83.3% of the measurement line ('3-point long line'). If the duct is >12 inches in diameter <i>and</i> the sampling port location meets the two and half-diameter criterion of Section 11.1.1 of Method 1 of 40 CFR part 60, appendix A, the duct may be sampled at '3-point long line'; otherwise, conduct the stratification testing and select sampling points according to Section 8.1.2 of Method 7E of 40 CFR part 60, appendix A. If using a control device, the sampling site must be located at the outlet of the control device.
		ii. Determine the O <sub>2</sub> concentration of the stationary RICE exhaust at the sampling port location; and	(1) Method 3 or 3A or 3B of 40 CFR part 60, appendix A-2, or ASTM Method D6522-00 (Reapproved 2005) <sup>a</sup> (heated probe not necessary)	(a) Measurements to determine O <sub>2</sub> concentration must be made at the same time and location as the measurements for formaldehyde or CO concentration.
		iii. Measure moisture content of the stationary RICE exhaust at the sampling port location; and	(1) Method 4 of 40 CFR part 60, appendix A-3, or Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 <sup>a</sup>	(a) Measurements to determine moisture content must be made at the same time and location as the measurements for formaldehyde or CO concentration.
		iv. Measure formaldehyde at the exhaust of the stationary RICE; or	(1) Method 320 or 323 of 40 CFR part 63, appendix A; or ASTM D6348-03 <sup>a</sup> , provided in ASTM D6348-03 Annex A5 (Analyte Spiking Technique), the percent R must be greater than or equal to 70 and less than or equal to 130	(a) Formaldehyde concentration must be at 15 percent O <sub>2</sub> , dry basis. Results of this test consist of the average of the three 1-hour or longer runs.
		v. measure CO at the exhaust of the stationary RICE	(1) Method 10 of 40 CFR part 60, appendix A-4, ASTM Method D6522-00 (2005) <sup>ac</sup> , Method 320 of 40 CFR part 63, appendix A, or ASTM D6348-03 <sup>a</sup>	(a) CO concentration must be at 15 percent O <sub>2</sub> , dry basis. Results of this test consist of the average of the three 1-hour or longer runs.

<sup>a</sup>You may also use Methods 3A and 10 as options to ASTM-D6522-00 (2005). You may obtain a copy of ASTM-D6522-00 (2005) from at least one of the following addresses: American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959, or University Microfilms International, 300 North Zeeb Road, Ann Arbor, MI 48106.

<sup>b</sup>You may obtain a copy of ASTM-D6348-03 from at least one of the following addresses: American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959, or University Microfilms International, 300 North Zeeb Road, Ann Arbor, MI 48106.

[79 FR 11290, Feb. 27, 2014]

**Table 5 to Subpart ZZZZ of Part 63—Initial Compliance With Emission Limitations, Operating Limitations, and Other Requirements**

As stated in §§63.6612, 63.6625 and 63.6630, you must initially comply with the emission and operating limitations as required by the following:

For each . . .	Complying with the requirement to . . .	You have demonstrated initial compliance if . . .
1. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Reduce CO emissions and using oxidation catalyst, and using a CPMS	i. The average reduction of emissions of CO determined from the initial performance test achieves the required CO percent reduction; and ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b); and iii. You have recorded the catalyst pressure drop and catalyst inlet temperature during the initial performance test.
2. Non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Limit the concentration of CO, using oxidation catalyst, and using a CPMS	i. The average CO concentration determined from the initial performance test is less than or equal to the CO emission limitation; and
		ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b); and
		iii. You have recorded the catalyst pressure drop and catalyst inlet temperature during the initial performance test.
3. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Reduce CO emissions and not using oxidation catalyst	i. The average reduction of emissions of CO determined from the initial performance test achieves the required CO percent reduction; and ii. You have installed a CPMS to continuously monitor operating parameters approved by the Administrator (if any) according to the requirements in §63.6625(b); and iii. You have recorded the approved operating parameters (if any) during the initial performance test.

For each . . .	Complying with the requirement to . . .	You have demonstrated initial compliance if . . .
4. Non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Limit the concentration of CO, and not using oxidation catalyst	i. The average CO concentration determined from the initial performance test is less than or equal to the CO emission limitation; and ii. You have installed a CPMS to continuously monitor operating parameters approved by the Administrator (if any) according to the requirements in §63.6625(b); and
		iii. You have recorded the approved operating parameters (if any) during the initial performance test.
5. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Reduce CO emissions, and using a CEMS	i. You have installed a CEMS to continuously monitor CO and either O <sub>2</sub> or CO <sub>2</sub> at both the inlet and outlet of the oxidation catalyst according to the requirements in §63.6625(a); and ii. You have conducted a performance evaluation of your CEMS using PS 3 and 4A of 40 CFR part 60, appendix B; and
		iii. The average reduction of CO calculated using §63.6620 equals or exceeds the required percent reduction. The initial test comprises the first 4-hour period after successful validation of the CEMS. Compliance is based on the average percent reduction achieved during the 4-hour period.
6. Non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP located at an area source of HAP	a. Limit the concentration of CO, and using a CEMS	i. You have installed a CEMS to continuously monitor CO and either O <sub>2</sub> or CO <sub>2</sub> at the outlet of the oxidation catalyst according to the requirements in §63.6625(a); and
		ii. You have conducted a performance evaluation of your CEMS using PS 3 and 4A of 40 CFR part 60, appendix B; and
		iii. The average concentration of CO calculated using §63.6620 is less than or equal to the CO emission limitation. The initial test comprises the first 4-hour period after successful validation of the CEMS. Compliance is based on the average concentration measured during the 4-hour period.
7. Non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Reduce formaldehyde emissions and using NSCR	i. The average reduction of emissions of formaldehyde determined from the initial performance test is equal to or greater than the required formaldehyde percent reduction, or the average reduction of emissions of THC determined from the initial performance test is equal to or greater than 30 percent; and

For each . . .	Complying with the requirement to . . .	You have demonstrated initial compliance if . . .
		ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b); and
		iii. You have recorded the catalyst pressure drop and catalyst inlet temperature during the initial performance test.
8. Non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Reduce formaldehyde emissions and not using NSCR	i. The average reduction of emissions of formaldehyde determined from the initial performance test is equal to or greater than the required formaldehyde percent reduction or the average reduction of emissions of THC determined from the initial performance test is equal to or greater than 30 percent; and
		ii. You have installed a CPMS to continuously monitor operating parameters approved by the Administrator (if any) according to the requirements in §63.6625(b); and
		iii. You have recorded the approved operating parameters (if any) during the initial performance test.
9. New or reconstructed non-emergency stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE 250≤HP≤500 located at a major source of HAP, and existing non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Limit the concentration of formaldehyde in the stationary RICE exhaust and using oxidation catalyst or NSCR	i. The average formaldehyde concentration, corrected to 15 percent O <sub>2</sub> , dry basis, from the three test runs is less than or equal to the formaldehyde emission limitation; and ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b); and
		iii. You have recorded the catalyst pressure drop and catalyst inlet temperature during the initial performance test.
10. New or reconstructed non-emergency stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE 250≤HP≤500 located at a major source of HAP, and existing non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Limit the concentration of formaldehyde in the stationary RICE exhaust and not using oxidation catalyst or NSCR	i. The average formaldehyde concentration, corrected to 15 percent O <sub>2</sub> , dry basis, from the three test runs is less than or equal to the formaldehyde emission limitation; and ii. You have installed a CPMS to continuously monitor operating parameters approved by the Administrator (if any) according to the requirements in §63.6625(b); and
		iii. You have recorded the approved operating parameters (if any) during the initial performance test.
11. Existing non-emergency stationary RICE 100≤HP≤500 located at a major source of HAP, and existing non-emergency stationary CI RICE 300<HP≤500 located at an area source of HAP	a. Reduce CO emissions	i. The average reduction of emissions of CO or formaldehyde, as applicable determined from the initial performance test is equal to or greater than the required CO or formaldehyde, as applicable, percent reduction.

For each . . .	Complying with the requirement to . . .	You have demonstrated initial compliance if . . .
12. Existing non-emergency stationary RICE 100≤HP≤500 located at a major source of HAP, and existing non-emergency stationary CI RICE 300<HP≤500 located at an area source of HAP	a. Limit the concentration of formaldehyde or CO in the stationary RICE exhaust	i. The average formaldehyde or CO concentration, as applicable, corrected to 15 percent O <sub>2</sub> , dry basis, from the three test runs is less than or equal to the formaldehyde or CO emission limitation, as applicable.
13. Existing non-emergency 4SLB stationary RICE >500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year	a. Install an oxidation catalyst	i. You have conducted an initial compliance demonstration as specified in §63.6630(e) to show that the average reduction of emissions of CO is 93 percent or more, or the average CO concentration is less than or equal to 47 ppmvd at 15 percent O <sub>2</sub> ;
		ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b), or you have installed equipment to automatically shut down the engine if the catalyst inlet temperature exceeds 1350 °F.
14. Existing non-emergency 4SRB stationary RICE >500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year	a. Install NSCR	i. You have conducted an initial compliance demonstration as specified in §63.6630(e) to show that the average reduction of emissions of CO is 75 percent or more, the average CO concentration is less than or equal to 270 ppmvd at 15 percent O <sub>2</sub> , or the average reduction of emissions of THC is 30 percent or more;
		ii. You have installed a CPMS to continuously monitor catalyst inlet temperature according to the requirements in §63.6625(b), or you have installed equipment to automatically shut down the engine if the catalyst inlet temperature exceeds 1250 °F.

[78 FR 6712, Jan. 30, 2013]

**Table 6 to Subpart ZZZZ of Part 63—Continuous Compliance With Emission Limitations, and Other Requirements**

As stated in §63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
1. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, and new or reconstructed non-emergency CI stationary RICE >500 HP located at a major source of HAP	a. Reduce CO emissions and using an oxidation catalyst, and using a CPMS	i. Conducting semiannual performance tests for CO to demonstrate that the required CO percent reduction is achieved <sup>a</sup> ; and ii. Collecting the catalyst inlet temperature data according to §63.6625(b); and iii. Reducing these data to 4-hour rolling averages; and

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the catalyst inlet temperature; and
		v. Measuring the pressure drop across the catalyst once per month and demonstrating that the pressure drop across the catalyst is within the operating limitation established during the performance test.
2. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, and new or reconstructed non-emergency CI stationary RICE >500 HP located at a major source of HAP	a. Reduce CO emissions and not using an oxidation catalyst, and using a CPMS	i. Conducting semiannual performance tests for CO to demonstrate that the required CO percent reduction is achieved <sup>a</sup> ; and ii. Collecting the approved operating parameter (if any) data according to §63.6625(b); and iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the operating parameters established during the performance test.
3. New or reconstructed non-emergency 2SLB stationary RICE >500 HP located at a major source of HAP, new or reconstructed non-emergency 4SLB stationary RICE ≥250 HP located at a major source of HAP, new or reconstructed non-emergency stationary CI RICE >500 HP located at a major source of HAP, and existing non-emergency stationary CI RICE >500 HP	a. Reduce CO emissions or limit the concentration of CO in the stationary RICE exhaust, and using a CEMS	i. Collecting the monitoring data according to §63.6625(a), reducing the measurements to 1-hour averages, calculating the percent reduction or concentration of CO emissions according to §63.6620; and ii. Demonstrating that the catalyst achieves the required percent reduction of CO emissions over the 4-hour averaging period, or that the emission remain at or below the CO concentration limit; and
		iii. Conducting an annual RATA of your CEMS using PS 3 and 4A of 40 CFR part 60, appendix B, as well as daily and periodic data quality checks in accordance with 40 CFR part 60, appendix F, procedure 1.
4. Non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Reduce formaldehyde emissions and using NSCR	i. Collecting the catalyst inlet temperature data according to §63.6625(b); and
		ii. Reducing these data to 4-hour rolling averages; and
		iii. Maintaining the 4-hour rolling averages within the operating limitations for the catalyst inlet temperature; and
		iv. Measuring the pressure drop across the catalyst once per month and demonstrating that the pressure drop across the catalyst is within the operating limitation established during the performance test.

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
5. Non-emergency 4SRB stationary RICE >500 HP located at a major source of HAP	a. Reduce formaldehyde emissions and not using NSCR	i. Collecting the approved operating parameter (if any) data according to §63.6625(b); and
		ii. Reducing these data to 4-hour rolling averages; and
		iii. Maintaining the 4-hour rolling averages within the operating limitations for the operating parameters established during the performance test.
6. Non-emergency 4SRB stationary RICE with a brake HP ≥5,000 located at a major source of HAP	a. Reduce formaldehyde emissions	Conducting semiannual performance tests for formaldehyde to demonstrate that the required formaldehyde percent reduction is achieved, or to demonstrate that the average reduction of emissions of THC determined from the performance test is equal to or greater than 30 percent. <sup>a</sup>
7. New or reconstructed non-emergency stationary RICE >500 HP located at a major source of HAP and new or reconstructed non-emergency 4SLB stationary RICE 250≤HP≤500 located at a major source of HAP	a. Limit the concentration of formaldehyde in the stationary RICE exhaust and using oxidation catalyst or NSCR	i. Conducting semiannual performance tests for formaldehyde to demonstrate that your emissions remain at or below the formaldehyde concentration limit <sup>a</sup> ; and
		ii. Collecting the catalyst inlet temperature data according to §63.6625(b); and
		iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the catalyst inlet temperature; and
		v. Measuring the pressure drop across the catalyst once per month and demonstrating that the pressure drop across the catalyst is within the operating limitation established during the performance test.
8. New or reconstructed non-emergency stationary RICE >500 HP located at a major source of HAP and new or reconstructed non-emergency 4SLB stationary RICE 250≤HP≤500 located at a major source of HAP	a. Limit the concentration of formaldehyde in the stationary RICE exhaust and not using oxidation catalyst or NSCR	i. Conducting semiannual performance tests for formaldehyde to demonstrate that your emissions remain at or below the formaldehyde concentration limit <sup>a</sup> ; and
		ii. Collecting the approved operating parameter (if any) data according to §63.6625(b); and
		iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the operating parameters established during the performance test.

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
<p>9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE &lt;100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency stationary SI RICE located at an area source of HAP which combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE &gt;500 HP located at an area source of HAP that operate 24 hours or less per calendar year, and existing non-emergency 4SLB and 4SRB stationary RICE &gt;500 HP located at an area source of HAP that are remote stationary RICE</p>	<p>a. Work or Management practices</p>	<p>i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.</p>
<p>10. Existing stationary CI RICE &gt;500 HP that are not limited use stationary RICE</p>	<p>a. Reduce CO emissions, or limit the concentration of CO in the stationary RICE exhaust, and using oxidation catalyst</p>	<p>i. Conducting performance tests every 8,760 hours or 3 years, whichever comes first, for CO or formaldehyde, as appropriate, to demonstrate that the required CO or formaldehyde, as appropriate, percent reduction is achieved or that your emissions remain at or below the CO or formaldehyde concentration limit; and</p>
		<p>ii. Collecting the catalyst inlet temperature data according to §63.6625(b); and</p>
		<p>iii. Reducing these data to 4-hour rolling averages; and</p>
		<p>iv. Maintaining the 4-hour rolling averages within the operating limitations for the catalyst inlet temperature; and</p>
		<p>v. Measuring the pressure drop across the catalyst once per month and demonstrating that the pressure drop across the catalyst is within the operating limitation established during the performance test.</p>
<p>11. Existing stationary CI RICE &gt;500 HP that are not limited use stationary RICE</p>	<p>a. Reduce CO emissions, or limit the concentration of CO in the stationary RICE exhaust, and not using oxidation catalyst</p>	<p>i. Conducting performance tests every 8,760 hours or 3 years, whichever comes first, for CO or formaldehyde, as appropriate, to demonstrate that the required CO or formaldehyde, as appropriate, percent reduction is achieved or that your emissions remain at or below the CO or formaldehyde concentration limit; and</p>
		<p>ii. Collecting the approved operating parameter (if any) data according to §63.6625(b); and</p>

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
		iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the operating parameters established during the performance test.
12. Existing limited use CI stationary RICE >500 HP	a. Reduce CO emissions or limit the concentration of CO in the stationary RICE exhaust, and using an oxidation catalyst	i. Conducting performance tests every 8,760 hours or 5 years, whichever comes first, for CO or formaldehyde, as appropriate, to demonstrate that the required CO or formaldehyde, as appropriate, percent reduction is achieved or that your emissions remain at or below the CO or formaldehyde concentration limit; and
		ii. Collecting the catalyst inlet temperature data according to §63.6625(b); and
		iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the catalyst inlet temperature; and
		v. Measuring the pressure drop across the catalyst once per month and demonstrating that the pressure drop across the catalyst is within the operating limitation established during the performance test.
13. Existing limited use CI stationary RICE >500 HP	a. Reduce CO emissions or limit the concentration of CO in the stationary RICE exhaust, and not using an oxidation catalyst	i. Conducting performance tests every 8,760 hours or 5 years, whichever comes first, for CO or formaldehyde, as appropriate, to demonstrate that the required CO or formaldehyde, as appropriate, percent reduction is achieved or that your emissions remain at or below the CO or formaldehyde concentration limit; and
		ii. Collecting the approved operating parameter (if any) data according to §63.6625(b); and
		iii. Reducing these data to 4-hour rolling averages; and
		iv. Maintaining the 4-hour rolling averages within the operating limitations for the operating parameters established during the performance test.

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
<p>14. Existing non-emergency 4SLB stationary RICE &gt;500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year</p>	<p>a. Install an oxidation catalyst</p>	<p>i. Conducting annual compliance demonstrations as specified in §63.6640(c) to show that the average reduction of emissions of CO is 93 percent or more, or the average CO concentration is less than or equal to 47 ppmvd at 15 percent O<sub>2</sub>; and either                      ii. Collecting the catalyst inlet temperature data according to §63.6625(b), reducing these data to 4-hour rolling averages; and maintaining the 4-hour rolling averages within the limitation of greater than 450 °F and less than or equal to 1350 °F for the catalyst inlet temperature; or                      iii. Immediately shutting down the engine if the catalyst inlet temperature exceeds 1350 °F.</p>
<p>15. Existing non-emergency 4SRB stationary RICE &gt;500 HP located at an area source of HAP that are not remote stationary RICE and that are operated more than 24 hours per calendar year</p>	<p>a. Install NSCR</p>	<p>i. Conducting annual compliance demonstrations as specified in §63.6640(c) to show that the average reduction of emissions of CO is 75 percent or more, the average CO concentration is less than or equal to 270 ppmvd at 15 percent O<sub>2</sub>, or the average reduction of emissions of THC is 30 percent or more; and either                      ii. Collecting the catalyst inlet temperature data according to §63.6625(b), reducing these data to 4-hour rolling averages; and maintaining the 4-hour rolling averages within the limitation of greater than or equal to 750 °F and less than or equal to 1250 °F for the catalyst inlet temperature; or                      iii. Immediately shutting down the engine if the catalyst inlet temperature exceeds 1250 °F.</p>

<sup>a</sup>After you have demonstrated compliance for two consecutive tests, you may reduce the frequency of subsequent performance tests to annually. If the results of any subsequent annual performance test indicate the stationary RICE is not in compliance with the CO or formaldehyde emission limitation, or you deviate from any of your operating limitations, you must resume semiannual performance tests.

[78 FR 6715, Jan. 30, 2013]

**Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports**

As stated in §63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
<p>1. Existing non-emergency, non-black start stationary RICE 100≤HP≤500 located at a major source of HAP; existing non-emergency, non-black start stationary CI RICE &gt;500 HP located at a major source of HAP; existing non-emergency 4SRB stationary RICE &gt;500 HP located at a major source of HAP; existing non-emergency, non-black start stationary CI RICE &gt;300 HP located at an area source of HAP; new or reconstructed non-emergency stationary RICE &gt;500 HP located at a major source of HAP; and new or reconstructed non-emergency 4SLB stationary RICE 250≤HP≤500 located at a major source of HAP</p>	<p>Compliance report</p>	<p>a. If there are no deviations from any emission limitations or operating limitations that apply to you, a statement that there were no deviations from the emission limitations or operating limitations during the reporting period. If there were no periods during which the CMS, including CEMS and CPMS, was out-of-control, as specified in §63.8(c)(7), a statement that there were not periods during which the CMS was out-of-control during the reporting period; or</p>	<p>i. Semiannually according to the requirements in §63.6650(b)(1)-(5) for engines that are not limited use stationary RICE subject to numerical emission limitations; and ii. Annually according to the requirements in §63.6650(b)(6)-(9) for engines that are limited use stationary RICE subject to numerical emission limitations.</p>
		<p>b. If you had a deviation from any emission limitation or operating limitation during the reporting period, the information in §63.6650(d). If there were periods during which the CMS, including CEMS and CPMS, was out-of-control, as specified in §63.8(c)(7), the information in §63.6650(e); or</p>	<p>i. Semiannually according to the requirements in §63.6650(b).</p>
		<p>c. If you had a malfunction during the reporting period, the information in §63.6650(c)(4).</p>	<p>i. Semiannually according to the requirements in §63.6650(b).</p>
<p>2. New or reconstructed non-emergency stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis</p>	<p>Report</p>	<p>a. The fuel flow rate of each fuel and the heating values that were used in your calculations, and you must demonstrate that the percentage of heat input provided by landfill gas or digester gas, is equivalent to 10 percent or more of the gross heat input on an annual basis; and</p>	<p>i. Annually, according to the requirements in §63.6650.</p>
		<p>b. The operating limits provided in your federally enforceable permit, and any deviations from these limits; and</p>	<p>i. See item 2.a.i.</p>
		<p>c. Any problems or errors suspected with the meters.</p>	<p>i. See item 2.a.i.</p>
<p>3. Existing non-emergency, non-black start 4SLB and 4SRB stationary RICE &gt;500 HP located at an area source of HAP that are not remote stationary RICE and that operate more than 24 hours per calendar year</p>	<p>Compliance report</p>	<p>a. The results of the annual compliance demonstration, if conducted during the reporting period.</p>	<p>i. Semiannually according to the requirements in §63.6650(b)(1)-(5).</p>

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified in §63.6640(f)(2)(ii) and (iii) or that operate for the purposes specified in §63.6640(f)(4)( ii)	Report	a. The information in §63.6650(h)(1)	i. annually according to the requirements in §63.6650(h)(2)-(3).

[78 FR 6719, Jan. 30, 2013]

**Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.**

As stated in §63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in §63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at §§63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	
§63.7(b)(1)	Notification of performance test	Yes	Except that §63.7(b)(1) only applies as specified in §63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that §63.7(b)(2) only applies as specified in §63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that §63.7(c) only applies as specified in §63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at §63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at §63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at §63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for §63.8(e)(5)(ii), which applies to COMS.
		Except that §63.8(e) only applies as specified in §63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that §63.8(f)(4) only applies as specified in §63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that §63.8(f)(6) only applies as specified in §63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at §§63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that §63.9(b)(3) is reserved.
		Except that §63.9(b) only applies as specified in §63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that §63.9(c) only applies as specified in §63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that §63.9(d) only applies as specified in §63.6645.
§63.9(e)	Notification of performance test	Yes	Except that §63.9(e) only applies as specified in §63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that §63.9(g) only applies as specified in §63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		Except that §63.9(g) only applies as specified in §63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. §63.9(h)(4) is reserved.
			Except that §63.9(h) only applies as specified in §63.6645.
§63.9(i)	Adjustment of submittal deadlines	Yes.	
§63.9(j)	Change in previous information	Yes.	
§63.10(a)	Administrative provisions for recordkeeping/reporting	Yes.	

<b>General provisions citation</b>	<b>Subject of citation</b>	<b>Applies to subpart</b>	<b>Explanation</b>
§63.10(b)(1)	Record retention	Yes	Except that the most recent 2 years of data do not have to be retained on site.
§63.10(b)(2)(i)-(v)	Records related to SSM	No.	
§63.10(b)(2)(vi)-(xi)	Records	Yes.	
§63.10(b)(2)(xii)	Record when under waiver	Yes.	
§63.10(b)(2)(xiii)	Records when using alternative to RATA	Yes	For CO standard if using RATA alternative.
§63.10(b)(2)(xiv)	Records of supporting documentation	Yes.	
§63.10(b)(3)	Records of applicability determination	Yes.	
§63.10(c)	Additional records for sources using CEMS	Yes	Except that §63.10(c)(2)-(4) and (9) are reserved.
§63.10(d)(1)	General reporting requirements	Yes.	
§63.10(d)(2)	Report of performance test results	Yes.	
§63.10(d)(3)	Reporting opacity or VE observations	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.10(d)(4)	Progress reports	Yes.	
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No.	
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Yes.	
§63.10(e)(2)(ii)	COMS-related report	No	Subpart ZZZZ does not require COMS.

## Appendix A—Protocol for Using an Electrochemical Analyzer to Determine Oxygen and Carbon Monoxide Concentrations From Certain Engines

### 1.0 Scope and Application. What is this Protocol?

This protocol is a procedure for using portable electrochemical (EC) cells for measuring carbon monoxide (CO) and oxygen (O<sub>2</sub>) concentrations in controlled and uncontrolled emissions from existing stationary 4-stroke lean burn and 4-stroke rich burn reciprocating internal combustion engines as specified in the applicable rule.

#### 1.1 Analytes. What does this protocol determine?

This protocol measures the engine exhaust gas concentrations of carbon monoxide (CO) and oxygen (O<sub>2</sub>).

Analyte	CAS No.	Sensitivity
Carbon monoxide (CO)	630-08-0	Minimum detectable limit should be 2 percent of the nominal range or 1 ppm, whichever is less restrictive.
Oxygen (O <sub>2</sub> )	7782-44-7	

#### 1.2 Applicability. When is this protocol acceptable?

This protocol is applicable to 40 CFR part 63, subpart ZZZZ. Because of inherent cross sensitivities of EC cells, you must not apply this protocol to other emissions sources without specific instruction to that effect.

#### 1.3 Data Quality Objectives. How good must my collected data be?

Refer to Section 13 to verify and document acceptable analyzer performance.

#### 1.4 Range. What is the targeted analytical range for this protocol?

The measurement system and EC cell design(s) conforming to this protocol will determine the analytical range for each gas component. The nominal ranges are defined by choosing up-scale calibration gas concentrations near the maximum anticipated flue gas concentrations for CO and O<sub>2</sub>, or no more than twice the permitted CO level.

#### 1.5 Sensitivity. What minimum detectable limit will this protocol yield for a particular gas component?

The minimum detectable limit depends on the nominal range and resolution of the specific EC cell used, and the signal to noise ratio of the measurement system. The minimum detectable limit should be 2 percent of the nominal range or 1 ppm, whichever is less restrictive.

### 2.0 Summary of Protocol

In this protocol, a gas sample is extracted from an engine exhaust system and then conveyed to a portable EC analyzer for measurement of CO and O<sub>2</sub> gas concentrations. This method provides measurement system performance specifications and sampling protocols to ensure reliable data. You may use additions to, or modifications of vendor supplied measurement systems (e.g., heated or unheated sample lines, thermocouples, flow meters, selective gas scrubbers, etc.) to meet the design specifications of this protocol. Do not make changes to the measurement system from the as-verified configuration (Section 3.12).

### 3.0 Definitions

**3.1 Measurement System.** The total equipment required for the measurement of CO and O<sub>2</sub> concentrations. The measurement system consists of the following major subsystems:

*3.1.1 Data Recorder.* A strip chart recorder, computer or digital recorder for logging measurement data from the analyzer output. You may record measurement data from the digital data display manually or electronically.

*3.1.2 Electrochemical (EC) Cell.* A device, similar to a fuel cell, used to sense the presence of a specific analyte and generate an electrical current output proportional to the analyte concentration.

*3.1.3 Interference Gas Scrubber.* A device used to remove or neutralize chemical compounds that may interfere with the selective operation of an EC cell.

*3.1.4 Moisture Removal System.* Any device used to reduce the concentration of moisture in the sample stream so as to protect the EC cells from the damaging effects of condensation and to minimize errors in measurements caused by the scrubbing of soluble gases.

*3.1.5 Sample Interface.* The portion of the system used for one or more of the following: sample acquisition; sample transport; sample conditioning or protection of the EC cell from any degrading effects of the engine exhaust effluent; removal of particulate matter and condensed moisture.

*3.2 Nominal Range.* The range of analyte concentrations over which each EC cell is operated (normally 25 percent to 150 percent of up-scale calibration gas value). Several nominal ranges can be used for any given cell so long as the calibration and repeatability checks for that range remain within specifications.

*3.3 Calibration Gas.* A vendor certified concentration of a specific analyte in an appropriate balance gas.

*3.4 Zero Calibration Error.* The analyte concentration output exhibited by the EC cell in response to zero-level calibration gas.

*3.5 Up-Scale Calibration Error.* The mean of the difference between the analyte concentration exhibited by the EC cell and the certified concentration of the up-scale calibration gas.

*3.6 Interference Check.* A procedure for quantifying analytical interference from components in the engine exhaust gas other than the targeted analytes.

*3.7 Repeatability Check.* A protocol for demonstrating that an EC cell operated over a given nominal analyte concentration range provides a stable and consistent response and is not significantly affected by repeated exposure to that gas.

*3.8 Sample Flow Rate.* The flow rate of the gas sample as it passes through the EC cell. In some situations, EC cells can experience drift with changes in flow rate. The flow rate must be monitored and documented during all phases of a sampling run.

*3.9 Sampling Run.* A timed three-phase event whereby an EC cell's response rises and plateaus in a sample conditioning phase, remains relatively constant during a measurement data phase, then declines during a refresh phase. The sample conditioning phase exposes the EC cell to the gas sample for a length of time sufficient to reach a constant response. The measurement data phase is the time interval during which gas sample measurements can be made that meet the acceptance criteria of this protocol. The refresh phase then purges the EC cells with CO-free air. The refresh phase replenishes requisite O<sub>2</sub> and moisture in the electrolyte reserve and provides a mechanism to de-gas or desorb any interference gas scrubbers or filters so as to enable a stable CO EC cell response. There are four primary types of sampling runs: pre-sampling calibrations; stack gas sampling; post-sampling calibration checks; and measurement system repeatability checks. Stack gas sampling runs can be chained together for extended evaluations, providing all other procedural specifications are met.

*3.10 Sampling Day.* A time not to exceed twelve hours from the time of the pre-sampling calibration to the post-sampling calibration check. During this time, stack gas sampling runs can be repeated without repeated recalibrations, providing all other sampling specifications have been met.

*3.11 Pre-Sampling Calibration/Post-Sampling Calibration Check.* The protocols executed at the beginning and end of each sampling day to bracket measurement readings with controlled performance checks.

*3.12 Performance-Established Configuration.* The EC cell and sampling system configuration that existed at the time that it initially met the performance requirements of this protocol.

#### **4.0 Interferences.**

When present in sufficient concentrations, NO and NO<sub>2</sub> are two gas species that have been reported to interfere with CO concentration measurements. In the likelihood of this occurrence, it is the protocol user's responsibility to employ and properly maintain an appropriate CO EC cell filter or scrubber for removal of these gases, as described in Section 6.2.12.

#### **5.0 Safety. [Reserved]**

#### **6.0 Equipment and Supplies.**

##### **6.1 What equipment do I need for the measurement system?**

The system must maintain the gas sample at conditions that will prevent moisture condensation in the sample transport lines, both before and as the sample gas contacts the EC cells. The essential components of the measurement system are described below.

##### **6.2 Measurement System Components.**

*6.2.1 Sample Probe.* A single extraction-point probe constructed of glass, stainless steel or other non-reactive material, and of length sufficient to reach any designated sampling point. The sample probe must be designed to prevent plugging due to condensation or particulate matter.

*6.2.2 Sample Line.* Non-reactive tubing to transport the effluent from the sample probe to the EC cell.

*6.2.3 Calibration Assembly (optional).* A three-way valve assembly or equivalent to introduce calibration gases at ambient pressure at the exit end of the sample probe during calibration checks. The assembly must be designed such that only stack gas or calibration gas flows in the sample line and all gases flow through any gas path filters.

*6.2.4 Particulate Filter (optional).* Filters before the inlet of the EC cell to prevent accumulation of particulate material in the measurement system and extend the useful life of the components. All filters must be fabricated of materials that are non-reactive to the gas mixtures being sampled.

*6.2.5 Sample Pump.* A leak-free pump to provide undiluted sample gas to the system at a flow rate sufficient to minimize the response time of the measurement system. If located upstream of the EC cells, the pump must be constructed of a material that is non-reactive to the gas mixtures being sampled.

*6.2.8 Sample Flow Rate Monitoring.* An adjustable rotameter or equivalent device used to adjust and maintain the sample flow rate through the analyzer as prescribed.

*6.2.9 Sample Gas Manifold (optional).* A manifold to divert a portion of the sample gas stream to the analyzer and the remainder to a by-pass discharge vent. The sample gas manifold may also include provisions for introducing calibration gases directly to the analyzer. The manifold must be constructed of a material that is non-reactive to the gas mixtures being sampled.

*6.2.10 EC cell.* A device containing one or more EC cells to determine the CO and O<sub>2</sub> concentrations in the sample gas stream. The EC cell(s) must meet the applicable performance specifications of Section 13 of this protocol.

*6.2.11 Data Recorder.* A strip chart recorder, computer or digital recorder to make a record of analyzer output data. The data recorder resolution (i.e., readability) must be no greater than 1 ppm for CO; 0.1 percent for O<sub>2</sub>; and one degree (either °C or °F) for temperature. Alternatively, you may use a digital or analog meter having the same resolution to observe and manually record the analyzer responses.

**6.2.12 Interference Gas Filter or Scrubber.** A device to remove interfering compounds upstream of the CO EC cell. Specific interference gas filters or scrubbers used in the performance-established configuration of the analyzer must continue to be used. Such a filter or scrubber must have a means to determine when the removal agent is exhausted. Periodically replace or replenish it in accordance with the manufacturer's recommendations.

## **7.0 Reagents and Standards. What calibration gases are needed?**

**7.1 Calibration Gases.** CO calibration gases for the EC cell must be CO in nitrogen or CO in a mixture of nitrogen and O<sub>2</sub>. Use CO calibration gases with labeled concentration values certified by the manufacturer to be within  $\pm 5$  percent of the label value. Dry ambient air (20.9 percent O<sub>2</sub>) is acceptable for calibration of the O<sub>2</sub> cell. If needed, any lower percentage O<sub>2</sub> calibration gas must be a mixture of O<sub>2</sub> in nitrogen.

**7.1.1 Up-Scale CO Calibration Gas Concentration.** Choose one or more up-scale gas concentrations such that the average of the stack gas measurements for each stack gas sampling run are between 25 and 150 percent of those concentrations. Alternatively, choose an up-scale gas that does not exceed twice the concentration of the applicable outlet standard. If a measured gas value exceeds 150 percent of the up-scale CO calibration gas value at any time during the stack gas sampling run, the run must be discarded and repeated.

**7.1.2 Up-Scale O<sub>2</sub> Calibration Gas Concentration.**

Select an O<sub>2</sub> gas concentration such that the difference between the gas concentration and the average stack gas measurement or reading for each sample run is less than 15 percent O<sub>2</sub>. When the average exhaust gas O<sub>2</sub> readings are above 6 percent, you may use dry ambient air (20.9 percent O<sub>2</sub>) for the up-scale O<sub>2</sub> calibration gas.

**7.1.3 Zero Gas.** Use an inert gas that contains less than 0.25 percent of the up-scale CO calibration gas concentration. You may use dry air that is free from ambient CO and other combustion gas products (e.g., CO<sub>2</sub>).

## **8.0 Sample Collection and Analysis**

**8.1 Selection of Sampling Sites.**

**8.1.1 Control Device Inlet.** Select a sampling site sufficiently downstream of the engine so that the combustion gases should be well mixed. Use a single sampling extraction point near the center of the duct (e.g., within the 10 percent centroidal area), unless instructed otherwise.

**8.1.2 Exhaust Gas Outlet.** Select a sampling site located at least two stack diameters downstream of any disturbance (e.g., turbocharger exhaust, crossover junction or recirculation take-off) and at least one-half stack diameter upstream of the gas discharge to the atmosphere. Use a single sampling extraction point near the center of the duct (e.g., within the 10 percent centroidal area), unless instructed otherwise.

**8.2 Stack Gas Collection and Analysis.** Prior to the first stack gas sampling run, conduct that the pre-sampling calibration in accordance with Section 10.1. Use Figure 1 to record all data. Zero the analyzer with zero gas. Confirm and record that the scrubber media color is correct and not exhausted. Then position the probe at the sampling point and begin the sampling run at the same flow rate used during the up-scale calibration. Record the start time. Record all EC cell output responses and the flow rate during the "sample conditioning phase" once per minute until constant readings are obtained. Then begin the "measurement data phase" and record readings every 15 seconds for at least two minutes (or eight readings), or as otherwise required to achieve two continuous minutes of data that meet the specification given in Section 13.1. Finally, perform the "refresh phase" by introducing dry air, free from CO and other combustion gases, until several minute-to-minute readings of consistent value have been obtained. For each run use the "measurement data phase" readings to calculate the average stack gas CO and O<sub>2</sub> concentrations.

**8.3 EC Cell Rate.** Maintain the EC cell sample flow rate so that it does not vary by more than  $\pm 10$  percent throughout the pre-sampling calibration, stack gas sampling and post-sampling calibration check. Alternatively, the EC cell sample flow rate can be maintained within a tolerance range that does not affect the gas concentration readings by more than  $\pm 3$  percent, as instructed by the EC cell manufacturer.

## **9.0 Quality Control (Reserved)**

## 10.0 Calibration and Standardization

*10.1 Pre-Sampling Calibration.* Conduct the following protocol once for each nominal range to be used on each EC cell before performing a stack gas sampling run on each field sampling day. Repeat the calibration if you replace an EC cell before completing all of the sampling runs. There is no prescribed order for calibration of the EC cells; however, each cell must complete the measurement data phase during calibration. Assemble the measurement system by following the manufacturer's recommended protocols including for preparing and preconditioning the EC cell. Assure the measurement system has no leaks and verify the gas scrubbing agent is not depleted. Use Figure 1 to record all data.

*10.1.1 Zero Calibration.* For both the O<sub>2</sub> and CO cells, introduce zero gas to the measurement system (e.g., at the calibration assembly) and record the concentration reading every minute until readings are constant for at least two consecutive minutes. Include the time and sample flow rate. Repeat the steps in this section at least once to verify the zero calibration for each component gas.

*10.1.2 Zero Calibration Tolerance.* For each zero gas introduction, the zero level output must be less than or equal to  $\pm 3$  percent of the up-scale gas value or  $\pm 1$  ppm, whichever is less restrictive, for the CO channel and less than or equal to  $\pm 0.3$  percent O<sub>2</sub> for the O<sub>2</sub> channel.

*10.1.3 Up-Scale Calibration.* Individually introduce each calibration gas to the measurement system (e.g., at the calibration assembly) and record the start time. Record all EC cell output responses and the flow rate during this "sample conditioning phase" once per minute until readings are constant for at least two minutes. Then begin the "measurement data phase" and record readings every 15 seconds for a total of two minutes, or as otherwise required. Finally, perform the "refresh phase" by introducing dry air, free from CO and other combustion gases, until readings are constant for at least two consecutive minutes. Then repeat the steps in this section at least once to verify the calibration for each component gas. Introduce all gases to flow through the entire sample handling system (i.e., at the exit end of the sampling probe or the calibration assembly).

*10.1.4 Up-Scale Calibration Error.* The mean of the difference of the "measurement data phase" readings from the reported standard gas value must be less than or equal to  $\pm 5$  percent or  $\pm 1$  ppm for CO or  $\pm 0.5$  percent O<sub>2</sub>, whichever is less restrictive, respectively. The maximum allowable deviation from the mean measured value of any single "measurement data phase" reading must be less than or equal to  $\pm 2$  percent or  $\pm 1$  ppm for CO or  $\pm 0.5$  percent O<sub>2</sub>, whichever is less restrictive, respectively.

*10.2 Post-Sampling Calibration Check.* Conduct a stack gas post-sampling calibration check after the stack gas sampling run or set of runs and within 12 hours of the initial calibration. Conduct up-scale and zero calibration checks using the protocol in Section 10.1. Make no changes to the sampling system or EC cell calibration until all post-sampling calibration checks have been recorded. If either the zero or up-scale calibration error exceeds the respective specification in Sections 10.1.2 and 10.1.4 then all measurement data collected since the previous successful calibrations are invalid and re-calibration and re-sampling are required. If the sampling system is disassembled or the EC cell calibration is adjusted, repeat the calibration check before conducting the next analyzer sampling run.

## 11.0 Analytical Procedure

The analytical procedure is fully discussed in Section 8.

## 12.0 Calculations and Data Analysis

Determine the CO and O<sub>2</sub> concentrations for each stack gas sampling run by calculating the mean gas concentrations of the data recorded during the "measurement data phase".

## 13.0 Protocol Performance

Use the following protocols to verify consistent analyzer performance during each field sampling day.

*13.1 Measurement Data Phase Performance Check.* Calculate the mean of the readings from the "measurement data phase". The maximum allowable deviation from the mean for each of the individual readings is  $\pm 2$  percent, or  $\pm 1$  ppm,

whichever is less restrictive. Record the mean value and maximum deviation for each gas monitored. Data must conform to Section 10.1.4. The EC cell flow rate must conform to the specification in Section 8.3.

*Example:* A measurement data phase is invalid if the maximum deviation of any single reading comprising that mean is greater than  $\pm 2$  percent or  $\pm 1$  ppm (the default criteria). For example, if the mean = 30 ppm, single readings of below 29 ppm and above 31 ppm are disallowed).

**13.2 Interference Check.** Before the initial use of the EC cell and interference gas scrubber in the field, and semi-annually thereafter, challenge the interference gas scrubber with NO and NO<sub>2</sub> gas standards that are generally recognized as representative of diesel-fueled engine NO and NO<sub>2</sub> emission values. Record the responses displayed by the CO EC cell and other pertinent data on Figure 1 or a similar form.

**13.2.1 Interference Response.** The combined NO and NO<sub>2</sub> interference response should be less than or equal to  $\pm 5$  percent of the up-scale CO calibration gas concentration.

**13.3 Repeatability Check.** Conduct the following check once for each nominal range that is to be used on the CO EC cell within 5 days prior to each field sampling program. If a field sampling program lasts longer than 5 days, repeat this check every 5 days. Immediately repeat the check if the EC cell is replaced or if the EC cell is exposed to gas concentrations greater than 150 percent of the highest up-scale gas concentration.

**13.3.1 Repeatability Check Procedure.** Perform a complete EC cell sampling run (all three phases) by introducing the CO calibration gas to the measurement system and record the response. Follow Section 10.1.3. Use Figure 1 to record all data. Repeat the run three times for a total of four complete runs. During the four repeatability check runs, do not adjust the system except where necessary to achieve the correct calibration gas flow rate at the analyzer.

**13.3.2 Repeatability Check Calculations.** Determine the highest and lowest average "measurement data phase" CO concentrations from the four repeatability check runs and record the results on Figure 1 or a similar form. The absolute value of the difference between the maximum and minimum average values recorded must not vary more than  $\pm 3$  percent or  $\pm 1$  ppm of the up-scale gas value, whichever is less restrictive.

## Attachment R

### Part 70 Operating Permit No: 147-39554-00065

[Downloaded from the eCFR on November 25, 2015]

#### Title 40: Protection of Environment

#### PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

#### Subpart DDDDD—National Emission Standards for Hazardous Air Pollutants for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters

Source: 76 FR 15664, Mar. 21, 2011, unless otherwise noted.

#### What This Subpart Covers

##### §63.7480 What is the purpose of this subpart?

This subpart establishes national emission limitations and work practice standards for hazardous air pollutants (HAP) emitted from industrial, commercial, and institutional boilers and process heaters located at major sources of HAP. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations and work practice standards.

##### §63.7485 Am I subject to this subpart?

You are subject to this subpart if you own or operate an industrial, commercial, or institutional boiler or process heater as defined in §63.7575 that is located at, or is part of, a major source of HAP, except as specified in §63.7491. For purposes of this subpart, a major source of HAP is as defined in §63.2, except that for oil and natural gas production facilities, a major source of HAP is as defined in §63.7575.

[78 FR 7162, Jan. 31, 2013]

##### §63.7490 What is the affected source of this subpart?

(a) This subpart applies to new, reconstructed, and existing affected sources as described in paragraphs (a)(1) and (2) of this section.

(1) The affected source of this subpart is the collection at a major source of all existing industrial, commercial, and institutional boilers and process heaters within a subcategory as defined in §63.7575.

(2) The affected source of this subpart is each new or reconstructed industrial, commercial, or institutional boiler or process heater, as defined in §63.7575, located at a major source.

(b) A boiler or process heater is new if you commence construction of the boiler or process heater after June 4, 2010, and you meet the applicability criteria at the time you commence construction.

(c) A boiler or process heater is reconstructed if you meet the reconstruction criteria as defined in §63.2, you commence reconstruction after June 4, 2010, and you meet the applicability criteria at the time you commence reconstruction.

(d) A boiler or process heater is existing if it is not new or reconstructed.

(e) An existing electric utility steam generating unit (EGU) that meets the applicability requirements of this subpart after the effective date of this final rule due to a change (e.g., fuel switch) is considered to be an existing source under this subpart.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7162, Jan. 31, 2013]

**§63.7491 Are any boilers or process heaters not subject to this subpart?**

The types of boilers and process heaters listed in paragraphs (a) through (n) of this section are not subject to this subpart.

(a) An electric utility steam generating unit (EGU) covered by subpart UUUUU of this part or a natural gas-fired EGU as defined in subpart UUUUU of this part firing at least 85 percent natural gas on an annual heat input basis.

(b) A recovery boiler or furnace covered by subpart MM of this part.

(c) A boiler or process heater that is used specifically for research and development, including test steam boilers used to provide steam for testing the propulsion systems on military vessels. This does not include units that provide heat or steam to a process at a research and development facility.

(d) A hot water heater as defined in this subpart.

(e) A refining kettle covered by subpart X of this part.

(f) An ethylene cracking furnace covered by subpart YY of this part.

(g) Blast furnace stoves as described in EPA-453/R-01-005 (incorporated by reference, see §63.14).

(h) Any boiler or process heater that is part of the affected source subject to another subpart of this part, such as boilers and process heaters used as control devices to comply with subparts JJJ, OOO, PPP, and U of this part.

(i) Any boiler or process heater that is used as a control device to comply with another subpart of this part, or part 60, part 61, or part 65 of this chapter provided that at least 50 percent of the average annual heat input during any 3 consecutive calendar years to the boiler or process heater is provided by regulated gas streams that are subject to another standard.

(j) Temporary boilers and process heaters as defined in this subpart.

(k) Blast furnace gas fuel-fired boilers and process heaters as defined in this subpart.

(l) Any boiler or process heater specifically listed as an affected source in any standard(s) established under section 129 of the Clean Air Act.

(m) A unit that burns hazardous waste covered by Subpart EEE of this part. A unit that is exempt from Subpart EEE as specified in §63.1200(b) is not covered by Subpart EEE.

(n) Residential boilers as defined in this subpart.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7162, Jan. 31, 2013; 80 FR 72806, Nov. 20, 2015]

**§63.7495 When do I have to comply with this subpart?**

(a) If you have a new or reconstructed boiler or process heater, you must comply with this subpart by April 1, 2013, or upon startup of your boiler or process heater, whichever is later.

(b) If you have an existing boiler or process heater, you must comply with this subpart no later than January 31, 2016, except as provided in §63.6(i).

(c) If you have an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP, paragraphs (c)(1) and (2) of this section apply to you.

(1) Any new or reconstructed boiler or process heater at the existing source must be in compliance with this subpart upon startup.

(2) Any existing boiler or process heater at the existing source must be in compliance with this subpart within 3 years after the source becomes a major source.

(d) You must meet the notification requirements in §63.7545 according to the schedule in §63.7545 and in subpart A of this part. Some of the notifications must be submitted before you are required to comply with the emission limits and work practice standards in this subpart.

(e) If you own or operate an industrial, commercial, or institutional boiler or process heater and would be subject to this subpart except for the exemption in §63.7491(l) for commercial and industrial solid waste incineration units covered by part 60, subpart CCCC or subpart DDDD, and you cease combusting solid waste, you must be in compliance with this subpart and are no longer subject to part 60, subparts CCCC or DDDD beginning on the effective date of the switch as identified under the provisions of §60.2145(a)(2) and (3) or §60.2710(a)(2) and (3).

(f) If you own or operate an existing EGU that becomes subject to this subpart after January 31, 2016, you must be in compliance with the applicable existing source provisions of this subpart on the effective date such unit becomes subject to this subpart.

(g) If you own or operate an existing industrial, commercial, or institutional boiler or process heater and would be subject to this subpart except for an exemption in §63.7491(i) that becomes subject to this subpart after January 31, 2013, you must be in compliance with the applicable existing source provisions of this subpart within 3 years after such unit becomes subject to this subpart.

(h) If you own or operate an existing industrial, commercial, or institutional boiler or process heater and have switched fuels or made a physical change to the boiler or process heater that resulted in the applicability of a different subcategory after the compliance date of this subpart, you must be in compliance with the applicable existing source provisions of this subpart on the effective date of the fuel switch or physical change.

(i) If you own or operate a new industrial, commercial, or institutional boiler or process heater and have switched fuels or made a physical change to the boiler or process heater that resulted in the applicability of a different subcategory, you must be in compliance with the applicable new source provisions of this subpart on the effective date of the fuel switch or physical change.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7162, Jan. 31, 2013; 80 FR 72807, Nov. 20, 2015]

## **Emission Limitations and Work Practice Standards**

### **§63.7499 What are the subcategories of boilers and process heaters?**

The subcategories of boilers and process heaters, as defined in §63.7575 are:

(a) Pulverized coal/solid fossil fuel units.

(b) Stokers designed to burn coal/solid fossil fuel.

(c) Fluidized bed units designed to burn coal/solid fossil fuel.

(d) Stokers/sloped grate/other units designed to burn kiln dried biomass/bio-based solid.

- (e) Fluidized bed units designed to burn biomass/bio-based solid.
- (f) Suspension burners designed to burn biomass/bio-based solid.
- (g) Fuel cells designed to burn biomass/bio-based solid.
- (h) Hybrid suspension/grate burners designed to burn wet biomass/bio-based solid.
- (i) Stokers/sloped grate/other units designed to burn wet biomass/bio-based solid.
- (j) Dutch ovens/pile burners designed to burn biomass/bio-based solid.
- (k) Units designed to burn liquid fuel that are non-continental units.
- (l) Units designed to burn gas 1 fuels.
- (m) Units designed to burn gas 2 (other) gases.
- (n) Metal process furnaces.
- (o) Limited-use boilers and process heaters.
- (p) Units designed to burn solid fuel.
- (q) Units designed to burn liquid fuel.
- (r) Units designed to burn coal/solid fossil fuel.
- (s) Fluidized bed units with an integrated fluidized bed heat exchanger designed to burn coal/solid fossil fuel.
- (t) Units designed to burn heavy liquid fuel.
- (u) Units designed to burn light liquid fuel.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7163, Jan. 31, 2013]

**§63.7500 What emission limitations, work practice standards, and operating limits must I meet?**

(a) You must meet the requirements in paragraphs (a)(1) through (3) of this section, except as provided in paragraphs (b), through (e) of this section. You must meet these requirements at all times the affected unit is operating, except as provided in paragraph (f) of this section.

(1) You must meet each emission limit and work practice standard in Tables 1 through 3, and 11 through 13 to this subpart that applies to your boiler or process heater, for each boiler or process heater at your source, except as provided under §63.7522. The output-based emission limits, in units of pounds per million Btu of steam output, in Tables 1 or 2 to this subpart are an alternative applicable only to boilers and process heaters that generate either steam, cogenerate steam with electricity, or both. The output-based emission limits, in units of pounds per megawatt-hour, in Tables 1 or 2 to this subpart are an alternative applicable only to boilers that generate only electricity. Boilers that perform multiple functions (cogeneration and electricity generation) or supply steam to common headers would calculate a total steam energy output using equation 21 of §63.7575 to demonstrate compliance with the output-based emission limits, in units of pounds per million Btu of steam output, in Tables 1 or 2 to this subpart. If you operate a new boiler or process heater, you can choose to comply with alternative limits as discussed in paragraphs (a)(1)(i) through (iii) of this section, but on or after January 31, 2016, you must comply with the emission limits in Table 1 to this subpart.

(i) If your boiler or process heater commenced construction or reconstruction after June 4, 2010 and before May 20, 2011, you may comply with the emission limits in Table 1 or 11 to this subpart until January 31, 2016.

(ii) If your boiler or process heater commenced construction or reconstruction on or after May 20, 2011 and before December 23, 2011, you may comply with the emission limits in Table 1 or 12 to this subpart until January 31, 2016.

(iii) If your boiler or process heater commenced construction or reconstruction on or after December 23, 2011 and before April 1, 2013, you may comply with the emission limits in Table 1 or 13 to this subpart until January 31, 2016.

(2) You must meet each operating limit in Table 4 to this subpart that applies to your boiler or process heater. If you use a control device or combination of control devices not covered in Table 4 to this subpart, or you wish to establish and monitor an alternative operating limit or an alternative monitoring parameter, you must apply to the EPA Administrator for approval of alternative monitoring under §63.8(f).

(3) At all times, you must operate and maintain any affected source (as defined in §63.7490), including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator that may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

(b) As provided in §63.6(g), EPA may approve use of an alternative to the work practice standards in this section.

(c) Limited-use boilers and process heaters must complete a tune-up every 5 years as specified in §63.7540. They are not subject to the emission limits in Tables 1 and 2 or 11 through 13 to this subpart, the annual tune-up, or the energy assessment requirements in Table 3 to this subpart, or the operating limits in Table 4 to this subpart.

(d) Boilers and process heaters with a heat input capacity of less than or equal to 5 million Btu per hour in the units designed to burn gas 2 (other) fuels subcategory or units designed to burn light liquid fuels subcategory must complete a tune-up every 5 years as specified in §63.7540.

(e) Boilers and process heaters in the units designed to burn gas 1 fuels subcategory with a heat input capacity of less than or equal to 5 million Btu per hour must complete a tune-up every 5 years as specified in §63.7540. Boilers and process heaters in the units designed to burn gas 1 fuels subcategory with a heat input capacity greater than 5 million Btu per hour and less than 10 million Btu per hour must complete a tune-up every 2 years as specified in §63.7540. Boilers and process heaters in the units designed to burn gas 1 fuels subcategory are not subject to the emission limits in Tables 1 and 2 or 11 through 13 to this subpart, or the operating limits in Table 4 to this subpart.

(f) These standards apply at all times the affected unit is operating, except during periods of startup and shutdown during which time you must comply only with items 5 and 6 of Table 3 to this subpart.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7163, Jan. 31, 2013; 80 FR 72807, Nov. 20, 2015]

#### **§63.7501 [Reserved]**

### **General Compliance Requirements**

#### **§63.7505 What are my general requirements for complying with this subpart?**

(a) You must be in compliance with the emission limits, work practice standards, and operating limits in this subpart. These emission and operating limits apply to you at all times the affected unit is operating except for the periods noted in §63.7500(f).

(b) [Reserved]

(c) You must demonstrate compliance with all applicable emission limits using performance stack testing, fuel analysis, or continuous monitoring systems (CMS), including a continuous emission monitoring system (CEMS), or particulate matter continuous parameter monitoring system (PM CPMS), where applicable. You may demonstrate compliance with the applicable emission limit for hydrogen chloride (HCl), mercury, or total selected metals (TSM) using fuel analysis if the emission rate calculated according to §63.7530(c) is less than the applicable emission limit. (For gaseous fuels, you may not use fuel analyses to comply with the TSM alternative standard or the HCl standard.) Otherwise, you must demonstrate compliance for HCl, mercury, or TSM using performance stack testing, if subject to an applicable emission limit listed in Tables 1, 2, or 11 through 13 to this subpart.

(d) If you demonstrate compliance with any applicable emission limit through performance testing and subsequent compliance with operating limits through the use of CPMS, or with a CEMS or COMS, you must develop a site-specific monitoring plan according to the requirements in paragraphs (d)(1) through (4) of this section for the use of any CEMS, COMS, or CPMS. This requirement also applies to you if you petition the EPA Administrator for alternative monitoring parameters under §63.8(f).

(1) For each CMS required in this section (including CEMS, COMS, or CPMS), you must develop, and submit to the Administrator for approval upon request, a site-specific monitoring plan that addresses design, data collection, and the quality assurance and quality control elements outlined in §63.8(d) and the elements described in paragraphs (d)(1)(i) through (iii) of this section. You must submit this site-specific monitoring plan, if requested, at least 60 days before your initial performance evaluation of your CMS. This requirement to develop and submit a site specific monitoring plan does not apply to affected sources with existing CEMS or COMS operated according to the performance specifications under appendix B to part 60 of this chapter and that meet the requirements of §63.7525. Using the process described in §63.8(f)(4), you may request approval of alternative monitoring system quality assurance and quality control procedures in place of those specified in this paragraph and, if approved, include the alternatives in your site-specific monitoring plan.

(i) Installation of the CMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (e.g., on or downstream of the last control device);

(ii) Performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction systems; and

(iii) Performance evaluation procedures and acceptance criteria (e.g., calibrations, accuracy audits, analytical drift).

(2) In your site-specific monitoring plan, you must also address paragraphs (d)(2)(i) through (iii) of this section.

(i) Ongoing operation and maintenance procedures in accordance with the general requirements of §63.8(c)(1)(ii), (c)(3), and (c)(4)(ii);

(ii) Ongoing data quality assurance procedures in accordance with the general requirements of §63.8(d); and

(iii) Ongoing recordkeeping and reporting procedures in accordance with the general requirements of §63.10(c) (as applicable in Table 10 to this subpart), (e)(1), and (e)(2)(i).

(3) You must conduct a performance evaluation of each CMS in accordance with your site-specific monitoring plan.

(4) You must operate and maintain the CMS in continuous operation according to the site-specific monitoring plan.

(e) If you have an applicable emission limit, and you choose to comply using definition (2) of "startup" in §63.7575, you must develop and implement a written startup and shutdown plan (SSP) according to the requirements in Table 3 to this subpart. The SSP must be maintained onsite and available upon request for public inspection.

## Testing, Fuel Analyses, and Initial Compliance Requirements

### §63.7510 What are my initial compliance requirements and by what date must I conduct them?

(a) For each boiler or process heater that is required or that you elect to demonstrate compliance with any of the applicable emission limits in Tables 1 or 2 or 11 through 13 of this subpart through performance (stack) testing, your initial compliance requirements include all the following:

(1) Conduct performance tests according to §63.7520 and Table 5 to this subpart.

(2) Conduct a fuel analysis for each type of fuel burned in your boiler or process heater according to §63.7521 and Table 6 to this subpart, except as specified in paragraphs (a)(2)(i) through (iii) of this section.

(i) For each boiler or process heater that burns a single type of fuel, you are not required to conduct a fuel analysis for each type of fuel burned in your boiler or process heater according to §63.7521 and Table 6 to this subpart. For purposes of this subpart, units that use a supplemental fuel only for startup, unit shutdown, and transient flame stability purposes still qualify as units that burn a single type of fuel, and the supplemental fuel is not subject to the fuel analysis requirements under §63.7521 and Table 6 to this subpart.

(ii) When natural gas, refinery gas, or other gas 1 fuels are co-fired with other fuels, you are not required to conduct a fuel analysis of those Gas 1 fuels according to §63.7521 and Table 6 to this subpart. If gaseous fuels other than natural gas, refinery gas, or other gas 1 fuels are co-fired with other fuels and those non-Gas 1 gaseous fuels are subject to another subpart of this part, part 60, part 61, or part 65, you are not required to conduct a fuel analysis of those non-Gas 1 fuels according to §63.7521 and Table 6 to this subpart.

(iii) You are not required to conduct a chlorine fuel analysis for any gaseous fuels. You must conduct a fuel analysis for mercury on gaseous fuels unless the fuel is exempted in paragraphs (a)(2)(i) and (ii) of this section.

(3) Establish operating limits according to §63.7530 and Table 7 to this subpart.

(4) Conduct CMS performance evaluations according to §63.7525.

(b) For each boiler or process heater that you elect to demonstrate compliance with the applicable emission limits in Tables 1 or 2 or 11 through 13 to this subpart for HCl, mercury, or TSM through fuel analysis, your initial compliance requirement is to conduct a fuel analysis for each type of fuel burned in your boiler or process heater according to §63.7521 and Table 6 to this subpart and establish operating limits according to §63.7530 and Table 8 to this subpart. The fuels described in paragraph (a)(2)(i) and (ii) of this section are exempt from these fuel analysis and operating limit requirements. The fuels described in paragraph (a)(2)(ii) of this section are exempt from the chloride fuel analysis and operating limit requirements. Boilers and process heaters that use a CEMS for mercury or HCl are exempt from the performance testing and operating limit requirements specified in paragraph (a) of this section for the HAP for which CEMS are used.

(c) If your boiler or process heater is subject to a carbon monoxide (CO) limit, your initial compliance demonstration for CO is to conduct a performance test for CO according to Table 5 to this subpart or conduct a performance evaluation of your continuous CO monitor, if applicable, according to §63.7525(a). Boilers and process heaters that use a CO CEMS to comply with the applicable alternative CO CEMS emission standard listed in Tables 1, 2, or 11 through 13 to this subpart, as specified in §63.7525(a), are exempt from the initial CO performance testing and oxygen concentration operating limit requirements specified in paragraph (a) of this section.

(d) If your boiler or process heater is subject to a PM limit, your initial compliance demonstration for PM is to conduct a performance test in accordance with §63.7520 and Table 5 to this subpart.

(e) For existing affected sources (as defined in §63.7490), you must complete the initial compliance demonstrations, as specified in paragraphs (a) through (d) of this section, no later than 180 days after the compliance date that is specified for your source in §63.7495 and according to the applicable provisions in §63.7(a)(2) as cited in Table 10 to this subpart, except as specified in paragraph (j) of this section. You must complete an initial tune-up by following the procedures described in §63.7540(a)(10)(i) through (vi) no later than the compliance date specified in §63.7495,

except as specified in paragraph (j) of this section. You must complete the one-time energy assessment specified in Table 3 to this subpart no later than the compliance date specified in §63.7495.

(f) For new or reconstructed affected sources (as defined in §63.7490), you must complete the initial compliance demonstration with the emission limits no later than July 30, 2013 or within 180 days after startup of the source, whichever is later. If you are demonstrating compliance with an emission limit in Tables 11 through 13 to this subpart that is less stringent (that is, higher) than the applicable emission limit in Table 1 to this subpart, you must demonstrate compliance with the applicable emission limit in Table 1 no later than July 29, 2016.

(g) For new or reconstructed affected sources (as defined in §63.7490), you must demonstrate initial compliance with the applicable work practice standards in Table 3 to this subpart within the applicable annual, biennial, or 5-year schedule as specified in §63.7515(d) following the initial compliance date specified in §63.7495(a). Thereafter, you are required to complete the applicable annual, biennial, or 5-year tune-up as specified in §63.7515(d).

(h) For affected sources (as defined in §63.7490) that ceased burning solid waste consistent with §63.7495(e) and for which the initial compliance date has passed, you must demonstrate compliance within 60 days of the effective date of the waste-to-fuel switch. If you have not conducted your compliance demonstration for this subpart within the previous 12 months, you must complete all compliance demonstrations for this subpart before you commence or recommence combustion of solid waste.

(i) For an existing EGU that becomes subject after January 31, 2016, you must demonstrate compliance within 180 days after becoming an affected source.

(j) For existing affected sources (as defined in §63.7490) that have not operated between the effective date of the rule and the compliance date that is specified for your source in §63.7495, you must complete the initial compliance demonstration, if subject to the emission limits in Table 2 to this subpart, as specified in paragraphs (a) through (d) of this section, no later than 180 days after the re-start of the affected source and according to the applicable provisions in §63.7(a)(2) as cited in Table 10 to this subpart. You must complete an initial tune-up by following the procedures described in §63.7540(a)(10)(i) through (vi) no later than 30 days after the re-start of the affected source and, if applicable, complete the one-time energy assessment specified in Table 3 to this subpart, no later than the compliance date specified in §63.7495.

(k) For affected sources, as defined in §63.7490, that switch subcategories consistent with §63.7545(h) after the initial compliance date, you must demonstrate compliance within 60 days of the effective date of the switch, unless you had previously conducted your compliance demonstration for this subcategory within the previous 12 months.

[78 FR 7164, Jan. 31, 2013, as amended at 80 FR 72808, Nov. 20, 2015]

**§63.7515 When must I conduct subsequent performance tests, fuel analyses, or tune-ups?**

(a) You must conduct all applicable performance tests according to §63.7520 on an annual basis, except as specified in paragraphs (b) through (e), (g), and (h) of this section. Annual performance tests must be completed no more than 13 months after the previous performance test, except as specified in paragraphs (b) through (e), (g), and (h) of this section.

(b) If your performance tests for a given pollutant for at least 2 consecutive years show that your emissions are at or below 75 percent of the emission limit (or, in limited instances as specified in Tables 1 and 2 or 11 through 13 to this subpart, at or below the emission limit) for the pollutant, and if there are no changes in the operation of the individual boiler or process heater or air pollution control equipment that could increase emissions, you may choose to conduct performance tests for the pollutant every third year. Each such performance test must be conducted no more than 37 months after the previous performance test. If you elect to demonstrate compliance using emission averaging under §63.7522, you must continue to conduct performance tests annually. The requirement to test at maximum chloride input level is waived unless the stack test is conducted for HCl. The requirement to test at maximum mercury input level is waived unless the stack test is conducted for mercury. The requirement to test at maximum TSM input level is waived unless the stack test is conducted for TSM.

(c) If a performance test shows emissions exceeded the emission limit or 75 percent of the emission limit (as specified in Tables 1 and 2 or 11 through 13 to this subpart) for a pollutant, you must conduct annual performance

tests for that pollutant until all performance tests over a consecutive 2-year period meet the required level (at or below 75 percent of the emission limit, as specified in Tables 1 and 2 or 11 through 13 to this subpart).

(d) If you are required to meet an applicable tune-up work practice standard, you must conduct an annual, biennial, or 5-year performance tune-up according to §63.7540(a)(10), (11), or (12), respectively. Each annual tune-up specified in §63.7540(a)(10) must be no more than 13 months after the previous tune-up. Each biennial tune-up specified in §63.7540(a)(11) must be conducted no more than 25 months after the previous tune-up. Each 5-year tune-up specified in §63.7540(a)(12) must be conducted no more than 61 months after the previous tune-up. For a new or reconstructed affected source (as defined in §63.7490), the first annual, biennial, or 5-year tune-up must be no later than 13 months, 25 months, or 61 months, respectively, after April 1, 2013 or the initial startup of the new or reconstructed affected source, whichever is later.

(e) If you demonstrate compliance with the mercury, HCl, or TSM based on fuel analysis, you must conduct a monthly fuel analysis according to §63.7521 for each type of fuel burned that is subject to an emission limit in Tables 1, 2, or 11 through 13 to this subpart. You may comply with this monthly requirement by completing the fuel analysis any time within the calendar month as long as the analysis is separated from the previous analysis by at least 14 calendar days. If you burn a new type of fuel, you must conduct a fuel analysis before burning the new type of fuel in your boiler or process heater. You must still meet all applicable continuous compliance requirements in §63.7540. If each of 12 consecutive monthly fuel analyses demonstrates 75 percent or less of the compliance level, you may decrease the fuel analysis frequency to quarterly for that fuel. If any quarterly sample exceeds 75 percent of the compliance level or you begin burning a new type of fuel, you must return to monthly monitoring for that fuel, until 12 months of fuel analyses are again less than 75 percent of the compliance level. If sampling is conducted on one day per month, samples should be no less than 14 days apart, but if multiple samples are taken per month, the 14-day restriction does not apply.

(f) You must report the results of performance tests and the associated fuel analyses within 60 days after the completion of the performance tests. This report must also verify that the operating limits for each boiler or process heater have not changed or provide documentation of revised operating limits established according to §63.7530 and Table 7 to this subpart, as applicable. The reports for all subsequent performance tests must include all applicable information required in §63.7550.

(g) For affected sources (as defined in §63.7490) that have not operated since the previous compliance demonstration and more than one year has passed since the previous compliance demonstration, you must complete the subsequent compliance demonstration, if subject to the emission limits in Tables 1, 2, or 11 through 13 to this subpart, no later than 180 days after the re-start of the affected source and according to the applicable provisions in §63.7(a)(2) as cited in Table 10 to this subpart. You must complete a subsequent tune-up by following the procedures described in §63.7540(a)(10)(i) through (vi) and the schedule described in §63.7540(a)(13) for units that are not operating at the time of their scheduled tune-up.

(h) If your affected boiler or process heater is in the unit designed to burn light liquid subcategory and you combust ultra-low sulfur liquid fuel, you do not need to conduct further performance tests (stack tests or fuel analyses) if the pollutants measured during the initial compliance performance tests meet the emission limits in Tables 1 or 2 of this subpart providing you demonstrate ongoing compliance with the emissions limits by monitoring and recording the type of fuel combusted on a monthly basis. If you intend to use a fuel other than ultra-low sulfur liquid fuel, natural gas, refinery gas, or other gas 1 fuel, you must conduct new performance tests within 60 days of burning the new fuel type.

(i) If you operate a CO CEMS that meets the Performance Specifications outlined in §63.7525(a)(3) of this subpart to demonstrate compliance with the applicable alternative CO CEMS emission standard listed in Tables 1, 2, or 11 through 13 to this subpart, you are not required to conduct CO performance tests and are not subject to the oxygen concentration operating limit requirement specified in §63.7510(a).

[78 FR 7165, Jan. 31, 2013, as amended at 80 FR 72808, Nov. 20, 2015]

#### **§63.7520 What stack tests and procedures must I use?**

(a) You must conduct all performance tests according to §63.7(c), (d), (f), and (h). You must also develop a site-specific stack test plan according to the requirements in §63.7(c). You shall conduct all performance tests under such conditions as the Administrator specifies to you based on the representative performance of each boiler or process

heater for the period being tested. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of the performance tests.

(b) You must conduct each performance test according to the requirements in Table 5 to this subpart.

(c) You must conduct each performance test under the specific conditions listed in Tables 5 and 7 to this subpart. You must conduct performance tests at representative operating load conditions while burning the type of fuel or mixture of fuels that has the highest content of chlorine and mercury, and TSM if you are opting to comply with the TSM alternative standard and you must demonstrate initial compliance and establish your operating limits based on these performance tests. These requirements could result in the need to conduct more than one performance test. Following each performance test and until the next performance test, you must comply with the operating limit for operating load conditions specified in Table 4 to this subpart.

(d) You must conduct a minimum of three separate test runs for each performance test required in this section, as specified in §63.7(e)(3). Each test run must comply with the minimum applicable sampling times or volumes specified in Tables 1 and 2 or 11 through 13 to this subpart.

(e) To determine compliance with the emission limits, you must use the F-Factor methodology and equations in sections 12.2 and 12.3 of EPA Method 19 at 40 CFR part 60, appendix A-7 of this chapter to convert the measured particulate matter (PM) concentrations, the measured HCl concentrations, the measured mercury concentrations, and the measured TSM concentrations that result from the performance test to pounds per million Btu heat input emission rates.

(f) Except for a 30-day rolling average based on CEMS (or sorbent trap monitoring system) data, if measurement results for any pollutant are reported as below the method detection level (e.g., laboratory analytical results for one or more sample components are below the method defined analytical detection level), you must use the method detection level as the measured emissions level for that pollutant in calculating compliance. The measured result for a multiple component analysis (e.g., analytical values for multiple Method 29 fractions both for individual HAP metals and for total HAP metals) may include a combination of method detection level data and analytical data reported above the method detection level.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7166, Jan. 31, 2013]

**§63.7521 What fuel analyses, fuel specification, and procedures must I use?**

(a) For solid and liquid fuels, you must conduct fuel analyses for chloride and mercury according to the procedures in paragraphs (b) through (e) of this section and Table 6 to this subpart, as applicable. For solid fuels and liquid fuels, you must also conduct fuel analyses for TSM if you are opting to comply with the TSM alternative standard. For gas 2 (other) fuels, you must conduct fuel analyses for mercury according to the procedures in paragraphs (b) through (e) of this section and Table 6 to this subpart, as applicable. (For gaseous fuels, you may not use fuel analyses to comply with the TSM alternative standard or the HCl standard.) For purposes of complying with this section, a fuel gas system that consists of multiple gaseous fuels collected and mixed with each other is considered a single fuel type and sampling and analysis is only required on the combined fuel gas system that will feed the boiler or process heater. Sampling and analysis of the individual gaseous streams prior to combining is not required. You are not required to conduct fuel analyses for fuels used for only startup, unit shutdown, and transient flame stability purposes. You are required to conduct fuel analyses only for fuels and units that are subject to emission limits for mercury, HCl, or TSM in Tables 1 and 2 or 11 through 13 to this subpart. Gaseous and liquid fuels are exempt from the sampling requirements in paragraphs (c) and (d) of this section.

(b) You must develop a site-specific fuel monitoring plan according to the following procedures and requirements in paragraphs (b)(1) and (2) of this section, if you are required to conduct fuel analyses as specified in §63.7510.

(1) If you intend to use an alternative analytical method other than those required by Table 6 to this subpart, you must submit the fuel analysis plan to the Administrator for review and approval no later than 60 days before the date that you intend to conduct the initial compliance demonstration described in §63.7510.

(2) You must include the information contained in paragraphs (b)(2)(i) through (vi) of this section in your fuel analysis plan.

- (i) The identification of all fuel types anticipated to be burned in each boiler or process heater.
  - (ii) For each anticipated fuel type, the notification of whether you or a fuel supplier will be conducting the fuel analysis.
  - (iii) For each anticipated fuel type, a detailed description of the sample location and specific procedures to be used for collecting and preparing the composite samples if your procedures are different from paragraph (c) or (d) of this section. Samples should be collected at a location that most accurately represents the fuel type, where possible, at a point prior to mixing with other dissimilar fuel types.
  - (iv) For each anticipated fuel type, the analytical methods from Table 6, with the expected minimum detection levels, to be used for the measurement of chlorine or mercury.
  - (v) If you request to use an alternative analytical method other than those required by Table 6 to this subpart, you must also include a detailed description of the methods and procedures that you are proposing to use. Methods in Table 6 shall be used until the requested alternative is approved.
  - (vi) If you will be using fuel analysis from a fuel supplier in lieu of site-specific sampling and analysis, the fuel supplier must use the analytical methods required by Table 6 to this subpart.
- (c) You must obtain composite fuel samples for each fuel type according to the procedures in paragraph (c)(1) or (2) of this section, or the methods listed in Table 6 to this subpart, or use an automated sampling mechanism that provides representative composite fuel samples for each fuel type that includes both coarse and fine material. At a minimum, for demonstrating initial compliance by fuel analysis, you must obtain three composite samples. For monthly fuel analyses, at a minimum, you must obtain a single composite sample. For fuel analyses as part of a performance stack test, as specified in §63.7510(a), you must obtain a composite fuel sample during each performance test run.
- (1) If sampling from a belt (or screw) feeder, collect fuel samples according to paragraphs (c)(1)(i) and (ii) of this section.
    - (i) Stop the belt and withdraw a 6-inch wide sample from the full cross-section of the stopped belt to obtain a minimum two pounds of sample. You must collect all the material (fines and coarse) in the full cross-section. You must transfer the sample to a clean plastic bag.
    - (ii) Each composite sample will consist of a minimum of three samples collected at approximately equal one-hour intervals during the testing period for sampling during performance stack testing.
  - (2) If sampling from a fuel pile or truck, you must collect fuel samples according to paragraphs (c)(2)(i) through (iii) of this section.
    - (i) For each composite sample, you must select a minimum of five sampling locations uniformly spaced over the surface of the pile.
    - (ii) At each sampling site, you must dig into the pile to a uniform depth of approximately 18 inches. You must insert a clean shovel into the hole and withdraw a sample, making sure that large pieces do not fall off during sampling; use the same shovel to collect all samples.
    - (iii) You must transfer all samples to a clean plastic bag for further processing.
- (d) You must prepare each composite sample according to the procedures in paragraphs (d)(1) through (7) of this section.
- (1) You must thoroughly mix and pour the entire composite sample over a clean plastic sheet.
  - (2) You must break large sample pieces (e.g., larger than 3 inches) into smaller sizes.

- (3) You must make a pie shape with the entire composite sample and subdivide it into four equal parts.
- (4) You must separate one of the quarter samples as the first subset.
- (5) If this subset is too large for grinding, you must repeat the procedure in paragraph (d)(3) of this section with the quarter sample and obtain a one-quarter subset from this sample.
- (6) You must grind the sample in a mill.
- (7) You must use the procedure in paragraph (d)(3) of this section to obtain a one-quarter subsample for analysis. If the quarter sample is too large, subdivide it further using the same procedure.
- (e) You must determine the concentration of pollutants in the fuel (mercury and/or chlorine and/or TSM) in units of pounds per million Btu of each composite sample for each fuel type according to the procedures in Table 6 to this subpart, for use in Equations 7, 8, and 9 of this subpart.
- (f) To demonstrate that a gaseous fuel other than natural gas or refinery gas qualifies as an other gas 1 fuel, as defined in §63.7575, you must conduct a fuel specification analyses for mercury according to the procedures in paragraphs (g) through (i) of this section and Table 6 to this subpart, as applicable, except as specified in paragraph (f)(1) through (4) of this section, or as an alternative where fuel specification analysis is not practical, you must measure mercury concentration in the exhaust gas when firing only the gaseous fuel to be demonstrated as an other gas 1 fuel in the boiler or process heater according to the procedures in Table 6 to this subpart.
- (1) You are not required to conduct the fuel specification analyses in paragraphs (g) through (i) of this section for natural gas or refinery gas.
- (2) You are not required to conduct the fuel specification analyses in paragraphs (g) through (i) of this section for gaseous fuels that are subject to another subpart of this part, part 60, part 61, or part 65.
- (3) You are not required to conduct the fuel specification analyses in paragraphs (g) through (i) of this section on gaseous fuels for units that are complying with the limits for units designed to burn gas 2 (other) fuels.
- (4) You are not required to conduct the fuel specification analyses in paragraphs (g) through (i) of this section for gas streams directly derived from natural gas at natural gas production sites or natural gas plants.
- (g) You must develop a site-specific fuel analysis plan for other gas 1 fuels according to the following procedures and requirements in paragraphs (g)(1) and (2) of this section.
- (1) If you intend to use an alternative analytical method other than those required by Table 6 to this subpart, you must submit the fuel analysis plan to the Administrator for review and approval no later than 60 days before the date that you intend to conduct the initial compliance demonstration described in §63.7510.
- (2) You must include the information contained in paragraphs (g)(2)(i) through (vi) of this section in your fuel analysis plan.
- (i) The identification of all gaseous fuel types other than those exempted from fuel specification analysis under (f)(1) through (3) of this section anticipated to be burned in each boiler or process heater.
- (ii) For each anticipated fuel type, the identification of whether you or a fuel supplier will be conducting the fuel specification analysis.
- (iii) For each anticipated fuel type, a detailed description of the sample location and specific procedures to be used for collecting and preparing the samples if your procedures are different from the sampling methods contained in Table 6 to this subpart. Samples should be collected at a location that most accurately represents the fuel type, where possible, at a point prior to mixing with other dissimilar fuel types. If multiple boilers or process heaters are fueled by a common fuel stream it is permissible to conduct a single gas specification at the common point of gas distribution.

(iv) For each anticipated fuel type, the analytical methods from Table 6 to this subpart, with the expected minimum detection levels, to be used for the measurement of mercury.

(v) If you request to use an alternative analytical method other than those required by Table 6 to this subpart, you must also include a detailed description of the methods and procedures that you are proposing to use. Methods in Table 6 to this subpart shall be used until the requested alternative is approved.

(vi) If you will be using fuel analysis from a fuel supplier in lieu of site-specific sampling and analysis, the fuel supplier must use the analytical methods required by Table 6 to this subpart. When using a fuel supplier's fuel analysis, the owner or operator is not required to submit the information in §63.7521(g)(2)(iii).

(h) You must obtain a single fuel sample for each fuel type for fuel specification of gaseous fuels.

(i) You must determine the concentration in the fuel of mercury, in units of microgram per cubic meter, dry basis, of each sample for each other gas 1 fuel type according to the procedures in Table 6 to this subpart.

[78 FR 7167, Jan. 31, 2013, as amended at 80 FR 72808, Nov. 20, 2015]

### **§63.7522 Can I use emissions averaging to comply with this subpart?**

(a) As an alternative to meeting the requirements of §63.7500 for PM (or TSM), HCl, or mercury on a boiler or process heater-specific basis, if you have more than one existing boiler or process heater in any subcategories located at your facility, you may demonstrate compliance by emissions averaging, if your averaged emissions are not more than 90 percent of the applicable emission limit, according to the procedures in this section. You may not include new boilers or process heaters in an emissions average.

(b) For a group of two or more existing boilers or process heaters in the same subcategory that each vent to a separate stack, you may average PM (or TSM), HCl, or mercury emissions among existing units to demonstrate compliance with the limits in Table 2 to this subpart as specified in paragraph (b)(1) through (3) of this section, if you satisfy the requirements in paragraphs (c) through (g) of this section.

(1) You may average units using a CEMS or PM CPMS for demonstrating compliance.

(2) For mercury and HCl, averaging is allowed as follows:

(i) You may average among units in any of the solid fuel subcategories.

(ii) You may average among units in any of the liquid fuel subcategories.

(iii) You may average among units in a subcategory of units designed to burn gas 2 (other) fuels.

(iv) You may not average across the units designed to burn liquid, units designed to burn solid fuel, and units designed to burn gas 2 (other) subcategories.

(3) For PM (or TSM), averaging is only allowed between units within each of the following subcategories and you may not average across subcategories:

(i) Units designed to burn coal/solid fossil fuel.

(ii) Stokers/sloped grate/other units designed to burn kiln dried biomass/bio-based solids.

(iii) Stokers/sloped grate/other units designed to burn wet biomass/bio-based solids.

(iv) Fluidized bed units designed to burn biomass/bio-based solid.

- (v) Suspension burners designed to burn biomass/bio-based solid.
- (vi) Dutch ovens/pile burners designed to burn biomass/bio-based solid.
- (vii) Fuel Cells designed to burn biomass/bio-based solid.
- (viii) Hybrid suspension/grate burners designed to burn wet biomass/bio-based solid.
- (ix) Units designed to burn heavy liquid fuel.
- (x) Units designed to burn light liquid fuel.
- (xi) Units designed to burn liquid fuel that are non-continental units.
- (xii) Units designed to burn gas 2 (other) gases.

(c) For each existing boiler or process heater in the averaging group, the emission rate achieved during the initial compliance test for the HAP being averaged must not exceed the emission level that was being achieved on April 1, 2013 or the control technology employed during the initial compliance test must not be less effective for the HAP being averaged than the control technology employed on April 1, 2013.

(d) The averaged emissions rate from the existing boilers and process heaters participating in the emissions averaging option must not exceed 90 percent of the limits in Table 2 to this subpart at all times the affected units are subject to numeric emission limits following the compliance date specified in §63.7495.

(e) You must demonstrate initial compliance according to paragraph (e)(1) or (2) of this section using the maximum rated heat input capacity or maximum steam generation capacity of each unit and the results of the initial performance tests or fuel analysis.

(1) You must use Equation 1a or 1b or 1c of this section to demonstrate that the PM (or TSM), HCl, or mercury emissions from all existing units participating in the emissions averaging option for that pollutant do not exceed the emission limits in Table 2 to this subpart. Use Equation 1a if you are complying with the emission limits on a heat input basis, use Equation 1b if you are complying with the emission limits on a steam generation (output) basis, and use Equation 1c if you are complying with the emission limits on a electric generation (output) basis.

$$AveWeightedEmissions = 1.1 \times \sum_{i=1}^n (Er \times Hm) \div \sum_{i=1}^n Hm \quad (\text{Eq. 1a})$$

Where:

AveWeightedEmissions = Average weighted emissions for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of heat input.

Er = Emission rate (as determined during the initial compliance demonstration) of PM (or TSM), HCl, or mercury from unit, i, in units of pounds per million Btu of heat input. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM using the applicable equation in §63.7530(c).

Hm = Maximum rated heat input capacity of unit, i, in units of million Btu per hour.

n = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

$$AveWeightedEmissions = 1.1 \times \frac{\sum_{i=1}^n (Er \times So)}{\sum_{i=1}^n So} \quad (\text{Eq. 1b})$$

Where:

AveWeightedEmissions = Average weighted emissions for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of steam output.

Er = Emission rate (as determined during the initial compliance demonstration) of PM (or TSM), HCl, or mercury from unit, i, in units of pounds per million Btu of steam output. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM using the applicable equation in §63.7530(c). If you are taking credit for energy conservation measures from a unit according to §63.7533, use the adjusted emission level for that unit, Eadj, determined according to §63.7533 for that unit.

So = Maximum steam output capacity of unit, i, in units of million Btu per hour, as defined in §63.7575.

n = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

$$AveWeightedEmissions = 1.1 \times \frac{\sum_{i=1}^n (Er \times Eo)}{\sum_{i=1}^n Eo} \quad (\text{Eq. 1c})$$

Where:

AveWeightedEmissions = Average weighted emissions for PM (or TSM), HCl, or mercury, in units of pounds per megawatt hour.

Er = Emission rate (as determined during the initial compliance demonstration) of PM (or TSM), HCl, or mercury from unit, i, in units of pounds per megawatt hour. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM using the applicable equation in §63.7530(c). If you are taking credit for energy conservation measures from a unit according to §63.7533, use the adjusted emission level for that unit, Eadj, determined according to §63.7533 for that unit.

Eo = Maximum electric generating output capacity of unit, i, in units of megawatt hour, as defined in §63.7575.

n = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

(2) If you are not capable of determining the maximum rated heat input capacity of one or more boilers that generate steam, you may use Equation 2 of this section as an alternative to using Equation 1a of this section to demonstrate that the PM (or TSM), HCl, or mercury emissions from all existing units participating in the emissions averaging option do not exceed the emission limits for that pollutant in Table 2 to this subpart that are in pounds per million Btu of heat input.

$$AveWeightedEmissions = 1.1 \times \frac{\sum_{i=1}^n (Er \times Sm \times Cfi)}{\sum_{i=1}^n (Sm \times Cfi)} \quad (\text{Eq. 2})$$

Where:

AveWeightedEmissions = Average weighted emission level for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of heat input.

$E_r$  = Emission rate (as determined during the most recent compliance demonstration) of PM (or TSM), HCl, or mercury from unit,  $i$ , in units of pounds per million Btu of heat input. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM using the applicable equation in §63.7530(c).

$S_m$  = Maximum steam generation capacity by unit,  $i$ , in units of pounds per hour.

$C_{fi}$  = Conversion factor, calculated from the most recent compliance test, in units of million Btu of heat input per pounds of steam generated for unit,  $i$ .

1.1 = Required discount factor.

(f) After the initial compliance demonstration described in paragraph (e) of this section, you must demonstrate compliance on a monthly basis determined at the end of every month (12 times per year) according to paragraphs (f)(1) through (3) of this section. The first monthly period begins on the compliance date specified in §63.7495. If the affected source elects to collect monthly data for up the 11 months preceding the first monthly period, these additional data points can be used to compute the 12-month rolling average in paragraph (f)(3) of this section.

(1) For each calendar month, you must use Equation 3a or 3b or 3c of this section to calculate the average weighted emission rate for that month. Use Equation 3a and the actual heat input for the month for each existing unit participating in the emissions averaging option if you are complying with emission limits on a heat input basis. Use Equation 3b and the actual steam generation for the month if you are complying with the emission limits on a steam generation (output) basis. Use Equation 3c and the actual electrical generation for the month if you are complying with the emission limits on an electrical generation (output) basis.

$$AveWeightedEmissions = 1.1 \times \sum_{i=1}^n (E_r \times H_b) \div \sum_{i=1}^n H_b \quad (\text{Eq. 3a})$$

Where:

$AveWeightedEmissions$  = Average weighted emission level for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of heat input, for that calendar month.

$E_r$  = Emission rate (as determined during the most recent compliance demonstration) of PM (or TSM), HCl, or mercury from unit,  $i$ , in units of pounds per million Btu of heat input. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM according to Table 6 to this subpart.

$H_b$  = The heat input for that calendar month to unit,  $i$ , in units of million Btu.

$n$  = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

$$AveWeightedEmissions = 1.1 \times \sum_{i=1}^n (E_r \times S_o) \div \sum_{i=1}^n S_o \quad (\text{Eq. 3b})$$

Where:

$AveWeightedEmissions$  = Average weighted emission level for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of steam output, for that calendar month.

$E_r$  = Emission rate (as determined during the most recent compliance demonstration) of PM (or TSM), HCl, or mercury from unit,  $i$ , in units of pounds per million Btu of steam output. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM according to Table 6 to this subpart. If you are taking credit for energy conservation measures from a unit

according to §63.7533, use the adjusted emission level for that unit,  $E_{adj}$ , determined according to §63.7533 for that unit.

$So$  = The steam output for that calendar month from unit,  $i$ , in units of million Btu, as defined in §63.7575.

$n$  = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

$$AveWeightedEmissions = 1.1 \times \sum_{i=1}^n (Er \times Eo) \div \sum_{i=1}^n Eo \quad (\text{Eq. 3c})$$

Where:

$AveWeightedEmissions$  = Average weighted emission level for PM (or TSM), HCl, or mercury, in units of pounds per megawatt hour, for that calendar month.

$Er$  = Emission rate (as determined during the most recent compliance demonstration) of PM (or TSM), HCl, or mercury from unit,  $i$ , in units of pounds per megawatt hour. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM according to Table 6 to this subpart. If you are taking credit for energy conservation measures from a unit according to §63.7533, use the adjusted emission level for that unit,  $E_{adj}$ , determined according to §63.7533 for that unit.

$Eo$  = The electric generating output for that calendar month from unit,  $i$ , in units of megawatt hour, as defined in §63.7575.

$n$  = Number of units participating in the emissions averaging option.

1.1 = Required discount factor.

(2) If you are not capable of monitoring heat input, you may use Equation 4 of this section as an alternative to using Equation 3a of this section to calculate the average weighted emission rate using the actual steam generation from the boilers participating in the emissions averaging option.

$$AveWeightedEmissions = 1.1 \times \sum_{i=1}^n (Er \times Sa \times Cfi) \div \sum_{i=1}^n (Sa \times Cfi) \quad (\text{Eq. 4})$$

Where:

$AveWeightedEmissions$  = average weighted emission level for PM (or TSM), HCl, or mercury, in units of pounds per million Btu of heat input for that calendar month.

$Er$  = Emission rate (as determined during the most recent compliance demonstration of PM (or TSM), HCl, or mercury from unit,  $i$ , in units of pounds per million Btu of heat input. Determine the emission rate for PM (or TSM), HCl, or mercury by performance testing according to Table 5 to this subpart, or by fuel analysis for HCl or mercury or TSM according to Table 6 to this subpart.

$Sa$  = Actual steam generation for that calendar month by boiler,  $i$ , in units of pounds.

$Cfi$  = Conversion factor, as calculated during the most recent compliance test, in units of million Btu of heat input per pounds of steam generated for boiler,  $i$ .

1.1 = Required discount factor.

(3) Until 12 monthly weighted average emission rates have been accumulated, calculate and report only the average weighted emission rate determined under paragraph (f)(1) or (2) of this section for each calendar month. After 12 monthly weighted average emission rates have been accumulated, for each subsequent calendar month, use Equation 5 of this section to calculate the 12-month rolling average of the monthly weighted average emission rates for the current calendar month and the previous 11 calendar months.

$$E_{avg} = \sum_{i=1}^{12} E_{Ri} + 12 \quad (\text{Eq. 5})$$

Where:

$E_{avg}$  = 12-month rolling average emission rate, (pounds per million Btu heat input)

$E_{Ri}$  = Monthly weighted average, for calendar month "i" (pounds per million Btu heat input), as calculated by paragraph (f)(1) or (2) of this section.

(g) You must develop, and submit upon request to the applicable Administrator for review and approval, an implementation plan for emission averaging according to the following procedures and requirements in paragraphs (g)(1) through (4) of this section.

(1) If requested, you must submit the implementation plan no later than 180 days before the date that the facility intends to demonstrate compliance using the emission averaging option.

(2) You must include the information contained in paragraphs (g)(2)(i) through (vii) of this section in your implementation plan for all emission sources included in an emissions average:

(i) The identification of all existing boilers and process heaters in the averaging group, including for each either the applicable HAP emission level or the control technology installed as of January 31, 2013 and the date on which you are requesting emission averaging to commence;

(ii) The process parameter (heat input or steam generated) that will be monitored for each averaging group;

(iii) The specific control technology or pollution prevention measure to be used for each emission boiler or process heater in the averaging group and the date of its installation or application. If the pollution prevention measure reduces or eliminates emissions from multiple boilers or process heaters, the owner or operator must identify each boiler or process heater;

(iv) The test plan for the measurement of PM (or TSM), HCl, or mercury emissions in accordance with the requirements in §63.7520;

(v) The operating parameters to be monitored for each control system or device consistent with §63.7500 and Table 4, and a description of how the operating limits will be determined;

(vi) If you request to monitor an alternative operating parameter pursuant to §63.7525, you must also include:

(A) A description of the parameter(s) to be monitored and an explanation of the criteria used to select the parameter(s); and

(B) A description of the methods and procedures that will be used to demonstrate that the parameter indicates proper operation of the control device; the frequency and content of monitoring, reporting, and recordkeeping requirements; and a demonstration, to the satisfaction of the Administrator, that the proposed monitoring frequency is sufficient to represent control device operating conditions; and

(vii) A demonstration that compliance with each of the applicable emission limit(s) will be achieved under representative operating load conditions. Following each compliance demonstration and until the next compliance

demonstration, you must comply with the operating limit for operating load conditions specified in Table 4 to this subpart.

(3) If submitted upon request, the Administrator shall review and approve or disapprove the plan according to the following criteria:

(i) Whether the content of the plan includes all of the information specified in paragraph (g)(2) of this section; and

(ii) Whether the plan presents sufficient information to determine that compliance will be achieved and maintained.

(4) The applicable Administrator shall not approve an emission averaging implementation plan containing any of the following provisions:

(i) Any averaging between emissions of differing pollutants or between differing sources; or

(ii) The inclusion of any emission source other than an existing unit in the same subcategories.

(h) For a group of two or more existing affected units, each of which vents through a single common stack, you may average PM (or TSM), HCl, or mercury emissions to demonstrate compliance with the limits for that pollutant in Table 2 to this subpart if you satisfy the requirements in paragraph (i) or (j) of this section.

(i) For a group of two or more existing units in the same subcategory, each of which vents through a common emissions control system to a common stack, that does not receive emissions from units in other subcategories or categories, you may treat such averaging group as a single existing unit for purposes of this subpart and comply with the requirements of this subpart as if the group were a single unit.

(j) For all other groups of units subject to the common stack requirements of paragraph (h) of this section, including situations where the exhaust of affected units are each individually controlled and then sent to a common stack, the owner or operator may elect to:

(1) Conduct performance tests according to procedures specified in §63.7520 in the common stack if affected units from other subcategories vent to the common stack. The emission limits that the group must comply with are determined by the use of Equation 6 of this section.

$$En = \sum_{i=1}^n (ELi \times Hi) \div \sum_{i=1}^n Hi \quad (\text{Eq. 6})$$

Where:

En = HAP emission limit, pounds per million British thermal units (lb/MMBtu) or parts per million (ppm).

Eli = Appropriate emission limit from Table 2 to this subpart for unit i, in units of lb/MMBtu or ppm.

Hi = Heat input from unit i, MMBtu.

(2) Conduct performance tests according to procedures specified in §63.7520 in the common stack. If affected units and non-affected units vent to the common stack, the non-affected units must be shut down or vented to a different stack during the performance test unless the facility determines to demonstrate compliance with the non-affected units venting to the stack; and

(3) Meet the applicable operating limit specified in §63.7540 and Table 8 to this subpart for each emissions control system (except that, if each unit venting to the common stack has an applicable opacity operating limit, then a single continuous opacity monitoring system may be located in the common stack instead of in each duct to the common stack).

(k) The common stack of a group of two or more existing boilers or process heaters in the same subcategories subject to paragraph (h) of this section may be treated as a separate stack for purposes of paragraph (b) of this section and included in an emissions averaging group subject to paragraph (b) of this section.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7168, Jan. 31, 2013; 80 FR 72809, Nov. 20, 2015]

**§63.7525 What are my monitoring, installation, operation, and maintenance requirements?**

(a) If your boiler or process heater is subject to a CO emission limit in Tables 1, 2, or 11 through 13 to this subpart, you must install, operate, and maintain an oxygen analyzer system, as defined in §63.7575, or install, certify, operate and maintain continuous emission monitoring systems for CO and oxygen (or carbon dioxide (CO<sub>2</sub>)) according to the procedures in paragraphs (a)(1) through (6) of this section.

(1) Install the CO CEMS and oxygen (or CO<sub>2</sub>) analyzer by the compliance date specified in §63.7495. The CO and oxygen (or CO<sub>2</sub>) levels shall be monitored at the same location at the outlet of the boiler or process heater. An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the CO emissions limit be determined using CO<sub>2</sub> as a diluent correction in place of oxygen at 3 percent. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3 percent oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

(2) To demonstrate compliance with the applicable alternative CO CEMS emission standard listed in Tables 1, 2, or 11 through 13 to this subpart, you must install, certify, operate, and maintain a CO CEMS and an oxygen analyzer according to the applicable procedures under Performance Specification 4, 4A, or 4B at 40 CFR part 60, appendix B; part 75 of this chapter (if an CO<sub>2</sub> analyzer is used); the site-specific monitoring plan developed according to §63.7505(d); and the requirements in §63.7540(a)(8) and paragraph (a) of this section. Any boiler or process heater that has a CO CEMS that is compliant with Performance Specification 4, 4A, or 4B at 40 CFR part 60, appendix B, a site-specific monitoring plan developed according to §63.7505(d), and the requirements in §63.7540(a)(8) and paragraph (a) of this section must use the CO CEMS to comply with the applicable alternative CO CEMS emission standard listed in Tables 1, 2, or 11 through 13 to this subpart.

(i) You must conduct a performance evaluation of each CO CEMS according to the requirements in §63.8(e) and according to Performance Specification 4, 4A, or 4B at 40 CFR part 60, appendix B.

(ii) During each relative accuracy test run of the CO CEMS, you must collect emission data for CO concurrently (or within a 30- to 60-minute period) by both the CO CEMS and by Method 10, 10A, or 10B at 40 CFR part 60, appendix A-4. The relative accuracy testing must be at representative operating conditions.

(iii) You must follow the quality assurance procedures (e.g., quarterly accuracy determinations and daily calibration drift tests) of Procedure 1 of appendix F to part 60. The measurement span value of the CO CEMS must be two times the applicable CO emission limit, expressed as a concentration.

(iv) Any CO CEMS that does not comply with §63.7525(a) cannot be used to meet any requirement in this subpart to demonstrate compliance with a CO emission limit listed in Tables 1, 2, or 11 through 13 to this subpart.

(v) For a new unit, complete the initial performance evaluation no later than July 30, 2013, or 180 days after the date of initial startup, whichever is later. For an existing unit, complete the initial performance evaluation no later than July 29, 2016.

(vi) When CO<sub>2</sub> is used to correct CO emissions and CO<sub>2</sub> is measured on a wet basis, correct for moisture as follows: Install, operate, maintain, and quality assure a continuous moisture monitoring system for measuring and recording the moisture content of the flue gases, in order to correct the measured hourly volumetric flow rates for moisture when calculating CO concentrations. The following continuous moisture monitoring systems are acceptable: A continuous moisture sensor; an oxygen analyzer (or analyzers) capable of measuring O<sub>2</sub> both on a wet basis and on a dry basis; or a stack temperature sensor and a moisture look-up table, *i.e.*, a psychrometric chart (for saturated gas streams following wet scrubbers or other demonstrably saturated gas streams, only). The moisture monitoring system shall include as a component the automated data acquisition and handling system (DAHS) for recording and

reporting both the raw data (e.g., hourly average wet-and dry basis O<sub>2</sub> values) and the hourly average values of the stack gas moisture content derived from those data. When a moisture look-up table is used, the moisture monitoring system shall be represented as a single component, the certified DAHS, in the monitoring plan for the unit or common stack.

(3) Complete a minimum of one cycle of CO and oxygen (or CO<sub>2</sub>) CEMS operation (sampling, analyzing, and data recording) for each successive 15-minute period. Collect CO and oxygen (or CO<sub>2</sub>) data concurrently. Collect at least four CO and oxygen (or CO<sub>2</sub>) CEMS data values representing the four 15-minute periods in an hour, or at least two 15-minute data values during an hour when CEMS calibration, quality assurance, or maintenance activities are being performed.

(4) Reduce the CO CEMS data as specified in §63.8(g)(2).

(5) Calculate one-hour arithmetic averages, corrected to 3 percent oxygen (or corrected to an CO<sub>2</sub> percentage determined to be equivalent to 3 percent oxygen) from each hour of CO CEMS data in parts per million CO concentration. The one-hour arithmetic averages required shall be used to calculate the 30-day or 10-day rolling average emissions. Use Equation 19-19 in section 12.4.1 of Method 19 of 40 CFR part 60, appendix A-7 for calculating the average CO concentration from the hourly values.

(6) For purposes of collecting CO data, operate the CO CEMS as specified in §63.7535(b). You must use all the data collected during all periods in calculating data averages and assessing compliance, except that you must exclude certain data as specified in §63.7535(c). Periods when CO data are unavailable may constitute monitoring deviations as specified in §63.7535(d).

(7) Operate an oxygen trim system with the oxygen level set no lower than the lowest hourly average oxygen concentration measured during the most recent CO performance test as the operating limit for oxygen according to Table 7 to this subpart.

(b) If your boiler or process heater is in the unit designed to burn coal/solid fossil fuel subcategory or the unit designed to burn heavy liquid subcategory and has an average annual heat input rate greater than 250 MMBtu per hour from solid fossil fuel and/or heavy liquid, and you demonstrate compliance with the PM limit instead of the alternative TSM limit, you must install, maintain, and operate a PM CPMS monitoring emissions discharged to the atmosphere and record the output of the system as specified in paragraphs (b)(1) through (4) of this section. As an alternative to use of a PM CPMS to demonstrate compliance with the PM limit, you may choose to use a PM CEMS. If you choose to use a PM CEMS to demonstrate compliance with the PM limit instead of the alternative TSM limit, you must install, certify, maintain, and operate a PM CEMS monitoring emissions discharged to the atmosphere and record the output of the system as specified in paragraph (b)(5) through (8) of this section. For other boilers or process heaters, you may elect to use a PM CPMS or PM CEMS operated in accordance with this section in lieu of using other CMS for monitoring PM compliance (e.g., bag leak detectors, ESP secondary power, and PM scrubber pressure). Owners of boilers and process heaters who elect to comply with the alternative TSM limit are not required to install a PM CPMS.

(1) Install, operate, and maintain your PM CPMS according to the procedures in your approved site-specific monitoring plan developed in accordance with §63.7505(d), the requirements in §63.7540(a)(9), and paragraphs (b)(1)(i) through (iii) of this section.

(i) The operating principle of the PM CPMS must be based on in-stack or extractive light scatter, light scintillation, beta attenuation, or mass accumulation detection of PM in the exhaust gas or representative exhaust gas sample. The reportable measurement output from the PM CPMS must be expressed as milliamps.

(ii) The PM CPMS must have a cycle time (i.e., period required to complete sampling, measurement, and reporting for each measurement) no longer than 60 minutes.

(iii) The PM CPMS must have a documented detection limit of 0.5 milligram per actual cubic meter, or less.

(2) For a new unit, complete the initial performance evaluation no later than July 30, 2013, or 180 days after the date of initial startup, whichever is later. For an existing unit, complete the initial performance evaluation no later than July 29, 2016.

(3) Collect PM CPMS hourly average output data for all boiler or process heater operating hours except as indicated in §63.7535(a) through (d). Express the PM CPMS output as milliamps.

(4) Calculate the arithmetic 30-day rolling average of all of the hourly average PM CPMS output data collected during all boiler or process heater operating hours (milliamps).

(5) Install, certify, operate, and maintain your PM CEMS according to the procedures in your approved site-specific monitoring plan developed in accordance with §63.7505(d), the requirements in §63.7540(a)(9), and paragraphs (b)(5)(i) through (iv) of this section.

(i) You shall conduct a performance evaluation of the PM CEMS according to the applicable requirements of §60.8(e), and Performance Specification 11 at 40 CFR part 60, appendix B of this chapter.

(ii) During each PM correlation testing run of the CEMS required by Performance Specification 11 at 40 CFR part 60, appendix B of this chapter, you shall collect PM and oxygen (or carbon dioxide) data concurrently (or within a 30-to 60-minute period) by both the CEMS and conducting performance tests using Method 5 at 40 CFR part 60, appendix A-3 or Method 17 at 40 CFR part 60, appendix A-6 of this chapter.

(iii) You shall perform quarterly accuracy determinations and daily calibration drift tests in accordance with Procedure 2 at 40 CFR part 60, appendix F of this chapter. You must perform Relative Response Audits annually and perform Response Correlation Audits every 3 years.

(iv) Within 60 days after the date of completing each CEMS relative accuracy test audit or performance test conducted to demonstrate compliance with this subpart, you must submit the relative accuracy test audit data and performance test data to the EPA by successfully submitting the data electronically into the EPA's Central Data Exchange by using the Electronic Reporting Tool (see <http://www.epa.gov/ttn/chief/ert/erttool.html>).

(6) For a new unit, complete the initial performance evaluation no later than July 30, 2013, or 180 days after the date of initial startup, whichever is later. For an existing unit, complete the initial performance evaluation no later than July 29, 2016.

(7) Collect PM CEMS hourly average output data for all boiler or process heater operating hours except as indicated in §63.7535(a) through (d).

(8) Calculate the arithmetic 30-day rolling average of all of the hourly average PM CEMS output data collected during all boiler or process heater operating hours.

(c) If you have an applicable opacity operating limit in this rule, and are not otherwise required or elect to install and operate a PM CPMS, PM CEMS, or a bag leak detection system, you must install, operate, certify and maintain each COMS according to the procedures in paragraphs (c)(1) through (7) of this section by the compliance date specified in §63.7495.

(1) Each COMS must be installed, operated, and maintained according to Performance Specification 1 at appendix B to part 60 of this chapter.

(2) You must conduct a performance evaluation of each COMS according to the requirements in §63.8(e) and according to Performance Specification 1 at appendix B to part 60 of this chapter.

(3) As specified in §63.8(c)(4)(i), each COMS must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(4) The COMS data must be reduced as specified in §63.8(g)(2).

(5) You must include in your site-specific monitoring plan procedures and acceptance criteria for operating and maintaining each COMS according to the requirements in §63.8(d). At a minimum, the monitoring plan must include a daily calibration drift assessment, a quarterly performance audit, and an annual zero alignment audit of each COMS.

(6) You must operate and maintain each COMS according to the requirements in the monitoring plan and the requirements of §63.8(e). You must identify periods the COMS is out of control including any periods that the COMS fails to pass a daily calibration drift assessment, a quarterly performance audit, or an annual zero alignment audit. Any 6-minute period for which the monitoring system is out of control and data are not available for a required calculation constitutes a deviation from the monitoring requirements.

(7) You must determine and record all the 6-minute averages (and daily block averages as applicable) collected for periods during which the COMS is not out of control.

(d) If you have an operating limit that requires the use of a CMS other than a PM CPMS or COMS, you must install, operate, and maintain each CMS according to the procedures in paragraphs (d)(1) through (5) of this section by the compliance date specified in §63.7495.

(1) The CPMS must complete a minimum of one cycle of operation every 15-minutes. You must have a minimum of four successive cycles of operation, one representing each of the four 15-minute periods in an hour, to have a valid hour of data.

(2) You must operate the monitoring system as specified in §63.7535(b), and comply with the data calculation requirements specified in §63.7535(c).

(3) Any 15-minute period for which the monitoring system is out-of-control and data are not available for a required calculation constitutes a deviation from the monitoring requirements. Other situations that constitute a monitoring deviation are specified in §63.7535(d).

(4) You must determine the 30-day rolling average of all recorded readings, except as provided in §63.7535(c).

(5) You must record the results of each inspection, calibration, and validation check.

(e) If you have an operating limit that requires the use of a flow monitoring system, you must meet the requirements in paragraphs (d) and (e)(1) through (4) of this section.

(1) You must install the flow sensor and other necessary equipment in a position that provides a representative flow.

(2) You must use a flow sensor with a measurement sensitivity of no greater than 2 percent of the design flow rate.

(3) You must minimize, consistent with good engineering practices, the effects of swirling flow or abnormal velocity distributions due to upstream and downstream disturbances.

(4) You must conduct a flow monitoring system performance evaluation in accordance with your monitoring plan at the time of each performance test but no less frequently than annually.

(f) If you have an operating limit that requires the use of a pressure monitoring system, you must meet the requirements in paragraphs (d) and (f)(1) through (6) of this section.

(1) Install the pressure sensor(s) in a position that provides a representative measurement of the pressure (e.g., PM scrubber pressure drop).

(2) Minimize or eliminate pulsating pressure, vibration, and internal and external corrosion consistent with good engineering practices.

(3) Use a pressure sensor with a minimum tolerance of 1.27 centimeters of water or a minimum tolerance of 1 percent of the pressure monitoring system operating range, whichever is less.

(4) Perform checks at least once each process operating day to ensure pressure measurements are not obstructed (e.g., check for pressure tap pluggage daily).

(5) Conduct a performance evaluation of the pressure monitoring system in accordance with your monitoring plan at the time of each performance test but no less frequently than annually.

(6) If at any time the measured pressure exceeds the manufacturer's specified maximum operating pressure range, conduct a performance evaluation of the pressure monitoring system in accordance with your monitoring plan and confirm that the pressure monitoring system continues to meet the performance requirements in your monitoring plan. Alternatively, install and verify the operation of a new pressure sensor.

(g) If you have an operating limit that requires a pH monitoring system, you must meet the requirements in paragraphs (d) and (g)(1) through (4) of this section.

(1) Install the pH sensor in a position that provides a representative measurement of scrubber effluent pH.

(2) Ensure the sample is properly mixed and representative of the fluid to be measured.

(3) Calibrate the pH monitoring system in accordance with your monitoring plan and according to the manufacturer's instructions. Clean the pH probe at least once each process operating day. Maintain on-site documentation that your calibration frequency is sufficient to maintain the specified accuracy of your device.

(4) Conduct a performance evaluation (including a two-point calibration with one of the two buffer solutions having a pH within 1 of the pH of the operating limit) of the pH monitoring system in accordance with your monitoring plan at the time of each performance test but no less frequently than annually.

(h) If you have an operating limit that requires a secondary electric power monitoring system for an electrostatic precipitator (ESP) operated with a wet scrubber, you must meet the requirements in paragraphs (h)(1) and (2) of this section.

(1) Install sensors to measure (secondary) voltage and current to the precipitator collection plates.

(2) Conduct a performance evaluation of the electric power monitoring system in accordance with your monitoring plan at the time of each performance test but no less frequently than annually.

(i) If you have an operating limit that requires the use of a monitoring system to measure sorbent injection rate (e.g., weigh belt, weigh hopper, or hopper flow measurement device), you must meet the requirements in paragraphs (d) and (i)(1) through (2) of this section.

(1) Install the system in a position(s) that provides a representative measurement of the total sorbent injection rate.

(2) Conduct a performance evaluation of the sorbent injection rate monitoring system in accordance with your monitoring plan at the time of each performance test but no less frequently than annually.

(j) If you are not required to use a PM CPMS and elect to use a fabric filter bag leak detection system to comply with the requirements of this subpart, you must install, calibrate, maintain, and continuously operate the bag leak detection system as specified in paragraphs (j)(1) through (6) of this section.

(1) You must install a bag leak detection sensor(s) in a position(s) that will be representative of the relative or absolute PM loadings for each exhaust stack, roof vent, or compartment (e.g., for a positive pressure fabric filter) of the fabric filter.

(2) Conduct a performance evaluation of the bag leak detection system in accordance with your monitoring plan and consistent with the guidance provided in EPA-454/R-98-015 (incorporated by reference, see §63.14).

(3) Use a bag leak detection system certified by the manufacturer to be capable of detecting PM emissions at concentrations of 10 milligrams per actual cubic meter or less.

(4) Use a bag leak detection system equipped with a device to record continuously the output signal from the sensor.

(5) Use a bag leak detection system equipped with a system that will alert plant operating personnel when an increase in relative PM emissions over a preset level is detected. The alert must easily recognizable (e.g., heard or seen) by plant operating personnel.

(6) Where multiple bag leak detectors are required, the system's instrumentation and alert may be shared among detectors.

(k) For each unit that meets the definition of limited-use boiler or process heater, you must keep fuel use records for the days the boiler or process heater was operating.

(l) For each unit for which you decide to demonstrate compliance with the mercury or HCl emissions limits in Tables 1 or 2 or 11 through 13 of this subpart by use of a CEMS for mercury or HCl, you must install, certify, maintain, and operate a CEMS measuring emissions discharged to the atmosphere and record the output of the system as specified in paragraphs (l)(1) through (8) of this section. For HCl, this option for an affected unit takes effect on the date a final performance specification for a HCl CEMS is published in the FEDERAL REGISTER or the date of approval of a site-specific monitoring plan.

(1) Notify the Administrator one month before starting use of the CEMS, and notify the Administrator one month before stopping use of the CEMS.

(2) Each CEMS shall be installed, certified, operated, and maintained according to the requirements in §63.7540(a)(14) for a mercury CEMS and §63.7540(a)(15) for a HCl CEMS.

(3) For a new unit, you must complete the initial performance evaluation of the CEMS by the latest of the dates specified in paragraph (l)(3)(i) through (iii) of this section.

(i) No later than July 30, 2013.

(ii) No later 180 days after the date of initial startup.

(iii) No later 180 days after notifying the Administrator before starting to use the CEMS in place of performance testing or fuel analysis to demonstrate compliance.

(4) For an existing unit, you must complete the initial performance evaluation by the latter of the two dates specified in paragraph (l)(4)(i) and (ii) of this section.

(i) No later than July 29, 2016.

(ii) No later 180 days after notifying the Administrator before starting to use the CEMS in place of performance testing or fuel analysis to demonstrate compliance.

(5) Compliance with the applicable emissions limit shall be determined based on the 30-day rolling average of the hourly arithmetic average emissions rates using the continuous monitoring system outlet data. The 30-day rolling arithmetic average emission rate (lb/MMBtu) shall be calculated using the equations in EPA Reference Method 19 at 40 CFR part 60, appendix A-7, but substituting the mercury or HCl concentration for the pollutant concentrations normally used in Method 19.

(6) Collect CEMS hourly averages for all operating hours on a 30-day rolling average basis. Collect at least four CMS data values representing the four 15-minute periods in an hour, or at least two 15-minute data values during an hour when CMS calibration, quality assurance, or maintenance activities are being performed.

(7) The one-hour arithmetic averages required shall be expressed in lb/MMBtu and shall be used to calculate the boiler 30-day and 10-day rolling average emissions.

(8) You are allowed to substitute the use of the PM, mercury or HCl CEMS for the applicable fuel analysis, annual performance test, and operating limits specified in Table 4 to this subpart to demonstrate compliance with the PM,

mercury or HCl emissions limit, and if you are using an acid gas wet scrubber or dry sorbent injection control technology to comply with the HCl emission limit, you are allowed to substitute the use of a sulfur dioxide (SO<sub>2</sub>) CEMS for the applicable fuel analysis, annual performance test, and operating limits specified in Table 4 to this subpart to demonstrate compliance with HCl emissions limit.

(m) If your unit is subject to a HCl emission limit in Tables 1, 2, or 11 through 13 of this subpart and you have an acid gas wet scrubber or dry sorbent injection control technology and you elect to use an SO<sub>2</sub> CEMS to demonstrate continuous compliance with the HCl emission limit, you must install the monitor at the outlet of the boiler or process heater, downstream of all emission control devices, and you must install, certify, operate, and maintain the CEMS according to either part 60 or part 75 of this chapter.

(1) The SO<sub>2</sub> CEMS must be installed by the compliance date specified in §63.7495.

(2) For on-going quality assurance (QA), the SO<sub>2</sub> CEMS must meet either the applicable daily and quarterly requirements in Procedure 1 of appendix F of part 60 or the applicable daily, quarterly, and semiannual or annual requirements in sections 2.1 through 2.3 of appendix B to part 75 of this chapter, with the following addition: You must perform the linearity checks required in section 2.2 of appendix B to part 75 of this chapter if the SO<sub>2</sub> CEMS has a span value of 30 ppm or less.

(3) For a new unit, the initial performance evaluation shall be completed no later than July 30, 2013, or 180 days after the date of initial startup, whichever is later. For an existing unit, the initial performance evaluation shall be completed no later than July 29, 2016.

(4) For purposes of collecting SO<sub>2</sub> data, you must operate the SO<sub>2</sub> CEMS as specified in §63.7535(b). You must use all the data collected during all periods in calculating data averages and assessing compliance, except that you must exclude certain data as specified in §63.7535(c). Periods when SO<sub>2</sub> data are unavailable may constitute monitoring deviations as specified in §63.7535(d).

(5) Collect CEMS hourly averages for all operating hours on a 30-day rolling average basis.

(6) Use only unadjusted, quality-assured SO<sub>2</sub> concentration values in the emissions calculations; do not apply bias adjustment factors to the part 75 SO<sub>2</sub> data and do not use part 75 substitute data values.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7171, Jan. 31, 2013; 80 FR 72810, Nov. 20, 2015]

**§63.7530 How do I demonstrate initial compliance with the emission limitations, fuel specifications and work practice standards?**

(a) You must demonstrate initial compliance with each emission limit that applies to you by conducting initial performance tests and fuel analyses and establishing operating limits, as applicable, according to §63.7520, paragraphs (b) and (c) of this section, and Tables 5 and 7 to this subpart. The requirement to conduct a fuel analysis is not applicable for units that burn a single type of fuel, as specified by §63.7510(a)(2). If applicable, you must also install, operate, and maintain all applicable CMS (including CEMS, COMS, and CPMS) according to §63.7525.

(b) If you demonstrate compliance through performance stack testing, you must establish each site-specific operating limit in Table 4 to this subpart that applies to you according to the requirements in §63.7520, Table 7 to this subpart, and paragraph (b)(4) of this section, as applicable. You must also conduct fuel analyses according to §63.7521 and establish maximum fuel pollutant input levels according to paragraphs (b)(1) through (3) of this section, as applicable, and as specified in §63.7510(a)(2). (Note that §63.7510(a)(2) exempts certain fuels from the fuel analysis requirements.) However, if you switch fuel(s) and cannot show that the new fuel(s) does (do) not increase the chlorine, mercury, or TSM input into the unit through the results of fuel analysis, then you must repeat the performance test to demonstrate compliance while burning the new fuel(s).

(1) You must establish the maximum chlorine fuel input (C<sub>input</sub>) during the initial fuel analysis according to the procedures in paragraphs (b)(1)(i) through (iii) of this section.

(i) You must determine the fuel type or fuel mixture that you could burn in your boiler or process heater that has the highest content of chlorine.

(ii) During the fuel analysis for hydrogen chloride, you must determine the fraction of the total heat input for each fuel type burned ( $Q_i$ ) based on the fuel mixture that has the highest content of chlorine, and the average chlorine concentration of each fuel type burned ( $C_i$ ).

(iii) You must establish a maximum chlorine input level using Equation 7 of this section.

$$Cl_{input} = \sum_{i=1}^n (C_i \times Q_i) \quad (\text{Eq. 7})$$

Where:

$Cl_{input}$  = Maximum amount of chlorine entering the boiler or process heater through fuels burned in units of pounds per million Btu.

$C_i$  = Arithmetic average concentration of chlorine in fuel type,  $i$ , analyzed according to §63.7521, in units of pounds per million Btu.

$Q_i$  = Fraction of total heat input from fuel type,  $i$ , based on the fuel mixture that has the highest content of chlorine during the initial compliance test. If you do not burn multiple fuel types during the performance testing, it is not necessary to determine the value of this term. Insert a value of "1" for  $Q_i$ . For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

$n$  = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest content of chlorine.

(2) You must establish the maximum mercury fuel input level ( $Mercury_{input}$ ) during the initial fuel analysis using the procedures in paragraphs (b)(2)(i) through (iii) of this section.

(i) You must determine the fuel type or fuel mixture that you could burn in your boiler or process heater that has the highest content of mercury.

(ii) During the compliance demonstration for mercury, you must determine the fraction of total heat input for each fuel burned ( $Q_i$ ) based on the fuel mixture that has the highest content of mercury, and the average mercury concentration of each fuel type burned ( $HG_i$ ).

(iii) You must establish a maximum mercury input level using Equation 8 of this section.

$$Mercury_{input} = \sum_{i=1}^n (HG_i \times Q_i) \quad (\text{Eq. 8})$$

Where:

$Mercury_{input}$  = Maximum amount of mercury entering the boiler or process heater through fuels burned in units of pounds per million Btu.

$HG_i$  = Arithmetic average concentration of mercury in fuel type,  $i$ , analyzed according to §63.7521, in units of pounds per million Btu.

$Q_i$  = Fraction of total heat input from fuel type,  $i$ , based on the fuel mixture that has the highest mercury content during the initial compliance test. If you do not burn multiple fuel types during the performance test, it is not necessary to determine the value of this term. Insert a value of "1" for  $Q_i$ . For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

$n$  = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest content of mercury.

(3) If you opt to comply with the alternative TSM limit, you must establish the maximum TSM fuel input (TSMinput) for solid or liquid fuels during the initial fuel analysis according to the procedures in paragraphs (b)(3)(i) through (iii) of this section.

(i) You must determine the fuel type or fuel mixture that you could burn in your boiler or process heater that has the highest content of TSM.

(ii) During the fuel analysis for TSM, you must determine the fraction of the total heat input for each fuel type burned (Qi) based on the fuel mixture that has the highest content of TSM, and the average TSM concentration of each fuel type burned (TSMi).

(iii) You must establish a maximum TSM input level using Equation 9 of this section.

$$TSM_{input} = \sum_{i=1}^n (TSM_i \times Q_i) \quad (\text{Eq. 9})$$

Where:

TSMinput = Maximum amount of TSM entering the boiler or process heater through fuels burned in units of pounds per million Btu.

TSMi = Arithmetic average concentration of TSM in fuel type, i, analyzed according to §63.7521, in units of pounds per million Btu.

Qi = Fraction of total heat input from fuel type, i, based on the fuel mixture that has the highest content of TSM during the initial compliance test. If you do not burn multiple fuel types during the performance testing, it is not necessary to determine the value of this term. Insert a value of "1" for Qi. For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

n = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest content of TSM.

(4) You must establish parameter operating limits according to paragraphs (b)(4)(i) through (ix) of this section. As indicated in Table 4 to this subpart, you are not required to establish and comply with the operating parameter limits when you are using a CEMS to monitor and demonstrate compliance with the applicable emission limit for that control device parameter.

(i) For a wet acid gas scrubber, you must establish the minimum scrubber effluent pH and liquid flow rate as defined in §63.7575, as your operating limits during the performance test during which you demonstrate compliance with your applicable limit. If you use a wet scrubber and you conduct separate performance tests for HCl and mercury emissions, you must establish one set of minimum scrubber effluent pH, liquid flow rate, and pressure drop operating limits. The minimum scrubber effluent pH operating limit must be established during the HCl performance test. If you conduct multiple performance tests, you must set the minimum liquid flow rate operating limit at the higher of the minimum values established during the performance tests.

(ii) For any particulate control device (e.g., ESP, particulate wet scrubber, fabric filter) for which you use a PM CPMS, you must establish your PM CPMS operating limit and determine compliance with it according to paragraphs (b)(4)(ii)(A) through (F) of this section.

(A) Determine your operating limit as the average PM CPMS output value recorded during the most recent performance test run demonstrating compliance with the filterable PM emission limit or at the PM CPMS output value corresponding to 75 percent of the emission limit if your PM performance test demonstrates compliance below 75 percent of the emission limit. You must verify an existing or establish a new operating limit after each repeated performance test. You must repeat the performance test annually and reassess and adjust the site-specific operating limit in accordance with the results of the performance test.

(1) Your PM CPMS must provide a 4-20 milliamp output and the establishment of its relationship to manual reference method measurements must be determined in units of milliamps.

(2) Your PM CPMS operating range must be capable of reading PM concentrations from zero to a level equivalent to at least two times your allowable emission limit. If your PM CPMS is an auto-ranging instrument capable of multiple scales, the primary range of the instrument must be capable of reading PM concentration from zero to a level equivalent to two times your allowable emission limit.

(3) During the initial performance test or any such subsequent performance test that demonstrates compliance with the PM limit, record and average all milliamp output values from the PM CPMS for the periods corresponding to the compliance test runs (e.g., average all your PM CPMS output values for three corresponding 2-hour Method 5I test runs).

(B) If the average of your three PM performance test runs are below 75 percent of your PM emission limit, you must calculate an operating limit by establishing a relationship of PM CPMS signal to PM concentration using the PM CPMS instrument zero, the average PM CPMS values corresponding to the three compliance test runs, and the average PM concentration from the Method 5 or performance test with the procedures in paragraphs (b)(4)(ii)(B)(1) through (4) of this section.

(1) Determine your instrument zero output with one of the following procedures:

(i) Zero point data for *in-situ* instruments should be obtained by removing the instrument from the stack and monitoring ambient air on a test bench.

(ii) Zero point data for *extractive* instruments should be obtained by removing the extractive probe from the stack and drawing in clean ambient air.

(iii) The zero point may also be established by performing manual reference method measurements when the flue gas is free of PM emissions or contains very low PM concentrations (e.g., when your process is not operating, but the fans are operating or your source is combusting only natural gas) and plotting these with the compliance data to find the zero intercept.

(iv) If none of the steps in paragraphs (b)(4)(ii)(B)(1)(i) through (iii) of this section are possible, you must use a zero output value provided by the manufacturer.

(2) Determine your PM CPMS instrument average in milliamps, and the average of your corresponding three PM compliance test runs, using equation 10.

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i, \bar{Y} = \frac{1}{n} \sum_{i=1}^n Y_i \quad (\text{Eq. 10})$$

Where:

$X_i$  = the PM CPMS data points for the three runs constituting the performance test,

$Y_i$  = the PM concentration value for the three runs constituting the performance test, and

$n$  = the number of data points.

(3) With your instrument zero expressed in milliamps, your three run average PM CPMS milliamp value, and your three run average PM concentration from your three compliance tests, determine a relationship of lb/MMBtu per milliamp with equation 11.

$$R = \frac{Y_i}{(X_i - z)} \quad (\text{Eq. 11})$$

Where:

R = the relative lb/MMBtu per milliamp for your PM CPMS,

$Y_1$  = the three run average lb/MMBtu PM concentration,

$X_1$  = the three run average milliamp output from you PM CPMS, and

z = the milliamp equivalent of your instrument zero determined from (B)(i).

(4) Determine your source specific 30-day rolling average operating limit using the lb/MMBtu per milliamp value from Equation 11 in equation 12, below. This sets your operating limit at the PM CPMS output value corresponding to 75 percent of your emission limit.

$$O_1 = z + \frac{0.75(L)}{R} \quad (\text{Eq. 12})$$

Where:

$O_1$  = the operating limit for your PM CPMS on a 30-day rolling average, in milliamps.

L = your source emission limit expressed in lb/MMBtu,

z = your instrument zero in milliamps, determined from (B)(i), and

R = the relative lb/MMBtu per milliamp for your PM CPMS, from Equation 11.

(C) If the average of your three PM compliance test runs is at or above 75 percent of your PM emission limit you must determine your 30-day rolling average operating limit by averaging the PM CPMS milliamp output corresponding to your three PM performance test runs that demonstrate compliance with the emission limit using equation 13 and you must submit all compliance test and PM CPMS data according to the reporting requirements in paragraph (b)(4)(ii)(F) of this section.

$$O_h = \frac{1}{n} \sum_{i=1}^n X_i \quad (\text{Eq. 13})$$

Where:

$X_i$  = the PM CPMS data points for all runs i,

n = the number of data points, and

$O_h$  = your site specific operating limit, in milliamps.

(D) To determine continuous compliance, you must record the PM CPMS output data for all periods when the process is operating and the PM CPMS is not out-of-control. You must demonstrate continuous compliance by using all quality-assured hourly average data collected by the PM CPMS for all operating hours to calculate the arithmetic average operating parameter in units of the operating limit (milliamps) on a 30-day rolling average basis, updated at the end of each new operating hour. Use Equation 14 to determine the 30-day rolling average.

$$30\text{-day} = \frac{\sum_{i=1}^n H_{pw}}{n} \quad (\text{Eq. 14})$$

Where:

30-day = 30-day average.

$H_{pvi}$  = is the hourly parameter value for hour  $i$

$n$  = is the number of valid hourly parameter values collected over the previous 30 operating days.

(E) Use EPA Method 5 of appendix A to part 60 of this chapter to determine PM emissions. For each performance test, conduct three separate runs under the conditions that exist when the affected source is operating at the highest load or capacity level reasonably expected to occur. Conduct each test run to collect a minimum sample volume specified in Tables 1, 2, or 11 through 13 to this subpart, as applicable, for determining compliance with a new source limit or an existing source limit. Calculate the average of the results from three runs to determine compliance. You need not determine the PM collected in the impingers ("back half") of the Method 5 particulate sampling train to demonstrate compliance with the PM standards of this subpart. This shall not preclude the permitting authority from requiring a determination of the "back half" for other purposes.

(F) For PM performance test reports used to set a PM CPMS operating limit, the electronic submission of the test report must also include the make and model of the PM CPMS instrument, serial number of the instrument, analytical principle of the instrument (e.g. beta attenuation), span of the instruments primary analytical range, milliamp value equivalent to the instrument zero output, technique by which this zero value was determined, and the average milliamp signals corresponding to each PM compliance test run.

(iii) For a particulate wet scrubber, you must establish the minimum pressure drop and liquid flow rate as defined in §63.7575, as your operating limits during the three-run performance test during which you demonstrate compliance with your applicable limit. If you use a wet scrubber and you conduct separate performance tests for PM and TSM emissions, you must establish one set of minimum scrubber liquid flow rate and pressure drop operating limits. The minimum scrubber effluent pH operating limit must be established during the HCl performance test. If you conduct multiple performance tests, you must set the minimum liquid flow rate and pressure drop operating limits at the higher of the minimum values established during the performance tests.

(iv) For an electrostatic precipitator (ESP) operated with a wet scrubber, you must establish the minimum total secondary electric power input, as defined in §63.7575, as your operating limit during the three-run performance test during which you demonstrate compliance with your applicable limit. (These operating limits do not apply to ESP that are operated as dry controls without a wet scrubber.)

(v) For a dry scrubber, you must establish the minimum sorbent injection rate for each sorbent, as defined in §63.7575, as your operating limit during the three-run performance test during which you demonstrate compliance with your applicable limit.

(vi) For activated carbon injection, you must establish the minimum activated carbon injection rate, as defined in §63.7575, as your operating limit during the three-run performance test during which you demonstrate compliance with your applicable limit.

(vii) The operating limit for boilers or process heaters with fabric filters that demonstrate continuous compliance through bag leak detection systems is that a bag leak detection system be installed according to the requirements in §63.7525, and that each fabric filter must be operated such that the bag leak detection system alert is not activated more than 5 percent of the operating time during a 6-month period.

(viii) For a minimum oxygen level, if you conduct multiple performance tests, you must set the minimum oxygen level at the lower of the minimum values established during the performance tests.

(ix) The operating limit for boilers or process heaters that demonstrate continuous compliance with the HCl emission limit using a SO<sub>2</sub> CEMS is to install and operate the SO<sub>2</sub> according to the requirements in §63.7525(m) establish a maximum SO<sub>2</sub> emission rate equal to the highest hourly average SO<sub>2</sub> measurement during the most recent three-run performance test for HCl.

(c) If you elect to demonstrate compliance with an applicable emission limit through fuel analysis, you must conduct fuel analyses according to §63.7521 and follow the procedures in paragraphs (c)(1) through (5) of this section.

(1) If you burn more than one fuel type, you must determine the fuel mixture you could burn in your boiler or process heater that would result in the maximum emission rates of the pollutants that you elect to demonstrate compliance through fuel analysis.

(2) You must determine the 90th percentile confidence level fuel pollutant concentration of the composite samples analyzed for each fuel type using the one-sided t-statistic test described in Equation 15 of this section.

$$P90 = \text{mean} + (SD \times t) \quad (\text{Eq. 15})$$

Where:

P90 = 90th percentile confidence level pollutant concentration, in pounds per million Btu.

Mean = Arithmetic average of the fuel pollutant concentration in the fuel samples analyzed according to §63.7521, in units of pounds per million Btu.

SD = Standard deviation of the mean of pollutant concentration in the fuel samples analyzed according to §63.7521, in units of pounds per million Btu. SD is calculated as the sample standard deviation divided by the square root of the number of samples.

t = t distribution critical value for 90th percentile ( $t_{0.1}$ ) probability for the appropriate degrees of freedom (number of samples minus one) as obtained from a t-Distribution Critical Value Table.

(3) To demonstrate compliance with the applicable emission limit for HCl, the HCl emission rate that you calculate for your boiler or process heater using Equation 16 of this section must not exceed the applicable emission limit for HCl.

$$HCl = \sum_{i=1}^n (Ci90 \times Qi \times 1.028) \quad (\text{Eq. 16})$$

Where:

HCl = HCl emission rate from the boiler or process heater in units of pounds per million Btu.

Ci90 = 90th percentile confidence level concentration of chlorine in fuel type, i, in units of pounds per million Btu as calculated according to Equation 15 of this section.

Qi = Fraction of total heat input from fuel type, i, based on the fuel mixture that has the highest content of chlorine. If you do not burn multiple fuel types, it is not necessary to determine the value of this term. Insert a value of "1" for Qi. For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

n = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest content of chlorine.

1.028 = Molecular weight ratio of HCl to chlorine.

(4) To demonstrate compliance with the applicable emission limit for mercury, the mercury emission rate that you calculate for your boiler or process heater using Equation 17 of this section must not exceed the applicable emission limit for mercury.

$$\text{Mercury} = \sum_{i=1}^n (Hgi90 \times Qi) \quad (\text{Eq. 17})$$

Where:

Mercury = Mercury emission rate from the boiler or process heater in units of pounds per million Btu.

Hgi90 = 90th percentile confidence level concentration of mercury in fuel, *i*, in units of pounds per million Btu as calculated according to Equation 15 of this section.

Qi = Fraction of total heat input from fuel type, *i*, based on the fuel mixture that has the highest mercury content. If you do not burn multiple fuel types, it is not necessary to determine the value of this term. Insert a value of "1" for Qi. For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

*n* = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest mercury content.

(5) To demonstrate compliance with the applicable emission limit for TSM for solid or liquid fuels, the TSM emission rate that you calculate for your boiler or process heater from solid fuels using Equation 18 of this section must not exceed the applicable emission limit for TSM.

$$\text{Metals} = \sum_{i=1}^n (TSM90i \times Qi) \quad (\text{Eq. 18})$$

Where:

Metals = TSM emission rate from the boiler or process heater in units of pounds per million Btu.

TSMi90 = 90th percentile confidence level concentration of TSM in fuel, *i*, in units of pounds per million Btu as calculated according to Equation 15 of this section.

Qi = Fraction of total heat input from fuel type, *i*, based on the fuel mixture that has the highest TSM content. If you do not burn multiple fuel types, it is not necessary to determine the value of this term. Insert a value of "1" for Qi. For continuous compliance demonstration, the actual fraction of the fuel burned during the month should be used.

*n* = Number of different fuel types burned in your boiler or process heater for the mixture that has the highest TSM content.

(d)[Reserved]

(e) You must include with the Notification of Compliance Status a signed certification that either the energy assessment was completed according to Table 3 to this subpart, and that the assessment is an accurate depiction of your facility at the time of the assessment, or that the maximum number of on-site technical hours specified in the definition of energy assessment applicable to the facility has been expended.

(f) You must submit the Notification of Compliance Status containing the results of the initial compliance demonstration according to the requirements in §63.7545(e).

(g) If you elect to demonstrate that a gaseous fuel meets the specifications of another gas 1 fuel as defined in §63.7575, you must conduct an initial fuel specification analyses according to §63.7521(f) through (i) and according to the frequency listed in §63.7540(c) and maintain records of the results of the testing as outlined in §63.7555(g). For samples where the initial mercury specification has not been exceeded, you will include a signed certification with the Notification of Compliance Status that the initial fuel specification test meets the gas specification outlined in the definition of other gas 1 fuels.

(h) If you own or operate a unit subject to emission limits in Tables 1 or 2 or 11 through 13 to this subpart, you must meet the work practice standard according to Table 3 of this subpart. During startup and shutdown, you must only follow the work practice standards according to items 5 and 6 of Table 3 of this subpart.

(i) If you opt to comply with the alternative SO<sub>2</sub> CEMS operating limit in Tables 4 and 8 to this subpart, you may do so only if your affected boiler or process heater:

- (1) Has a system using wet scrubber or dry sorbent injection and SO<sub>2</sub> CEMS installed on the unit; and
- (2) At all times, you operate the wet scrubber or dry sorbent injection for acid gas control on the unit consistent with §63.7500(a)(3); and
- (3) You establish a unit-specific maximum SO<sub>2</sub> operating limit by collecting the maximum hourly SO<sub>2</sub> emission rate on the SO<sub>2</sub> CEMS during the paired 3-run test for HCl. The maximum SO<sub>2</sub> operating limit is equal to the highest hourly average SO<sub>2</sub> concentration measured during the HCl performance test.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7174, Jan. 31, 2013; 80 FR 72811, Nov. 20, 2015]

**§63.7533 Can I use efficiency credits earned from implementation of energy conservation measures to comply with this subpart?**

(a) If you elect to comply with the alternative equivalent output-based emission limits, instead of the heat input-based limits listed in Table 2 to this subpart, and you want to take credit for implementing energy conservation measures identified in an energy assessment, you may demonstrate compliance using efficiency credits according to the procedures in this section. You may use this compliance approach for an existing affected boiler for demonstrating initial compliance according to §63.7522(e) and for demonstrating monthly compliance according to §63.7522(f). Owners or operators using this compliance approach must establish an emissions benchmark, calculate and document the efficiency credits, develop an Implementation Plan, comply with the general reporting requirements, and apply the efficiency credit according to the procedures in paragraphs (b) through (f) of this section. You cannot use this compliance approach for a new or reconstructed affected boiler. Additional guidance from the Department of Energy on efficiency credits is available at: <http://www.epa.gov/ttn/atw/boiler/boilerpg.html>.

(b) For each existing affected boiler for which you intend to apply emissions credits, establish a benchmark from which emission reduction credits may be generated by determining the actual annual fuel heat input to the affected boiler before initiation of an energy conservation activity to reduce energy demand (*i.e.*, fuel usage) according to paragraphs (b)(1) through (4) of this section. The benchmark shall be expressed in trillion Btu per year heat input.

(1) The benchmark from which efficiency credits may be generated shall be determined by using the most representative, accurate, and reliable process available for the source. The benchmark shall be established for a one-year period before the date that an energy demand reduction occurs, unless it can be demonstrated that a different time period is more representative of historical operations.

(2) Determine the starting point from which to measure progress. Inventory all fuel purchased and generated on-site (off-gases, residues) in physical units (MMBtu, million cubic feet, etc.).

(3) Document all uses of energy from the affected boiler. Use the most recent data available.

(4) Collect non-energy related facility and operational data to normalize, if necessary, the benchmark to current operations, such as building size, operating hours, etc. If possible, use actual data that are current and timely rather than estimated data.

(c) Efficiency credits can be generated if the energy conservation measures were implemented after January 1, 2008 and if sufficient information is available to determine the appropriate value of credits.

(1) The following emission points cannot be used to generate efficiency credits:

(i) Energy conservation measures implemented on or before January 1, 2008, unless the level of energy demand reduction is increased after January 1, 2008, in which case credit will be allowed only for change in demand reduction achieved after January 1, 2008.

(ii) Efficiency credits on shut-down boilers. Boilers that are shut down cannot be used to generate credits unless the facility provides documentation linking the permanent shutdown to energy conservation measures identified in the energy assessment. In this case, the bench established for the affected boiler to which the credits from the shutdown will be applied must be revised to include the benchmark established for the shutdown boiler.

(2) For all points included in calculating emissions credits, the owner or operator shall:

(i) Calculate annual credits for all energy demand points. Use Equation 19 to calculate credits. Energy conservation measures that meet the criteria of paragraph (c)(1) of this section shall not be included, except as specified in paragraph (c)(1)(i) of this section.

(3) Credits are generated by the difference between the benchmark that is established for each affected boiler, and the actual energy demand reductions from energy conservation measures implemented after January 1, 2008. Credits shall be calculated using Equation 19 of this section as follows:

(i) The overall equation for calculating credits is:

$$ECredits = \left( \sum_{i=1}^n EIS_{iactual} \right) + EI_{baseline} \quad (\text{Eq. 19})$$

Where:

ECredits = Energy Input Savings for all energy conservation measures implemented for an affected boiler, expressed as a decimal fraction of the baseline energy input.

EIS<sub>iactual</sub> = Energy Input Savings for each energy conservation measure, i, implemented for an affected boiler, million Btu per year.

EI<sub>baseline</sub> = Energy Input baseline for the affected boiler, million Btu per year.

n = Number of energy conservation measures included in the efficiency credit for the affected boiler.

(ii) [Reserved]

(d) The owner or operator shall develop, and submit for approval upon request by the Administrator, an Implementation Plan containing all of the information required in this paragraph for all boilers to be included in an efficiency credit approach. The Implementation Plan shall identify all existing affected boilers to be included in applying the efficiency credits. The Implementation Plan shall include a description of the energy conservation measures implemented and the energy savings generated from each measure and an explanation of the criteria used for determining that savings. If requested, you must submit the implementation plan for efficiency credits to the Administrator for review and approval no later than 180 days before the date on which the facility intends to demonstrate compliance using the efficiency credit approach.

(e) The emissions rate as calculated using Equation 20 of this section from each existing boiler participating in the efficiency credit option must be in compliance with the limits in Table 2 to this subpart at all times the affected unit is subject to numeric emission limits, following the compliance date specified in §63.7495.

(f) You must use Equation 20 of this section to demonstrate initial compliance by demonstrating that the emissions from the affected boiler participating in the efficiency credit compliance approach do not exceed the emission limits in Table 2 to this subpart.

$$E_{adj} = E_{in} \times (1 - ECredits) \quad (\text{Eq. 20})$$

Where:

$E_{adj}$  = Emission level adjusted by applying the efficiency credits earned, lb per million Btu steam output (or lb per MWh) for the affected boiler.

$E_m$  = Emissions measured during the performance test, lb per million Btu steam output (or lb per MWh) for the affected boiler.

ECredits = Efficiency credits from Equation 19 for the affected boiler.

(g) As part of each compliance report submitted as required under §63.7550, you must include documentation that the energy conservation measures implemented continue to generate the credit for use in demonstrating compliance with the emission limits.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7178, Jan. 31, 2013; 80 FR 72812, Nov. 20, 2015]

### **Continuous Compliance Requirements**

#### **§63.7535 Is there a minimum amount of monitoring data I must obtain?**

(a) You must monitor and collect data according to this section and the site-specific monitoring plan required by §63.7505(d).

(b) You must operate the monitoring system and collect data at all required intervals at all times that each boiler or process heater is operating and compliance is required, except for periods of monitoring system malfunctions or out of control periods (see §63.8(c)(7) of this part), and required monitoring system quality assurance or control activities, including, as applicable, calibration checks, required zero and span adjustments, and scheduled CMS maintenance as defined in your site-specific monitoring plan. A monitoring system malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring system failures that are caused in part by poor maintenance or careless operation are not malfunctions. You are required to complete monitoring system repairs in response to monitoring system malfunctions or out-of-control periods and to return the monitoring system to operation as expeditiously as practicable.

(c) You may not use data recorded during periods of startup and shutdown, monitoring system malfunctions or out-of-control periods, repairs associated with monitoring system malfunctions or out-of-control periods, or required monitoring system quality assurance or control activities in data averages and calculations used to report emissions or operating levels. You must record and make available upon request results of CMS performance audits and dates and duration of periods when the CMS is out of control to completion of the corrective actions necessary to return the CMS to operation consistent with your site-specific monitoring plan. You must use all the data collected during all other periods in assessing compliance and the operation of the control device and associated control system.

(d) Except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits, calibration checks, and required zero and span adjustments), failure to collect required data is a deviation of the monitoring requirements. In calculating monitoring results, do not use any data collected during periods of startup and shutdown, when the monitoring system is out of control as specified in your site-specific monitoring plan, while conducting repairs associated with periods when the monitoring system is out of control, or while conducting required monitoring system quality assurance or quality control activities. You must calculate monitoring results using all other monitoring data collected while the process is operating. You must report all periods when the monitoring system is out of control in your semi-annual report.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7179, Jan. 31, 2013; 80 FR 72812, Nov. 20, 2015]

#### **§63.7540 How do I demonstrate continuous compliance with the emission limitations, fuel specifications and work practice standards?**

(a) You must demonstrate continuous compliance with each emission limit in Tables 1 and 2 or 11 through 13 to this subpart, the work practice standards in Table 3 to this subpart, and the operating limits in Table 4 to this subpart that applies to you according to the methods specified in Table 8 to this subpart and paragraphs (a)(1) through (19) of this section.

(1) Following the date on which the initial compliance demonstration is completed or is required to be completed under §§63.7 and 63.7510, whichever date comes first, operation above the established maximum or below the established minimum operating limits shall constitute a deviation of established operating limits listed in Table 4 of this subpart except during performance tests conducted to determine compliance with the emission limits or to establish new operating limits. Operating limits must be confirmed or reestablished during performance tests.

(2) As specified in §63.7555(d), you must keep records of the type and amount of all fuels burned in each boiler or process heater during the reporting period to demonstrate that all fuel types and mixtures of fuels burned would result in either of the following:

(i) Equal to or lower emissions of HCl, mercury, and TSM than the applicable emission limit for each pollutant, if you demonstrate compliance through fuel analysis.

(ii) Equal to or lower fuel input of chlorine, mercury, and TSM than the maximum values calculated during the last performance test, if you demonstrate compliance through performance testing.

(3) If you demonstrate compliance with an applicable HCl emission limit through fuel analysis for a solid or liquid fuel and you plan to burn a new type of solid or liquid fuel, you must recalculate the HCl emission rate using Equation 16 of §63.7530 according to paragraphs (a)(3)(i) through (iii) of this section. You are not required to conduct fuel analyses for the fuels described in §63.7510(a)(2)(i) through (iii). You may exclude the fuels described in §63.7510(a)(2)(i) through (iii) when recalculating the HCl emission rate.

(i) You must determine the chlorine concentration for any new fuel type in units of pounds per million Btu, based on supplier data or your own fuel analysis, according to the provisions in your site-specific fuel analysis plan developed according to §63.7521(b).

(ii) You must determine the new mixture of fuels that will have the highest content of chlorine.

(iii) Recalculate the HCl emission rate from your boiler or process heater under these new conditions using Equation 16 of §63.7530. The recalculated HCl emission rate must be less than the applicable emission limit.

(4) If you demonstrate compliance with an applicable HCl emission limit through performance testing and you plan to burn a new type of fuel or a new mixture of fuels, you must recalculate the maximum chlorine input using Equation 7 of §63.7530. If the results of recalculating the maximum chlorine input using Equation 7 of §63.7530 are greater than the maximum chlorine input level established during the previous performance test, then you must conduct a new performance test within 60 days of burning the new fuel type or fuel mixture according to the procedures in §63.7520 to demonstrate that the HCl emissions do not exceed the emission limit. You must also establish new operating limits based on this performance test according to the procedures in §63.7530(b). In recalculating the maximum chlorine input and establishing the new operating limits, you are not required to conduct fuel analyses for and include the fuels described in §63.7510(a)(2)(i) through (iii).

(5) If you demonstrate compliance with an applicable mercury emission limit through fuel analysis, and you plan to burn a new type of fuel, you must recalculate the mercury emission rate using Equation 17 of §63.7530 according to the procedures specified in paragraphs (a)(5)(i) through (iii) of this section. You are not required to conduct fuel analyses for the fuels described in §63.7510(a)(2)(i) through (iii). You may exclude the fuels described in §63.7510(a)(2)(i) through (iii) when recalculating the mercury emission rate.

(i) You must determine the mercury concentration for any new fuel type in units of pounds per million Btu, based on supplier data or your own fuel analysis, according to the provisions in your site-specific fuel analysis plan developed according to §63.7521(b).

(ii) You must determine the new mixture of fuels that will have the highest content of mercury.

(iii) Recalculate the mercury emission rate from your boiler or process heater under these new conditions using Equation 17 of §63.7530. The recalculated mercury emission rate must be less than the applicable emission limit.

(6) If you demonstrate compliance with an applicable mercury emission limit through performance testing, and you plan to burn a new type of fuel or a new mixture of fuels, you must recalculate the maximum mercury input using

Equation 8 of §63.7530. If the results of recalculating the maximum mercury input using Equation 8 of §63.7530 are higher than the maximum mercury input level established during the previous performance test, then you must conduct a new performance test within 60 days of burning the new fuel type or fuel mixture according to the procedures in §63.7520 to demonstrate that the mercury emissions do not exceed the emission limit. You must also establish new operating limits based on this performance test according to the procedures in §63.7530(b). You are not required to conduct fuel analyses for the fuels described in §63.7510(a)(2)(i) through (iii). You may exclude the fuels described in §63.7510(a)(2)(i) through (iii) when recalculating the mercury emission rate.

(7) If your unit is controlled with a fabric filter, and you demonstrate continuous compliance using a bag leak detection system, you must initiate corrective action within 1 hour of a bag leak detection system alert and complete corrective actions as soon as practical, and operate and maintain the fabric filter system such that the periods which would cause an alert are no more than 5 percent of the operating time during a 6-month period. You must also keep records of the date, time, and duration of each alert, the time corrective action was initiated and completed, and a brief description of the cause of the alert and the corrective action taken. You must also record the percent of the operating time during each 6-month period that the conditions exist for an alert. In calculating this operating time percentage, if inspection of the fabric filter demonstrates that no corrective action is required, no alert time is counted. If corrective action is required, each alert shall be counted as a minimum of 1 hour. If you take longer than 1 hour to initiate corrective action, the alert time shall be counted as the actual amount of time taken to initiate corrective action.

(8) To demonstrate compliance with the applicable alternative CO CEMS emission limit listed in Tables 1, 2, or 11 through 13 to this subpart, you must meet the requirements in paragraphs (a)(8)(i) through (iv) of this section.

(i) Continuously monitor CO according to §§63.7525(a) and 63.7535.

(ii) Maintain a CO emission level below or at your applicable alternative CO CEMS-based standard in Tables 1 or 2 or 11 through 13 to this subpart at all times the affected unit is subject to numeric emission limits.

(iii) Keep records of CO levels according to §63.7555(b).

(iv) You must record and make available upon request results of CO CEMS performance audits, dates and duration of periods when the CO CEMS is out of control to completion of the corrective actions necessary to return the CO CEMS to operation consistent with your site-specific monitoring plan.

(9) The owner or operator of a boiler or process heater using a PM CPMS or a PM CEMS to meet requirements of this subpart shall install, certify, operate, and maintain the PM CPMS or PM CEMS in accordance with your site-specific monitoring plan as required in §63.7505(d).

(10) If your boiler or process heater has a heat input capacity of 10 million Btu per hour or greater, you must conduct an annual tune-up of the boiler or process heater to demonstrate continuous compliance as specified in paragraphs (a)(10)(i) through (vi) of this section. You must conduct the tune-up while burning the type of fuel (or fuels in case of units that routinely burn a mixture) that provided the majority of the heat input to the boiler or process heater over the 12 months prior to the tune-up. This frequency does not apply to limited-use boilers and process heaters, as defined in §63.7575, or units with continuous oxygen trim systems that maintain an optimum air to fuel ratio.

(i) As applicable, inspect the burner, and clean or replace any components of the burner as necessary (you may perform the burner inspection any time prior to the tune-up or delay the burner inspection until the next scheduled unit shutdown). Units that produce electricity for sale may delay the burner inspection until the first outage, not to exceed 36 months from the previous inspection. At units where entry into a piece of process equipment or into a storage vessel is required to complete the tune-up inspections, inspections are required only during planned entries into the storage vessel or process equipment;

(ii) Inspect the flame pattern, as applicable, and adjust the burner as necessary to optimize the flame pattern. The adjustment should be consistent with the manufacturer's specifications, if available;

(iii) Inspect the system controlling the air-to-fuel ratio, as applicable, and ensure that it is correctly calibrated and functioning properly (you may delay the inspection until the next scheduled unit shutdown). Units that produce electricity for sale may delay the inspection until the first outage, not to exceed 36 months from the previous inspection;

- (iv) Optimize total emissions of CO. This optimization should be consistent with the manufacturer's specifications, if available, and with any NO<sub>x</sub> requirement to which the unit is subject;
- (v) Measure the concentrations in the effluent stream of CO in parts per million, by volume, and oxygen in volume percent, before and after the adjustments are made (measurements may be either on a dry or wet basis, as long as it is the same basis before and after the adjustments are made). Measurements may be taken using a portable CO analyzer; and
- (vi) Maintain on-site and submit, if requested by the Administrator, a report containing the information in paragraphs (a)(10)(vi)(A) through (C) of this section,
- (A) The concentrations of CO in the effluent stream in parts per million by volume, and oxygen in volume percent, measured at high fire or typical operating load, before and after the tune-up of the boiler or process heater;
- (B) A description of any corrective actions taken as a part of the tune-up; and
- (C) The type and amount of fuel used over the 12 months prior to the tune-up, but only if the unit was physically and legally capable of using more than one type of fuel during that period. Units sharing a fuel meter may estimate the fuel used by each unit.
- (11) If your boiler or process heater has a heat input capacity of less than 10 million Btu per hour (except as specified in paragraph (a)(12) of this section), you must conduct a biennial tune-up of the boiler or process heater as specified in paragraphs (a)(10)(i) through (vi) of this section to demonstrate continuous compliance.
- (12) If your boiler or process heater has a continuous oxygen trim system that maintains an optimum air to fuel ratio, or a heat input capacity of less than or equal to 5 million Btu per hour and the unit is in the units designed to burn gas 1; units designed to burn gas 2 (other); or units designed to burn light liquid subcategories, or meets the definition of limited-use boiler or process heater in §63.7575, you must conduct a tune-up of the boiler or process heater every 5 years as specified in paragraphs (a)(10)(i) through (vi) of this section to demonstrate continuous compliance. You may delay the burner inspection specified in paragraph (a)(10)(i) of this section until the next scheduled or unscheduled unit shutdown, but you must inspect each burner at least once every 72 months. If an oxygen trim system is utilized on a unit without emission standards to reduce the tune-up frequency to once every 5 years, set the oxygen level no lower than the oxygen concentration measured during the most recent tune-up.
- (13) If the unit is not operating on the required date for a tune-up, the tune-up must be conducted within 30 calendar days of startup.
- (14) If you are using a CEMS measuring mercury emissions to meet requirements of this subpart you must install, certify, operate, and maintain the mercury CEMS as specified in paragraphs (a)(14)(i) and (ii) of this section.
- (i) Operate the mercury CEMS in accordance with performance specification 12A of 40 CFR part 60, appendix B or operate a sorbent trap based integrated monitor in accordance with performance specification 12B of 40 CFR part 60, appendix B. The duration of the performance test must be 30 operating days if you specified a 30 operating day basis in §63.7545(e)(2)(iii) for mercury CEMS or it must be 720 hours if you specified a 720 hour basis in §63.7545(e)(2)(iii) for mercury CEMS. For each day in which the unit operates, you must obtain hourly mercury concentration data, and stack gas volumetric flow rate data.
- (ii) If you are using a mercury CEMS, you must install, operate, calibrate, and maintain an instrument for continuously measuring and recording the mercury mass emissions rate to the atmosphere according to the requirements of performance specifications 6 and 12A of 40 CFR part 60, appendix B, and quality assurance procedure 6 of 40 CFR part 60, appendix F.
- (15) If you are using a CEMS to measure HCl emissions to meet requirements of this subpart, you must install, certify, operate, and maintain the HCl CEMS as specified in paragraphs (a)(15)(i) and (ii) of this section. This option for an affected unit takes effect on the date a final performance specification for an HCl CEMS is published in the FEDERAL REGISTER or the date of approval of a site-specific monitoring plan.

(i) Operate the continuous emissions monitoring system in accordance with the applicable performance specification in 40 CFR part 60, appendix B. The duration of the performance test must be 30 operating days if you specified a 30 operating day basis in §63.7545(e)(2)(iii) for HCl CEMS or it must be 720 hours if you specified a 720 hour basis in §63.7545(e)(2)(iii) for HCl CEMS. For each day in which the unit operates, you must obtain hourly HCl concentration data, and stack gas volumetric flow rate data.

(ii) If you are using a HCl CEMS, you must install, operate, calibrate, and maintain an instrument for continuously measuring and recording the HCl mass emissions rate to the atmosphere according to the requirements of the applicable performance specification of 40 CFR part 60, appendix B, and the quality assurance procedures of 40 CFR part 60, appendix F.

(16) If you demonstrate compliance with an applicable TSM emission limit through performance testing, and you plan to burn a new type of fuel or a new mixture of fuels, you must recalculate the maximum TSM input using Equation 9 of §63.7530. If the results of recalculating the maximum TSM input using Equation 9 of §63.7530 are higher than the maximum total selected input level established during the previous performance test, then you must conduct a new performance test within 60 days of burning the new fuel type or fuel mixture according to the procedures in §63.7520 to demonstrate that the TSM emissions do not exceed the emission limit. You must also establish new operating limits based on this performance test according to the procedures in §63.7530(b). You are not required to conduct fuel analyses for the fuels described in §63.7510(a)(2)(i) through (iii). You may exclude the fuels described in §63.7510(a)(2)(i) through (iii) when recalculating the TSM emission rate.

(17) If you demonstrate compliance with an applicable TSM emission limit through fuel analysis for solid or liquid fuels, and you plan to burn a new type of fuel, you must recalculate the TSM emission rate using Equation 18 of §63.7530 according to the procedures specified in paragraphs (a)(5)(i) through (iii) of this section. You are not required to conduct fuel analyses for the fuels described in §63.7510(a)(2)(i) through (iii). You may exclude the fuels described in §63.7510(a)(2)(i) through (iii) when recalculating the TSM emission rate.

(i) You must determine the TSM concentration for any new fuel type in units of pounds per million Btu, based on supplier data or your own fuel analysis, according to the provisions in your site-specific fuel analysis plan developed according to §63.7521(b).

(ii) You must determine the new mixture of fuels that will have the highest content of TSM.

(iii) Recalculate the TSM emission rate from your boiler or process heater under these new conditions using Equation 18 of §63.7530. The recalculated TSM emission rate must be less than the applicable emission limit.

(18) If you demonstrate continuous PM emissions compliance with a PM CPMS you will use a PM CPMS to establish a site-specific operating limit corresponding to the results of the performance test demonstrating compliance with the PM limit. You will conduct your performance test using the test method criteria in Table 5 of this subpart. You will use the PM CPMS to demonstrate continuous compliance with this operating limit. You must repeat the performance test annually and reassess and adjust the site-specific operating limit in accordance with the results of the performance test.

(i) To determine continuous compliance, you must record the PM CPMS output data for all periods when the process is operating and the PM CPMS is not out-of-control. You must demonstrate continuous compliance by using all quality-assured hourly average data collected by the PM CPMS for all operating hours to calculate the arithmetic average operating parameter in units of the operating limit (milliamps) on a 30-day rolling average basis.

(ii) For any deviation of the 30-day rolling PM CPMS average value from the established operating parameter limit, you must:

(A) Within 48 hours of the deviation, visually inspect the air pollution control device (APCD);

(B) If inspection of the APCD identifies the cause of the deviation, take corrective action as soon as possible and return the PM CPMS measurement to within the established value; and

(C) Within 30 days of the deviation or at the time of the annual compliance test, whichever comes first, conduct a PM emissions compliance test to determine compliance with the PM emissions limit and to verify or re-establish the

CPMS operating limit. You are not required to conduct additional testing for any deviations that occur between the time of the original deviation and the PM emissions compliance test required under this paragraph.

(iii) PM CPMS deviations from the operating limit leading to more than four required performance tests in a 12-month operating period constitute a separate violation of this subpart.

(19) If you choose to comply with the PM filterable emissions limit by using PM CEMS you must install, certify, operate, and maintain a PM CEMS and record the output of the PM CEMS as specified in paragraphs (a)(19)(i) through (vii) of this section. The compliance limit will be expressed as a 30-day rolling average of the numerical emissions limit value applicable for your unit in Tables 1 or 2 or 11 through 13 of this subpart.

(i) Install and certify your PM CEMS according to the procedures and requirements in Performance Specification 11— Specifications and Test Procedures for Particulate Matter Continuous Emission Monitoring Systems at Stationary Sources in Appendix B to part 60 of this chapter, using test criteria outlined in Table V of this rule. The reportable measurement output from the PM CEMS must be expressed in units of the applicable emissions limit (e.g., lb/MMBtu, lb/MWh).

(ii) Operate and maintain your PM CEMS according to the procedures and requirements in Procedure 2— Quality Assurance Requirements for Particulate Matter Continuous Emission Monitoring Systems at Stationary Sources in Appendix F to part 60 of this chapter.

(A) You must conduct the relative response audit (RRA) for your PM CEMS at least once annually.

(B) You must conduct the relative correlation audit (RCA) for your PM CEMS at least once every 3 years.

(iii) Collect PM CEMS hourly average output data for all boiler operating hours except as indicated in paragraph (v) of this section.

(iv) Calculate the arithmetic 30-day rolling average of all of the hourly average PM CEMS output data collected during all nonexempt boiler or process heater operating hours.

(v) You must collect data using the PM CEMS at all times the unit is operating and at the intervals specified this paragraph (a), except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required monitoring system quality assurance or quality control activities.

(vi) You must use all the data collected during all boiler or process heater operating hours in assessing the compliance with your operating limit except:

(A) Any data collected during monitoring system malfunctions, repairs associated with monitoring system malfunctions, or required monitoring system quality assurance or control activities conducted during monitoring system malfunctions in calculations and report any such periods in your annual deviation report;

(B) Any data collected during periods when the monitoring system is out of control as specified in your site-specific monitoring plan, repairs associated with periods when the monitoring system is out of control, or required monitoring system quality assurance or control activities conducted during out of control periods in calculations used to report emissions or operating levels and report any such periods in your annual deviation report;

(C) Any data recorded during periods of startup or shutdown.

(vii) You must record and make available upon request results of PM CEMS system performance audits, dates and duration of periods when the PM CEMS is out of control to completion of the corrective actions necessary to return the PM CEMS to operation consistent with your site-specific monitoring plan.

(b) You must report each instance in which you did not meet each emission limit and operating limit in Tables 1 through 4 or 11 through 13 to this subpart that apply to you. These instances are deviations from the emission limits or operating limits, respectively, in this subpart. These deviations must be reported according to the requirements in §63.7550.

(c) If you elected to demonstrate that the unit meets the specification for mercury for the unit designed to burn gas 1 subcategory, you must follow the sampling frequency specified in paragraphs (c)(1) through (4) of this section and conduct this sampling according to the procedures in §63.7521(f) through (i).

(1) If the initial mercury constituents in the gaseous fuels are measured to be equal to or less than half of the mercury specification as defined in §63.7575, you do not need to conduct further sampling.

(2) If the initial mercury constituents are greater than half but equal to or less than 75 percent of the mercury specification as defined in §63.7575, you will conduct semi-annual sampling. If 6 consecutive semi-annual fuel analyses demonstrate 50 percent or less of the mercury specification, you do not need to conduct further sampling. If any semi-annual sample exceeds 75 percent of the mercury specification, you must return to monthly sampling for that fuel, until 12 months of fuel analyses again are less than 75 percent of the compliance level.

(3) If the initial mercury constituents are greater than 75 percent of the mercury specification as defined in §63.7575, you will conduct monthly sampling. If 12 consecutive monthly fuel analyses demonstrate 75 percent or less of the mercury specification, you may decrease the fuel analysis frequency to semi-annual for that fuel.

(4) If the initial sample exceeds the mercury specification as defined in §63.7575, each affected boiler or process heater combusting this fuel is not part of the unit designed to burn gas 1 subcategory and must be in compliance with the emission and operating limits for the appropriate subcategory. You may elect to conduct additional monthly sampling while complying with these emissions and operating limits to demonstrate that the fuel qualifies as another gas 1 fuel. If 12 consecutive monthly fuel analyses samples are at or below the mercury specification as defined in §63.7575, each affected boiler or process heater combusting the fuel can elect to switch back into the unit designed to burn gas 1 subcategory until the mercury specification is exceeded.

(d) For startup and shutdown, you must meet the work practice standards according to items 5 and 6 of Table 3 of this subpart.

[78 FR 7179, Jan. 31, 2013, as amended at 80 FR 72813, Nov. 20, 2015]

**§63.7541 How do I demonstrate continuous compliance under the emissions averaging provision?**

(a) Following the compliance date, the owner or operator must demonstrate compliance with this subpart on a continuous basis by meeting the requirements of paragraphs (a)(1) through (5) of this section.

(1) For each calendar month, demonstrate compliance with the average weighted emissions limit for the existing units participating in the emissions averaging option as determined in §63.7522(f) and (g).

(2) You must maintain the applicable opacity limit according to paragraphs (a)(2)(i) and (ii) of this section.

(i) For each existing unit participating in the emissions averaging option that is equipped with a dry control system and not vented to a common stack, maintain opacity at or below the applicable limit.

(ii) For each group of units participating in the emissions averaging option where each unit in the group is equipped with a dry control system and vented to a common stack that does not receive emissions from non-affected units, maintain opacity at or below the applicable limit at the common stack.

(3) For each existing unit participating in the emissions averaging option that is equipped with a wet scrubber, maintain the 30-day rolling average parameter values at or above the operating limits established during the most recent performance test.

(4) For each existing unit participating in the emissions averaging option that has an approved alternative operating parameter, maintain the 30-day rolling average parameter values consistent with the approved monitoring plan.

(5) For each existing unit participating in the emissions averaging option venting to a common stack configuration containing affected units from other subcategories, maintain the appropriate operating limit for each unit as specified in Table 4 to this subpart that applies.

(b) Any instance where the owner or operator fails to comply with the continuous monitoring requirements in paragraphs (a)(1) through (5) of this section is a deviation.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7182, Jan. 31, 2013]

### **Notification, Reports, and Records**

#### **§63.7545 What notifications must I submit and when?**

(a) You must submit to the Administrator all of the notifications in §§63.7(b) and (c), 63.8(e), (f)(4) and (6), and 63.9(b) through (h) that apply to you by the dates specified.

(b) As specified in §63.9(b)(2), if you startup your affected source before January 31, 2013, you must submit an Initial Notification not later than 120 days after January 31, 2013.

(c) As specified in §63.9(b)(4) and (5), if you startup your new or reconstructed affected source on or after January 31, 2013, you must submit an Initial Notification not later than 15 days after the actual date of startup of the affected source.

(d) If you are required to conduct a performance test you must submit a Notification of Intent to conduct a performance test at least 60 days before the performance test is scheduled to begin.

(e) If you are required to conduct an initial compliance demonstration as specified in §63.7530, you must submit a Notification of Compliance Status according to §63.9(h)(2)(ii). For the initial compliance demonstration for each boiler or process heater, you must submit the Notification of Compliance Status, including all performance test results and fuel analyses, before the close of business on the 60th day following the completion of all performance test and/or other initial compliance demonstrations for all boiler or process heaters at the facility according to §63.10(d)(2). The Notification of Compliance Status report must contain all the information specified in paragraphs (e)(1) through (8) of this section, as applicable. If you are not required to conduct an initial compliance demonstration as specified in §63.7530(a), the Notification of Compliance Status must only contain the information specified in paragraphs (e)(1) and (8) of this section and must be submitted within 60 days of the compliance date specified at §63.7495(b).

(1) A description of the affected unit(s) including identification of which subcategories the unit is in, the design heat input capacity of the unit, a description of the add-on controls used on the unit to comply with this subpart, description of the fuel(s) burned, including whether the fuel(s) were a secondary material determined by you or the EPA through a petition process to be a non-waste under §241.3 of this chapter, whether the fuel(s) were a secondary material processed from discarded non-hazardous secondary materials within the meaning of §241.3 of this chapter, and justification for the selection of fuel(s) burned during the compliance demonstration.

(2) Summary of the results of all performance tests and fuel analyses, and calculations conducted to demonstrate initial compliance including all established operating limits, and including:

(i) Identification of whether you are complying with the PM emission limit or the alternative TSM emission limit.

(ii) Identification of whether you are complying with the output-based emission limits or the heat input-based (i.e., lb/MMBtu or ppm) emission limits,

(iii) Identification of whether you are complying the arithmetic mean of all valid hours of data from the previous 30 operating days or of the previous 720 hours. This identification shall be specified separately for each operating parameter.

(3) A summary of the maximum CO emission levels recorded during the performance test to show that you have met any applicable emission standard in Tables 1, 2, or 11 through 13 to this subpart, if you are not using a CO CEMS to demonstrate compliance.

(4) Identification of whether you plan to demonstrate compliance with each applicable emission limit through performance testing, a CEMS, or fuel analysis.

(5) Identification of whether you plan to demonstrate compliance by emissions averaging and identification of whether you plan to demonstrate compliance by using efficiency credits through energy conservation:

(i) If you plan to demonstrate compliance by emission averaging, report the emission level that was being achieved or the control technology employed on January 31, 2013.

(ii) [Reserved]

(6) A signed certification that you have met all applicable emission limits and work practice standards.

(7) If you had a deviation from any emission limit, work practice standard, or operating limit, you must also submit a description of the deviation, the duration of the deviation, and the corrective action taken in the Notification of Compliance Status report.

(8) In addition to the information required in §63.9(h)(2), your notification of compliance status must include the following certification(s) of compliance, as applicable, and signed by a responsible official:

(i) "This facility completed the required initial tune-up for all of the boilers and process heaters covered by 40 CFR part 63 subpart DDDDD at this site according to the procedures in §63.7540(a)(10)(i) through (vi)."

(ii) "This facility has had an energy assessment performed according to §63.7530(e)."

(iii) Except for units that burn only natural gas, refinery gas, or other gas 1 fuel, or units that qualify for a statutory exemption as provided in section 129(g)(1) of the Clean Air Act, include the following: "No secondary materials that are solid waste were combusted in any affected unit."

(f) If you operate a unit designed to burn natural gas, refinery gas, or other gas 1 fuels that is subject to this subpart, and you intend to use a fuel other than natural gas, refinery gas, gaseous fuel subject to another subpart of this part, part 60, 61, or 65, or other gas 1 fuel to fire the affected unit during a period of natural gas curtailment or supply interruption, as defined in §63.7575, you must submit a notification of alternative fuel use within 48 hours of the declaration of each period of natural gas curtailment or supply interruption, as defined in §63.7575. The notification must include the information specified in paragraphs (f)(1) through (5) of this section.

(1) Company name and address.

(2) Identification of the affected unit.

(3) Reason you are unable to use natural gas or equivalent fuel, including the date when the natural gas curtailment was declared or the natural gas supply interruption began.

(4) Type of alternative fuel that you intend to use.

(5) Dates when the alternative fuel use is expected to begin and end.

(g) If you intend to commence or recommence combustion of solid waste, you must provide 30 days prior notice of the date upon which you will commence or recommence combustion of solid waste. The notification must identify:

(1) The name of the owner or operator of the affected source, as defined in §63.7490, the location of the source, the boiler(s) or process heater(s) that will commence burning solid waste, and the date of the notice.

(2) The currently applicable subcategories under this subpart.

(3) The date on which you became subject to the currently applicable emission limits.

(4) The date upon which you will commence combusting solid waste.

(h) If you have switched fuels or made a physical change to the boiler or process heater and the fuel switch or physical change resulted in the applicability of a different subcategory, you must provide notice of the date upon which you switched fuels or made the physical change within 30 days of the switch/change. The notification must identify:

(1) The name of the owner or operator of the affected source, as defined in §63.7490, the location of the source, the boiler(s) and process heater(s) that have switched fuels, were physically changed, and the date of the notice.

(2) The currently applicable subcategory under this subpart.

(3) The date upon which the fuel switch or physical change occurred.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7183, Jan. 31, 2013; 80 FR 72814, Nov. 20, 2015]

**§63.7550 What reports must I submit and when?**

(a) You must submit each report in Table 9 to this subpart that applies to you.

(b) Unless the EPA Administrator has approved a different schedule for submission of reports under §63.10(a), you must submit each report, according to paragraph (h) of this section, by the date in Table 9 to this subpart and according to the requirements in paragraphs (b)(1) through (4) of this section. For units that are subject only to a requirement to conduct subsequent annual, biennial, or 5-year tune-up according to §63.7540(a)(10), (11), or (12), respectively, and not subject to emission limits or Table 4 operating limits, you may submit only an annual, biennial, or 5-year compliance report, as applicable, as specified in paragraphs (b)(1) through (4) of this section, instead of a semi-annual compliance report.

(1) The first semi-annual compliance report must cover the period beginning on the compliance date that is specified for each boiler or process heater in §63.7495 and ending on June 30 or December 31, whichever date is the first date that occurs at least 180 days after the compliance date that is specified for your source in §63.7495. If submitting an annual, biennial, or 5-year compliance report, the first compliance report must cover the period beginning on the compliance date that is specified for each boiler or process heater in §63.7495 and ending on December 31 within 1, 2, or 5 years, as applicable, after the compliance date that is specified for your source in §63.7495.

(2) The first semi-annual compliance report must be postmarked or submitted no later than July 31 or January 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for each boiler or process heater in §63.7495. The first annual, biennial, or 5-year compliance report must be postmarked or submitted no later than January 31.

(3) Each subsequent semi-annual compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31. Annual, biennial, and 5-year compliance reports must cover the applicable 1-, 2-, or 5-year periods from January 1 to December 31.

(4) Each subsequent semi-annual compliance report must be postmarked or submitted no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period. Annual, biennial, and 5-year compliance reports must be postmarked or submitted no later than January 31.

(5) For each affected source that is subject to permitting regulations pursuant to part 70 or part 71 of this chapter, and if the permitting authority has established dates for submitting semiannual reports pursuant to 70.6(a)(3)(iii)(A) or 71.6(a)(3)(iii)(A), you may submit the first and subsequent compliance reports according to the dates the permitting authority has established in the permit instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(c) A compliance report must contain the following information depending on how the facility chooses to comply with the limits set in this rule.

(1) If the facility is subject to the requirements of a tune up you must submit a compliance report with the information in paragraphs (c)(5)(i) through (iii) of this section, (xiv) and (xvii) of this section, and paragraph (c)(5)(iv) of this section for limited-use boiler or process heater.

(2) If you are complying with the fuel analysis you must submit a compliance report with the information in paragraphs (c)(5)(i) through (iii), (vi), (x), (xi), (xiii), (xv), (xvii), (xviii) and paragraph (d) of this section.

(3) If you are complying with the applicable emissions limit with performance testing you must submit a compliance report with the information in (c)(5)(i) through (iii), (vi), (vii), (viii), (ix), (xi), (xiii), (xv), (xvii), (xviii) and paragraph (d) of this section.

(4) If you are complying with an emissions limit using a CMS the compliance report must contain the information required in paragraphs (c)(5)(i) through (iii), (v), (vi), (xi) through (xiii), (xv) through (xviii), and paragraph (e) of this section.

(5)(i) Company and Facility name and address.

(ii) Process unit information, emissions limitations, and operating parameter limitations.

(iii) Date of report and beginning and ending dates of the reporting period.

(iv) The total operating time during the reporting period.

(v) If you use a CMS, including CEMS, COMS, or CPMS, you must include the monitoring equipment manufacturer(s) and model numbers and the date of the last CMS certification or audit.

(vi) The total fuel use by each individual boiler or process heater subject to an emission limit within the reporting period, including, but not limited to, a description of the fuel, whether the fuel has received a non-waste determination by the EPA or your basis for concluding that the fuel is not a waste, and the total fuel usage amount with units of measure.

(vii) If you are conducting performance tests once every 3 years consistent with §63.7515(b) or (c), the date of the last 2 performance tests and a statement as to whether there have been any operational changes since the last performance test that could increase emissions.

(viii) A statement indicating that you burned no new types of fuel in an individual boiler or process heater subject to an emission limit. Or, if you did burn a new type of fuel and are subject to a HCl emission limit, you must submit the calculation of chlorine input, using Equation 7 of §63.7530, that demonstrates that your source is still within its maximum chlorine input level established during the previous performance testing (for sources that demonstrate compliance through performance testing) or you must submit the calculation of HCl emission rate using Equation 16 of §63.7530 that demonstrates that your source is still meeting the emission limit for HCl emissions (for boilers or process heaters that demonstrate compliance through fuel analysis). If you burned a new type of fuel and are subject to a mercury emission limit, you must submit the calculation of mercury input, using Equation 8 of §63.7530, that demonstrates that your source is still within its maximum mercury input level established during the previous performance testing (for sources that demonstrate compliance through performance testing), or you must submit the calculation of mercury emission rate using Equation 17 of §63.7530 that demonstrates that your source is still meeting the emission limit for mercury emissions (for boilers or process heaters that demonstrate compliance through fuel analysis). If you burned a new type of fuel and are subject to a TSM emission limit, you must submit the calculation of TSM input, using Equation 9 of §63.7530, that demonstrates that your source is still within its maximum TSM input level established during the previous performance testing (for sources that demonstrate compliance through performance testing), or you must submit the calculation of TSM emission rate, using Equation 18 of §63.7530, that demonstrates that your source is still meeting the emission limit for TSM emissions (for boilers or process heaters that demonstrate compliance through fuel analysis).

(ix) If you wish to burn a new type of fuel in an individual boiler or process heater subject to an emission limit and you cannot demonstrate compliance with the maximum chlorine input operating limit using Equation 7 of §63.7530 or the maximum mercury input operating limit using Equation 8 of §63.7530, or the maximum TSM input operating limit

using Equation 9 of §63.7530 you must include in the compliance report a statement indicating the intent to conduct a new performance test within 60 days of starting to burn the new fuel.

(x) A summary of any monthly fuel analyses conducted to demonstrate compliance according to §§63.7521 and 63.7530 for individual boilers or process heaters subject to emission limits, and any fuel specification analyses conducted according to §§63.7521(f) and 63.7530(g).

(xi) If there are no deviations from any emission limits or operating limits in this subpart that apply to you, a statement that there were no deviations from the emission limits or operating limits during the reporting period.

(xii) If there were no deviations from the monitoring requirements including no periods during which the CMSs, including CEMS, COMS, and CPMS, were out of control as specified in §63.8(c)(7), a statement that there were no deviations and no periods during which the CMS were out of control during the reporting period.

(xiii) If a malfunction occurred during the reporting period, the report must include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by you during a malfunction of a boiler, process heater, or associated air pollution control device or CMS to minimize emissions in accordance with §63.7500(a)(3), including actions taken to correct the malfunction.

(xiv) Include the date of the most recent tune-up for each unit subject to only the requirement to conduct an annual, biennial, or 5-year tune-up according to §63.7540(a)(10), (11), or (12) respectively. Include the date of the most recent burner inspection if it was not done annually, biennially, or on a 5-year period and was delayed until the next scheduled or unscheduled unit shutdown.

(xv) If you plan to demonstrate compliance by emission averaging, certify the emission level achieved or the control technology employed is no less stringent than the level or control technology contained in the notification of compliance status in §63.7545(e)(5)(i).

(xvi) For each reporting period, the compliance reports must include all of the calculated 30 day rolling average values for CEMS (CO, HCl, SO<sub>2</sub>, and mercury), 10 day rolling average values for CO CEMS when the limit is expressed as a 10 day instead of 30 day rolling average, and the PM CPMS data.

(xvii) Statement by a responsible official with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(xviii) For each instance of startup or shutdown include the information required to be monitored, collected, or recorded according to the requirements of §63.7555(d).

(d) For each deviation from an emission limit or operating limit in this subpart that occurs at an individual boiler or process heater where you are not using a CMS to comply with that emission limit or operating limit, or from the work practice standards for periods if startup and shutdown, the compliance report must additionally contain the information required in paragraphs (d)(1) through (3) of this section.

(1) A description of the deviation and which emission limit, operating limit, or work practice standard from which you deviated.

(2) Information on the number, duration, and cause of deviations (including unknown cause), as applicable, and the corrective action taken.

(3) If the deviation occurred during an annual performance test, provide the date the annual performance test was completed.

(e) For each deviation from an emission limit, operating limit, and monitoring requirement in this subpart occurring at an individual boiler or process heater where you are using a CMS to comply with that emission limit or operating limit, the compliance report must additionally contain the information required in paragraphs (e)(1) through (9) of this section. This includes any deviations from your site-specific monitoring plan as required in §63.7505(d).

- (1) The date and time that each deviation started and stopped and description of the nature of the deviation (i.e., what you deviated from).
- (2) The date and time that each CMS was inoperative, except for zero (low-level) and high-level checks.
- (3) The date, time, and duration that each CMS was out of control, including the information in §63.8(c)(8).
- (4) The date and time that each deviation started and stopped.
- (5) A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.
- (6) A characterization of the total duration of the deviations during the reporting period into those that are due to control equipment problems, process problems, other known causes, and other unknown causes.
- (7) A summary of the total duration of CMS's downtime during the reporting period and the total duration of CMS downtime as a percent of the total source operating time during that reporting period.
- (8) A brief description of the source for which there was a deviation.
- (9) A description of any changes in CMSs, processes, or controls since the last reporting period for the source for which there was a deviation.
- (f)-(g) [Reserved]
- (h) You must submit the reports according to the procedures specified in paragraphs (h)(1) through (3) of this section.
  - (1) Within 60 days after the date of completing each performance test (as defined in §63.2) required by this subpart, you must submit the results of the performance tests, including any fuel analyses, following the procedure specified in either paragraph (h)(1)(i) or (ii) of this section.
    - (i) For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT Web site (<http://www.epa.gov/ttn/chief/ert/index.html>), you must submit the results of the performance test to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (<https://cdx.epa.gov/>.) Performance test data must be submitted in a file format generated through use of the EPA's ERT or an electronic file format consistent with the extensible markup language (XML) schema listed on the EPA's ERT Web site. If you claim that some of the performance test information being submitted is confidential business information (CBI), you must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAPQS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.
    - (ii) For data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the test, you must submit the results of the performance test to the Administrator at the appropriate address listed in §63.13.
  - (2) Within 60 days after the date of completing each CEMS performance evaluation (as defined in 63.2), you must submit the results of the performance evaluation following the procedure specified in either paragraph (h)(2)(i) or (ii) of this section.
    - (i) For performance evaluations of continuous monitoring systems measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the evaluation, you must submit the results of the performance evaluation to the EPA via the CEDRI. (CEDRI can be accessed through the EPA's CDX.) Performance evaluation data must be submitted in a file format generated through the use

of the EPA's ERT or an alternate file format consistent with the XML schema listed on the EPA's ERT Web site. If you claim that some of the performance evaluation information being transmitted is CBI, you must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAPQS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(ii) For any performance evaluations of continuous monitoring systems measuring RATA pollutants that are not supported by the EPA's ERT as listed on the ERT Web site at the time of the evaluation, you must submit the results of the performance evaluation to the Administrator at the appropriate address listed in §63.13.

(3) You must submit all reports required by Table 9 of this subpart electronically to the EPA via the CEDRI. (CEDRI can be accessed through the EPA's CDX.) You must use the appropriate electronic report in CEDRI for this subpart. Instead of using the electronic report in CEDRI for this subpart, you may submit an alternate electronic file consistent with the XML schema listed on the CEDRI Web site (<http://www.epa.gov/ttn/chief/cedri/index.html>), once the XML schema is available. If the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, you must submit the report to the Administrator at the appropriate address listed in §63.13. You must begin submitting reports via CEDRI no later than 90 days after the form becomes available in CEDRI.

[78 FR 7183, Jan. 31, 2013, as amended at 80 FR 72814, Nov. 20, 2015]

#### **§63.7555 What records must I keep?**

(a) You must keep records according to paragraphs (a)(1) and (2) of this section.

(1) A copy of each notification and report that you submitted to comply with this subpart, including all documentation supporting any Initial Notification or Notification of Compliance Status or semiannual compliance report that you submitted, according to the requirements in §63.10(b)(2)(xiv).

(2) Records of performance tests, fuel analyses, or other compliance demonstrations and performance evaluations as required in §63.10(b)(2)(viii).

(3) For units in the limited use subcategory, you must keep a copy of the federally enforceable permit that limits the annual capacity factor to less than or equal to 10 percent and fuel use records for the days the boiler or process heater was operating.

(b) For each CEMS, COMS, and continuous monitoring system you must keep records according to paragraphs (b)(1) through (5) of this section.

(1) Records described in §63.10(b)(2)(vii) through (xi).

(2) Monitoring data for continuous opacity monitoring system during a performance evaluation as required in §63.6(h)(7)(i) and (ii).

(3) Previous (*i.e.*, superseded) versions of the performance evaluation plan as required in §63.8(d)(3).

(4) Request for alternatives to relative accuracy test for CEMS as required in §63.8(f)(6)(i).

(5) Records of the date and time that each deviation started and stopped.

(c) You must keep the records required in Table 8 to this subpart including records of all monitoring data and calculated averages for applicable operating limits, such as opacity, pressure drop, pH, and operating load, to show continuous compliance with each emission limit and operating limit that applies to you.

(d) For each boiler or process heater subject to an emission limit in Tables 1, 2, or 11 through 13 to this subpart, you must also keep the applicable records in paragraphs (d)(1) through (11) of this section.

(1) You must keep records of monthly fuel use by each boiler or process heater, including the type(s) of fuel and amount(s) used.

(2) If you combust non-hazardous secondary materials that have been determined not to be solid waste pursuant to §241.3(b)(1) and (2) of this chapter, you must keep a record that documents how the secondary material meets each of the legitimacy criteria under §241.3(d)(1) of this chapter. If you combust a fuel that has been processed from a discarded non-hazardous secondary material pursuant to §241.3(b)(4) of this chapter, you must keep records as to how the operations that produced the fuel satisfy the definition of processing in §241.2 of this chapter. If the fuel received a non-waste determination pursuant to the petition process submitted under §241.3(c) of this chapter, you must keep a record that documents how the fuel satisfies the requirements of the petition process. For operating units that combust non-hazardous secondary materials as fuel per §241.4 of this chapter, you must keep records documenting that the material is listed as a non-waste under §241.4(a) of this chapter. Units exempt from the incinerator standards under section 129(g)(1) of the Clean Air Act because they are qualifying facilities burning a homogeneous waste stream do not need to maintain the records described in this paragraph (d)(2).

(3) A copy of all calculations and supporting documentation of maximum chlorine fuel input, using Equation 7 of §63.7530, that were done to demonstrate continuous compliance with the HCl emission limit, for sources that demonstrate compliance through performance testing. For sources that demonstrate compliance through fuel analysis, a copy of all calculations and supporting documentation of HCl emission rates, using Equation 16 of §63.7530, that were done to demonstrate compliance with the HCl emission limit. Supporting documentation should include results of any fuel analyses and basis for the estimates of maximum chlorine fuel input or HCl emission rates. You can use the results from one fuel analysis for multiple boilers and process heaters provided they are all burning the same fuel type. However, you must calculate chlorine fuel input, or HCl emission rate, for each boiler and process heater.

(4) A copy of all calculations and supporting documentation of maximum mercury fuel input, using Equation 8 of §63.7530, that were done to demonstrate continuous compliance with the mercury emission limit for sources that demonstrate compliance through performance testing. For sources that demonstrate compliance through fuel analysis, a copy of all calculations and supporting documentation of mercury emission rates, using Equation 17 of §63.7530, that were done to demonstrate compliance with the mercury emission limit. Supporting documentation should include results of any fuel analyses and basis for the estimates of maximum mercury fuel input or mercury emission rates. You can use the results from one fuel analysis for multiple boilers and process heaters provided they are all burning the same fuel type. However, you must calculate mercury fuel input, or mercury emission rates, for each boiler and process heater.

(5) If, consistent with §63.7515(b), you choose to stack test less frequently than annually, you must keep a record that documents that your emissions in the previous stack test(s) were less than 75 percent of the applicable emission limit (or, in specific instances noted in Tables 1 and 2 or 11 through 13 to this subpart, less than the applicable emission limit), and document that there was no change in source operations including fuel composition and operation of air pollution control equipment that would cause emissions of the relevant pollutant to increase within the past year.

(6) Records of the occurrence and duration of each malfunction of the boiler or process heater, or of the associated air pollution control and monitoring equipment.

(7) Records of actions taken during periods of malfunction to minimize emissions in accordance with the general duty to minimize emissions in §63.7500(a)(3), including corrective actions to restore the malfunctioning boiler or process heater, air pollution control, or monitoring equipment to its normal or usual manner of operation.

(8) A copy of all calculations and supporting documentation of maximum TSM fuel input, using Equation 9 of §63.7530, that were done to demonstrate continuous compliance with the TSM emission limit for sources that demonstrate compliance through performance testing. For sources that demonstrate compliance through fuel analysis, a copy of all calculations and supporting documentation of TSM emission rates, using Equation 18 of §63.7530, that were done to demonstrate compliance with the TSM emission limit. Supporting documentation should include results of any fuel analyses and basis for the estimates of maximum TSM fuel input or TSM emission rates. You can use the results from one fuel analysis for multiple boilers and process heaters provided they are all burning

the same fuel type. However, you must calculate TSM fuel input, or TSM emission rates, for each boiler and process heater.

(9) You must maintain records of the calendar date, time, occurrence and duration of each startup and shutdown.

(10) You must maintain records of the type(s) and amount(s) of fuels used during each startup and shutdown.

(11) For each startup period, for units selecting paragraph (2) of the definition of "startup" in §63.7575 you must maintain records of the time that clean fuel combustion begins; the time when you start feeding fuels that are not clean fuels; the time when useful thermal energy is first supplied; and the time when the PM controls are engaged.

(12) If you choose to rely on paragraph (2) of the definition of "startup" in §63.7575, for each startup period, you must maintain records of the hourly steam temperature, hourly steam pressure, hourly steam flow, hourly flue gas temperature, and all hourly average CMS data (e.g., CEMS, PM CPMS, COMS, ESP total secondary electric power input, scrubber pressure drop, scrubber liquid flow rate) collected during each startup period to confirm that the control devices are engaged. In addition, if compliance with the PM emission limit is demonstrated using a PM control device, you must maintain records as specified in paragraphs (d)(12)(i) through (iii) of this section.

(i) For a boiler or process heater with an electrostatic precipitator, record the number of fields in service, as well as each field's secondary voltage and secondary current during each hour of startup.

(ii) For a boiler or process heater with a fabric filter, record the number of compartments in service, as well as the differential pressure across the baghouse during each hour of startup.

(iii) For a boiler or process heater with a wet scrubber needed for filterable PM control, record the scrubber's liquid flow rate and the pressure drop during each hour of startup.

(13) If you choose to use paragraph (2) of the definition of "startup" in §63.7575 and you find that you are unable to safely engage and operate your PM control(s) within 1 hour of first firing of non-clean fuels, you may choose to rely on paragraph (1) of definition of "startup" in §63.7575 or you may submit to the delegated permitting authority a request for a variance with the PM controls requirement, as described below.

(i) The request shall provide evidence of a documented manufacturer-identified safety issue.

(ii) The request shall provide information to document that the PM control device is adequately designed and sized to meet the applicable PM emission limit.

(iii) In addition, the request shall contain documentation that:

(A) The unit is using clean fuels to the maximum extent possible to bring the unit and PM control device up to the temperature necessary to alleviate or prevent the identified safety issues prior to the combustion of primary fuel;

(B) The unit has explicitly followed the manufacturer's procedures to alleviate or prevent the identified safety issue; and

(C) Identifies with specificity the details of the manufacturer's statement of concern.

(iv) You must comply with all other work practice requirements, including but not limited to data collection, recordkeeping, and reporting requirements.

(e) If you elect to average emissions consistent with §63.7522, you must additionally keep a copy of the emission averaging implementation plan required in §63.7522(g), all calculations required under §63.7522, including monthly records of heat input or steam generation, as applicable, and monitoring records consistent with §63.7541.

(f) If you elect to use efficiency credits from energy conservation measures to demonstrate compliance according to §63.7533, you must keep a copy of the Implementation Plan required in §63.7533(d) and copies of all data and calculations used to establish credits according to §63.7533(b), (c), and (f).

(g) If you elected to demonstrate that the unit meets the specification for mercury for the unit designed to burn gas 1 subcategory, you must maintain monthly records (or at the frequency required by §63.7540(c)) of the calculations and results of the fuel specification for mercury in Table 6.

(h) If you operate a unit in the unit designed to burn gas 1 subcategory that is subject to this subpart, and you use an alternative fuel other than natural gas, refinery gas, gaseous fuel subject to another subpart under this part, other gas 1 fuel, or gaseous fuel subject to another subpart of this part or part 60, 61, or 65, you must keep records of the total hours per calendar year that alternative fuel is burned and the total hours per calendar year that the unit operated during periods of gas curtailment or gas supply emergencies.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7185, Jan. 31, 2013; 80 FR 72816, Nov. 20, 2015]

**§63.7560 In what form and how long must I keep my records?**

(a) Your records must be in a form suitable and readily available for expeditious review, according to §63.10(b)(1).

(b) As specified in §63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

(c) You must keep each record on site, or they must be accessible from on site (for example, through a computer network), for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to §63.10(b)(1). You can keep the records off site for the remaining 3 years.

**Other Requirements and Information**

**§63.7565 What parts of the General Provisions apply to me?**

Table 10 to this subpart shows which parts of the General Provisions in §§63.1 through 63.15 apply to you.

**§63.7570 Who implements and enforces this subpart?**

(a) This subpart can be implemented and enforced by the EPA, or an Administrator such as your state, local, or tribal agency. If the EPA Administrator has delegated authority to your state, local, or tribal agency, then that agency (as well as the EPA) has the authority to implement and enforce this subpart. You should contact your EPA Regional Office to find out if this subpart is delegated to your state, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a state, local, or tribal agency under 40 CFR part 63, subpart E, the authorities listed in paragraphs (b)(1) through (4) of this section are retained by the EPA Administrator and are not transferred to the state, local, or tribal agency, however, the EPA retains oversight of this subpart and can take enforcement actions, as appropriate.

(1) Approval of alternatives to the emission limits and work practice standards in §63.7500(a) and (b) under §63.6(g), except as specified in §63.7555(d)(13).

(2) Approval of major change to test methods in Table 5 to this subpart under §63.7(e)(2)(ii) and (f) and as defined in §63.90, and alternative analytical methods requested under §63.7521(b)(2).

(3) Approval of major change to monitoring under §63.8(f) and as defined in §63.90, and approval of alternative operating parameters under §§63.7500(a)(2) and 63.7522(g)(2).

(4) Approval of major change to recordkeeping and reporting under §63.10(e) and as defined in §63.90.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7186, Jan. 31, 2013; 80 FR 72817, Nov. 20, 2015]

**§63.7575 What definitions apply to this subpart?**

Terms used in this subpart are defined in the Clean Air Act, in §63.2 (the General Provisions), and in this section as follows:

*10-day rolling average* means the arithmetic mean of the previous 240 hours of valid operating data. Valid data excludes hours during startup and shutdown, data collected during periods when the monitoring system is out of control as specified in your site-specific monitoring plan, while conducting repairs associated with periods when the monitoring system is out of control, or while conducting required monitoring system quality assurance or quality control activities, and periods when this unit is not operating. The 240 hours should be consecutive, but not necessarily continuous if operations were intermittent.

*30-day rolling average* means the arithmetic mean of the previous 720 hours of valid CO CEMS data. The 720 hours should be consecutive, but not necessarily continuous if operations were intermittent. For parameters other than CO, 30-day rolling average means either the arithmetic mean of all valid hours of data from 30 successive operating days or the arithmetic mean of the previous 720 hours of valid operating data. Valid data excludes hours during startup and shutdown, data collected during periods when the monitoring system is out of control as specified in your site-specific monitoring plan, while conducting repairs associated with periods when the monitoring system is out of control, or while conducting required monitoring system quality assurance or quality control activities, and periods when this unit is not operating.

*Annual capacity factor* means the ratio between the actual heat input to a boiler or process heater from the fuels burned during a calendar year and the potential heat input to the boiler or process heater had it been operated for 8,760 hours during a year at the maximum steady state design heat input capacity.

*Annual heat input* means the heat input for the 12 months preceding the compliance demonstration.

*Average annual heat input rate* means total heat input divided by the hours of operation for the 12 months preceding the compliance demonstration.

*Bag leak detection system* means a group of instruments that are capable of monitoring particulate matter loadings in the exhaust of a fabric filter (*i.e.*, baghouse) in order to detect bag failures. A bag leak detection system includes, but is not limited to, an instrument that operates on electrodynamic, triboelectric, light scattering, light transmittance, or other principle to monitor relative particulate matter loadings.

*Benchmark* means the fuel heat input for a boiler or process heater for the one-year period before the date that an energy demand reduction occurs, unless it can be demonstrated that a different time period is more representative of historical operations.

*Biodiesel* means a mono-alkyl ester derived from biomass and conforming to ASTM D6751-11b, Standard Specification for Biodiesel Fuel Blend Stock (B100) for Middle Distillate Fuels (incorporated by reference, see §63.14).

*Biomass or bio-based solid fuel* means any biomass-based solid fuel that is not a solid waste. This includes, but is not limited to, wood residue; wood products (*e.g.*, trees, tree stumps, tree limbs, bark, lumber, sawdust, sander dust, chips, scraps, slabs, millings, and shavings); animal manure, including litter and other bedding materials; vegetative agricultural and silvicultural materials, such as logging residues (slash), nut and grain hulls and chaff (*e.g.*, almond, walnut, peanut, rice, and wheat), bagasse, orchard prunings, corn stalks, coffee bean hulls and grounds. This definition of biomass is not intended to suggest that these materials are or are not solid waste.

*Blast furnace gas fuel-fired boiler or process heater* means an industrial/commercial/institutional boiler or process heater that receives 90 percent or more of its total annual gas volume from blast furnace gas.

*Boiler* means an enclosed device using controlled flame combustion and having the primary purpose of recovering thermal energy in the form of steam or hot water. Controlled flame combustion refers to a steady-state, or near steady-state, process wherein fuel and/or oxidizer feed rates are controlled. A device combusting solid waste, as

defined in §241.3 of this chapter, is not a boiler unless the device is exempt from the definition of a solid waste incineration unit as provided in section 129(g)(1) of the Clean Air Act. Waste heat boilers are excluded from this definition.

*Boiler system* means the boiler and associated components, such as, the feed water system, the combustion air system, the fuel system (including burners), blowdown system, combustion control systems, steam systems, and condensate return systems.

*Calendar year* means the period between January 1 and December 31, inclusive, for a given year.

*Clean dry biomass* means any biomass-based solid fuel that have not been painted, pigment-stained, or pressure treated, does not contain contaminants at concentrations not normally associated with virgin biomass materials and has a moisture content of less than 20 percent and is not a solid waste.

*Coal* means all solid fuels classifiable as anthracite, bituminous, sub-bituminous, or lignite by ASTM D388 (incorporated by reference, see §63.14), coal refuse, and petroleum coke. For the purposes of this subpart, this definition of "coal" includes synthetic fuels derived from coal, including but not limited to, solvent-refined coal, coal-oil mixtures, and coal-water mixtures. Coal derived gases are excluded from this definition.

*Coal refuse* means any by-product of coal mining or coal cleaning operations with an ash content greater than 50 percent (by weight) and a heating value less than 13,900 kilojoules per kilogram (6,000 Btu per pound) on a dry basis.

*Commercial/institutional boiler* means a boiler used in commercial establishments or institutional establishments such as medical centers, nursing homes, research centers, institutions of higher education, elementary and secondary schools, libraries, religious establishments, governmental buildings, hotels, restaurants, and laundries to provide electricity, steam, and/or hot water.

*Common stack* means the exhaust of emissions from two or more affected units through a single flue. Affected units with a common stack may each have separate air pollution control systems located before the common stack, or may have a single air pollution control system located after the exhausts come together in a single flue.

*Cost-effective energy conservation measure* means a measure that is implemented to improve the energy efficiency of the boiler or facility that has a payback (return of investment) period of 2 years or less.

*Daily block average* means the arithmetic mean of all valid emission concentrations or parameter levels recorded when a unit is operating measured over the 24-hour period from 12 a.m. (midnight) to 12 a.m. (midnight), except for periods of startup and shutdown or downtime.

*Deviation.* (1) *Deviation* means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

- (i) Fails to meet any applicable requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard; or
- (ii) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit.

(2) A deviation is not always a violation.

*Dioxins/furans* means tetra- through octa-chlorinated dibenzo-p-dioxins and dibenzofurans.

*Distillate oil* means fuel oils that contain 0.05 weight percent nitrogen or less and comply with the specifications for fuel oil numbers 1 and 2, as defined by the American Society of Testing and Materials in ASTM D396 (incorporated by reference, see §63.14) or diesel fuel oil numbers 1 and 2, as defined by the American Society for Testing and Materials in ASTM D975 (incorporated by reference, see §63.14), kerosene, and biodiesel as defined by the American Society of Testing and Materials in ASTM D6751-11b (incorporated by reference, see §60.14).

*Dry scrubber* means an add-on air pollution control system that injects dry alkaline sorbent (dry injection) or sprays an alkaline sorbent (spray dryer) to react with and neutralize acid gas in the exhaust stream forming a dry powder material. Sorbent injection systems used as control devices in fluidized bed boilers and process heaters are included in this definition. A dry scrubber is a dry control system.

*Dutch oven* means a unit having a refractory-walled cell connected to a conventional boiler setting. Fuel materials are introduced through an opening in the roof of the dutch oven and burn in a pile on its floor. Fluidized bed boilers are not part of the dutch oven design category.

*Efficiency credit* means emission reductions above those required by this subpart. Efficiency credits generated may be used to comply with the emissions limits. Credits may come from pollution prevention projects that result in reduced fuel use by affected units. Boilers that are shut down cannot be used to generate credits unless the facility provides documentation linking the permanent shutdown to implementation of the energy conservation measures identified in the energy assessment.

*Electric utility steam generating unit (EGU)* means a fossil fuel-fired combustion unit of more than 25 megawatts electric (MWe) that serves a generator that produces electricity for sale. A fossil fuel-fired unit that cogenerates steam and electricity and supplies more than one-third of its potential electric output capacity and more than 25 MWe output to any utility power distribution system for sale is considered an electric utility steam generating unit. To be "capable of combusting" fossil fuels, an EGU would need to have these fuels allowed in their operating permits and have the appropriate fuel handling facilities on-site or otherwise available (e.g., coal handling equipment, including coal storage area, belts and conveyers, pulverizers, etc.; oil storage facilities). In addition, fossil fuel-fired EGU means any EGU that fired fossil fuel for more than 10.0 percent of the average annual heat input in any 3 consecutive calendar years or for more than 15.0 percent of the annual heat input during any one calendar year after April 16, 2012.

*Electrostatic precipitator (ESP)* means an add-on air pollution control device used to capture particulate matter by charging the particles using an electrostatic field, collecting the particles using a grounded collecting surface, and transporting the particles into a hopper. An electrostatic precipitator is usually a dry control system.

*Energy assessment* means the following for the emission units covered by this subpart:

(1) The energy assessment for facilities with affected boilers and process heaters with a combined heat input capacity of less than 0.3 trillion Btu (TBtu) per year will be 8 on-site technical labor hours in length maximum, but may be longer at the discretion of the owner or operator of the affected source. The boiler system(s), process heater(s), and any on-site energy use system(s) accounting for at least 50 percent of the affected boiler(s) energy (e.g., steam, hot water, process heat, or electricity) production, as applicable, will be evaluated to identify energy savings opportunities, within the limit of performing an 8-hour on-site energy assessment.

(2) The energy assessment for facilities with affected boilers and process heaters with a combined heat input capacity of 0.3 to 1.0 TBtu/year will be 24 on-site technical labor hours in length maximum, but may be longer at the discretion of the owner or operator of the affected source. The boiler system(s), process heater(s), and any on-site energy use system(s) accounting for at least 33 percent of the energy (e.g., steam, hot water, process heat, or electricity) production, as applicable, will be evaluated to identify energy savings opportunities, within the limit of performing a 24-hour on-site energy assessment.

(3) The energy assessment for facilities with affected boilers and process heaters with a combined heat input capacity greater than 1.0 TBtu/year will be up to 24 on-site technical labor hours in length for the first TBtu/yr plus 8 on-site technical labor hours for every additional 1.0 TBtu/yr not to exceed 160 on-site technical hours, but may be longer at the discretion of the owner or operator of the affected source. The boiler system(s), process heater(s), and any on-site energy use system(s) accounting for at least 20 percent of the energy (e.g., steam, process heat, hot water, or electricity) production, as applicable, will be evaluated to identify energy savings opportunities.

(4) The on-site energy use systems serving as the basis for the percent of affected boiler(s) and process heater(s) energy production in paragraphs (1), (2), and (3) of this definition may be segmented by production area or energy use area as most logical and applicable to the specific facility being assessed (e.g., product X manufacturing area; product Y drying area; Building Z).

*Energy management practices* means the set of practices and procedures designed to manage energy use that are demonstrated by the facility's energy policies, a facility energy manager and other staffing responsibilities, energy

performance measurement and tracking methods, an energy saving goal, action plans, operating procedures, internal reporting requirements, and periodic review intervals used at the facility.

*Energy management program* means a program that includes a set of practices and procedures designed to manage energy use that are demonstrated by the facility's energy policies, a facility energy manager and other staffing responsibilities, energy performance measurement and tracking methods, an energy saving goal, action plans, operating procedures, internal reporting requirements, and periodic review intervals used at the facility. Facilities may establish their program through energy management systems compatible with ISO 50001.

*Energy use system* includes the following systems located on-site that use energy (steam, hot water, or electricity) provided by the affected boiler or process heater: process heating; compressed air systems; machine drive (motors, pumps, fans); process cooling; facility heating, ventilation, and air-conditioning systems; hot water systems; building envelop; and lighting; or other systems that use steam, hot water, process heat, or electricity provided by the affected boiler or process heater. Energy use systems are only those systems using energy clearly produced by affected boilers and process heaters.

*Equivalent* means the following only as this term is used in Table 6 to this subpart:

(1) An equivalent sample collection procedure means a published voluntary consensus standard or practice (VCS) or EPA method that includes collection of a minimum of three composite fuel samples, with each composite consisting of a minimum of three increments collected at approximately equal intervals over the test period.

(2) An equivalent sample compositing procedure means a published VCS or EPA method to systematically mix and obtain a representative subsample (part) of the composite sample.

(3) An equivalent sample preparation procedure means a published VCS or EPA method that: Clearly states that the standard, practice or method is appropriate for the pollutant and the fuel matrix; or is cited as an appropriate sample preparation standard, practice or method for the pollutant in the chosen VCS or EPA determinative or analytical method.

(4) An equivalent procedure for determining heat content means a published VCS or EPA method to obtain gross calorific (or higher heating) value.

(5) An equivalent procedure for determining fuel moisture content means a published VCS or EPA method to obtain moisture content. If the sample analysis plan calls for determining metals (especially the mercury, selenium, or arsenic) using an aliquot of the dried sample, then the drying temperature must be modified to prevent vaporizing these metals. On the other hand, if metals analysis is done on an "as received" basis, a separate aliquot can be dried to determine moisture content and the metals concentration mathematically adjusted to a dry basis.

(6) An equivalent pollutant (mercury, HCl) determinative or analytical procedure means a published VCS or EPA method that clearly states that the standard, practice, or method is appropriate for the pollutant and the fuel matrix and has a published detection limit equal or lower than the methods listed in Table 6 to this subpart for the same purpose.

*Fabric filter* means an add-on air pollution control device used to capture particulate matter by filtering gas streams through filter media, also known as a baghouse. A fabric filter is a dry control system.

*Federally enforceable* means all limitations and conditions that are enforceable by the EPA Administrator, including, but not limited to, the requirements of 40 CFR parts 60, 61, 63, and 65, requirements within any applicable state implementation plan, and any permit requirements established under 40 CFR 52.21 or under 40 CFR 51.18 and 40 CFR 51.24.

*Fluidized bed boiler* means a boiler utilizing a fluidized bed combustion process that is not a pulverized coal boiler.

*Fluidized bed boiler with an integrated fluidized bed heat exchanger* means a boiler utilizing a fluidized bed combustion where the entire tube surface area is located outside of the furnace section at the exit of the cyclone section and exposed to the flue gas stream for conductive heat transfer. This design applies only to boilers in the unit designed to burn coal/solid fossil fuel subcategory that fire coal refuse.

*Fluidized bed combustion* means a process where a fuel is burned in a bed of granulated particles, which are maintained in a mobile suspension by the forward flow of air and combustion products.

*Fossil fuel* means natural gas, oil, coal, and any form of solid, liquid, or gaseous fuel derived from such material.

*Fuel cell* means a boiler type in which the fuel is dropped onto suspended fixed grates and is fired in a pile. The refractory-lined fuel cell uses combustion air preheating and positioning of secondary and tertiary air injection ports to improve boiler efficiency. Fluidized bed, dutch oven, pile burner, hybrid suspension grate, and suspension burners are not part of the fuel cell subcategory.

*Fuel type* means each category of fuels that share a common name or classification. Examples include, but are not limited to, bituminous coal, sub-bituminous coal, lignite, anthracite, biomass, distillate oil, residual oil. Individual fuel types received from different suppliers are not considered new fuel types.

*Gaseous fuel* includes, but is not limited to, natural gas, process gas, landfill gas, coal derived gas, refinery gas, and biogas. Blast furnace gas and process gases that are regulated under another subpart of this part, or part 60, part 61, or part 65 of this chapter, are exempted from this definition.

*Heat input* means heat derived from combustion of fuel in a boiler or process heater and does not include the heat input from preheated combustion air, recirculated flue gases, returned condensate, or exhaust gases from other sources such as gas turbines, internal combustion engines, kilns, etc.

*Heavy liquid* includes residual oil and any other liquid fuel not classified as a light liquid.

*Hourly average* means the arithmetic average of at least four CMS data values representing the four 15-minute periods in an hour, or at least two 15-minute data values during an hour when CMS calibration, quality assurance, or maintenance activities are being performed.

*Hot water heater* means a closed vessel with a capacity of no more than 120 U.S. gallons in which water is heated by combustion of gaseous, liquid, or biomass/bio-based solid fuel and is withdrawn for use external to the vessel. Hot water boilers (i.e., not generating steam) combusting gaseous, liquid, or biomass fuel with a heat input capacity of less than 1.6 million Btu per hour are included in this definition. The 120 U.S. gallon capacity threshold to be considered a hot water heater is independent of the 1.6 MMBtu/hr heat input capacity threshold for hot water boilers. Hot water heater also means a tankless unit that provides on demand hot water.

*Hybrid suspension grate boiler* means a boiler designed with air distributors to spread the fuel material over the entire width and depth of the boiler combustion zone. The biomass fuel combusted in these units exceeds a moisture content of 40 percent on an as-fired annual heat input basis as demonstrated by monthly fuel analysis. The drying and much of the combustion of the fuel takes place in suspension, and the combustion is completed on the grate or floor of the boiler. Fluidized bed, dutch oven, and pile burner designs are not part of the hybrid suspension grate boiler design category.

*Industrial boiler* means a boiler used in manufacturing, processing, mining, and refining or any other industry to provide steam, hot water, and/or electricity.

*Light liquid* includes distillate oil, biodiesel, or vegetable oil.

*Limited-use boiler or process heater* means any boiler or process heater that burns any amount of solid, liquid, or gaseous fuels and has a federally enforceable annual capacity factor of no more than 10 percent.

*Liquid fuel* includes, but is not limited to, light liquid, heavy liquid, any form of liquid fuel derived from petroleum, used oil, liquid biofuels, biodiesel, and vegetable oil.

*Load fraction* means the actual heat input of a boiler or process heater divided by heat input during the performance test that established the minimum sorbent injection rate or minimum activated carbon injection rate, expressed as a fraction (e.g., for 50 percent load the load fraction is 0.5). For boilers and process heaters that co-fire natural gas or refinery gas with a solid or liquid fuel, the load fraction is determined by the actual heat input of the solid or liquid fuel

divided by heat input of the solid or liquid fuel fired during the performance test (e.g., if the performance test was conducted at 100 percent solid fuel firing, for 100 percent load firing 50 percent solid fuel and 50 percent natural gas the load fraction is 0.5).

*Major source for oil and natural gas production facilities*, as used in this subpart, shall have the same meaning as in §63.2, except that:

(1) Emissions from any oil or gas exploration or production well (with its associated equipment, as defined in this section), and emissions from any pipeline compressor station or pump station shall not be aggregated with emissions from other similar units to determine whether such emission points or stations are major sources, even when emission points are in a contiguous area or under common control;

(2) Emissions from processes, operations, or equipment that are not part of the same facility, as defined in this section, shall not be aggregated; and

(3) For facilities that are production field facilities, only HAP emissions from glycol dehydration units and storage vessels with the potential for flash emissions shall be aggregated for a major source determination. For facilities that are not production field facilities, HAP emissions from all HAP emission units shall be aggregated for a major source determination.

*Metal process furnaces* are a subcategory of process heaters, as defined in this subpart, which include natural gas-fired annealing furnaces, preheat furnaces, reheat furnaces, aging furnaces, heat treat furnaces, and homogenizing furnaces.

*Million Btu (MMBtu)* means one million British thermal units.

*Minimum activated carbon injection rate* means load fraction multiplied by the lowest hourly average activated carbon injection rate measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limit.

*Minimum oxygen level* means the lowest hourly average oxygen level measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limit.

*Minimum pressure drop* means the lowest hourly average pressure drop measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limit.

*Minimum scrubber effluent pH* means the lowest hourly average sorbent liquid pH measured at the inlet to the wet scrubber according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable hydrogen chloride emission limit.

*Minimum scrubber liquid flow rate* means the lowest hourly average liquid flow rate (e.g., to the PM scrubber or to the acid gas scrubber) measured according to Table 7 to this subpart during the most recent performance stack test demonstrating compliance with the applicable emission limit.

*Minimum scrubber pressure drop* means the lowest hourly average scrubber pressure drop measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limit.

*Minimum sorbent injection rate* means:

(1) The load fraction multiplied by the lowest hourly average sorbent injection rate for each sorbent measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limits; or

(2) For fluidized bed combustion not using an acid gas wet scrubber or dry sorbent injection control technology to comply with the HCl emission limit, the lowest average ratio of sorbent to sulfur measured during the most recent performance test.

*Minimum total secondary electric power* means the lowest hourly average total secondary electric power determined from the values of secondary voltage and secondary current to the electrostatic precipitator measured according to Table 7 to this subpart during the most recent performance test demonstrating compliance with the applicable emission limits.

*Natural gas* means:

(1) A naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in geologic formations beneath the earth's surface, of which the principal constituent is methane; or

(2) Liquefied petroleum gas, as defined in ASTM D1835 (incorporated by reference, see §63.14); or

(3) A mixture of hydrocarbons that maintains a gaseous state at ISO conditions. Additionally, natural gas must either be composed of at least 70 percent methane by volume or have a gross calorific value between 35 and 41 megajoules (MJ) per dry standard cubic meter (950 and 1,100 Btu per dry standard cubic foot); or

(4) Propane or propane derived synthetic natural gas. Propane means a colorless gas derived from petroleum and natural gas, with the molecular structure C<sub>3</sub>H<sub>8</sub>.

*Opacity* means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background.

*Operating day* means a 24-hour period between 12 midnight and the following midnight during which any fuel is combusted at any time in the boiler or process heater unit. It is not necessary for fuel to be combusted for the entire 24-hour period. For calculating rolling average emissions, an operating day does not include the hours of operation during startup or shutdown.

*Other combustor* means a unit designed to burn solid fuel that is not classified as a dutch oven, fluidized bed, fuel cell, hybrid suspension grate boiler, pulverized coal boiler, stoker, sloped grate, or suspension boiler as defined in this subpart.

*Other gas 1 fuel* means a gaseous fuel that is not natural gas or refinery gas and does not exceed a maximum concentration of 40 micrograms/cubic meters of mercury.

*Oxygen analyzer system* means all equipment required to determine the oxygen content of a gas stream and used to monitor oxygen in the boiler or process heater flue gas, boiler or process heater, firebox, or other appropriate location. This definition includes oxygen trim systems. The source owner or operator must install, calibrate, maintain, and operate the oxygen analyzer system in accordance with the manufacturer's recommendations.

*Oxygen trim system* means a system of monitors that is used to maintain excess air at the desired level in a combustion device over its operating load range. A typical system consists of a flue gas oxygen and/or CO monitor that automatically provides a feedback signal to the combustion air controller or draft controller.

*Particulate matter (PM)* means any finely divided solid or liquid material, other than uncombined water, as measured by the test methods specified under this subpart, or an approved alternative method.

*Period of gas curtailment or supply interruption* means a period of time during which the supply of gaseous fuel to an affected boiler or process heater is restricted or halted for reasons beyond the control of the facility. The act of entering into a contractual agreement with a supplier of natural gas established for curtailment purposes does not constitute a reason that is under the control of a facility for the purposes of this definition. An increase in the cost or unit price of natural gas due to normal market fluctuations not during periods of supplier delivery restriction does not constitute a period of natural gas curtailment or supply interruption. On-site gaseous fuel system emergencies or equipment failures qualify as periods of supply interruption when the emergency or failure is beyond the control of the facility.

*Pile burner* means a boiler design incorporating a design where the anticipated biomass fuel has a high relative moisture content. Grates serve to support the fuel, and underfire air flowing up through the grates provides oxygen for

combustion, cools the grates, promotes turbulence in the fuel bed, and fires the fuel. The most common form of pile burning is the dutch oven.

*Process heater* means an enclosed device using controlled flame, and the unit's primary purpose is to transfer heat indirectly to a process material (liquid, gas, or solid) or to a heat transfer material (e.g., glycol or a mixture of glycol and water) for use in a process unit, instead of generating steam. Process heaters are devices in which the combustion gases do not come into direct contact with process materials. A device combusting solid waste, as defined in §241.3 of this chapter, is not a process heater unless the device is exempt from the definition of a solid waste incineration unit as provided in section 129(g)(1) of the Clean Air Act. Process heaters do not include units used for comfort heat or space heat, food preparation for on-site consumption, or autoclaves. Waste heat process heaters are excluded from this definition.

*Pulverized coal boiler* means a boiler in which pulverized coal or other solid fossil fuel is introduced into an air stream that carries the coal to the combustion chamber of the boiler where it is fired in suspension.

*Qualified energy assessor* means:

(1) Someone who has demonstrated capabilities to evaluate energy savings opportunities for steam generation and major energy using systems, including, but not limited to:

- (i) Boiler combustion management.
- (ii) Boiler thermal energy recovery, including
  - (A) Conventional feed water economizer,
  - (B) Conventional combustion air preheater, and
  - (C) Condensing economizer.
- (iii) Boiler blowdown thermal energy recovery.
- (iv) Primary energy resource selection, including
  - (A) Fuel (primary energy source) switching, and
  - (B) Applied steam energy versus direct-fired energy versus electricity.
- (v) Insulation issues.
- (vi) Steam trap and steam leak management.
- (vi) Condensate recovery.
- (viii) Steam end-use management.

(2) Capabilities and knowledge includes, but is not limited to:

- (i) Background, experience, and recognized abilities to perform the assessment activities, data analysis, and report preparation.
- (ii) Familiarity with operating and maintenance practices for steam or process heating systems.
- (iii) Additional potential steam system improvement opportunities including improving steam turbine operations and reducing steam demand.

(iv) Additional process heating system opportunities including effective utilization of waste heat and use of proper process heating methods.

(v) Boiler-steam turbine cogeneration systems.

(vi) Industry specific steam end-use systems.

*Refinery gas* means any gas that is generated at a petroleum refinery and is combusted. Refinery gas includes natural gas when the natural gas is combined and combusted in any proportion with a gas generated at a refinery. Refinery gas includes gases generated from other facilities when that gas is combined and combusted in any proportion with gas generated at a refinery.

*Regulated gas stream* means an offgas stream that is routed to a boiler or process heater for the purpose of achieving compliance with a standard under another subpart of this part or part 60, part 61, or part 65 of this chapter.

*Residential boiler* means a boiler used to provide heat and/or hot water and/or as part of a residential combined heat and power system. This definition includes boilers located at an institutional facility (e.g., university campus, military base, church grounds) or commercial/industrial facility (e.g., farm) used primarily to provide heat and/or hot water for:

(1) A dwelling containing four or fewer families; or

(2) A single unit residence dwelling that has since been converted or subdivided into condominiums or apartments.

*Residual oil* means crude oil, fuel oil that does not comply with the specifications under the definition of distillate oil, and all fuel oil numbers 4, 5, and 6, as defined by the American Society of Testing and Materials in ASTM D396-10 (incorporated by reference, see §63.14(b)).

*Responsible official* means responsible official as defined in §70.2.

*Rolling average* means the average of all data collected during the applicable averaging period. For demonstration of compliance with a CO CEMS-based emission limit based on CO concentration a 30-day (10-day) rolling average is comprised of the average of all the hourly average concentrations over the previous 720 (240) operating hours calculated each operating day. To demonstrate compliance on a 30-day rolling average basis for parameters other than CO, you must indicate the basis of the 30-day rolling average period you are using for compliance, as discussed in §63.7545(e)(2)(iii). If you indicate the 30 operating day basis, you must calculate a new average value each operating day and shall include the measured hourly values for the preceding 30 operating days. If you select the 720 operating hours basis, you must average of all the hourly average concentrations over the previous 720 operating hours calculated each operating day.

*Secondary material* means the material as defined in §241.2 of this chapter.

*Shutdown* means the period in which cessation of operation of a boiler or process heater is initiated for any purpose. Shutdown begins when the boiler or process heater no longer supplies useful thermal energy (such as heat or steam) for heating, cooling, or process purposes and/or generates electricity or when no fuel is being fed to the boiler or process heater, whichever is earlier. Shutdown ends when the boiler or process heater no longer supplies useful thermal energy (such as steam or heat) for heating, cooling, or process purposes and/or generates electricity, and no fuel is being combusted in the boiler or process heater.

*Sloped grate* means a unit where the solid fuel is fed to the top of the grate from where it slides downwards; while sliding the fuel first dries and then ignites and burns. The ash is deposited at the bottom of the grate. Fluidized bed, dutch oven, pile burner, hybrid suspension grate, suspension burners, and fuel cells are not considered to be a sloped grate design.

*Solid fossil fuel* includes, but is not limited to, coal, coke, petroleum coke, and tire derived fuel.

*Solid fuel* means any solid fossil fuel or biomass or bio-based solid fuel.

*Startup means:*

(1) Either the first-ever firing of fuel in a boiler or process heater for the purpose of supplying useful thermal energy for heating and/or producing electricity, or for any other purpose, or the firing of fuel in a boiler after a shutdown event for any purpose. Startup ends when any of the useful thermal energy from the boiler or process heater is supplied for heating, and/or producing electricity, or for any other purpose, or

(2) The period in which operation of a boiler or process heater is initiated for any purpose. Startup begins with either the first-ever firing of fuel in a boiler or process heater for the purpose of supplying useful thermal energy (such as steam or heat) for heating, cooling or process purposes, or producing electricity, or the firing of fuel in a boiler or process heater for any purpose after a shutdown event. Startup ends four hours after when the boiler or process heater supplies useful thermal energy (such as heat or steam) for heating, cooling, or process purposes, or generates electricity, whichever is earlier.

*Steam output means:*

(1) For a boiler that produces steam for process or heating only (no power generation), the energy content in terms of MMBtu of the boiler steam output,

(2) For a boiler that cogenerates process steam and electricity (also known as combined heat and power), the total energy output, which is the sum of the energy content of the steam exiting the turbine and sent to process in MMBtu and the energy of the electricity generated converted to MMBtu at a rate of 10,000 Btu per kilowatt-hour generated (10 MMBtu per megawatt-hour), and

(3) For a boiler that generates only electricity, the alternate output-based emission limits would be the appropriate emission limit from Table 1 or 2 of this subpart in units of pounds per million Btu heat input (lb per MWh).

(4) For a boiler that performs multiple functions and produces steam to be used for any combination of paragraphs (1), (2), and (3) of this definition that includes electricity generation of paragraph (3) of this definition, the total energy output, in terms of MMBtu of steam output, is the sum of the energy content of steam sent directly to the process and/or used for heating ( $S_1$ ), the energy content of turbine steam sent to process plus energy in electricity according to paragraph (2) of this definition ( $S_2$ ), and the energy content of electricity generated by a electricity only turbine as paragraph (3) of this definition ( $MW_{(3)}$ ) and would be calculated using Equation 21 of this section. In the case of boilers supplying steam to one or more common heaters,  $S_1$ ,  $S_2$ , and  $MW_{(3)}$  for each boiler would be calculated based on the its (steam energy) contribution (fraction of total steam energy) to the common heater.

$$SO_M = S_1 + S_2 + (MW_{(3)} \times CF_n) \quad (\text{Eq. 21})$$

Where:

$SO_M$  = Total steam output for multi-function boiler, MMBtu

$S_1$  = Energy content of steam sent directly to the process and/or used for heating, MMBtu

$S_2$  = Energy content of turbine steam sent to the process plus energy in electricity according to (2) above, MMBtu

$MW_{(3)}$  = Electricity generated according to paragraph (3) of this definition, MWh

$CF_n$  = Conversion factor for the appropriate subcategory for converting electricity generated according to paragraph (3) of this definition to equivalent steam energy, MMBtu/MWh

$CF_n$  for emission limits for boilers in the unit designed to burn solid fuel subcategory = 10.8

$CF_n$  PM and CO emission limits for boilers in one of the subcategories of units designed to burn coal = 11.7

$CF_n$  PM and CO emission limits for boilers in one of the subcategories of units designed to burn biomass = 12.1

CFn for emission limits for boilers in one of the subcategories of units designed to burn liquid fuel = 11.2

CFn for emission limits for boilers in the unit designed to burn gas 2 (other) subcategory = 6.2

*Stoker* means a unit consisting of a mechanically operated fuel feeding mechanism, a stationary or moving grate to support the burning of fuel and admit under-grate air to the fuel, an overfire air system to complete combustion, and an ash discharge system. This definition of stoker includes air swept stokers. There are two general types of stokers: Underfeed and overfeed. Overfeed stokers include mass feed and spreader stokers. Fluidized bed, dutch oven, pile burner, hybrid suspension grate, suspension burners, and fuel cells are not considered to be a stoker design.

*Stoker/sloped grate/other unit designed to burn kiln dried biomass* means the unit is in the units designed to burn biomass/bio-based solid subcategory that is either a stoker, sloped grate, or other combustor design and is not in the stoker/sloped grate/other units designed to burn wet biomass subcategory.

*Stoker/sloped grate/other unit designed to burn wet biomass* means the unit is in the units designed to burn biomass/bio-based solid subcategory that is either a stoker, sloped grate, or other combustor design and any of the biomass/bio-based solid fuel combusted in the unit exceeds 20 percent moisture on an annual heat input basis.

*Suspension burner* means a unit designed to fire dry biomass/biobased solid particles in suspension that are conveyed in an airstream to the furnace like pulverized coal. The combustion of the fuel material is completed on a grate or floor below. The biomass/biobased fuel combusted in the unit shall not exceed 20 percent moisture on an annual heat input basis. Fluidized bed, dutch oven, pile burner, and hybrid suspension grate units are not part of the suspension burner subcategory.

*Temporary boiler* means any gaseous or liquid fuel boiler or process heater that is designed to, and is capable of, being carried or moved from one location to another by means of, for example, wheels, skids, carrying handles, dollies, trailers, or platforms. A boiler or process heater is not a temporary boiler or process heater if any one of the following conditions exists:

- (1) The equipment is attached to a foundation.
- (2) The boiler or process heater or a replacement remains at a location within the facility and performs the same or similar function for more than 12 consecutive months, unless the regulatory agency approves an extension. An extension may be granted by the regulating agency upon petition by the owner or operator of a unit specifying the basis for such a request. Any temporary boiler or process heater that replaces a temporary boiler or process heater at a location and performs the same or similar function will be included in calculating the consecutive time period.
- (3) The equipment is located at a seasonal facility and operates during the full annual operating period of the seasonal facility, remains at the facility for at least 2 years, and operates at that facility for at least 3 months each year.
- (4) The equipment is moved from one location to another within the facility but continues to perform the same or similar function and serve the same electricity, process heat, steam, and/or hot water system in an attempt to circumvent the residence time requirements of this definition.

*Total selected metals (TSM)* means the sum of the following metallic hazardous air pollutants: arsenic, beryllium, cadmium, chromium, lead, manganese, nickel and selenium.

*Traditional fuel* means the fuel as defined in §241.2 of this chapter.

*Tune-up* means adjustments made to a boiler or process heater in accordance with the procedures outlined in §63.7540(a)(10).

*Ultra low sulfur liquid fuel* means a distillate oil that has less than or equal to 15 ppm sulfur.

*Unit designed to burn biomass/bio-based solid subcategory* includes any boiler or process heater that burns at least 10 percent biomass or bio-based solids on an annual heat input basis in combination with solid fossil fuels, liquid fuels, or gaseous fuels.

*Unit designed to burn coal/solid fossil fuel subcategory* includes any boiler or process heater that burns any coal or other solid fossil fuel alone or at least 10 percent coal or other solid fossil fuel on an annual heat input basis in combination with liquid fuels, gaseous fuels, or less than 10 percent biomass and bio-based solids on an annual heat input basis.

*Unit designed to burn gas 1 subcategory* includes any boiler or process heater that burns only natural gas, refinery gas, and/or other gas 1 fuels. Gaseous fuel boilers and process heaters that burn liquid fuel for periodic testing of liquid fuel, maintenance, or operator training, not to exceed a combined total of 48 hours during any calendar year, are included in this definition. Gaseous fuel boilers and process heaters that burn liquid fuel during periods of gas curtailment or gas supply interruptions of any duration are also included in this definition.

*Unit designed to burn gas 2 (other) subcategory* includes any boiler or process heater that is not in the unit designed to burn gas 1 subcategory and burns any gaseous fuels either alone or in combination with less than 10 percent coal/solid fossil fuel, and less than 10 percent biomass/bio-based solid fuel on an annual heat input basis, and no liquid fuels. Gaseous fuel boilers and process heaters that are not in the unit designed to burn gas 1 subcategory and that burn liquid fuel for periodic testing of liquid fuel, maintenance, or operator training, not to exceed a combined total of 48 hours during any calendar year, are included in this definition. Gaseous fuel boilers and process heaters that are not in the unit designed to burn gas 1 subcategory and that burn liquid fuel during periods of gas curtailment or gas supply interruption of any duration are also included in this definition.

*Unit designed to burn heavy liquid subcategory* means a unit in the unit designed to burn liquid subcategory where at least 10 percent of the heat input from liquid fuels on an annual heat input basis comes from heavy liquids.

*Unit designed to burn light liquid subcategory* means a unit in the unit designed to burn liquid subcategory that is not part of the unit designed to burn heavy liquid subcategory.

*Unit designed to burn liquid subcategory* includes any boiler or process heater that burns any liquid fuel, but less than 10 percent coal/solid fossil fuel and less than 10 percent biomass/bio-based solid fuel on an annual heat input basis, either alone or in combination with gaseous fuels. Units in the unit design to burn gas 1 or unit designed to burn gas 2 (other) subcategories that burn liquid fuel for periodic testing of liquid fuel, maintenance, or operator training, not to exceed a combined total of 48 hours during any calendar year are not included in this definition. Units in the unit design to burn gas 1 or unit designed to burn gas 2 (other) subcategories during periods of gas curtailment or gas supply interruption of any duration are also not included in this definition.

*Unit designed to burn liquid fuel that is a non-continental unit* means an industrial, commercial, or institutional boiler or process heater meeting the definition of the unit designed to burn liquid subcategory located in the State of Hawaii, the Virgin Islands, Guam, American Samoa, the Commonwealth of Puerto Rico, or the Northern Mariana Islands.

*Unit designed to burn solid fuel subcategory* means any boiler or process heater that burns only solid fuels or at least 10 percent solid fuel on an annual heat input basis in combination with liquid fuels or gaseous fuels.

*Useful thermal energy* means energy (*i.e.*, steam, hot water, or process heat) that meets the minimum operating temperature, flow, and/or pressure required by any energy use system that uses energy provided by the affected boiler or process heater.

*Vegetable oil* means oils extracted from vegetation.

*Voluntary Consensus Standards or VCS* mean technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. EPA/Office of Air Quality Planning and Standards, by precedent, has only used VCS that are written in English. Examples of VCS bodies are: American Society of Testing and Materials (ASTM 100 Barr Harbor Drive, P.O. Box CB700, West Conshohocken, Pennsylvania 19428-B2959, (800) 262-1373, <http://www.astm.org>), American Society of Mechanical Engineers (ASME ASME, Three Park Avenue, New York, NY 10016-5990, (800) 843-2763, <http://www.asme.org>), International Standards Organization (ISO 1, ch. de la Voie-Creuse, Case postale 56, CH-1211

Geneva 20, Switzerland, + 41 22 749 01 11, <http://www.iso.org/iso/home.htm>), Standards Australia (AS Level 10, The Exchange Centre, 20 Bridge Street, Sydney, GPO Box 476, Sydney NSW 2001, + 61 2 9237 6171 <http://www.stadards.org.au>), British Standards Institution (BSI, 389 Chiswick High Road, London, W4 4AL, United Kingdom, + 44 (0)20 8996 9001, <http://www.bsigroup.com>), Canadian Standards Association (CSA 5060 Spectrum Way, Suite 100, Mississauga, Ontario L4W 5N6, Canada, 800-463-6727, <http://www.csa.ca>), European Committee for Standardization (CEN CENELEC Management Centre Avenue Marnix 17 B-1000 Brussels, Belgium + 32 2 550 08 11, <http://www.cen.eu/cen>), and German Engineering Standards (VDI VDI Guidelines Department, P.O. Box 10 11 39 40002, Duesseldorf, Germany, + 49 211 6214-230, <http://www.vdi.eu>). The types of standards that are not considered VCS are standards developed by: The United States, e.g., California (CARB) and Texas (TCEQ); industry groups, such as American Petroleum Institute (API), Gas Processors Association (GPA), and Gas Research Institute (GRI); and other branches of the U.S. government, e.g., Department of Defense (DOD) and Department of Transportation (DOT). This does not preclude EPA from using standards developed by groups that are not VCS bodies within their rule. When this occurs, EPA has done searches and reviews for VCS equivalent to these non-EPA methods.

*Waste heat boiler* means a device that recovers normally unused energy (i.e., hot exhaust gas) and converts it to usable heat. Waste heat boilers are also referred to as heat recovery steam generators. Waste heat boilers are heat exchangers generating steam from incoming hot exhaust gas from an industrial (e.g., thermal oxidizer, kiln, furnace) or power (e.g., combustion turbine, engine) equipment. Duct burners are sometimes used to increase the temperature of the incoming hot exhaust gas.

*Waste heat process heater* means an enclosed device that recovers normally unused energy (i.e., hot exhaust gas) and converts it to usable heat. Waste heat process heaters are also referred to as recuperative process heaters. This definition includes both fired and unfired waste heat process heaters.

*Wet scrubber* means any add-on air pollution control device that mixes an aqueous stream or slurry with the exhaust gases from a boiler or process heater to control emissions of particulate matter or to absorb and neutralize acid gases, such as hydrogen chloride. A wet scrubber creates an aqueous stream or slurry as a byproduct of the emissions control process.

*Work practice standard* means any design, equipment, work practice, or operational standard, or combination thereof, that is promulgated pursuant to section 112(h) of the Clean Air Act.

[78 FR 15664, Mar. 21, 2011, as amended at 78 FR 7163, Jan. 31, 2013; 80 FR 72817, Nov. 20, 2015]

**Table 1 to Subpart DDDDD of Part 63—Emission Limits for New or Reconstructed Boilers and Process Heaters**

As stated in §63.7500, you must comply with the following applicable emission limits:

[Units with heat input capacity of 10 million Btu per hour or greater]

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
1. Units in all subcategories designed to burn solid fuel.	a. HCl	2.2E-02 lb per MMBtu of heat input	2.5E-02 lb per MMBtu of steam output or 0.28 lb per MWh	For M26A, collect a minimum of 1 dscm per run; for M26 collect a minimum of 120 liters per run.

If your boiler or process heater is in this subcategory . . . . .	For the following pollutants . . . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . . . .	Using this specified sampling volume or test run duration . . . . .
	b. Mercury	8.0E-07 <sup>a</sup> lb per MMBtu of heat input	8.7E-07 <sup>a</sup> lb per MMBtu of steam output or 1.1E-05 <sup>a</sup> lb per MWh	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
2. Units designed to burn coal/solid fossil fuel	a. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	1.1E-03 lb per MMBtu of steam output or 1.4E-02 lb per MWh; or (2.7E-05 lb per MMBtu of steam output or 2.9E-04 lb per MWh)	Collect a minimum of 3 dscm per run.
3. Pulverized coal boilers designed to burn coal/solid fossil fuel	a. Carbon monoxide (CO) (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (320 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	0.11 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
4. Stokers/others designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (340 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	0.12 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
5. Fluidized bed units designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (230 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	0.11 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
6. Fluidized bed units with an integrated heat exchanger designed to burn coal/solid fossil fuel	a. CO (or CEMS)	140 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (150 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	1.2E-01 lb per MMBtu of steam output or 1.5 lb per MWh; 3-run average	1 hr minimum sampling time.
7. Stokers/sloped grate/others designed to burn wet biomass fuel	a. CO (or CEMS)	620 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (390 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	5.8E-01 lb per MMBtu of steam output or 6.8 lb per MWh; 3-run average	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (2.6E-05 lb per MMBtu of heat input)	3.5E-02 lb per MMBtu of steam output or 4.2E-01 lb per MWh; or (2.7E-05 lb per MMBtu of steam output or 3.7E-04 lb per MWh)	Collect a minimum of 2 dscm per run.
8. Stokers/sloped grate/others designed to burn kiln-dried biomass fuel	a. CO	460 ppm by volume on a dry basis corrected to 3 percent oxygen	4.2E-01 lb per MMBtu of steam output or 5.1 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (4.0E-03 lb per MMBtu of heat input)	3.5E-02 lb per MMBtu of steam output or 4.2E-01 lb per MWh; or (4.2E-03 lb per MMBtu of steam output or 5.6E-02 lb per MWh)	Collect a minimum of 2 dscm per run.
9. Fluidized bed units designed to burn biomass/bio-based solids	a. CO (or CEMS)	230 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (310 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	2.2E-01 lb per MMBtu of steam output or 2.6 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	9.8E-03 lb per MMBtu of heat input; or (8.3E-05 <sup>a</sup> lb per MMBtu of heat input)	1.2E-02 lb per MMBtu of steam output or 0.14 lb per MWh; or (1.1E-04 <sup>a</sup> lb per MMBtu of steam output or 1.2E-03 <sup>a</sup> lb per MWh)	Collect a minimum of 3 dscm per run.
10. Suspension burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	2,400 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (2,000 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 10-day rolling average)	1.9 lb per MMBtu of steam output or 27 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (6.5E-03 lb per MMBtu of heat input)	3.1E-02 lb per MMBtu of steam output or 4.2E-01 lb per MWh; or (6.6E-03 lb per MMBtu of steam output or 9.1E-02 lb per MWh)	Collect a minimum of 2 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
11. Dutch Ovens/Pile burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	330 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (520 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 10-day rolling average)	3.5E-01 lb per MMBtu of steam output or 3.6 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.2E-03 lb per MMBtu of heat input; or (3.9E-05 lb per MMBtu of heat input)	4.3E-03 lb per MMBtu of steam output or 4.5E-02 lb per MWh; or (5.2E-05 lb per MMBtu of steam output or 5.5E-04 lb per MWh)	Collect a minimum of 3 dscm per run.
12. Fuel cell units designed to burn biomass/bio-based solids	a. CO	910 ppm by volume on a dry basis corrected to 3 percent oxygen	1.1 lb per MMBtu of steam output or 1.0E + 01 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.0E-02 lb per MMBtu of heat input; or (2.9E-05 <sup>a</sup> lb per MMBtu of heat input)	3.0E-02 lb per MMBtu of steam output or 2.8E-01 lb per MWh; or (5.1E-05 lb per MMBtu of steam output or 4.1E-04 lb per MWh)	Collect a minimum of 2 dscm per run.
13. Hybrid suspension grate boiler designed to burn biomass/bio-based solids	a. CO (or CEMS)	1,100 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (900 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>d</sup> 30-day rolling average)	1.4 lb per MMBtu of steam output or 12 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.6E-02 lb per MMBtu of heat input; or (4.4E-04 lb per MMBtu of heat input)	3.3E-02 lb per MMBtu of steam output or 3.7E-01 lb per MWh; or (5.5E-04 lb per MMBtu of steam output or 6.2E-03 lb per MWh)	Collect a minimum of 3 dscm per run.
14. Units designed to burn liquid fuel	a. HCl	4.4E-04 lb per MMBtu of heat input	4.8E-04 lb per MMBtu of steam output or 6.1E-03 lb per MWh	For M26A: Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Mercury	4.8E-07 <sup>a</sup> lb per MMBtu of heat input	5.3E-07 <sup>a</sup> lb per MMBtu of steam output or 6.7E-06 <sup>a</sup> lb per MWh	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
15. Units designed to burn heavy liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	0.13 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.3E-02 lb per MMBtu of heat input; or (7.5E-05 lb per MMBtu of heat input)	1.5E-02 lb per MMBtu of steam output or 1.8E-01 lb per MWh; or (8.2E-05 lb per MMBtu of steam output or 1.1E-03 lb per MWh)	Collect a minimum of 3 dscm per run.
16. Units designed to burn light liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen	0.13 lb per MMBtu of steam output or 1.4 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.1E-03 <sup>a</sup> lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	1.2E-03 <sup>a</sup> lb per MMBtu of steam output or 1.6E-02 <sup>a</sup> lb per MWh; or (3.2E-05 lb per MMBtu of steam output or 4.0E-04 lb per MWh)	Collect a minimum of 3 dscm per run.
17. Units designed to burn liquid fuel that are non-continental units	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average based on stack test	0.13 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.3E-02 lb per MMBtu of heat input; or (8.6E-04 lb per MMBtu of heat input)	2.5E-02 lb per MMBtu of steam output or 3.2E-01 lb per MWh; or (9.4E-04 lb per MMBtu of steam output or 1.2E-02 lb per MWh)	Collect a minimum of 4 dscm per run.
18. Units designed to burn gas 2 (other) gases	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen	0.16 lb per MMBtu of steam output or 1.0 lb per MWh	1 hr minimum sampling time.
	b. HCl	1.7E-03 lb per MMBtu of heat input	2.9E-03 lb per MMBtu of steam output or 1.8E-02 lb per MWh	For M26A, Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	Or the emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	c. Mercury	7.9E-06 lb per MMBtu of heat input	1.4E-05 lb per MMBtu of steam output or 8.3E-05 lb per MWh	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
	d. Filterable PM (or TSM)	6.7E-03 lb per MMBtu of heat input; or (2.1E-04 lb per MMBtu of heat input)	1.2E-02 lb per MMBtu of steam output or 7.0E-02 lb per MWh; or (3.5E-04 lb per MMBtu of steam output or 2.2E-03 lb per MWh)	Collect a minimum of 3 dscm per run.

<sup>a</sup>If you are conducting stack tests to demonstrate compliance and your performance tests for this pollutant for at least 2 consecutive years show that your emissions are at or below this limit, you can skip testing according to §63.7515 if all of the other provisions of §63.7515 are met. For all other pollutants that do not contain a footnote “a”, your performance tests for this pollutant for at least 2 consecutive years must show that your emissions are at or below 75 percent of this limit in order to qualify for skip testing.

<sup>b</sup>Incorporated by reference, see §63.14.

<sup>c</sup>If your affected source is a new or reconstructed affected source that commenced construction or reconstruction after June 4, 2010, and before April 1, 2013, you may comply with the emission limits in Tables 11, 12 or 13 to this subpart until January 31, 2016. On and after January 31, 2016, you must comply with the emission limits in Table 1 to this subpart.

<sup>d</sup>An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the carbon monoxide emissions limit be determined using carbon dioxide as a diluent correction in place of oxygen at 3%. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3% oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

[78 FR 7193, Jan. 31, 2013, as amended at 80 FR 72819, Nov. 20, 2015]

**Table 2 to Subpart DDDDD of Part 63—Emission Limits for Existing Boilers and Process Heaters**

As stated in §63.7500, you must comply with the following applicable emission limits:

[Units with heat input capacity of 10 million Btu per hour or greater]

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	The emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
1. Units in all subcategories designed to burn solid fuel	a. HCl	2.2E-02 lb per MMBtu of heat input	2.5E-02 lb per MMBtu of steam output or 0.27 lb per MWh	For M26A, Collect a minimum of 1 dscm per run; for M26, collect a minimum of 120 liters per run.
	b. Mercury	5.7E-06 lb per MMBtu of heat input	6.4E-06 lb per MMBtu of steam output or 7.3E-05 lb per MWh	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
2. Units design to burn coal/solid fossil fuel	a. Filterable PM (or TSM)	4.0E-02 lb per MMBtu of heat input; or (5.3E-05 lb per MMBtu of heat input)	4.2E-02 lb per MMBtu of steam output or 4.9E-01 lb per MWh; or (5.6E-05 lb per MMBtu of steam output or 6.5E-04 lb per MWh)	Collect a minimum of 2 dscm per run.
3. Pulverized coal boilers designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (320 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	0.11 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
4. Stokers/others designed to burn coal/solid fossil fuel	a. CO (or CEMS)	160 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (340 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	0.14 lb per MMBtu of steam output or 1.7 lb per MWh; 3-run average	1 hr minimum sampling time.
5. Fluidized bed units designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (230 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	0.12 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	The emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
6. Fluidized bed units with an integrated heat exchanger designed to burn coal/solid fossil fuel	a. CO (or CEMS)	140 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (150 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1.3E-01 lb per MMBtu of steam output or 1.5 lb per MWh; 3-run average	1 hr minimum sampling time.
7. Stokers/sloped grate/others designed to burn wet biomass fuel	a. CO (or CEMS)	1,500 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (720 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1.4 lb per MMBtu of steam output or 17 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.7E-02 lb per MMBtu of heat input; or (2.4E-04 lb per MMBtu of heat input)	4.3E-02 lb per MMBtu of steam output or 5.2E-01 lb per MWh; or (2.8E-04 lb per MMBtu of steam output or 3.4E-04 lb per MWh)	Collect a minimum of 2 dscm per run.
8. Stokers/sloped grate/others designed to burn kiln-dried biomass fuel	a. CO	460 ppm by volume on a dry basis corrected to 3 percent oxygen	4.2E-01 lb per MMBtu of steam output or 5.1 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.2E-01 lb per MMBtu of heat input; or (4.0E-03 lb per MMBtu of heat input)	3.7E-01 lb per MMBtu of steam output or 4.5 lb per MWh; or (4.6E-03 lb per MMBtu of steam output or 5.6E-02 lb per MWh)	Collect a minimum of 1 dscm per run.
9. Fluidized bed units designed to burn biomass/bio-based solid	a. CO (or CEMS)	470 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (310 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	4.6E-01 lb per MMBtu of steam output or 5.2 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.1E-01 lb per MMBtu of heat input; or (1.2E-03 lb per MMBtu of heat input)	1.4E-01 lb per MMBtu of steam output or 1.6 lb per MWh; or (1.5E-03 lb per MMBtu of steam output or 1.7E-02 lb per MWh)	Collect a minimum of 1 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	The emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
10. Suspension burners designed to burn biomass/bio-based solid	a. CO (or CEMS)	2,400 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (2,000 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1.9 lb per MMBtu of steam output or 27 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	5.1E-02 lb per MMBtu of heat input; or (6.5E-03 lb per MMBtu of heat input)	5.2E-02 lb per MMBtu of steam output or 7.1E-01 lb per MWh; or (6.6E-03 lb per MMBtu of steam output or 9.1E-02 lb per MWh)	Collect a minimum of 2 dscm per run.
11. Dutch Ovens/Pile burners designed to burn biomass/bio-based solid	a. CO (or CEMS)	770 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (520 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	8.4E-01 lb per MMBtu of steam output or 8.4 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.8E-01 lb per MMBtu of heat input; or (2.0E-03 lb per MMBtu of heat input)	3.9E-01 lb per MMBtu of steam output or 3.9 lb per MWh; or (2.8E-03 lb per MMBtu of steam output or 2.8E-02 lb per MWh)	Collect a minimum of 1 dscm per run.
12. Fuel cell units designed to burn biomass/bio-based solid	a. CO	1,100 ppm by volume on a dry basis corrected to 3 percent oxygen	2.4 lb per MMBtu of steam output or 12 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.0E-02 lb per MMBtu of heat input; or (5.8E-03 lb per MMBtu of heat input)	5.5E-02 lb per MMBtu of steam output or 2.8E-01 lb per MWh; or (1.6E-02 lb per MMBtu of steam output or 8.1E-02 lb per MWh)	Collect a minimum of 2 dscm per run.
13. Hybrid suspension grate units designed to burn biomass/bio-based solid	a. CO (or CEMS)	3,500 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (900 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	3.5 lb per MMBtu of steam output or 39 lb per MWh; 3-run average	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	The emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Filterable PM (or TSM)	4.4E-01 lb per MMBtu of heat input; or (4.5E-04 lb per MMBtu of heat input)	5.5E-01 lb per MMBtu of steam output or 6.2 lb per MWh; or (5.7E-04 lb per MMBtu of steam output or 6.3E-03 lb per MWh)	Collect a minimum of 1 dscm per run.
14. Units designed to burn liquid fuel	a. HCl	1.1E-03 lb per MMBtu of heat input	1.4E-03 lb per MMBtu of steam output or 1.6E-02 lb per MWh	For M26A, collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	b. Mercury	2.0E-06 <sup>a</sup> lb per MMBtu of heat input	2.5E-06 <sup>a</sup> lb per MMBtu of steam output or 2.8E-05 lb per MWh	For M29, collect a minimum of 3 dscm per run; for M30A or M30B collect a minimum sample as specified in the method, for ASTM D6784, <sup>b</sup> collect a minimum of 2 dscm.
15. Units designed to burn heavy liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	0.13 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	6.2E-02 lb per MMBtu of heat input; or (2.0E-04 lb per MMBtu of heat input)	7.5E-02 lb per MMBtu of steam output or 8.6E-01 lb per MWh; or (2.5E-04 lb per MMBtu of steam output or 2.8E-03 lb per MWh)	Collect a minimum of 1 dscm per run.
16. Units designed to burn light liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen	0.13 lb per MMBtu of steam output or 1.4 lb per MWh	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	7.9E-03 <sup>a</sup> lb per MMBtu of heat input; or (6.2E-05 lb per MMBtu of heat input)	9.6E-03 <sup>a</sup> lb per MMBtu of steam output or 1.1E-01 <sup>a</sup> lb per MWh; or (7.5E-05 lb per MMBtu of steam output or 8.6E-04 lb per MWh)	Collect a minimum of 3 dscm per run.
17. Units designed to burn liquid fuel that are non-continental units	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average based on stack test	0.13 lb per MMBtu of steam output or 1.4 lb per MWh; 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.7E-01 lb per MMBtu of heat input; or (8.6E-04 lb per MMBtu of heat input)	3.3E-01 lb per MMBtu of steam output or 3.8 lb per MWh; or (1.1E-03 lb per MMBtu of steam output or 1.2E-02 lb per MWh)	Collect a minimum of 2 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during startup and shutdown . . .	The emissions must not exceed the following alternative output-based limits, except during startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
18. Units designed to burn gas 2 (other) gases	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen	0.16 lb per MMBtu of steam output or 1.0 lb per MWh	1 hr minimum sampling time.
	b. HCl	1.7E-03 lb per MMBtu of heat input	2.9E-03 lb per MMBtu of steam output or 1.8E-02 lb per MWh	For M26A, collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	c. Mercury	7.9E-06 lb per MMBtu of heat input	1.4E-05 lb per MMBtu of steam output or 8.3E-05 lb per MWh	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 2 dscm.
	d. Filterable PM (or TSM)	6.7E-03 lb per MMBtu of heat input or (2.1E-04 lb per MMBtu of heat input)	1.2E-02 lb per MMBtu of steam output or 7.0E-02 lb per MWh; or (3.5E-04 lb per MMBtu of steam output or 2.2E-03 lb per MWh)	Collect a minimum of 3 dscm per run.

<sup>a</sup>If you are conducting stack tests to demonstrate compliance and your performance tests for this pollutant for at least 2 consecutive years show that your emissions are at or below this limit, you can skip testing according to §63.7515 if all of the other provisions of §63.7515 are met. For all other pollutants that do not contain a footnote a, your performance tests for this pollutant for at least 2 consecutive years must show that your emissions are at or below 75 percent of this limit in order to qualify for skip testing.

<sup>b</sup>Incorporated by reference, see §63.14.

<sup>c</sup>An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the carbon monoxide emissions limit be determined using carbon dioxide as a diluent correction in place of oxygen at 3%. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3% oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

[78 FR 7195, Jan. 31, 2013, as amended at 80 FR 72821, Nov. 20, 2015]

**Table 3 to Subpart DDDDD of Part 63—Work Practice Standards**

As stated in §63.7500, you must comply with the following applicable work practice standards:

If your unit is . . .	You must meet the following . . .
1. A new or existing boiler or process heater with a continuous oxygen trim system that maintains an optimum air to fuel ratio, or a heat input capacity of less than or equal to 5 million Btu per hour in any of the following subcategories: unit designed to burn gas 1; unit designed to burn gas 2 (other); or unit designed to burn light liquid, or a limited use boiler or process heater	Conduct a tune-up of the boiler or process heater every 5 years as specified in §63.7540.
2. A new or existing boiler or process heater without a continuous oxygen trim system and with heat input capacity of less than 10 million Btu per hour in the unit designed to burn heavy liquid or unit designed to burn solid fuel subcategories; or a new or existing boiler or process heater with heat input capacity of less than 10 million Btu per hour, but greater than 5 million Btu per hour, in any of the following subcategories: unit designed to burn gas 1; unit designed to burn gas 2 (other); or unit designed to burn light liquid	Conduct a tune-up of the boiler or process heater biennially as specified in §63.7540.
3. A new or existing boiler or process heater without a continuous oxygen trim system and with heat input capacity of 10 million Btu per hour or greater	Conduct a tune-up of the boiler or process heater annually as specified in §63.7540. Units in either the Gas 1 or Metal Process Furnace subcategories will conduct this tune-up as a work practice for all regulated emissions under this subpart. Units in all other subcategories will conduct this tune-up as a work practice for dioxins/furans.
4. An existing boiler or process heater located at a major source facility, not including limited use units	Must have a one-time energy assessment performed by a qualified energy assessor. An energy assessment completed on or after January 1, 2008, that meets or is amended to meet the energy assessment requirements in this table, satisfies the energy assessment requirement. A facility that operated under an energy management program developed according to the ENERGY STAR guidelines for energy management or compatible with ISO 50001 for at least one year between January 1, 2008 and the compliance date specified in §63.7495 that includes the affected units also satisfies the energy assessment requirement. The energy assessment must include the following with extent of the evaluation for items a. to e. appropriate for the on-site technical hours listed in §63.7575:
	a. A visual inspection of the boiler or process heater system.
	b. An evaluation of operating characteristics of the boiler or process heater systems, specifications of energy using systems, operating and maintenance procedures, and unusual operating constraints.
	c. An inventory of major energy use systems consuming energy from affected boilers and process heaters and which are under the control of the boiler/process heater owner/operator.

If your unit is . . .	You must meet the following . . .
	d. A review of available architectural and engineering plans, facility operation and maintenance procedures and logs, and fuel usage.
	e. A review of the facility's energy management program and provide recommendations for improvements consistent with the definition of energy management program, if identified.
	f. A list of cost-effective energy conservation measures that are within the facility's control.
	g. A list of the energy savings potential of the energy conservation measures identified.
	h. A comprehensive report detailing the ways to improve efficiency, the cost of specific improvements, benefits, and the time frame for recouping those investments.
5. An existing or new boiler or process heater subject to emission limits in Table 1 or 2 or 11 through 13 to this subpart during startup	<p>a. You must operate all CMS during startup.</p> <p>b. For startup of a boiler or process heater, you must use one or a combination of the following clean fuels: Natural gas, synthetic natural gas, propane, other Gas 1 fuels, distillate oil, syngas, ultra-low sulfur diesel, fuel oil-soaked rags, kerosene, hydrogen, paper, cardboard, refinery gas, liquefied petroleum gas, clean dry biomass, and any fuels meeting the appropriate HCl, mercury and TSM emission standards by fuel analysis.</p> <p>c. You have the option of complying using either of the following work practice standards.            (1) If you choose to comply using definition (1) of "startup" in §63.7575, once you start firing fuels that are not clean fuels, you must vent emissions to the main stack(s) and engage all of the applicable control devices except limestone injection in fluidized bed combustion (FBC) boilers, dry scrubber, fabric filter, and selective catalytic reduction (SCR). You must start your limestone injection in FBC boilers, dry scrubber, fabric filter, and SCR systems as expeditiously as possible. Startup ends when steam or heat is supplied for any purpose, OR            (2) If you choose to comply using definition (2) of "startup" in §63.7575, once you start to feed fuels that are not clean fuels, you must vent emissions to the main stack(s) and engage all of the applicable control devices so as to comply with the emission limits within 4 hours of start of supplying useful thermal energy. You must engage and operate PM control within one hour of first feeding fuels that are not clean fuels<sup>a</sup>. You must start all applicable control devices as expeditiously as possible, but, in any case, when necessary to comply with other standards applicable to the source by a permit limit or a rule other than this subpart that require operation of the control devices. You must develop and implement a written startup and shutdown plan, as specified in §63.7505(e).</p> <p>d. You must comply with all applicable emission limits at all times except during startup and shutdown periods at which time you must meet this work practice. You must collect monitoring data during periods of startup, as specified in §63.7535(b). You must keep records during periods of startup. You must provide reports concerning activities and periods of startup, as specified in §63.7555.</p>

If your unit is . . .	You must meet the following . . .
6. An existing or new boiler or process heater subject to emission limits in Tables 1 or 2 or 11 through 13 to this subpart during shutdown	<p>You must operate all CMS during shutdown. While firing fuels that are not clean fuels during shutdown, you must vent emissions to the main stack(s) and operate all applicable control devices, except limestone injection in FBC boilers, dry scrubber, fabric filter, and SCR but, in any case, when necessary to comply with other standards applicable to the source that require operation of the control device.</p> <p>If, in addition to the fuel used prior to initiation of shutdown, another fuel must be used to support the shutdown process, that additional fuel must be one or a combination of the following clean fuels: Natural gas, synthetic natural gas, propane, other Gas 1 fuels, distillate oil, syngas, ultra-low sulfur diesel, refinery gas, and liquefied petroleum gas. You must comply with all applicable emissions limits at all times except for startup or shutdown periods conforming with this work practice. You must collect monitoring data during periods of shutdown, as specified in §63.7535(b). You must keep records during periods of shutdown. You must provide reports concerning activities and periods of shutdown, as specified in §63.7555.</p>

<sup>a</sup>As specified in §63.7555(d)(13), the source may request an alternative timeframe with the PM controls requirement to the permitting authority (state, local, or tribal agency) that has been delegated authority for this subpart by EPA. The source must provide evidence that (1) it is unable to safely engage and operate the PM control(s) to meet the “fuel firing + 1 hour” requirement and (2) the PM control device is appropriately designed and sized to meet the filterable PM emission limit. It is acknowledged that there may be another control device that has been installed other than ESP that provides additional PM control (e.g., scrubber).

[78 FR 7198, Jan. 31, 2013, as amended at 80 FR 72823, Nov. 20, 2015]

**Table 4 to Subpart DDDDD of Part 63—Operating Limits for Boilers and Process Heaters**

As stated in §63.7500, you must comply with the applicable operating limits:

Table 4 to Subpart DDDDD of Part 63—Operating Limits for Boilers and Process Heaters

When complying with a Table 1, 2, 11, 12, or 13 numerical emission limit using . . .	You must meet these operating limits . . .
1. Wet PM scrubber control on a boiler or process heater not using a PM CPMS	Maintain the 30-day rolling average pressure drop and the 30-day rolling average liquid flow rate at or above the lowest one-hour average pressure drop and the lowest one-hour average liquid flow rate, respectively, measured during the performance test demonstrating compliance with the PM emission limitation according to §63.7530(b) and Table 7 to this subpart.
2. Wet acid gas (HCl) scrubber <sup>a</sup> control on a boiler or process heater not using a HCl CEMS	Maintain the 30-day rolling average effluent pH at or above the lowest one-hour average pH and the 30-day rolling average liquid flow rate at or above the lowest one-hour average liquid flow rate measured during the performance test demonstrating compliance with the HCl emission limitation according to §63.7530(b) and Table 7 to this subpart.
3. Fabric filter control on a boiler or process heater not using a PM CPMS	a. Maintain opacity to less than or equal to 10 percent opacity or the highest hourly average opacity reading measured during the performance test run demonstrating compliance with the PM (or TSM) emission limitation (daily block average); or

When complying with a Table 1, 2, 11, 12, or 13 numerical emission limit using . . .	You must meet these operating limits . . .
	b. Install and operate a bag leak detection system according to §63.7525 and operate the fabric filter such that the bag leak detection system alert is not activated more than 5 percent of the operating time during each 6-month period.
4. Electrostatic precipitator control on a boiler or process heater not using a PM CPMS	a. This option is for boilers and process heaters that operate dry control systems ( <i>i.e.</i> , an ESP without a wet scrubber). Existing and new boilers and process heaters must maintain opacity to less than or equal to 10 percent opacity or the highest hourly average opacity reading measured during the performance test run demonstrating compliance with the PM (or TSM) emission limitation (daily block average).
	b. This option is only for boilers and process heaters not subject to PM CPMS or continuous compliance with an opacity limit ( <i>i.e.</i> , dry ESP). Maintain the 30-day rolling average total secondary electric power input of the electrostatic precipitator at or above the operating limits established during the performance test according to §63.7530(b) and Table 7 to this subpart.
5. Dry scrubber or carbon injection control on a boiler or process heater not using a mercury CEMS	Maintain the minimum sorbent or carbon injection rate as defined in §63.7575 of this subpart.
6. Any other add-on air pollution control type on a boiler or process heater not using a PM CPMS	This option is for boilers and process heaters that operate dry control systems. Existing and new boilers and process heaters must maintain opacity to less than or equal to 10 percent opacity or the highest hourly average opacity reading measured during the performance test run demonstrating compliance with the PM (or TSM) emission limitation (daily block average).
7. Performance testing	For boilers and process heaters that demonstrate compliance with a performance test, maintain the 30-day rolling average operating load of each unit such that it does not exceed 110 percent of the highest hourly average operating load recorded during the performance test.
8. Oxygen analyzer system	For boilers and process heaters subject to a CO emission limit that demonstrate compliance with an O <sub>2</sub> analyzer system as specified in §63.7525(a), maintain the 30-day rolling average oxygen content at or above the lowest hourly average oxygen concentration measured during the CO performance test, as specified in Table 8. This requirement does not apply to units that install an oxygen trim system since these units will set the trim system to the level specified in §63.7525(a).
9. SO <sub>2</sub> CEMS	For boilers or process heaters subject to an HCl emission limit that demonstrate compliance with an SO <sub>2</sub> CEMS, maintain the 30-day rolling average SO <sub>2</sub> emission rate at or below the highest hourly average SO <sub>2</sub> concentration measured during the HCl performance test, as specified in Table 8.

<sup>a</sup>A wet acid gas scrubber is a control device that removes acid gases by contacting the combustion gas with an alkaline slurry or solution. Alkaline reagents include, but not limited to, lime, limestone and sodium.

[80 FR 72874, Nov. 20, 2015]

**Table 5 to Subpart DDDDD of Part 63—Performance Testing Requirements**

As stated in §63.7520, you must comply with the following requirements for performance testing for existing, new or reconstructed affected sources:

<b>To conduct a performance test for the following pollutant . . .</b>	<b>You must. . .</b>	<b>Using, as appropriate . . .</b>
1. Filterable PM	a. Select sampling ports location and the number of traverse points	Method 1 at 40 CFR part 60, appendix A-1 of this chapter.
	b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2F, or 2G at 40 CFR part 60, appendix A-1 or A-2 to part 60 of this chapter.
	c. Determine oxygen or carbon dioxide concentration of the stack gas	Method 3A or 3B at 40 CFR part 60, appendix A-2 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981. <sup>a</sup>
	d. Measure the moisture content of the stack gas	Method 4 at 40 CFR part 60, appendix A-3 of this chapter.
	e. Measure the PM emission concentration	Method 5 or 17 (positive pressure fabric filters must use Method 5D) at 40 CFR part 60, appendix A-3 or A-6 of this chapter.
	f. Convert emissions concentration to lb per MMBtu emission rates	Method 19 F-factor methodology at 40 CFR part 60, appendix A-7 of this chapter.
2. TSM	a. Select sampling ports location and the number of traverse points	Method 1 at 40 CFR part 60, appendix A-1 of this chapter.
	b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2F, or 2G at 40 CFR part 60, appendix A-1 or A-2 of this chapter.
	c. Determine oxygen or carbon dioxide concentration of the stack gas	Method 3A or 3B at 40 CFR part 60, appendix A-1 of this chapter, or ANSI/ASME PTC 19.10-1981. <sup>a</sup>
	d. Measure the moisture content of the stack gas	Method 4 at 40 CFR part 60, appendix A-3 of this chapter.
	e. Measure the TSM emission concentration	Method 29 at 40 CFR part 60, appendix A-8 of this chapter
	f. Convert emissions concentration to lb per MMBtu emission rates	Method 19 F-factor methodology at 40 CFR part 60, appendix A-7 of this chapter.
3. Hydrogen chloride	a. Select sampling ports location and the number of traverse points	Method 1 at 40 CFR part 60, appendix A-1 of this chapter.
	b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2F, or 2G at 40 CFR part 60, appendix A-2 of this chapter.
	c. Determine oxygen or carbon dioxide concentration of the stack gas	Method 3A or 3B at 40 CFR part 60, appendix A-2 of this chapter, or ANSI/ASME PTC 19.10-1981. <sup>a</sup>

To conduct a performance test for the following pollutant . . .	You must. . .	Using, as appropriate . . .
	d. Measure the moisture content of the stack gas	Method 4 at 40 CFR part 60, appendix A-3 of this chapter.
	e. Measure the hydrogen chloride emission concentration	Method 26 or 26A (M26 or M26A) at 40 CFR part 60, appendix A-8 of this chapter.
	f. Convert emissions concentration to lb per MMBtu emission rates	Method 19 F-factor methodology at 40 CFR part 60, appendix A-7 of this chapter.
4. Mercury	a. Select sampling ports location and the number of traverse points	Method 1 at 40 CFR part 60, appendix A-1 of this chapter.
	b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2F, or 2G at 40 CFR part 60, appendix A-1 or A-2 of this chapter.
	c. Determine oxygen or carbon dioxide concentration of the stack gas	Method 3A or 3B at 40 CFR part 60, appendix A-1 of this chapter, or ANSI/ASME PTC 19.10-1981. <sup>a</sup>
	d. Measure the moisture content of the stack gas	Method 4 at 40 CFR part 60, appendix A-3 of this chapter.
	e. Measure the mercury emission concentration	Method 29, 30A, or 30B (M29, M30A, or M30B) at 40 CFR part 60, appendix A-8 of this chapter or Method 101A at 40 CFR part 61, appendix B of this chapter, or ASTM Method D6784. <sup>a</sup>
	f. Convert emissions concentration to lb per MMBtu emission rates	Method 19 F-factor methodology at 40 CFR part 60, appendix A-7 of this chapter.
5. CO	a. Select the sampling ports location and the number of traverse points	Method 1 at 40 CFR part 60, appendix A-1 of this chapter.
	b. Determine oxygen concentration of the stack gas	Method 3A or 3B at 40 CFR part 60, appendix A-3 of this chapter, or ASTM D6522-00 (Reapproved 2005), or ANSI/ASME PTC 19.10-1981. <sup>a</sup>
	c. Measure the moisture content of the stack gas	Method 4 at 40 CFR part 60, appendix A-3 of this chapter.
	d. Measure the CO emission concentration	Method 10 at 40 CFR part 60, appendix A-4 of this chapter. Use a measurement span value of 2 times the concentration of the applicable emission limit.

<sup>a</sup>Incorporated by reference, see §63.14.

**Table 6 to Subpart DDDDD of Part 63—Fuel Analysis Requirements**

As stated in §63.7521, you must comply with the following requirements for fuel analysis testing for existing, new or reconstructed affected sources. However, equivalent methods (as defined in §63.7575) may be used in lieu of the prescribed methods at the discretion of the source owner or operator:

To conduct a fuel analysis for the following pollutant . . .	You must . . .	Using . . .
1. Mercury	a. Collect fuel samples	Procedure in §63.7521(c) or ASTM D5192, <sup>a</sup> or ASTM D7430, <sup>a</sup> or ASTM D6883, <sup>a</sup> or ASTM D2234/D2234M <sup>a</sup> (for coal) or ASTM D6323 <sup>a</sup> (for solid), or ASTM D4177 <sup>a</sup> (for liquid), or ASTM D4057 <sup>a</sup> (for liquid), or equivalent.
	b. Composite fuel samples	Procedure in §63.7521(d) or equivalent.
	c. Prepare composited fuel samples	EPA SW-846-3050B <sup>a</sup> (for solid samples), ASTM D2013/D2013M <sup>a</sup> (for coal), ASTM D5198 <sup>a</sup> (for biomass), or EPA 3050 <sup>a</sup> (for solid fuel), or EPA 821-R-01-013 <sup>a</sup> (for liquid or solid), or equivalent.
	d. Determine heat content of the fuel type	ASTM D5865 <sup>a</sup> (for coal) or ASTM E711 <sup>a</sup> (for biomass), or ASTM D5864 <sup>a</sup> for liquids and other solids, or ASTM D240 <sup>a</sup> or equivalent.
	e. Determine moisture content of the fuel type	ASTM D3173, <sup>a</sup> ASTM E871, <sup>a</sup> or ASTM D5864, <sup>a</sup> or ASTM D240, or ASTM D95 <sup>a</sup> (for liquid fuels), or ASTM D4006 <sup>a</sup> (for liquid fuels), or equivalent.
	f. Measure mercury concentration in fuel sample	ASTM D6722 <sup>a</sup> (for coal), EPA SW-846-7471B <sup>a</sup> or EPA 1631 or EPA 1631E (for solid samples), or EPA SW-846-7470A <sup>a</sup> (for liquid samples), or EPA 821-R-01-013 (for liquid or solid), or equivalent.
	g. Convert concentration into units of pounds of mercury per MMBtu of heat content	For fuel mixtures use Equation 8 in §63.7530.
2. HCl	a. Collect fuel samples	Procedure in §63.7521(c) or ASTM D5192, <sup>a</sup> or ASTM D7430, <sup>a</sup> or ASTM D6883, <sup>a</sup> or ASTM D2234/D2234M <sup>a</sup> (for coal) or ASTM D6323 <sup>a</sup> (for coal or biomass), ASTM D4177 <sup>a</sup> (for liquid fuels) or ASTM D4057 <sup>a</sup> (for liquid fuels), or equivalent.
	b. Composite fuel samples	Procedure in §63.7521(d) or equivalent.
	c. Prepare composited fuel samples	EPA SW-846-3050B <sup>a</sup> (for solid samples), ASTM D2013/D2013M <sup>a</sup> (for coal), or ASTM D5198 <sup>a</sup> (for biomass), or EPA 3050 <sup>a</sup> or equivalent.
	d. Determine heat content of the fuel type	ASTM D5865 <sup>a</sup> (for coal) or ASTM E711 <sup>a</sup> (for biomass), ASTM D5864, ASTM D240 <sup>a</sup> or equivalent.
	e. Determine moisture content of the fuel type	ASTM D3173 <sup>a</sup> or ASTM E871, <sup>a</sup> or D5864, <sup>a</sup> or ASTM D240, <sup>a</sup> or ASTM D95 <sup>a</sup> (for liquid fuels), or ASTM D4006 <sup>a</sup> (for liquid fuels), or equivalent.
	f. Measure chlorine concentration in fuel sample	EPA SW-846-9250, <sup>a</sup> ASTM D6721, <sup>a</sup> ASTM D4208 <sup>a</sup> (for coal), or EPA SW-846-5050 <sup>a</sup> or ASTM E776 <sup>a</sup> (for solid fuel), or EPA SW-846-9056 <sup>a</sup> or SW-846-9076 <sup>a</sup> (for solids or liquids) or equivalent.

To conduct a fuel analysis for the following pollutant . . .	You must . . .	Using . . .
	g. Convert concentrations into units of pounds of HCl per MMBtu of heat content	For fuel mixtures use Equation 7 in §63.7530 and convert from chlorine to HCl by multiplying by 1.028.
3. Mercury Fuel Specification for other gas 1 fuels	a. Measure mercury concentration in the fuel sample and convert to units of micrograms per cubic meter, or	Method 30B (M30B) at 40 CFR part 60, appendix A-8 of this chapter or ASTM D5954, <sup>a</sup> ASTM D6350, <sup>a</sup> ISO 6978-1:2003(E), <sup>a</sup> or ISO 6978-2:2003(E), <sup>a</sup> or EPA-1631 <sup>a</sup> or equivalent.
	b. Measure mercury concentration in the exhaust gas when firing only the other gas 1 fuel is fired in the boiler or process heater	Method 29, 30A, or 30B (M29, M30A, or M30B) at 40 CFR part 60, appendix A-8 of this chapter or Method 101A or Method 102 at 40 CFR part 61, appendix B of this chapter, or ASTM Method D6784 <sup>a</sup> or equivalent.
4. TSM	a. Collect fuel samples	Procedure in §63.7521(c) or ASTM D5192, <sup>a</sup> or ASTM D7430, <sup>a</sup> or ASTM D6883, <sup>a</sup> or ASTM D2234/D2234M <sup>a</sup> (for coal) or ASTM D6323 <sup>a</sup> (for coal or biomass), or ASTM D4177, <sup>a</sup> (for liquid fuels) or ASTM D4057 <sup>a</sup> (for liquid fuels), or equivalent.
	b. Composite fuel samples	Procedure in §63.7521(d) or equivalent.
	c. Prepare composited fuel samples	EPA SW-846-3050B <sup>a</sup> (for solid samples), ASTM D2013/D2013M <sup>a</sup> (for coal), ASTM D5198 <sup>a</sup> or TAPPI T266 <sup>a</sup> (for biomass), or EPA 3050 <sup>a</sup> or equivalent.
	d. Determine heat content of the fuel type	ASTM D5865 <sup>a</sup> (for coal) or ASTM E711 <sup>a</sup> (for biomass), or ASTM D5864 <sup>a</sup> for liquids and other solids, or ASTM D240 <sup>a</sup> or equivalent.
	e. Determine moisture content of the fuel type	ASTM D3173 <sup>a</sup> or ASTM E871, <sup>a</sup> or D5864, or ASTM D240, <sup>a</sup> or ASTM D95 <sup>a</sup> (for liquid fuels), or ASTM D4006 <sup>a</sup> (for liquid fuels), or ASTM D4177 <sup>a</sup> (for liquid fuels) or ASTM D4057 <sup>a</sup> (for liquid fuels), or equivalent.
	f. Measure TSM concentration in fuel sample	ASTM D3683, <sup>a</sup> or ASTM D4606, <sup>a</sup> or ASTM D6357 <sup>a</sup> or EPA 200.8 <sup>a</sup> or EPA SW-846-6020, <sup>a</sup> or EPA SW-846-6020A, <sup>a</sup> or EPA SW-846-6010C, <sup>a</sup> EPA 7060 <sup>a</sup> or EPA 7060A <sup>a</sup> (for arsenic only), or EPA SW-846-7740 <sup>a</sup> (for selenium only).
	g. Convert concentrations into units of pounds of TSM per MMBtu of heat content	For fuel mixtures use Equation 9 in §63.7530.

<sup>a</sup>Incorporated by reference, see §63.14.

**Table 7 to Subpart DDDDD of Part 63—Establishing Operating Limits<sup>ab</sup>**

As stated in §63.7520, you must comply with the following requirements for establishing operating limits:

Table 7 to Subpart DDDDD of Part 63—Establishing Operating Limits<sup>ab</sup>

If you have an applicable emission limit for . . .	And your operating limits are based on . . .	You must . . .	Using . . .	According to the following requirements
1. PM, TSM, or mercury	a. Wet scrubber operating parameters	i. Establish a site-specific minimum scrubber pressure drop and minimum flow rate operating limit according to §63.7530(b)	(1) Data from the scrubber pressure drop and liquid flow rate monitors and the PM, TSM, or mercury performance test	(a) You must collect scrubber pressure drop and liquid flow rate data every 15 minutes during the entire period of the performance tests. (b) Determine the lowest hourly average scrubber pressure drop and liquid flow rate by computing the hourly averages using all of the 15-minute readings taken during each performance test.
	b. Electrostatic precipitator operating parameters (option only for units that operate wet scrubbers)	i. Establish a site-specific minimum total secondary electric power input according to §63.7530(b)	(1) Data from the voltage and secondary amperage monitors during the PM or mercury performance test	(a) You must collect secondary voltage and secondary amperage for each ESP cell and calculate total secondary electric power input data every 15 minutes during the entire period of the performance tests. (b) Determine the average total secondary electric power input by computing the hourly averages using all of the 15-minute readings taken during each performance test.
	c. Opacity	i. Establish a site-specific maximum opacity level	(1) Data from the opacity monitoring system during the PM performance test	(a) You must collect opacity readings every 15 minutes during the entire period of the performance tests. (b) Determine the average hourly opacity reading for each performance test run by computing the hourly averages using all of the 15-minute readings taken during each performance test run. (c) Determine the highest hourly average opacity reading measured during the test run demonstrating compliance with the PM (or TSM) emission limitation.

If you have an applicable emission limit for . . .	And your operating limits are based on . . .	You must . . .	Using . . .	According to the following requirements
2. HCl	a. Wet scrubber operating parameters	i. Establish site-specific minimum effluent pH and flow rate operating limits according to §63.7530(b)	(1) Data from the pH and liquid flow-rate monitors and the HCl performance test	(a) You must collect pH and liquid flow-rate data every 15 minutes during the entire period of the performance tests. (b) Determine the hourly average pH and liquid flow rate by computing the hourly averages using all of the 15-minute readings taken during each performance test.
	b. Dry scrubber operating parameters	i. Establish a site-specific minimum sorbent injection rate operating limit according to §63.7530(b). If different acid gas sorbents are used during the HCl performance test, the average value for each sorbent becomes the site-specific operating limit for that sorbent	(1) Data from the sorbent injection rate monitors and HCl or mercury performance test	(a) You must collect sorbent injection rate data every 15 minutes during the entire period of the performance tests. (b) Determine the hourly average sorbent injection rate by computing the hourly averages using all of the 15-minute readings taken during each performance test. (c) Determine the lowest hourly average of the three test run averages established during the performance test as your operating limit. When your unit operates at lower loads, multiply your sorbent injection rate by the load fraction, as defined in §63.7575, to determine the required injection rate.
	c. Alternative Maximum SO <sub>2</sub> emission rate	i. Establish a site-specific maximum SO <sub>2</sub> emission rate operating limit according to §63.7530(b)	(1) Data from SO <sub>2</sub> CEMS and the HCl performance test	(a) You must collect the SO <sub>2</sub> emissions data according to §63.7525(m) during the most recent HCl performance tests. (b) The maximum SO <sub>2</sub> emission rate is equal to the highest hourly average SO <sub>2</sub> emission rate measured during the most recent HCl performance tests.

If you have an applicable emission limit for . . .	And your operating limits are based on . . .	You must . . .	Using . . .	According to the following requirements
3. Mercury	a. Activated carbon injection	i. Establish a site-specific minimum activated carbon injection rate operating limit according to §63.7530(b)	(1) Data from the activated carbon rate monitors and mercury performance test	(a) You must collect activated carbon injection rate data every 15 minutes during the entire period of the performance tests. (b) Determine the hourly average activated carbon injection rate by computing the hourly averages using all of the 15-minute readings taken during each performance test. (c) Determine the lowest hourly average established during the performance test as your operating limit. When your unit operates at lower loads, multiply your activated carbon injection rate by the load fraction, as defined in §63.7575, to determine the required injection rate.
4. Carbon monoxide for which compliance is demonstrated by a performance test	a. Oxygen	i. Establish a unit-specific limit for minimum oxygen level according to §63.7530(b)	(1) Data from the oxygen analyzer system specified in §63.7525(a)	(a) You must collect oxygen data every 15 minutes during the entire period of the performance tests. (b) Determine the hourly average oxygen concentration by computing the hourly averages using all of the 15-minute readings taken during each performance test. (c) Determine the lowest hourly average established during the performance test as your minimum operating limit.
5. Any pollutant for which compliance is demonstrated by a performance test	a. Boiler or process heater operating load	i. Establish a unit specific limit for maximum operating load according to §63.7520(c)	(1) Data from the operating load monitors or from steam generation monitors	(a) You must collect operating load or steam generation data every 15 minutes during the entire period of the performance test. (b) Determine the average operating load by computing the hourly averages using all of the 15-minute readings taken during each performance test. (c) Determine the highest hourly average of the three test run averages during the performance test, and multiply this by 1.1 (110 percent) as your operating limit.

<sup>a</sup>Operating limits must be confirmed or reestablished during performance tests.

<sup>b</sup>If you conduct multiple performance tests, you must set the minimum liquid flow rate and pressure drop operating limits at the higher of the minimum values established during the performance tests. For a minimum oxygen level, if you conduct multiple performance tests, you must set the minimum oxygen level at the lower of the minimum values established during the performance tests.

[80 FR 72827, Nov. 20, 2015]

**Table 8 to Subpart DDDDD of Part 63—Demonstrating Continuous Compliance**

As stated in §63.7540, you must show continuous compliance with the emission limitations for each boiler or process heater according to the following:

<b>If you must meet the following operating limits or work practice standards . . .</b>	<b>You must demonstrate continuous compliance by . . .</b>
1. Opacity	a. Collecting the opacity monitoring system data according to §63.7525(c) and §63.7535; and b. Reducing the opacity monitoring data to 6-minute averages; and c. Maintaining daily block average opacity to less than or equal to 10 percent or the highest hourly average opacity reading measured during the performance test run demonstrating compliance with the PM (or TSM) emission limitation.
2. PM CPMS	a. Collecting the PM CPMS output data according to §63.7525; b. Reducing the data to 30-day rolling averages; and c. Maintaining the 30-day rolling average PM CPMS output data to less than the operating limit established during the performance test according to §63.7530(b)(4).
3. Fabric Filter Bag Leak Detection Operation	Installing and operating a bag leak detection system according to §63.7525 and operating the fabric filter such that the requirements in §63.7540(a)(7) are met.
4. Wet Scrubber Pressure Drop and Liquid Flow-rate	a. Collecting the pressure drop and liquid flow rate monitoring system data according to §§63.7525 and 63.7535; and b. Reducing the data to 30-day rolling averages; and c. Maintaining the 30-day rolling average pressure drop and liquid flow-rate at or above the operating limits established during the performance test according to §63.7530(b).
5. Wet Scrubber pH	a. Collecting the pH monitoring system data according to §§63.7525 and 63.7535; and b. Reducing the data to 30-day rolling averages; and c. Maintaining the 30-day rolling average pH at or above the operating limit established during the performance test according to §63.7530(b).
6. Dry Scrubber Sorbent or Carbon Injection Rate	a. Collecting the sorbent or carbon injection rate monitoring system data for the dry scrubber according to §§63.7525 and 63.7535; and b. Reducing the data to 30-day rolling averages; and c. Maintaining the 30-day rolling average sorbent or carbon injection rate at or above the minimum sorbent or carbon injection rate as defined in §63.7575.
7. Electrostatic Precipitator Total Secondary Electric Power Input	a. Collecting the total secondary electric power input monitoring system data for the electrostatic precipitator according to §§63.7525 and 63.7535; and b. Reducing the data to 30-day rolling averages; and

If you must meet the following operating limits or work practice standards . . .	You must demonstrate continuous compliance by . . .
	c. Maintaining the 30-day rolling average total secondary electric power input at or above the operating limits established during the performance test according to §63.7530(b).
8. Emission limits using fuel analysis	a. Conduct monthly fuel analysis for HCl or mercury or TSM according to Table 6 to this subpart; and
	b. Reduce the data to 12-month rolling averages; and
	c. Maintain the 12-month rolling average at or below the applicable emission limit for HCl or mercury or TSM in Tables 1 and 2 or 11 through 13 to this subpart.
	d. Calculate the HCl, mercury, and/or TSM emission rate from the boiler or process heater in units of lb/MMBtu using Equation 15 and Equations 17, 18, and/or 19 in §63.7530.
9. Oxygen content	a. Continuously monitor the oxygen content using an oxygen analyzer system according to §63.7525(a). This requirement does not apply to units that install an oxygen trim system since these units will set the trim system to the level specified in §63.7525(a)(7).
	b. Reducing the data to 30-day rolling averages; and
	c. Maintain the 30-day rolling average oxygen content at or above the lowest hourly average oxygen level measured during the CO performance test.
10. Boiler or process heater operating load	a. Collecting operating load data or steam generation data every 15 minutes. b. Reducing the data to 30-day rolling averages; and
	c. Maintaining the 30-day rolling average operating load such that it does not exceed 110 percent of the highest hourly average operating load recorded during the performance test according to §63.7520(c).
11. SO <sub>2</sub> emissions using SO <sub>2</sub> CEMS	a. Collecting the SO <sub>2</sub> CEMS output data according to §63.7525;
	b. Reducing the data to 30-day rolling averages; and
	c. Maintaining the 30-day rolling average SO <sub>2</sub> CEMS emission rate to a level at or below the highest hourly SO <sub>2</sub> rate measured during the HCl performance test according to §63.7530.

[78 FR 7204, Jan. 31, 2013, as amended at 80 FR 72829, Nov. 20, 2015]

**Table 9 to Subpart DDDDD of Part 63—Reporting Requirements**

As stated in §63.7550, you must comply with the following requirements for reports:

You must submit a(n)	The report must contain . . .	You must submit the report . . .
1. Compliance report	a. Information required in §63.7550(c)(1) through (5); and	Semiannually, annually, biennially, or every 5 years according to the requirements in §63.7550(b).

You must submit a(n)	The report must contain . . .	You must submit the report . . .
	b. If there are no deviations from any emission limitation (emission limit and operating limit) that applies to you and there are no deviations from the requirements for work practice standards for periods of startup and shutdown in Table 3 to this subpart that apply to you, a statement that there were no deviations from the emission limitations and work practice standards during the reporting period. If there were no periods during which the CMSs, including continuous emissions monitoring system, continuous opacity monitoring system, and operating parameter monitoring systems, were out-of-control as specified in §63.8(c)(7), a statement that there were no periods during which the CMSs were out-of-control during the reporting period; and	
	c. If you have a deviation from any emission limitation (emission limit and operating limit) where you are not using a CMS to comply with that emission limit or operating limit, or a deviation from a work practice standard for periods of startup and shutdown, during the reporting period, the report must contain the information in §63.7550(d); and	
	d. If there were periods during which the CMSs, including continuous emissions monitoring system, continuous opacity monitoring system, and operating parameter monitoring systems, were out-of-control as specified in §63.8(c)(7), or otherwise not operating, the report must contain the information in §63.7550(e)	

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7205, Jan. 31, 2013; 80 FR 72830, Nov. 20, 2015]

**Table 10 to Subpart DDDDD of Part 63—Applicability of General Provisions to Subpart DDDDD**

As stated in §63.7565, you must comply with the applicable General Provisions according to the following:

Citation	Subject	Applies to subpart DDDDD
§63.1	Applicability	Yes.
§63.2	Definitions	Yes. Additional terms defined in §63.7575
§63.3	Units and Abbreviations	Yes.
§63.4	Prohibited Activities and Circumvention	Yes.
§63.5	Preconstruction Review and Notification Requirements	Yes.
§63.6(a), (b)(1)-(b)(5), (b)(7), (c)	Compliance with Standards and Maintenance Requirements	Yes.
§63.6(e)(1)(i)	General duty to minimize emissions.	No. See §63.7500(a)(3) for the general duty requirement.
§63.6(e)(1)(ii)	Requirement to correct malfunctions as soon as practicable.	No.
§63.6(e)(3)	Startup, shutdown, and malfunction plan requirements.	No.

Citation	Subject	Applies to subpart DDDDD
§63.6(f)(1)	Startup, shutdown, and malfunction exemptions for compliance with non-opacity emission standards.	No.
§63.6(f)(2) and (3)	Compliance with non-opacity emission standards.	Yes.
§63.6(g)	Use of alternative standards	Yes, except §63.7555(d)(13) specifies the procedure for application and approval of an alternative timeframe with the PM controls requirement in the startup work practice (2).
§63.6(h)(1)	Startup, shutdown, and malfunction exemptions to opacity standards.	No. See §63.7500(a).
§63.6(h)(2) to (h)(9)	Determining compliance with opacity emission standards	No. Subpart DDDDD specifies opacity as an operating limit not an emission standard.
§63.6(i)	Extension of compliance	Yes. Note: Facilities may also request extensions of compliance for the installation of combined heat and power, waste heat recovery, or gas pipeline or fuel feeding infrastructure as a means of complying with this subpart.
§63.6(j)	Presidential exemption.	Yes.
§63.7(a), (b), (c), and (d)	Performance Testing Requirements	Yes.
§63.7(e)(1)	Conditions for conducting performance tests	No. Subpart DDDDD specifies conditions for conducting performance tests at §63.7520(a) to (c).
§63.7(e)(2)-(e)(9), (f), (g), and (h)	Performance Testing Requirements	Yes.
§63.8(a) and (b)	Applicability and Conduct of Monitoring	Yes.
§63.8(c)(1)	Operation and maintenance of CMS	Yes.
§63.8(c)(1)(i)	General duty to minimize emissions and CMS operation	No. See §63.7500(a)(3).
§63.8(c)(1)(ii)	Operation and maintenance of CMS	Yes.
§63.8(c)(1)(iii)	Startup, shutdown, and malfunction plans for CMS	No.
§63.8(c)(2) to (c)(9)	Operation and maintenance of CMS	Yes.
§63.8(d)(1) and (2)	Monitoring Requirements, Quality Control Program	Yes.

Citation	Subject	Applies to subpart DDDDD
§63.8(d)(3)	Written procedures for CMS	Yes, except for the last sentence, which refers to a startup, shutdown, and malfunction plan. Startup, shutdown, and malfunction plans are not required.
§63.8(e)	Performance evaluation of a CMS	Yes.
§63.8(f)	Use of an alternative monitoring method.	Yes.
§63.8(g)	Reduction of monitoring data	Yes.
§63.9	Notification Requirements	Yes.
§63.10(a), (b)(1)	Recordkeeping and Reporting Requirements	Yes.
§63.10(b)(2)(i)	Recordkeeping of occurrence and duration of startups or shutdowns	Yes.
§63.10(b)(2)(ii)	Recordkeeping of malfunctions	No. See §63.7555(d)(7) for recordkeeping of occurrence and duration and §63.7555(d)(8) for actions taken during malfunctions.
§63.10(b)(2)(iii)	Maintenance records	Yes.
§63.10(b)(2)(iv) and (v)	Actions taken to minimize emissions during startup, shutdown, or malfunction	No.
§63.10(b)(2)(vi)	Recordkeeping for CMS malfunctions	Yes.
§63.10(b)(2)(vii) to (xiv)	Other CMS requirements	Yes.
§63.10(b)(3)	Recordkeeping requirements for applicability determinations	No.
§63.10(c)(1) to (9)	Recordkeeping for sources with CMS	Yes.
§63.10(c)(10) and (11)	Recording nature and cause of malfunctions, and corrective actions	No. See §63.7555(d)(7) for recordkeeping of occurrence and duration and §63.7555(d)(8) for actions taken during malfunctions.
§63.10(c)(12) and (13)	Recordkeeping for sources with CMS	Yes.
§63.10(c)(15)	Use of startup, shutdown, and malfunction plan	No.
§63.10(d)(1) and (2)	General reporting requirements	Yes.
§63.10(d)(3)	Reporting opacity or visible emission observation results	No.
§63.10(d)(4)	Progress reports under an extension of compliance	Yes.
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No. See §63.7550(c)(11) for malfunction reporting requirements.

Citation	Subject	Applies to subpart DDDDD
§63.10(e)	Additional reporting requirements for sources with CMS	Yes.
§63.10(f)	Waiver of recordkeeping or reporting requirements	Yes.
§63.11	Control Device Requirements	No.
§63.12	State Authority and Delegation	Yes.
§63.13-63.16	Addresses, Incorporation by Reference, Availability of Information, Performance Track Provisions	Yes.
§63.1(a)(5), (a)(7)-(a)(9), (b)(2), (c)(3)-(4), (d), 63.6(b)(6), (c)(3), (c)(4), (d), (e)(2), (e)(3)(ii), (h)(3), (h)(5)(iv), 63.8(a)(3), 63.9(b)(3), (h)(4), 63.10(c)(2)-(4), (c)(9).	Reserved	No.

[76 FR 15664, Mar. 21, 2011, as amended at 78 FR 7205, Jan. 31, 2013; 80 FR 72830, Nov. 20, 2015]

**Table 11 to Subpart DDDDD of Part 63—Alternative Emission Limits for New or Reconstructed Boilers and Process Heaters That Commenced Construction or Reconstruction After June 4, 2010, and Before May 20, 2011**

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
1. Units in all subcategories designed to burn solid fuel	a. HCl	0.022 lb per MMBtu of heat input	For M26A, collect a minimum of 1 dscm per run; for M26 collect a minimum of 120 liters per run.
2. Units in all subcategories designed to burn solid fuel that combust at least 10 percent biomass/bio-based solids on an annual heat input basis and less than 10 percent coal/solid fossil fuels on an annual heat input basis	a. Mercury	8.0E-07 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
3. Units in all subcategories designed to burn solid fuel that combust at least 10 percent coal/solid fossil fuels on an annual heat input basis and less than 10 percent biomass/bio-based solids on an annual heat input basis	a. Mercury	2.0E-06 lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
4. Units design to burn coal/solid fossil fuel	a. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
5. Pulverized coal boilers designed to burn coal/solid fossil fuel	a. Carbon monoxide (CO) (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (320 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
6. Stokers designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (340 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
7. Fluidized bed units designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (230 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
8. Fluidized bed units with an integrated heat exchanger designed to burn coal/solid fossil fuel	a. CO (or CEMS)	140 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (150 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
9. Stokers/sloped grate/others designed to burn wet biomass fuel	a. CO (or CEMS)	620 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (390 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (2.6E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
10. Stokers/sloped grate/others designed to burn kiln-dried biomass fuel	a. CO	560 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (4.0E-03 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
11. Fluidized bed units designed to burn biomass/bio-based solids	a. CO (or CEMS)	230 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (310 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	9.8E-03 lb per MMBtu of heat input; or (8.3E-05 <sup>a</sup> lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
12. Suspension burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	2,400 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (2,000 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (6.5E-03 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
13. Dutch Ovens/Pile burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	1,010 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (520 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	8.0E-03 lb per MMBtu of heat input; or (3.9E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
14. Fuel cell units designed to burn biomass/bio-based solids	a. CO	910 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.0E-02 lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
15. Hybrid suspension grate boiler designed to burn biomass/bio-based solids	a. CO (or CEMS)	1,100 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (900 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.6E-02 lb per MMBtu of heat input; or (4.4E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
16. Units designed to burn liquid fuel	a. HCl	4.4E-04 lb per MMBtu of heat input	For M26A: Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	b. Mercury	4.8E-07 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
17. Units designed to burn heavy liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Filterable PM (or TSM)	1.3E-02 lb per MMBtu of heat input; or (7.5E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
18. Units designed to burn light liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.0E-03 <sup>a</sup> lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
19. Units designed to burn liquid fuel that are non-continental units	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average based on stack test	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.3E-02 lb per MMBtu of heat input; or (8.6E-04 lb per MMBtu of heat input)	Collect a minimum of 4 dscm per run.
20. Units designed to burn gas 2 (other) gases	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. HCl	1.7E-03 lb per MMBtu of heat input	For M26A, Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	c. Mercury	7.9E-06 lb per MMBtu of heat input	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
	d. Filterable PM (or TSM)	6.7E-03 lb per MMBtu of heat input; or (2.1E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.

<sup>a</sup>If you are conducting stack tests to demonstrate compliance and your performance tests for this pollutant for at least 2 consecutive years show that your emissions are at or below this limit, you can skip testing according to §63.7515 if all of the other provision of §63.7515 are met. For all other pollutants that do not contain a footnote “a”, your performance tests for this pollutant for at least 2 consecutive years must show that your emissions are at or below 75 percent of this limit in order to qualify for skip testing.

<sup>b</sup>Incorporated by reference, see §63.14.

<sup>c</sup>An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the carbon monoxide emissions limit be determined using carbon dioxide as a diluent correction in place of oxygen at 3%. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3% oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

[80 FR 72831, Nov. 20, 2015]

**Table 12 to Subpart DDDDD of Part 63—Alternative Emission Limits for New or Reconstructed Boilers and Process Heaters That Commenced Construction or Reconstruction After May 20, 2011, and Before December 23, 2011**

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
1. Units in all subcategories designed to burn solid fuel	a. HCl	0.022 lb per MMBtu of heat input	For M26A, collect a minimum of 1 dscm per run; for M26 collect a minimum of 120 liters per run.
	b. Mercury	3.5E-06 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
2. Units design to burn coal/solid fossil fuel	a. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
3. Pulverized coal boilers designed to burn coal/solid fossil fuel	a. Carbon monoxide (CO) (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (320 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
4. Stokers designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (340 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
5. Fluidized bed units designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (230 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
6. Fluidized bed units with an integrated heat exchanger designed to burn coal/solid fossil fuel	a. CO (or CEMS)	140 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (150 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
7. Stokers/sloped grate/others designed to burn wet biomass fuel	a. CO (or CEMS)	620 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (390 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (2.6E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
8. Stokers/sloped grate/others designed to burn kiln-dried biomass fuel	a. CO b. Filterable PM (or TSM)	460 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average 3.0E-02 lb per MMBtu of heat input; or (4.0E-03 lb per MMBtu of heat input)	1 hr minimum sampling time. Collect a minimum of 2 dscm per run.
9. Fluidized bed units designed to burn biomass/bio-based solids	a. CO (or CEMS)	260 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (310 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	9.8E-03 lb per MMBtu of heat input; or (8.3E-05 <sup>a</sup> lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
10. Suspension burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	2,400 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (2,000 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (6.5E-03 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
11. Dutch Ovens/Pile burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	470 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (520 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.2E-03 lb per MMBtu of heat input; or (3.9E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
12. Fuel cell units designed to burn biomass/bio-based solids	a. CO b. Filterable PM (or TSM)	910 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average 2.0E-02 lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	1 hr minimum sampling time. Collect a minimum of 2 dscm per run.
13. Hybrid suspension grate boiler designed to burn biomass/bio-based solids	a. CO (or CEMS)	1,500 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (900 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.6E-02 lb per MMBtu of heat input; or (4.4E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
14. Units designed to burn liquid fuel	a. HCl	4.4E-04 lb per MMBtu of heat input	For M26A: Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Mercury	4.8E-07 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
15. Units designed to burn heavy liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.3E-02 lb per MMBtu of heat input; or (7.5E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
16. Units designed to burn light liquid fuel	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.3E-03 <sup>a</sup> lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
17. Units designed to burn liquid fuel that are non-continental units	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average based on stack test	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.3E-02 lb per MMBtu of heat input; or (8.6E-04 lb per MMBtu of heat input)	Collect a minimum of 4 dscm per run.
18. Units designed to burn gas 2 (other) gases	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average	1 hr minimum sampling time.
	b. HCl	1.7E-03 lb per MMBtu of heat input	For M26A, Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	c. Mercury	7.9E-06 lb per MMBtu of heat input	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
	d. Filterable PM (or TSM)	6.7E-03 lb per MMBtu of heat input; or (2.1E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.

<sup>a</sup>If you are conducting stack tests to demonstrate compliance and your performance tests for this pollutant for at least 2 consecutive years show that your emissions are at or below this limit, you can skip testing according to §63.7515 if all of the other provision of §63.7515 are met. For all other pollutants that do not contain a footnote “a”, your performance tests for this pollutant for at least 2 consecutive years must show that your emissions are at or below 75 percent of this limit in order to qualify for skip testing.

<sup>b</sup>Incorporated by reference, see §63.14.

<sup>c</sup>An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the carbon monoxide emissions limit be determined using carbon dioxide as a diluent correction in place of oxygen at 3%. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3% oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

[80 FR 72834, Nov. 20, 2015]

**Table 13 to Subpart DDDDD of Part 63— Alternative Emission Limits for New or Reconstructed Boilers and Process Heaters That Commenced Construction or Reconstruction After December 23, 2011, and Before April 1, 2013**

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
1. Units in all subcategories designed to burn solid fuel	a. HCl	0.022 lb per MMBtu of heat input	For M26A, collect a minimum of 1 dscm per run; for M26 collect a minimum of 120 liters per run.
	b. Mercury	8.6E-07 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
2. Pulverized coal boilers designed to burn coal/solid fossil fuel	a. Carbon monoxide (CO) (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (320 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.8E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
3. Stokers designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (340 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.8E-02 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
4. Fluidized bed units designed to burn coal/solid fossil fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (230 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
5. Fluidized bed units with an integrated heat exchanger designed to burn coal/solid fossil fuel	a. CO (or CEMS)	140 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (150 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Filterable PM (or TSM)	1.1E-03 lb per MMBtu of heat input; or (2.3E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
6. Stokers/sloped grate/others designed to burn wet biomass fuel	a. CO (or CEMS)	620 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (410 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.0E-02 lb per MMBtu of heat input; or (2.6E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
7. Stokers/sloped grate/others designed to burn kiln-dried biomass fuel	a. CO	460 ppm by volume on a dry basis corrected to 3 percent oxygen	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.2E-01 lb per MMBtu of heat input; or (4.0E-03 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
8. Fluidized bed units designed to burn biomass/bio-based solids	a. CO (or CEMS)	230 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (310 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	9.8E-03 lb per MMBtu of heat input; or (8.3E-05 <sup>a</sup> lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.*
9. Suspension burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	2,400 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (2,000 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	5.1E-02 lb per MMBtu of heat input; or (6.5E-03 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
10. Dutch Ovens/Pile burners designed to burn biomass/bio-based solids	a. CO (or CEMS)	810 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (520 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	3.6E-02 lb per MMBtu of heat input; or (3.9E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
11. Fuel cell units designed to burn biomass/bio-based solids	a. CO	910 ppm by volume on a dry basis corrected to 3 percent oxygen	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.0E-02 lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
12. Hybrid suspension grate boiler designed to burn biomass/bio-based solids	a. CO (or CEMS)	1,500 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (900 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 30-day rolling average)	1 hr minimum sampling time.

If your boiler or process heater is in this subcategory . . .	For the following pollutants . . .	The emissions must not exceed the following emission limits, except during periods of startup and shutdown . . .	Using this specified sampling volume or test run duration . . .
	b. Filterable PM (or TSM)	2.6E-02 lb per MMBtu of heat input; or (4.4E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
13. Units designed to burn liquid fuel	a. HCl	1.2E-03 lb per MMBtu of heat input	For M26A: Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	b. Mercury	4.9E-07 <sup>a</sup> lb per MMBtu of heat input	For M29, collect a minimum of 4 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 4 dscm.
14. Units designed to burn heavy liquid fuel	a. CO (or CEMS)	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average; or (18 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 10-day rolling average)	1 hr minimum sampling time.
15. Units designed to burn light liquid fuel	a. CO (or CEMS)	130 <sup>a</sup> ppm by volume on a dry basis corrected to 3 percent oxygen; or (60 ppm by volume on a dry basis corrected to 3 percent oxygen, <sup>c</sup> 1-day block average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	1.1E-03 <sup>a</sup> lb per MMBtu of heat input; or (2.9E-05 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.
16. Units designed to burn liquid fuel that are non-continental units	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-run average based on stack test; or (91 ppm by volume on a dry basis corrected to 3 percent oxygen, 3-hour rolling average)	1 hr minimum sampling time.
	b. Filterable PM (or TSM)	2.3E-02 lb per MMBtu of heat input; or (8.6E-04 lb per MMBtu of heat input)	Collect a minimum of 2 dscm per run.
17. Units designed to burn gas 2 (other) gases	a. CO	130 ppm by volume on a dry basis corrected to 3 percent oxygen	1 hr minimum sampling time.
	b. HCl	1.7E-03 lb per MMBtu of heat input	For M26A, Collect a minimum of 2 dscm per run; for M26, collect a minimum of 240 liters per run.
	c. Mercury	7.9E-06 lb per MMBtu of heat input	For M29, collect a minimum of 3 dscm per run; for M30A or M30B, collect a minimum sample as specified in the method; for ASTM D6784 <sup>b</sup> collect a minimum of 3 dscm.
	d. Filterable PM (or TSM)	6.7E-03 lb per MMBtu of heat input; or (2.1E-04 lb per MMBtu of heat input)	Collect a minimum of 3 dscm per run.

<sup>a</sup>If you are conducting stack tests to demonstrate compliance and your performance tests for this pollutant for at least 2 consecutive years show that your emissions are at or below this limit and you are not required to conduct testing for CEMS or CPMS monitor certification, you can skip testing according to §63.7515 if all of the other provision of

§63.7515 are met. For all other pollutants that do not contain a footnote “a”, your performance tests for this pollutant for at least 2 consecutive years must show that your emissions are at or below 75 percent of this limit in order to qualify for skip testing.

<sup>b</sup>Incorporated by reference, see §63.14.

<sup>c</sup>An owner or operator may request an alternative test method under §63.7 of this chapter, in order that compliance with the carbon monoxide emissions limit be determined using carbon dioxide as a diluent correction in place of oxygen at 3%. EPA Method 19 F-factors and EPA Method 19 equations must be used to generate the appropriate CO<sub>2</sub> correction percentage for the fuel type burned in the unit, and must also take into account that the 3% oxygen correction is to be done on a dry basis. The alternative test method request must account for any CO<sub>2</sub> being added to, or removed from, the emissions gas stream as a result of limestone injection, scrubber media, etc.

**Indiana Department of Environmental Management  
Office of Air Quality**

Addendum to the Technical Support Document (ATSD) for a  
PSD/New Source Construction and Part 70 Operating Permit

**Source Background and Description**

<b>Source Name:</b>	<b>Riverview Energy Corporation</b>
<b>Source Location:</b>	<b>4704 E 2000 N, Dale, IN 47523</b>
<b>County:</b>	<b>Spencer</b>
<b>SIC Code:</b>	<b>2911 (Petroleum Refining), 2999 (Products of Petroleum and Coal, Not Elsewhere Classified)</b>
<b>Operation Permit No.:</b>	<b>T143-39554-00065</b>
<b>Permit Reviewer:</b>	<b>Douglas Logan, P.E.</b>

On October 24, 2018, the Office of Air Quality (OAQ) had a notice published in The Journal-Democrat, Spencer, Indiana, stating that Riverview Energy Corporation (herein referred to as "Riverview", "Riverview Energy", "Riverview Energy Corporation", and "REC") had applied for a PSD/New Source Construction and Part 70 Operating Permit to construct and operate a direct coal hydrogenation (DCH) facility to convert coal to liquid fuels. The notice also stated that the OAQ proposed to issue a PSD/New Source Construction and Part 70 Operating Permit for this operation and provided information on how the public could review the proposed permit and other documentation. Finally, the notice informed interested parties that the period to provide comments on whether or not this permit should be issued as proposed ended on December 10, 2018

On December 5, 2018, a public hearing was held at Heritage Hills High School, 3644 E CR 1600 N, Lincoln City, Indiana 47552 regarding the draft PSD/New Source Construction and Part 70 Operating Permit for this operation.

IDEM, OAQ thanks the all of the commenters and attendees at the public hearing for their interest in the proposed permit and their participation in the permit review process.

The Technical Support Document (TSD) is used by IDEM, OAQ for historical purposes. IDEM, OAQ does not make any changes to the original TSD, but the Permit will have the updated changes. The comments and revised permit language are provided below with deleted language as ~~strikeouts~~ and new language **bolded**.

**Public Hearing Statements and IDEM Responses**

Statements made by the public hearing attendees and IDEM responses are included as Appendix D to this ATSD. The IDEM responses in Appendix D refer back to the General Statements and IDEM Responses section below.

**General Statements and IDEM Responses**

**General Statement 1 - Greenhouse Gas Emissions and Climate Change:**

Many commenters expressed concern regarding greenhouse gas emissions, also referred to as carbon or carbon dioxide (CO<sub>2</sub>) emissions, and their effect on human health and the environment (e.g., climate change, global warming, heat stress to animals, stronger tornados/storms/hurricanes, increased precipitation and associated flooding, crop damage/losses, more drought and associated reduced crop yields, food shortages, forest/brush fires, and soil erosion, higher incidence of crop diseases and pests, and higher incidence of human/animal diseases from mosquitos and ticks).

### **IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change:**

IDEM, OAQ understands the commenters concern regarding greenhouse gas emissions and their effect on human health and the environment.

IDEM, OAQ has limited authority to regulate greenhouse gas (GHG) emissions. Due to a ruling by the United States Supreme Court on June 23, 2014, in the case of Utility Air Regulatory Group v. EPA, 134 S. Ct. 2427 (2014) (available at [https://www.supremecourt.gov/opinions/13pdf/12-1146\\_4g18.pdf](https://www.supremecourt.gov/opinions/13pdf/12-1146_4g18.pdf)), IDEM, OAQ cannot consider GHG emissions alone to determine operating permit applicability or Prevention of Significant Deterioration applicability to any new source of air pollution emissions or any modification at an existing source. However, the Supreme Court's decision left in place regulations that required sources already subject to Prevention of Significant Deterioration (PSD) requirements for other pollutants subject to regulation (i.e., "anyway sources"), to also undergo PSD Best Available Control Technology (BACT) review for GHG emissions, if they emitted GHGs in amounts equal to or greater than 75,000 tons per year of carbon dioxide equivalent (CO<sub>2</sub>e) emissions that EPA established as the significant amount in the Tailoring Rule (75 FR 31514). Carbon dioxide equivalent or CO<sub>2</sub>e is defined at 40 Code of Federal Regulations (CFR) 98.6. Since this source is subject to PSD BACT for PM, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, NO<sub>x</sub>, VOC, and CO, and the GHG emissions are greater than the Tailoring Rule "significant amount", then GHG emissions are also subject to PSD BACT. The permit includes the PSD BACT requirements that limit GHG (CO<sub>2</sub>e) emissions in conditions D.3.1(f)(4), D.4.1(m), D.5.1(g), D.7.1(g), D.9.1(d), and D.10.1(h). The PSD BACT analysis for GHG emissions is included in Appendix B of this Addendum to the Technical Support Document (ATSD).

IDEM has no authority to create any permit limits or measures in excess of what is legally required for a regulated source. The Indiana air permitting requirements that are applicable to this source are part of our state implementation plan (SIP) that is approved by the U.S. Environmental Protection Agency (EPA). Environmental laws are enacted by the Indiana legislature. The legislature has also given rulemaking authority to the Indiana Environmental Rules Board. More information about the rulemaking process is available at <http://www.in.gov/idem/4087.htm> on IDEM's Website.

Information regarding human health and climate change is available at <https://www.epa.gov/climate-research/human-health-and-climate-change-research> on U.S. EPA's website. U.S. EPA released its Fourth National Climate Assessment in November 2018. The report is available at <https://www.globalchange.gov/browse> on the U.S. Global Change Research Program website. The U.S. Global Change Research Program (USGCRP) is a federal program mandated by Congress to coordinate Federal research and investments in understanding the forces shaping the global environment, both human and natural, and their impacts on society.

### **General Statement 2 - Particulate Matter:**

Many commenters expressed concern regarding emissions of particulate matter from the proposed source.

### **IDEM Response to General Statement 2 - Particulate Matter:**

IDEM, OAQ recognizes that air emissions, including particulate matter emissions and fugitive dust, are of great concern to the commenters and other local residents.

IDEM, OAQ issues air pollution permits to facilities that emit regulated levels of pollutants to the air. Permits require sources to comply with all health-based and technology-based standards established by the U.S. Environmental Protection Agency (EPA) and the Indiana Environmental Rules Board. If the information provided by the applicant in an air permit application indicates that that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

The permit includes the following requirements related to particulate matter emissions and fugitive dust:

- Permit Condition C.2 - Opacity requires the source to comply with opacity limits under 326 IAC 5-1-2;
- Permit Condition C.5 - Fugitive Dust Emissions prohibits the Permittee from allowing fugitive dust to escape beyond the property line or boundaries of the property, right-of-way, or easement on which the source is located, in a manner that would violate 326 Indiana Administrative Code (IAC) 6-4.
- Sections D.1 through D.13 and E.1 through E.17 contain applicable particulate matter (PM/PM10/PM2.5) limitations and standards for various emissions units. These sections also contain any applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

Particulate matter emissions, as well as all other regulated air emissions from the source, are described on pages 24 through 26 of the Technical Support Document (TSD). The TSD was part of the permit documents provided during the public notice period and is available at <https://permits.air.idem.in.gov/39554d.pdf> on IDEM's website. The first table on page 25 is labeled "Part 70: Uncontrolled PTE (tons/year)" and shows the amount of each regulated air emission that the source would emit if there were no permit requirements. This is the source's Potential to Emit (PTE). The second table on page 25 is labeled "Source-Wide Emissions after Issuance (ton/year)" and shows emissions after issuance of the permit. Please refer to the TSD more extensive information regarding these emissions.

The PSD BACT analysis for particulate matter emission (PM/PM10/PM2.5) is included in Appendix B of this Addendum to the Technical Support Document (ATSD).

### **General Statement 3 - Issuance of the Permit:**

Many commenters expressed opposition to issuing the permit and many commenters expressed support for issuing the permit.

### **IDEM Response to General Statement 3 - Issuance of the Permit:**

IDEM's mission is to implement federal and state regulations to protect human health and the environment while allowing for environmentally sound operations of industrial, agricultural, commercial, and government activities vital to a prosperous economy.

IDEM, OAQ issues air pollution permits to facilities that emit regulated levels of pollutants to the air. Permits require sources to comply with all health-based and technology-based standards established by the U.S. Environmental Protection Agency (EPA) and the Indiana Environmental Rules Board. If the information provided by the applicant in an air permit application indicates that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

The proposed permit contains all health-based and technology-based standards established by the U.S. EPA and the Indiana Environmental Rules Board, which will limit the amount of emissions from the facility to the very lowest level allowed by law. In addition, IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

This proposed permit for Riverview Energy Corporation is protective of human health and the environment and will allow for environmentally sound operations that may support a prosperous economy.

IDEM OAQ handles all air permit applications on an objective, consistent, and impartial basis. IDEM, OAQ staff are expected to comply with all applicable state ethics rules and policies. They strive to draft air permit documents and associated calculations/analyses that are thorough, accurate, and that contain all applicable state and federal requirements. All permit limitations are federally enforceable as a practical matter and protective of human health and the environment.

All of Indiana's air pollution control rules are contained in Title 326 of the Indiana Administrative Code, which is available at [http://www.in.gov/legislative/iac/iac\\_title?iact=326](http://www.in.gov/legislative/iac/iac_title?iact=326) on the Internet. For information on how to get involved in Indiana's Environmental Rulemaking Process, please go to <https://www.in.gov/idem/legal/2334.htm> on IDEM's website.

**General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution:**

Many commenters expressed the source would have a negative impact on the following issues (with a summary of the comments provided for each issue):

- **Employment** - the source will only provide minimum-wage jobs; jobs might not be union jobs; additional local job opportunities are not needed since unemployment is low and there are too many other local job openings; jobs will not be green jobs; construction workers will travel here to work on the construction of the plant, but they will not live here or improve our local economy; the source will not retain or attract highly educated, environmentally concerned workers to Indiana;
- **Quality of Life** - the source would have a negative effect on the quality of life in the local area (tranquility, visible beauty, landscapes, relaxing atmosphere);
- **Noise, Odor, Light Pollution** - the source would be a "nuisance" due to noise/sound, odor, and light/visual pollution;
- **Safety** - the source would be unsafe due to risks of fire, explosion, earthquake, tornado, operator error, or equipment failure; emergency personnel in this area will be ill-equipped to handle an emergency situation at this plant.
- **Traffic** - the source would cause addition truck and rail traffic in the local area;
- **Property Values** - the source would cause reduced property values and reduced property tax revenues; the source would cause citizens to move away and no new residents will replace them;
- **Tourism** - the source would have a negative impact on tourism and its associated revenues at national and state parks and landmarks, campgrounds, trails, forests, religious landmarks, golf courses;

Many commenters expressed the permit should not be approved for the following reasons:

- **Zoning** - the source property should not be zoned for industrial use; rural areas, farmland, wilderness, and recreational areas are being lost to industrial-use areas;
- **Sustainability Issues** - the source will use a process/technology that is not environmentally sustainable; the source will be dependent on fossil fuels/coal reserves that will be depleted in the future; the source will not utilize renewable sources of energy such as wind and solar; the source will not use a "green" technology, the source will have a large carbon footprint and increase CO<sub>2</sub>/greenhouse gases and global warming/climate change;
- **Costs/Technology Issues** - the source will use a process that is not technologically feasible or will be cost prohibitive (not cost effective/viable); the source will use the wrong type of process/technology; the source will use a process/technology that is

old/outdated (not modern); the source will use a process that has never been proven in the United States; the source will be dependent on uncertain petroleum markets (diesel fuel demand); the plant will go bankrupt, because the technology is not feasible and not sustainable, and the local government and residents will have to pay for any site clean-up, back taxes, and associated legal fees; tax revenues will not be available to fix roads, since it will be used up for tax abatements for the source; the energy markets will change in the near future and wind and solar will be cheaper than coal, gas, and oil;

- **Funding Uncertainties** - investors for the plant are unknown; Riverview has not yet acquired the funding/money to build and operate the plant; the proposed plant is a scam for a few business people to get rich on government (taxpayer's) subsidies;
- **Profits** - the majority of the profits from the plant will go to non-local persons/companies/shareholders/Board of Directors, not to the local economy or workers; the state and/or local government officials value jobs and money over the health, safety, and wellbeing of local citizens and the environment;
- **Possible Future Expansion** - the source may expand operations or increase production in the future;
- **Possible Future Violations** - the source may have future violations of environmental law;
- **Water Usage** - the source will require 1.8 million gallons of groundwater to be pumped from an aquifer of the Ohio River, with used wastewater treated and pumped back to the aquifer, but it is not known how the wastewater will be treated, if there will be any groundwater contamination, who will pay for the water pipe, and why the source can't reuse the wastewater;
- **Water Pollution** - the source may result in water pollution or may violate water pollution regulations;
- **Land Pollution** - the source may result in land pollution.

**IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution:**

Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, and Tourism

IDEM, OAQ recognizes that construction of any new industrial facility can raise concerns about potential negative impacts with respect to employment, quality of life, noise, odor, light pollution, safety, traffic, property values, and tourism. However, IDEM, OAQ does not have legal authority to deny an air permit or to include additional permit terms that are based on concerns about these potential negative impacts.

Persons that consider noise, odor, light pollution, and/or traffic from a source to be a "nuisance" as defined under Indiana Code IC 32-30-6 (Chapter 6. Nuisance Actions) can bring an action to abate or enjoin the nuisance pursuant to provisions of IC 32-30-6. Under IC 32-30-6-6, "Nuisance described and considered subject to an action" is defined. Under IC 32-30-6-7, any person whose property is injuriously affected or whose personal enjoyment is lessened by a nuisance can bring an action to abate or enjoin the nuisance. Indiana nuisance law does not require IDEM, OAQ to make a determination whether a source could be a "nuisance" as defined by IC 32-30-6, and does not authorize IDEM, OAQ to deny an air permit based on a determination of possible future nuisance.

Several commenters expressed specific concern about the odor of hydrogen sulfide (H<sub>2</sub>S) emissions. Additional notes have been added to the calculations explaining that the H<sub>2</sub>S concentration of 10 ppmvd (parts per million by volume, dry basis) is considered a conservative, worst case emission factor to determine whether PSD BACT requirements are applicable to the pollutant. The petroleum refining NSPS, 40 CFR 60, Subpart Ja, limits H<sub>2</sub>S emissions from

reduction control systems not followed by incineration to 10 ppmvd, and because the source will use a reduction control system followed by incineration, actual H<sub>2</sub>S emissions are expected to be much lower. The permit does not include limits on H<sub>2</sub>S emissions from the sulfur recovery process because the uncontrolled potential to emit H<sub>2</sub>S, using the 10 ppmvd emission factor, is less than 10 tons per year; therefore the potential to emit H<sub>2</sub>S after issuance value included in the emissions summary tables is shown as the worst-case uncontrolled value. Recognizing of course that the perception of odor is highly variable, nevertheless the combination of incinerator destruction efficiency and dispersion makes H<sub>2</sub>S unlikely to present noticeable odors around the source. Because the source will use a reduction control system (converting sulfur to H<sub>2</sub>S, followed by amine scrubbing with recycle to the reactor furnace) followed by incineration, actual H<sub>2</sub>S emissions after incineration controls are expected to be significantly lower than the value of 5.11 tons per year considered as the potential to emit and negative impacts to the local area due to H<sub>2</sub>S odor is not anticipated.

#### Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, and Possible Future Expansion

IDEM, OAQ also understands that residents that live in an area with the prospect of industrial expansion will have concerns with the propriety of the zoning and the possibility of possible future expansion. Additionally, IDEM, OAQ also understands that some residents have a general concern that the source would be environmentally unsustainable or economically/technologically infeasible and the possibility that profit from the proposed plant will go out of state. IDEM's authority does not allow the air permits to address these types of issues.

#### Possible Future Violations

IDEM, OAQ understands that residents have concern that the proposed plant could result possible future violations of environmental law. However, court cases in Indiana support the proposition that an initial permit cannot be denied due to an allegation of possible future violations of environmental law. See Talara Lykins - CAFO, 2007 OEA 114, DeGroot Dairy CFO, 2006 OEA 1, Kyle Hall, 2008 OEA 100, which can be found at the following website: <https://www.in.gov/oea/2335.htm>

IDEM, OAQ encourages residents to contact an IDEM, OAQ compliance inspector if they witness or have evidence of any compliance related concerns with this operation. An IDEM OAQ compliance inspector will investigate complaints, perform any necessary observations or inspections of the source, determine if a violation of a permit term or condition has occurred, take appropriate action when a violation is observed, and initiate any necessary actions to bring to source back into compliance with applicable permit conditions and state and federal rules and regulations. The current compliance inspector for each county in Indiana can be found at the following website: <http://www.in.gov/idem/airquality/2418.htm>. The current IDEM OAQ compliance inspector for Spencer County is Daniel Roos, who may be contacted by telephone at (812) 380-2309 or toll free (888) 672-8323 an ask for Daniel Roos or by e-mail at droos@idem.IN.gov.

If the commenter or citizens have complaints and issues with the source with respect to compliance with its air permit, complaints can be submitted to IDEM three (3) different ways:

1. Online at: <https://www.in.gov/idem/5274.htm>;
2. Through the Complaint Coordinator at (800) 451-6027 ext. 24464; or
3. By printing, completing, and mailing a paper-based Complaint Submission Form (Available under Agency Forms at: <http://www.in.gov/idem/5157.htm>)

IDEM, OAQ and U.S. EPA inspections are unannounced. IDEM, OAQ normally inspects major sources on an annual basis. IDEM, OAQ will make more frequent inspections on a case-by-case basis based on the compliance history of the source and any public complaints received. During an inspection, the IDEM, OAQ inspector will perform a records review, and inspect the facility operations, to determine if the source is in compliance with all air permit terms and conditions.

Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions. If noncompliance with any air permit condition is detected, IDEM, OAQ has a wide range of enforcement options including warnings, civil penalties, criminal charges and, in extreme cases, an injunction to cease operations at the facility.

#### Water Usage

With respect to the issued raised about potential water usage and water discharge/pollution to the Ohio River, these issues are outside the scope of this air pollution permit. Riverview will be required to obtain any applicable permit(s) from IDEM's Office of Water Quality (OWQ), which will contain all applicable state and federal rules and regulations related to water usage, discharge, and pollution. This proposed air permit only contains applicable state and federal rules and regulations related air pollution.

#### Water Pollution and Land Pollution

IDEM, OAQ understands that residents have concern that the proposed new source could result in water or land pollution. Riverview will be required to obtain applicable permits from IDEM's Office of Land Quality (OLQ) and Office of Water Quality (OWQ), which will contain all applicable state and federal rules and regulations related to land and water pollution. This proposed air permit only contains applicable state and federal rules and regulations related air pollution.

#### **General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source:**

Many commenters expressed concern over the local air quality, its effect on human health, and the impact of additional air pollution from this source on human health and the environment.

#### **IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source:**

IDEM, OAQ relies on the scientific expertise of U.S. EPA which has developed the National Ambient Air Quality Standards (NAAQS) to protect public health and the environment. Since U.S. EPA has classified Spencer County as attainment or unclassifiable in Indiana for all criteria pollutants, ambient air pollution levels in Spencer County are not considered harmful to human health, including the health of sensitive persons, such as asthmatics, children and the elderly.

In addition, data provided below from the US Department of Health and Human Services, Centers for Disease Control and Prevention (CDC) and the Indiana State Department of Health (ISDH) do not support commenter claims that the rates of asthma-related health effects, cancer incidence, or cancer mortality (death) are profoundly higher in all counties in southwest Indiana as compared to the Indiana (state-wide) rates.

#### National Ambient Air Quality Standards (NAAQS) and Spencer County Attainment Status

The federal Clean Air Act requires the U.S. EPA to set National Ambient Air Quality Standards (NAAQS) for six criteria pollutants. These standards are set at levels that protect human health, including the health of sensitive persons, such as asthmatics, children and the elderly. The NAAQS are often referred to as the federal health standards for outdoor air. More information about these pollutants is available at <https://www.epa.gov/criteria-air-pollutants> on U.S. EPA's website. The complete table of the NAAQS can be found at <https://www.epa.gov/criteria-air-pollutants/naaqs-table>.

IDEM conducts sampling of the ambient air at monitoring stations around Indiana. This air monitoring is conducted to measure whether the NAAQS are being met. Information about Indiana's air monitoring system and monitoring results is available

at <http://www.in.gov/idem/airquality/2346.htm>. Information about current and expected air pollution levels is on IDEM's SmogWatch site at <http://www.in.gov/apps/idem/smog/> on the internet. For additional discussion regarding ambient air monitoring, see IDEM Response to General Statement 6 - Air Monitoring

The federal CAA requires that, no later than one year after promulgation of a new or revised NAAQS for any of the six criteria pollutants, the governor of each state must submit a list of all areas within their state indicating how each would be classified under the new or revised standard. The classification choices are:

- Attainment: If air quality in an area meets the current NAAQS it is considered to be in "attainment", unless it contributes ambient air quality in a nearby area that does not meet the current NAAQS.
- Nonattainment: If air quality in an area exceeds the current NAAQS, or contributes to ambient air quality in a nearby area that does not meet the current NAAQS, it is considered to be in "nonattainment".
- Unclassifiable: If air quality data does not exist that enables an area to be deemed "attainment" or "nonattainment", it is considered to be "unclassifiable".

326 IAC 1-2-86 defines "unclassifiable (unclassified) areas" as "[a] geographical area which cannot be classified as attainment or nonattainment on the basis of available information, *but for the purpose of establishing emission limitations in the applicable rule, an area comparable to an attainment area.*" (emphasis added)

Within one year of the governor's submittal, U.S. EPA announces a list of federally designated nonattainment areas. States may contest the designation of any areas within their borders that were not included in their own submissions. The public has the opportunity to comment on proposed plans before U.S. EPA makes a final decision.

Indiana attainment status designations are codified in the Code of Federal Regulations (CFR) at 40 CFR 81.315, which can be found at the following website: [https://www.ecfr.gov/cgi-bin/text-idx?SID=eed1ca0ec6d31179af79405ddffaae05&mc=true&node=se40.18.81\\_1315&rqn=div8](https://www.ecfr.gov/cgi-bin/text-idx?SID=eed1ca0ec6d31179af79405ddffaae05&mc=true&node=se40.18.81_1315&rqn=div8)

Since U.S. EPA has classified Spencer County as attainment or unclassifiable in Indiana for all criteria pollutants, ambient air pollution levels in Spencer County are not considered harmful to human health, including the health of sensitive persons, such as asthmatics, children and the elderly.

IDEM, OAQ performed an air quality analysis for this proposed facility (see Appendix C to this ATSD for the revised air quality analysis in its entirety). The modeling results for this proposed facility showed that pollutant concentrations were under the NAAQS and PSD increments for all averaging times and pollutants and thereby at a level that will be protective of public health and the environment in the surrounding area.

#### Health Statistics in Indiana, Southwest Indiana, and Spencer County

To address concerns over the air quality in Spencer County and southwest Indiana, and its effect on the human health, IDEM, OAQ has provided asthma and cancer data from the US Department of Health and Human Services, Centers for Disease Control and Prevention (CDC) and the Indiana State Department of Health (ISDH).

### 1. Asthma Prevalence in the United States and Indiana

The following information is provided on the CDC website at <https://www.cdc.gov/asthma/brfss/2016/tableC1.htm>.

2016 Adult Asthma Data: Prevalence Tables and Maps

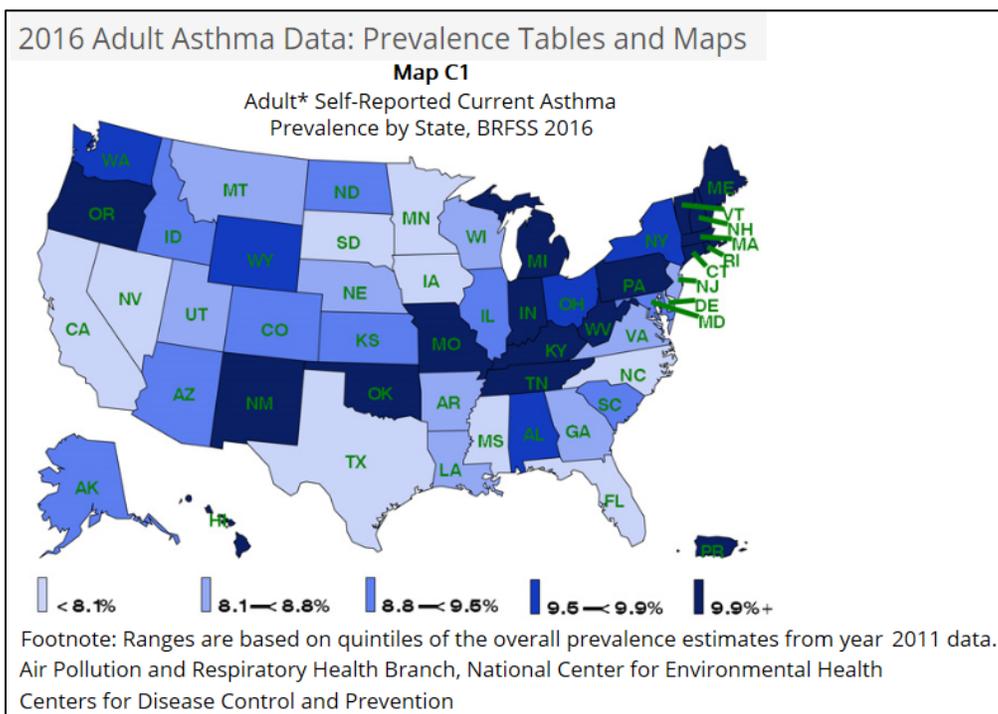

**Table C1**  
 Adult\* Self-Reported Current Asthma Prevalence and Number by State or Territory, BRFSS 2016

State	Sample Size §	Prevalence (Percent)	Standard Error	95% CI (Percent)
U.S. Total**	474,486	8.9	0.08	(8.7-9.1)
IN	11,023	10.2	0.42	(9.3-11.0)

\* Aged 18+ years  
 \*\* U.S. Total includes 50 states plus the District of Columbia and excludes the three territories.  
 ¶ CI denotes confidence interval.  
 § Sample size is the number of respondents reported current asthma

Asthma and Community Health Branch, National Center for Environmental Health  
 Centers for Disease Control and Prevention

The following information is provided on the CDC website at <https://www.cdc.gov/asthma/brfss/2016/mapC1.htm>.

The CDC data above indicate that the 2016 adult self-reported current asthma prevalence in Indiana (10.2%) was higher than the national average (8.9%), but was similar to several other states with asthma prevalence greater than 9.9% (CT, HI, KY, MA, ME, MI, MO, NH, NM, OK, OR, PA, PR, RI, TN, VT, WV).

## 2. Asthma Hospital Emergency Department Visits and Hospital Admissions

The following information is provided on the CDC website at  
<https://www.cdc.gov/asthma/national-surveillance-data/healthcare-use.htm#2015edv>

**Table B.** Emergency department visits (ED) with asthma as the primary diagnosis per 10,000 population, by selected patient characteristics: United States, 2014

Characteristics	Weighted No. of Visits	Standard Error of Weighted No. of visits	Rate per 10,000 population* (SE)
<b>Total</b>	<b>2,024,408</b>	<b>256,718</b>	<b>64.5 (8.2)</b>
Child (aged 0-17 years)†	936,326	153,733	127.5 (20.9)
Adult (aged 18+ years)§	1,088,082	151,620	45.3 (6.3)

*Crude rate per 10,000 population (Standard error (SE) is not available). †Rate of child hospital inpatient stays was calculated using the weighted number of visits for children aged 0-17 years and dividing it by the civilian non-institutionalized population for children aged 0-17 years per 10,000. ‡Rate of adult hospital visits was calculated using the weighted number of visits for adults aged 18+ years divided by the civilian non-institutionalized population for adults aged 18+ years per 10,000.		

The following asthma data and reports are provided on the Indiana State Department of Health (ISDH) Asthma Data and Reports website at <https://www.in.gov/isdh/17279.htm>

1. Indiana Public Health District Asthma Profiles, June 2016  
<https://www.in.gov/isdh/files/District%20Asthma%20Profiles.pptx>

The asthma profile for southwest Indiana (ISDH Health District 10) specifies the following 5-year (2010-2014) average rates:

asthma emergency department visits	44.8 per 10,000 residents
asthma hospital admissions	7.5 per 10,000 residents

2. County Emergency Department Visit and Hospitalization Rates, 2015  
<https://www.in.gov/isdh/files/2015%20County%20ED%20and%20Hosp%20aa%20Rates.pdf>

This report contains the following rates for all Indiana residents (all ages) in 2015:

asthma emergency department visits	47.4 per 10,000 residents
asthma hospital admissions	8.7 per 10,000 residents

This report also contains the following rates for southwest Indiana (ISDH Health District 10) county residents (all ages) in 2015:

County	Asthma Emergency Department Visits Per 10,000 Residents
Crawford	24.6
Daviess	47.2
Dubois	5.6
Gibson	47.4
Knox	43.6
Martin	15.0*

County	Asthma Emergency Department Visits Per 10,000 Residents
Perry	73.8
Pike	14.4*
Posey	20.7
Spencer	22.5
Vanderburgh	54.9
Warrick	30.1
* Rates were considered unstable, since fewer than 20 emergency department visits occurred in the county.	

County	Asthma Hospital Admissions Per 10,000 Residents
Crawford	¥
Daviess	5.1*
Dubois	2.2*
Gibson	4.0*
Knox	2.3*
Martin	¥
Perry	3.0*
Pike	¥
Posey	11.9
Spencer	5.4*
Vanderburgh	11.1
Warrick	6.2
¥ The rates were not reported, since fewer than 5 hospitalizations occurred in the county. * Rates were considered unstable, since fewer than 20 hospitalizations occurred in the county.	

The CDC and ISDH data provided above indicate that the rate of asthma emergency department visits in southwest Indiana (ISDH Health District 10) (44.8 per 10,000 residents) was lower than the Indiana state-wide rate (47.4 per 10,000 residents), lower than the Midwest Region rate (87.5 per 10,000 residents), and lower than the national rate (64.5 per 10,000 residents). The rate of asthma emergency department visits for counties within southwest Indiana (ISDH Health District 10) were equal to or lower than then Indiana state-wide rate (47.4 per 10,000 residents), except Perry County (73.8 per 10,000 residents) and Vanderburgh County (54.9 per 10,000 residents).

The CDC and ISDH data provided above indicate that the rate of asthma hospital admissions (hospital inpatient stays) in southwest Indiana (ISDH Health District 10) (7.5 per 10,000 residents) was lower than the Indiana state-wide rate (8.7 per 10,000 residents), lower than the Midwest Region rate (11.5 per 10,000 residents), and lower than the national rate (10.7 per 10,000 residents). The rate of asthma hospital admissions (hospital inpatient stays) for counties within southwest Indiana (ISDH Health District 10) were equal to or lower than then Indiana state-wide rate (8.7 per 10,000 residents), except Posey County (11.9 per 10,000 residents) and Vanderburgh County (11.1 per 10,000 residents).

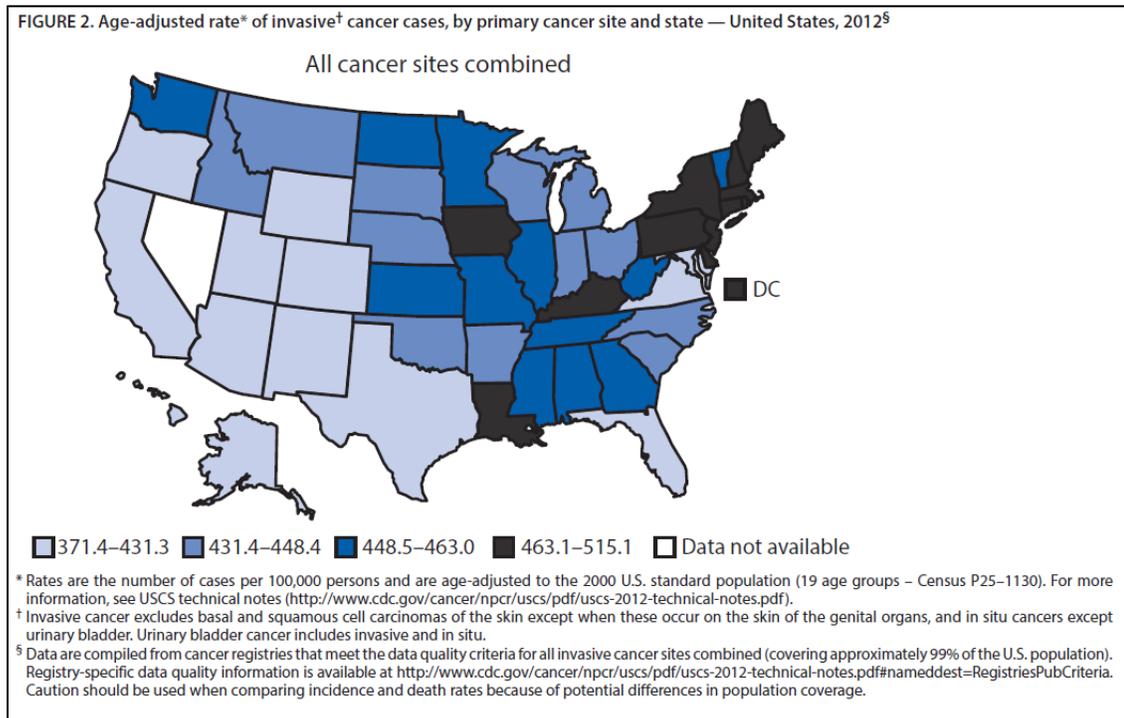

The CDC and ISDH data provided above do not support commenter claims that rates of asthma-related health effects are profoundly higher in all counties in southwest Indiana as compared to the rates in Indiana (state-wide), the Midwest, or the nation. For most counties in southwest Indiana, rates of asthma-related health effects are lower or not statistically different than the Indiana (state-wide) rates.

Additional information is provided on the ISDH Asthma Data and Reports website at <https://www.in.gov/isdh/17279.htm>

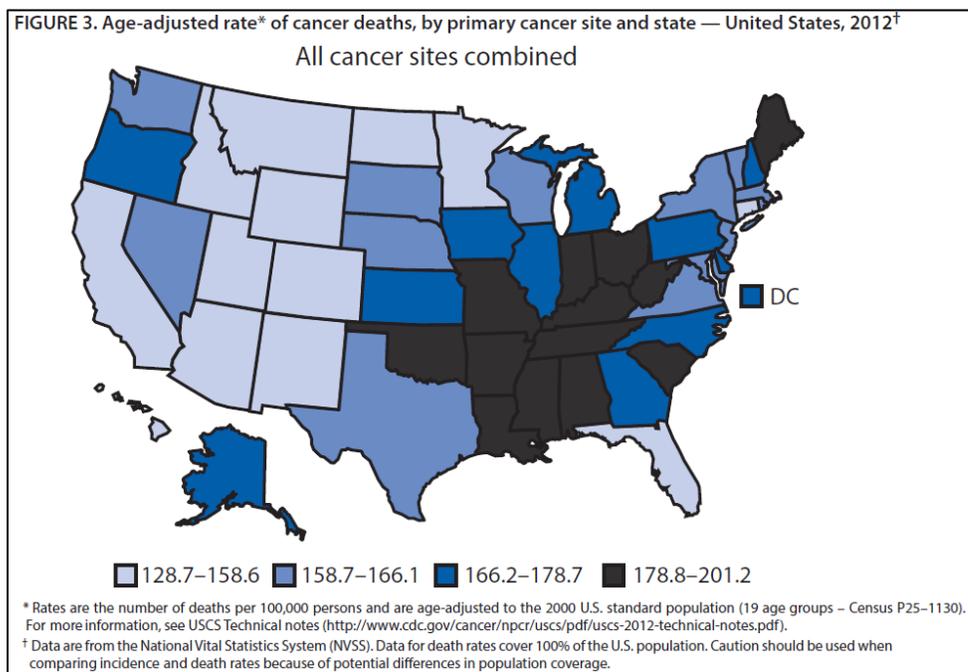

### 3. Cancer Prevalence and Deaths in the United States and Indiana

The following information is provided on the CDC website at <https://www.cdc.gov/mmwr/volumes/63/wr/pdfs/mm6355a4.pdf>

The United States nation-wide cancer incidence rate (invasive cancer cases) in 2012 was 440.3 per 100,000 persons.

The CDC data above indicate that the 2012 cancer incidence rate (invasive cancer cases) in Indiana (439.4 per 100,000 persons) was similar to the overall national rate (440.3 per 100,000 persons).

The CDC data above indicate that the number of 2012 cancer deaths in Indiana (184.2 per 100,000 persons) was higher than the overall national rate (166.4 per 100,000 persons), but was similar to several other states with cancer incidence rates between 178.8 and 201.2 per 100,000 persons (AL, AR, IN, KY, LA, MO, MS, OH, OK, SC, TN, WV).

The Indiana State Department of Health (ISDH) gathers data about cancer in Indiana by way of the Indiana State Cancer Registry in order to conduct epidemiologic surveys of cancer and to apply appropriate preventive and control measures. More information on the Indiana State Cancer Registry, including governing laws, policy and procedures, training and education materials, statics report generator, and cancer cluster information can be accessed from the following website: <https://www.in.gov/isdh/24968.htm>.

ISDH provides on its website (<https://www.in.gov/isdh/22689.htm>) the following information on cancer rates in Indiana, including Southwest Indiana:

1. Cancer Rates for Indiana's Public Health Districts, 2008-2012  
[https://www.in.gov/isdh/files/District\\_Report\\_081815.pdf](https://www.in.gov/isdh/files/District_Report_081815.pdf)

The ISDH data provided in this report for 2008-2012 indicate that Indiana had a state-wide overall cancer incidence rate of 466.9 per 100,000 people and southwest Indiana (ISDH Health District 10) had a lower, but not statistically different, overall cancer incidence rate of 457.5 per 100,000 people.

The ISDH data provided in this report for 2008-2012 indicate that Indiana had a state-wide overall cancer mortality rate of 187.3 per 100,000 people and southwest Indiana (ISDH Health District 10) had a statistically lower overall cancer mortality rate of 180.6 per 100,000 people.

2. Indiana Cancer Facts and Figures 2015 (the Indiana Cancer Consortium)  
[http://indianacancer.org/wp-content/uploads/2015/05/Indiana-Cancer-Facts-and-Figures-2015\\_web.pdf](http://indianacancer.org/wp-content/uploads/2015/05/Indiana-Cancer-Facts-and-Figures-2015_web.pdf)

This report contains the following data for southwest Indiana (ISDH Health District 10) county residents (all ages) for 2008-2012:

County	All Cancers Incidence Rates Per 100,000 Residents*
<b>Indiana (state-wide)</b>	<b>466.6</b>
Crawford	479.5
Daviess	438.9
Dubois	445.0
Gibson	450.3
Knox	510.4 ↑
Martin	541.9 ↑
Perry	443.2
Pike	425.1
Posey	468.9
Spencer	448.5
Vanderburgh	445.3 ↓
Warrick	476.2
* Rates are per 100,000 people and age-adjusted to the 2000 US Standard Population ↑ ↓ symbols denote whether the county's rate is significantly different than the Indiana rate (466.6 per 100,000 residents) based on the 95% confidence interval overlap method. Because of limitations of this method, some of the counties without ↑ ↓ symbols could still have significantly different rates than the state.	

The ISDH data provided in the table above indicate that the 2008-2012 all cancers incidence rates for counties within southwest Indiana (ISDH Health District 10) were not statistically different than then Indiana state-wide rate (466.6 per 100,000 residents), except Knox County (510.4 per 10,000 residents), Martin County (541.9 per 10,000 residents), and Vanderburgh (445.3 per 10,000 residents).

County	All Cancers Mortality (Death) Rates Per 100,000 Residents*
<b>Indiana (state-wide)</b>	<b>187.3</b>
Crawford	171.1
Daviess	182.4
Dubois	173.7
Gibson	174.3
Knox	181.0
Martin	189.3
Perry	212.7
Pike	180.3
Posey	165.2
Spencer	181.0
Vanderburgh	187.0
Warrick	167.5 ↓
* Rates are per 100,000 people and age-adjusted to the 2000 US Standard Population ↑ ↓ symbols denote whether the county's rate is significantly different than the Indiana rate (187.3 per 100,000 residents) based on the 95% confidence interval overlap method. Because of limitations of this method, some of the counties without ↑ ↓ symbols could still have significantly different rates than the state.	

The ISDH data provided in the table above indicate that the 2008-2012 all cancers mortality (death) rates for counties within southwest Indiana (ISDH Health District 10) were not statistically

different than then Indiana state-wide rate (187.3 per 100,000 residents), except Warrick County (167.5 per 10,000 residents).

The CDC and ISDH data provided above do not support commenter claims that cancer incidence and/or cancer mortality (death) rates are profoundly higher in all counties in southwest Indiana as compared to the Indiana (state-wide) rates. For most counties in southwest Indiana, cancer incidence and/or cancer mortality (death) rates are lower or not statistically different than the Indiana (state-wide) rates.

#### 4. Additional Information on Cancer Clusters

ISDH provides on its website (<https://www.in.gov/isdh/26882.htm>) the following cancer cluster information:

##### A. Cancer Cluster Concerns in Indiana

The term cancer cluster is used in several ways, with slightly different meanings. The official definition used by the Centers for Disease Control and Prevention (CDC), the National Cancer Institute, and other public health institutions is “a greater than expected number of cancer cases that occurs within a group of people in a geographic area over a defined period of time.” Until all of these parameters are met, the group of cancer cases is often referred to as a suspected cancer cluster.

Worries about suspected cancer clusters typically begin when people notice that several relatives, friends, neighbors and/or co-workers have been diagnosed with cancer. While most of the suspected cancer concerns are not considered cancer clusters, when reported, each inquiry is assessed using all the tools available to the Indiana State Department of Health (ISDH) and investigated through a systematic process as outlined by the [Guidelines for the Management of Inquiries Related to Cancer Concerns or Suspected Cancer Clusters in Indiana](#).

ISDH thoroughly investigates all suspected cancer cluster concerns reported by the public and coordinates internal and external examination with local, state and federal experts from environmental management, academia, medical oncology, and public health (as needed). All investigations proceed in collaboration with the relevant local health department.

##### B. Trevor’s Law

On June 22, 2016, Trevor’s Law was enacted. This federal law addresses the investigation of potential cancer clusters by requiring the Secretary of the United States Department of Health and Human Services (HHS) to develop criteria for the designation of cancer clusters, as well as develop, publish, and periodically update guidelines for the investigation of potential cancer clusters. In addition, the law requires that HHS provide assistance to state and local health departments. ISDH’s current [guidelines](#) for responding to inquiries related to suspected cancer clusters align with the 2013 [guidelines](#) from the CDC and the Council of State and Territorial Epidemiologists. These guidelines have not changed since the passage of Trevor’s Law. The ISDH will continue to monitor for new guidance or changes in resources provided by federal partners.

##### C. Information for Hoosiers

- [Questions and Answers about Suspected Cancer Clusters](#)  
Please read this first if you are concerned about a suspected cancer cluster in Indiana.
- [How to Report a Suspected Cancer Cluster](#)  
Instructions on how to officially report a suspected cancer cluster in Indiana.

## 5. Cancer Prevention and Control in Indiana

The Indiana State Department of Health (ISDH) provides the following information regarding cancer control efforts in Indiana on its website: <https://www.in.gov/isdh/24969.htm>.

Cancer control efforts in Indiana are led by the Indiana Comprehensive Cancer Control Program, along with the Indiana Cancer Consortium. The Indiana Cancer Consortium is a statewide network of public and private partnerships whose mission is to reduce the cancer burden in Indiana through the development, implementation, and evaluation of a comprehensive plan that addresses cancer across the continuum from prevention through palliation. Visit the Indiana Cancer Consortium's Web site at <http://www.indianacancer.org/>.

The Indiana Cancer Consortium (ICC) and diverse partners from across the state have developed the [Indiana Cancer Control Plan 2018-2020](#) (ICCP 2018-2020), a comprehensive roadmap for actions that will guide cancer control efforts and promote collaboration between organizations and the citizens of Indiana. The Indiana Cancer Control Plan contains the following information:

Experts agree that cancer can be caused by both internal and external factors. These factors can sometimes act together, or in sequence, to cause cancer. While risk factors such as family history or age cannot be avoided, many cancers can be prevented through changes in lifestyle and behavior. According to the American Cancer Society (ACS), all cancers caused by tobacco use and heavy alcohol consumption could be prevented completely. In 2016, the ACS reported that 188,800 of the estimated 595,690 cancer deaths in the nation were caused by cigarette smoking. In addition, according to the Centers for Disease Control and Prevention, overweight and obesity are associated with increased risk of 13 types of cancer. These cancers account for about 40 percent of all cancers diagnosed in the United States in 2014. Other preventive behaviors include practicing sun safety, such as using sunscreen, avoiding indoor tanning devices, and wearing protective clothing, and getting recommended vaccines that can prevent cancer, such as the human papillomavirus (HPV) vaccine, which can prevent cervical, head, neck, and other cancers.

The ICC has identified five objectives that support primary prevention of cancer in Indiana.

1. Increase the percentage of Hoosiers at a healthful weight.
2. Reduce the proportion of Hoosiers who use tobacco.
3. Reduce exposure to ultraviolet (UV) rays.
4. Increase completion rates for vaccines that have been shown to reduce cancer.
5. Reduce radon exposure.

### Impact of Additional Air Pollution from this Source

IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

For a detailed explanation of the methodology used in the Air Quality Analysis see Appendix C to this ATSD and IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis.

For the Air Quality Analysis, IDEM, OAQ used the U.S. EPA developed American Meteorological Society Environmental Protection Agency Regulatory Model (AERMOD) and the EPA mandated policies and guidance to replicate weather conditions in order to predict the worst case scenario source impacts on the surrounding area. Riverview's modeled results using AERMOD were compared to the primary and secondary NAAQS standards and concentrations were found to be at a level that will be protective of public health and the environment in the surrounding area. The primary health-based standards are protective of sensitive groups, such as the elderly and children. The secondary standards take environmental and welfare impacts into account,

including ecological effects and deposition of pollutants to the surface of vegetation, soils or water bodies as well as aquatic life, wildlife and endangered species.

In addition, the annual modeled concentrations for each of the hazardous air pollutants (HAPs) was compared to their respective cancer unit risk factor (URF) and non-cancer chronic reference concentration (RfC) value and the cumulative risk from HAPs was found to be below the cancer and non-cancerous risk thresholds. The cumulative cancer risk estimate from all HAPs was well below the U.S. EPA excess cancer risk threshold of one in ten thousand (1.0E-04) and the cumulative non-cancer health effects were below a Hazard Index (HI) of 1.

The maximum permitted emissions of hydrogen sulfide (H<sub>2</sub>S) from Riverview of 5.11 tons per year fall below the PSD significant emission rate for H<sub>2</sub>S of 10 tons per year, as established in 40 CFR 52.21(b)(23)(i) and were not modeled. Pollutants that fall below significant emission rates do not require modeling. Any source with emissions lower than the significant emission rate threshold is not considered to threaten public health or welfare.

While IDEM has not conducted its own studies, IDEM, OAQ relies on the scientific expertise of U.S. EPA which has developed the National Ambient Air Quality Standards (NAAQS) to protect public health and the environment. The Clean Air Act requires that U.S. EPA conduct periodic review of the most current scientific information to determine if air quality standards are adequate to protect human health and general welfare. This review includes an integrated science assessment which is a comprehensive review of science judgments and risk and exposure assessments. An independent committee, the Clean Air Scientific Advisory Committee (CASAC), reviews all health information and makes recommendations to U.S. EPA on whether current health standards are protective of public health and welfare or should be revised. After any health standard recommendations have been approved and finalized through rulemaking, IDEM is required to follow the new standards. Additional information on the CASAC can be found at the following website: <https://yosemite.epa.gov/sab/sabpeople.nsf/webcommittees/CASAC>.

#### **General Statement 6 - Air Monitoring:**

Several commenters expressed concern that IDEM, OAQ does not adequately monitor ambient air quality in southwest Indiana, does not have enough ambient air monitors or monitoring data for Spencer County, and that IDEM, OAQ did not propose any additional air monitoring for the proposed plant or Spencer County.

#### **IDEM Response to General Statement 6 - Air Monitoring:**

##### Summary of Air Monitoring in Indiana

The Indiana Department of Environmental Management (IDEM) regulates air quality to protect public health and the environment in the State of Indiana. Air monitoring data are required by regulation and are used to determine compliance with U.S. EPA's National Ambient Air Quality Standards (NAAQS). Other important uses of the air monitoring data include, the production of a daily Air Quality Index (AQI) report, daily air quality forecast report, support of short and long-term health risk assessments, identification of a localized health concern, and tracking long-term trends in air quality. Indiana monitors the six criteria pollutants which have NAAQS identified for them; carbon monoxide (CO), lead, nitrogen dioxide (NO<sub>2</sub>), ground-level ozone (O<sub>3</sub>), particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>), and sulfur dioxide (SO<sub>2</sub>). Other pollutants which do not have ambient standards established for them are also monitored: toxics (volatile organic compounds, VOCs), metals, carbonyls, PM<sub>2.5</sub> speciated compounds, ozone precursors, and carbon dioxide (CO<sub>2</sub>). In addition, meteorological data are also collected to support the monitoring and aid in analysis of the data.

IDEM presents two different types of air quality data, intermittent and continuous, on IDEM's Internet website <http://www.in.gov/idem/airquality/2346.htm>. Monthly and annual summary reports of pollutants collected by manual methods are available as well as hourly values from continuous

monitors. The Leading Environmental Analysis and Display System (LEADS) provides on-line access to Indiana's continuous air quality monitoring network. It has been available to the public since July, 2007. LEADS offers access to near real-time data from 59 active and historic data from 12 discontinued continuous air monitoring sites across Indiana. This allows anyone to track pollutant and meteorological values throughout the day. In addition, past data back to 1998 are available as raw data and canned summary reports or user specified retrievals. Intermittent data from 41 sites are available on LEADS. Site information with site photographs can be found at the following website: [http://idem.tx.sutron.com/cgi-bin/site\\_photo.pl](http://idem.tx.sutron.com/cgi-bin/site_photo.pl)

IDEM issues Air Quality Action Day (AQAD) advisories on days when ground level ozone pollution or fine particulate matter (PM2.5) could build to unhealthy levels in the outdoor air. IDEM issues AQAD advisories based on air quality forecasts, air quality standards, and Air Quality Index (AQI) categories. Typical conditions for ozone AQADs in Indiana are high temperatures approaching 80° Fahrenheit or above, clear skies, dry atmosphere, calm to light southerly winds, very little air mixing, high NOx values the previous night, and/or persistent high pressure over the eastern Midwest states and East Coast. Typical conditions for PM2.5 AQADs in Indiana are temperature inversions, light winds, clear skies, persistent high pressure, high humidity values, transport from high PM2.5 locations (such as wildfires), and/or warm and humid air over snow cover during the winter. When AQADs are predicted, Hoosiers can take action to protect their health and protect air quality. For additional information on AQAD advisories and actions to take during AQAD advisories, please see the following website: <https://www.in.gov/idem/airquality/2691.htm>

The Air Quality Index (AQI) is a health index which combines the evaluation of various air pollutants in order to provide an easily understood measure of air quality. The AQI focuses on health effects that can occur within a few hours or days after breathing polluted air. Air monitoring data are used to issue health alerts to warn the public of elevated pollution levels. The index provides a scale to which air quality is compared and indicates the associated health effects of concern. IDEM issues health alerts for high air pollutant levels based on the AQI. The AQI uses index numbers, health effect levels, and colors to communicate the health levels. The higher the AQI value, the greater the level of air pollution and the greater the chance of health impacts. For example, an AQI value of 50 represents good air quality and little potential to affect public health, while an AQI value over 300 represents hazardous air quality that could cause health effects. An AQI value of 100 generally corresponds to the National Ambient Air Quality Standard (NAAQS) for the pollutant, which is the level the United States Environmental Protection Agency (U.S. EPA) has set to protect public health. AQI values below 100 are generally regarded as satisfactory. When AQI values are above 100, air quality is considered to be unhealthy, first for certain sensitive groups of people, then for everyone as AQI values get higher. The Air Quality Index (AQI) report and additional information on the AQI can be found at the following website: [http://idem.tx.sutron.com/cgi-bin/aqi\\_map.pl](http://idem.tx.sutron.com/cgi-bin/aqi_map.pl).

Extensive information about IDEM, OAQ's air monitoring is available at <https://www.in.gov/idem/airquality/2346.htm> on IDEM's website.

Additional information about Indiana's air monitoring system and monitoring results is available through links on IDEM's SmogWatch site at <https://www.in.gov/idem/airquality/pages/smogwatch/index.htm>. SmogWatch is an informational tool created by IDEM to share air quality forecasts for each day. SmogWatch provides daily information about ground-level ozone and particulate matter air quality forecasts, health information, and monitoring data for seven regions of Indiana. Near real time data are available at <http://idem.tx.sutron.com/cgi-bin/airfacts.pl>.

#### Ambient Air Monitoring in Southwest Indiana

The table below summarizes the ambient monitors located in southwest Indiana and the types of pollutants and parameters measured at each monitor.

Air Monitor Information			Parameter Monitored and Date Monitoring Began										
Air Quality System # (AQS#)	County (City)	Site Name	O <sub>3</sub>	SO <sub>2</sub>	CO	NO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub> (FRM)**	PM <sub>2.5</sub> (cont.)**	PM <sub>2.5</sub> (spec.)**	PM <sub>2.5</sub> (spec. cont.)**	Toxics (VOCs)	Met. Data**
180190006	Clark (Jeffersonville)	Jeffersonville - Walnut St (to be relocated*)					6/26/03	6/26/03	(to be added)	7/1/08	(black carbon to be added)		
180190008	Clark (Charlestown)	Charlestown State Park	5/4/07					7/1/08					5/29/08
180190009	Clark (Clarksville)	Clarksville										3/7/08	
180372001	Dubois (Jasper)	Jasper - Post Office					7/1/87	1/1/00		1/4/05			
180431004	Floyd (New Albany)	New Albany (Green Valley Elem. Sch.)	1/1/77	11/1/76				1/18/99	11/1/03				
181230009	Perry (Leopold)	Leopold (Perry Central HS)	4/1/04										
181290003	Posey (Evansville)	St. Philips	7/1/96										7/1/96
181470009	Spencer (Dale)	Dale (David Turnham School)						2/1/00					
181630013	Vanderburgh (Inglefield)	Inglefield (Scott Elem. School)	5/1/80										
181630016	Vanderburgh (Evansville)	Evansville - U. of E.						6/5/99				6/23/99	
181630021	Vanderburgh (Evansville)	Evansville - Buena Vista	7/8/09	7/8/09		7/8/09	7/10/09	7/10/09	7/14/09	7/8/09	7/8/09		
181630022	Vanderburgh (Evansville)	Evansville - Lloyd			9/10/09								
181630023	Vanderburgh (Evansville)	Evansville - E. Walnut						1/1/13					
181730008	Warrick (Boonville)	Boonville (Boonville HS)	4/16/91										
181730009	Warrick (Lynnville)	Lynnville (Tecumseh HS)	5/2/91										
181730011	Warrick (Dayville)	Dayville	4/1/07										10/1/08
*Relocation of the Jeffersonville (180190006) site continues to be delayed due to lease negotiations between IDEM and property owners. When the new site is setup, continuous PM2.5 and black carbon will be installed.													
**FRM = Federal Reference Method; Met. = Meteorological; cont. = continuous; spec. = speciated; spec. cont. = speciated continuous													

### Ambient Air Monitoring Network Plan

In October 2006, United States Environmental Protection Agency (U.S. EPA) issued final regulations concerning state and local agency ambient air monitoring networks. These regulations in 40 Code of Federal Regulations 58, Subpart B (40 CFR 58.10), require states to submit an annual monitoring network review to U.S. EPA. This network plan is required to provide the framework for establishment and maintenance of an air quality surveillance system and to list any changes that are proposed to take place to the current network. The current monitoring plan for 2019 can be found here: [https://www.in.gov/idem/airquality/files/monitoring\\_network\\_review\\_2019.pdf](https://www.in.gov/idem/airquality/files/monitoring_network_review_2019.pdf)

Locations of the monitors are reviewed annually pursuant to 40 CFR 58.10 and are subject to public comment. Comments on the ambient air monitoring network can be made during the public comment period for the 2020 network plan. IDEM, OAQ will evaluate the request and act if any changes are necessary to meet the monitoring goals and monitoring projects across the state. IDEM's contact for the monitoring plan is Steve Lengerich. Mr. Lengerich may be contacted by U.S. Mail at Steve Lengerich, IDEM/OAQ/AMB, 100 North Senate Avenue, Shadeland, Indianapolis, IN 46204-2251, by FAX at 317-308-3239 or by e-mail at [slengeri@idem.IN.gov](mailto:slengeri@idem.IN.gov).

### Monitoring Associated with This Proposed Permit

The proposed permit requires either stack testing or continuous emissions monitoring (with associated record keeping and reporting requirements) for most of the point source emissions at the source. The IDEM, OAQ Compliance and Enforcement Branch will observe all stack tests and review all stack test protocols and results. Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions.

In addition, the impact of air pollution emissions from this proposed plant to ambient air pollution levels in southwest Indiana will be monitored as part of IDEM, OAQ's ambient air monitoring in southwest Indiana.

One commenter suggested that the source should be required to perform ambient air monitoring of PM<sub>2.5</sub> after construction. As noted in IDEM Response to General Statement 14, modeling PM<sub>2.5</sub> did not show any effect above the 0.2 µg/m<sup>3</sup> Significant Impact Level (SIL) beyond 500 m (1,640 ft, slightly more than 1/4 mile) from the property line. Results of modeling that includes data from the Dale PM<sub>2.5</sub> monitor do not demonstrate a need for monitoring ambient PM<sub>2.5</sub> concentrations at the source because concentrations are well below the health-based NAAQS for both 24-hour and annual PM<sub>2.5</sub>.

Other than the stack testing and compliance monitoring required by the proposed permit and IDEM, OAQ's ambient air monitoring within in southwest Indiana, IDEM OAQ is not planning any additional air, soil, or water sampling in local areas near this proposed plant.

### **General Statement 7 - Emission Factors and Calculation Methodologies Used in Determining the Potential to Emit and the Associated Air Quality Analysis**

Several commenters expressed concern that the emission factors and calculation methodologies used in determining the Potential to Emit (PTE) and the associated Air Quality Analysis are not conservative enough, are flawed, are not accurate, or are not based on actual data from a direct coal hydrogenation (DCH) facility to convert coal to liquid fuels.

## **IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis:**

IDEM, OAQ has evaluated the emission factors and calculation methodology used to determine the potential to emit of this proposed facility and has determined that the PTE calculations are sufficiently conservative for purposes of determining permitting level, applicability of state and federal rules and regulations, and for performing air quality analyses.

Below is additional information about emission factors, calculation methodologies used in determining the potential to emit and the associated Air Quality Analysis.

### Potential to Emit and Emission Factors

Indiana's Part 70 Permit Program rules are contained in Indiana Administrative Code (IAC), Title 326, Article 2, Rule 7 (326 IAC 2-7). Under 326 IAC 2-7-1(30) (Definitions), "Potential to Emit" is defined as follows:

"Potential to emit" means the maximum capacity of a stationary source to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or type or amount of material combusted, stored, or processed shall be treated as part of its design if the limitation is enforceable by the U.S. EPA. This term does not alter or affect the use of this term for any other purpose under the CAA, (or the term "capacity factor" as used in Title IV of the CAA) (or the regulations promulgated thereunder).

In general, IDEM, OAQ determines the uncontrolled/unlimited potential to emit (PTE) based on the following:

1. The maximum capacity at which the equipment is capable of operating under its physical and operational design. Physical and operation design factors may be considered in determining the maximum capacity such as operational or process designs that have inherent limitations or bottlenecks, non-continuous operations, and equipment that performs a process function and reduces emissions as a secondary effect of their existence (i.e., controls that are integral to the process);
2. Assuming the equipment operates 24 hours a day, 365 days a year (8,760 hours per year), or the maximum hours of operation that the equipment can operate under its physical and operational design; and
3. For sources that can operate under different scenarios (e.g., different raw material inputs, product outputs, fuels burned, operating conditions/scenarios, etc.), the PTE will be based on the worst-case scenario resulting in the greatest amount of emissions.

There are no provisions that mandate the specific source of an emission factor. When determining the PTE for permitting purposes, IDEM, OAQ typically uses emission factors/data from the following sources:

- performance test data or continuous emissions monitoring systems (CEMS) data on similar emission units;
- equipment vendor emissions data and guarantees;
- emission data or emission estimation methods from EPA documents, including background information documents for new source performance standards, national emissions standards for hazardous air pollutants, and Section 111(d) standards for designated pollutants;

- AP-42 emission factors (EPA's Compilation of Air Pollution Emission Factors AP-42) (<https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors>);
- emission factors from EPA's online Factor Information REtrieval system (WebFIRE) (<https://www.epa.gov/electronic-reporting-air-emissions/webfire>);
- emission factors from technical literature or trade industry studies;
- State emission inventory questionnaires for comparable sources;
- Material balance determinations; and
- Other methods approved by IDEM, OAQ.

These types of emission factors/data sources are also discussed in U.S. EPA's October 1990 Draft New Source Review Workshop Manual, Prevention of Significant Deterioration and Nonattainment Area Permitting (referred to as the "1990 Draft NSR Manual") (<https://www.epa.gov/sites/production/files/2015-07/documents/1990wman.pdf>)

The individual processes in this proposed direct coal hydrogenation (DCH) facility to convert coal to liquid fuels are similar or identical to individual processes in other industries that have established emissions factors and air pollution permitting requirements. For the individual processes in this proposed plant, the PTE was based on the following:

- Block 1000 Coal Handling Operations - Compilation of Air Pollutant Emissions Factors, Volume I: Stationary Point and Area Sources, 5th Ed. (AP-42), including section 11.9- Western Surface Coal Mining, 11.10 - Coal Cleaning, and 11.19.2 - Crushed Stone Processing and Pulverized Mineral Processing; and Fugitive Emissions from Integrated Iron and Steel Plants, EPA 600/2-78-050, March 1978.

- Block 7000 Hydrogen Production - emission factors provided by the source were from information provided by an equipment supplier and stack test data on steam-hydrocarbon-reforming operations at two (2) sources in Iowa.
- Block 8000 Wastewater Treatment - AP-42 Section 5.1 - Petroleum Refining.
- Additional calculations developed by IDEM using standard chemical engineering references and methods.

IDEM, OAQ understands that AP-42 emission factors represent average emissions for a source activity and that average emissions differ significantly from source to source. IDEM, OAQ also understands that some of the AP-42 emission factors used in the PTE calculations have a low emission factor quality rating (e.g., a rating of D or E) and may be less accurate, reliable, or robust than more highly-rated factors and may provide only an approximation of the average emissions.

IDEM, OAQ has evaluated the emission factors and calculation methodology used to determine the potential to emit of this proposed facility and has determined that the PTE calculations are sufficiently conservative for purposes of determining permitting level, applicability of state and federal rules and regulations, and for performing air quality analyses.

The proposed permit includes limitations on the potential to emit of the source, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD). The permit also contains testing, monitoring, record keeping, and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis. The air quality analyses are based on the modeling of the source-wide emissions after application of the limits in the proposed permit.

#### Air Quality Analysis Methodology

A detailed summary of the Air Quality Analyses performed for this proposed facility is included in Appendix C to this ATSD.

IDEM, OAQ follows all air quality modeling procedures for PSD/NSR established by the United States Environmental Protection Agency (U.S. EPA) in the U.S. EPA Revisions to the Guideline on Air Quality Models: Enhancements to the AERMOD Dispersion Modeling System and Incorporation of Approaches To Address Ozone and Fine Particulate Matter, U.S. Environmental Protection Agency, Air Quality Modeling Group, Support Center for Regulatory Atmospheric Modeling (SCRAM), August 2007, which can be found at the following website: [https://www3.epa.gov/ttn/scram/appendix\\_w-2016.htm](https://www3.epa.gov/ttn/scram/appendix_w-2016.htm)

For additional impact analysis for air, ground, and water pollution on soils, vegetation, and visibility, IDEM, OAQ follows the guidelines contained in U.S. EPA's Clean Air Act Permit Modeling Guidance which can be found at the following website: <https://www.epa.gov/scram/clean-air-act-permit-modeling-guidance#otherguide>

For conducting hazardous air pollutant (HAP) cancer risk and hazard screening analyses, IDEM, OAQ followed risk characterization methodologies contained in U.S. EPA's Air Toxics Risk Assessment Reference Library Volumes 2 and 3, which can be found at the following website: <https://www.epa.gov/fera/air-toxics-risk-assessment-reference-library-volumes-1-3>

Additional information on air dispersion modeling can be found on IDEM, OAQ's Modeling webpage: <https://www.in.gov/idem/airquality/2375.htm>.

Based on the regulations set forth in the Clean Air Act, the air emissions and modeled impacts from Riverview have been rigorously reviewed and evaluated with the U.S. EPA developed American Meteorological Society Environmental Protection Agency Regulatory Model (AERMOD). AERMOD is the air dispersion model based on planetary boundary layer turbulence

structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain.

IDEM, OAQ used AERMOD and the EPA mandated policies and guidance to replicate weather conditions in order to predict the worst case scenario source impacts on the surrounding area. Riverview's modeled results using AERMOD were compared to the primary and secondary NAAQS standards. The primary health-based standards are protective of sensitive groups, such as the elderly and children. The secondary standards take environmental and welfare impacts into account, including ecological effects and deposition of pollutants to the surface of vegetation, soils or water bodies as well as aquatic life, wildlife and endangered species.

Health-based standards are determined based on varying exposure times. Research and scientific/health assessments for risk and exposure are made to determine time-averaged periods for exposure to pollutants that are protective of public health and welfare. The research and assessments are incorporated in the recommendations from the Clean Air Scientific Advisory Committee (CASAC) to U.S. EPA on whether current health standards and the time-averaged period for each pollutant are protective of public health and welfare.

The hazardous air pollutants (HAPs) modeling incorporates the maximum permitted HAPs emission rates to determine annual modeled concentrations that are evaluated against risk and health concern reference concentrations. The reference concentrations are developed by the Agency for Toxic Substances and Disease Registry (ATSDR) and U.S. EPA's Integrated Risk Information System (IRIS) and serve as threshold values and upper ranges of acceptable risk. The annual modeled concentrations for each HAP are compared to their respective cancer risk and non-cancer chronic reference concentration. The assumptions for toxic exposure are listed in Section G of IDEM's Air Quality Analysis and include a constant 70-year exposure, assume all carcinogens cause the same type of cancer, all non-carcinogens have additive health effects and assume toxics are released at the maximum permitted rates as well as other conservative (worst case scenario) assumptions. The US EPA considers one in ten thousand (1.0E-04) excess cancer risk to be the upper range of acceptability with an ample margin of safety. IDEM evaluates source's excess cancer risk against a more conservative threshold of one in one million (1.0E-06).

#### **General Statement 8 – The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model:**

Many commenters expressed concern over validity of meteorological data inputs to the AERMOD dispersion model.

#### **IDEM Response to General Statement 8 – The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model:**

Title 40 Code of Federal Regulations (CFR) Part 51 - Appendix W "Guideline on Air Quality Models" states that "the use of 5 years of adequately representative National Weather Service (NWS) or comparable meteorological data, at least 1 year of site-specific, or at least 3 years of prognostic meteorological data, are required. If 1 year or more, up to 5 years of site-specific data are available, these data are preferred for use in air quality analyses. Depending on completeness of the data record, consecutive years of NWS, site-specific, or prognostic data are preferred."

IDEM has historically used 5-years (over 43,800 hours) of National Weather Service meteorological data in its air quality analyses. IDEM prepares meteorological data for 7 surface locations and regions around the state using AERMET, the meteorological preprocessor for AERMOD. These meteorological stations include surface stations at Evansville, Indianapolis, South Bend, Fort Wayne, Gary, Covington, Kentucky and Louisville, Kentucky processed with upper air stations at Lincoln, Illinois and Wilmington, Ohio. When the meteorological files to be used in the modeling are considered, the combination of surface and upper air stations depends on the location of the source location. AERMET formats and processes each of the 43,800 hours

of weather observations at the surface and upper levels of the atmosphere in order to replicate the weather in the air quality dispersion model. Elevation and terrain information are factored into the meteorological data processing as well as the elevation of the receptor grid points characterize the area surrounding the source. In the absence of on-site data, the guideline suggests the use of at least five years of NWS data (vs only one year or more of on-site data) that adequately represents the area. The Evansville NWS data is an adequate representation of the meteorological conditions in Spencer County and the southwest Indiana area because it is the closest NWS surface station to the proposed facility. The Evansville site provides a robust, quality-assured 5-year data set that may cover a wider range of meteorological parameters and conditions than a single year of data from the location of the proposed source in Spencer County. IDEM has conducted numerous air quality analyses for sources in and adjacent to Spencer County for many years and U.S. EPA has accepted the use of Evansville Regional Airport - NWS meteorological data for the southwestern portion of Indiana.

One commenter (Gebhart) also stated that conditions aloft (around 200 feet) do not take into account that meteorological parameters change with height. When processing meteorological data, IDEM utilizes upper air data from Lincoln, Illinois, which is the nearest upper air station to Southwest Indiana, as input into the AERMET preprocessor. AERMET is able to make many boundary layer calculations based on the vertical distribution of meteorological parameters. These wind profiles, developed from the surface and upper air data, recreate the wind flows at differing heights in the atmosphere. Emissions released at different stack heights can therefore be modeled appropriately.

Commenters noted that air temperature inversions are common in southern Indiana and expressed concern that these features would not be captured by the meteorological data. It is true that inversions frequently occur in this area and mixing heights and stable atmospheric conditions are accounted for in the NWS surface and upper air data. AERMET uses upper air data and surface data to capture these boundary layer features which are included in the air dispersion model runs that replicate actual meteorological conditions, such as inversions, and predict concentrations from modeled sources.

No changes were made as a result of this comment.

#### **General Statement 9 - Modeling Background Concentrations and Monitoring:**

Many commenters expressed concern over the modeling of background concentrations and monitoring.

#### **IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring:**

Monitoring data is used in the PSD modeling analysis to determine overall compliance with the National Ambient Air Quality Standards (NAAQS). Pre-construction monitoring thresholds for the designated time-averaged period for a pollutant allows an exemption from monitoring requirements per 40 Code of Federal Register (CFR) §Part 51.166(m) be granted by the reviewing agency if maximum modeled impacts are below the thresholds. For the Riverview modeling review, IDEM first conducted the pre-construction monitoring analysis which compared the maximum modeled impacts from the source to the de minimus impact thresholds found in 40 CFR Part 51.166(i)(5)(i). Riverview's modeled impacts were well below the annual NO<sub>2</sub> impact threshold of 14 µg/m<sup>3</sup> with the modeled concentration at 0.71 µg/m<sup>3</sup>, thereby exempting Riverview from pre-construction monitoring (see Appendix C to this ATSD for the Air Quality Analysis). As noted in Table 3 of the Air Quality Analysis, PM<sub>10</sub> and SO<sub>2</sub> modeled impacts were also below their respective pre-construction monitoring thresholds. PM<sub>2.5</sub> has no pre-construction monitoring threshold value but the Dale PM<sub>2.5</sub> monitoring data was used to satisfy the pre-construction monitoring requirement for PM<sub>2.5</sub>.

Because modeling indicated a significant impact for 1-hour NO<sub>2</sub>, IDEM reviewed the most current three-year monitored period for the nearest NO<sub>2</sub> monitoring station, Evansville - Buena Vista. The Evansville NO<sub>2</sub> monitoring data for 2015 through 2017 did not meet data completeness criteria

with several months in 2016, having less than 75% data completeness. Appendix A to the §Part 58 Quality Assurance Requirement for state or local air monitoring stations (SLAMS), National Core multipollutant monitoring stations (NCore) and PSD Air Monitoring Section 1.2 defines completeness as a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under correct, normal conditions. Appendix S to CFR Part 50 - Interpretation of the Primary National Ambient Air Quality Standards for Oxides of Nitrogen (NO<sub>2</sub>) contains the completeness criteria for 1-hour NO<sub>2</sub> in section 3.2 (b), requiring at least 75% of the daily and quarterly sampling periods have complete data. NO<sub>2</sub> data collected in March, July and August 2016 fell below 75% collected so the 3<sup>rd</sup> quarter of 2016 was below the data completeness threshold. Therefore, the 1-hour NO<sub>2</sub> design value for the Evansville - Buena Vista monitor was not acceptable for use in the Riverview NAAQS analysis.

Due to the incomplete data at Evansville, IDEM reviewed monitoring data throughout the state to find complete 1-hour NO<sub>2</sub> monitoring data that was representative if not conservative for use in Riverview's air quality analysis. Although the proposed location for Riverview would be considered rural, based on the Auer Land Use determination, the best available and complete data over the most three year was the South Bend - Shields Dr. monitoring station, a more urban area. Based on hourly monitoring data, the design values calculated for both sites showed the South Bend 1-hour NO<sub>2</sub> data was higher than the Evansville 1-hour NO<sub>2</sub> data. While the Evansville data did not meet completeness data, which affected the design value calculation, the South Bend 1-hour NO<sub>2</sub> design value for 2015-2017 was 36 parts per billion (67.68 µg/m<sup>3</sup>), over 10% higher than the Evansville 1-hour NO<sub>2</sub> design value at 32 ppb (60.3 µg/m<sup>3</sup>). The 1-hour nitrogen dioxide (NO<sub>2</sub>) NAAQS, based on health-based studies, is 75 parts per billion (ppb) or 188.6 micrograms per cubic meter (µg/m<sup>3</sup>). Both the Evansville and South Bend NO<sub>2</sub> background concentrations are well below the NAAQS. In fact, since 2010 when both the Evansville and South Bend annual daily maximum 98<sup>th</sup> percentiles were 41 ppb, South Bend's annual daily maximum 98<sup>th</sup> percentile values have measured between 2 to 10 ppb (5 to 25 µg/m<sup>3</sup>) higher than the annual daily maximum 98<sup>th</sup> percentile at Evansville. Therefore, the conservative nature of the South Bend NO<sub>2</sub> monitoring data requires that Riverview's environmental impact be smaller in order to attain the NAAQS.

A comment was made that several websites or applications have air quality monitoring concentrations at specific locations. While these websites and applications supply specific concentration values, this information is extrapolated or estimated from nearby monitoring sites or calculated through dispersion techniques. These calculated concentrations do not constitute observed data and would not meet the quality assurance methods mandated by U.S. EPA for use in PSD modeling purposes.

No changes were made as a result of this comment.

#### **General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County:**

Many commenters expressed concern over the amount of toxic chemicals released into the environment in Spencer County, based on the EPA's Toxic Release Inventory Data.

#### **IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County:**

Information about EPA's Toxics Release Inventory (TRI) can be found at the following website: <https://www.epa.gov/toxics-release-inventory-tri-program>

The Toxics Release Inventory (TRI) is a resource for learning about toxic chemical releases and pollution prevention activities reported by industrial and federal facilities. TRI data support informed decision-making by communities, government agencies, companies, and others. Section 313 of the Emergency Planning and Community Right-to-Know Act (EPCRA) created the TRI Program.

TRI releases are tracked under the following categories:

- Air releases (on site), including fugitive (non-point) and stack (point) emissions;
- Surface water discharges (on site) to bodies of water (e.g., streams, rivers, lakes);
- Land releases (on site), underground injection, landfills, land treatment/application farming, surface impoundments, and other disposal;
- Recycling (on site), including solvent recovery and metals recovery for possible reuse at the facility or for use in commerce;
- Used for energy recovery (on site), such as combustion in a furnace, kiln, boiler to generate heat or energy for use at the facility;
- Treatment (on site), such as biological treatment, incineration, and chemical oxidation, resulting in varying degrees of destruction of the toxic chemical;
- Discharge (off-site) to publicly owned treatment works (POTWs) (e.g., wastewater treatment facility) for treatment, resulting in varying degrees of removal of metals and other chemicals for further disposal, varying degrees of destruction of other toxic chemicals;
- Transfers (off-site) to other off-site locations for the purposes of recycling, energy recovery, treatment, or disposal;

It is very important to note that not all TRI releases (e.g., recycling, energy recovery, treatment) necessarily represent entry of the chemical into the environment.

Even more importantly, caution should be taken when using TRI data, since some companies/industries (e.g., utilities) overestimate the amount of air toxics released to the air, as there is no penalty for over-reporting releases. In some cases, utilities report uncontrolled emissions of air toxics, when in reality, the air pollution controls for particulate matter (PM/PM<sub>10</sub>/PM<sub>2.5</sub>), SO<sub>2</sub> and NO<sub>x</sub> will also control a portion of the air toxic emissions. Determining the exact amount toxic pollutants controlled by the air pollution controls is difficult and expensive. Thus the numbers reported in TRI could be significantly overestimated.

The following TRI Factsheet information for Spencer County, IN was accessed on the following TRI website: <https://www.epa.gov/toxics-release-inventory-tri-program>

<b>Quick Facts for Spencer County, IN (2017 Dataset, released October 2018)</b>	
Number of TRI Facilities: 4	
<ul style="list-style-type: none"> <li>• AK Steel Corp - Rockport Works</li> <li>• American Electric Power Rockport Plant</li> <li>• PVS Steel Services Inc.</li> <li>• Corn Island Shipyard Inc.</li> </ul>	
On-Site Releases:	Air: 407.2 thousand lbs Water: 11.752 million lbs Land: 2.233 million lbs <b>Total: 14.4 million lbs</b>
Total Off-Site:	1.02 million lbs
Total On-site and Off-site Disposal or Other Releases:	15.4 million lbs

There are four (4) facilities in Spencer County that are tracked in the TRI. In 2017, approximately 76.3% (11.752 million lbs) of the total on-site and off-site disposal or other releases (15.4 million lbs) in Spencer County resulted from with water releases of two (2) chemicals (nitrate compounds and sodium nitrite) by AK Steel Corp - Rockport Works. In 2017, the other 23.7% of the releases to Spencer County resulted primarily from 2.233 million lbs (14.5%) of on-site land releases at American Electric Power Rockport Plant, 1.02 million lbs (6.6%) off-site disposal or other releases by AK Steel Corp - Rockport Works, and 407.2 thousand lbs (2.6%) of on-site air emissions at all four (4) facilities in Spencer County.

The amount of air toxics released from Riverview will be regulated under state and federal permitting requirements and have been found to meet all health-based threshold levels.

No changes were made as a result of this comment.

**General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility":**

Many commenters expressed concern that IDEM, OAQ determined in the Air Quality Analysis that "No significant impacts are expected from the proposed facility".

**IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility":**

The use of the word "significant" within the context of the federal rules under the Clean Air Act is used in a definitional sense to indicate an established threshold for a particular pollutant. When impact levels are below a certain defined threshold, the impact is termed as "not significant". If an impact level is over the established threshold, the impact is considered "significant" and additional requirements with more comprehensive modeling will be conducted. As IDEM uses the term "significant" or "not significant" it is within the federal definitional sense and not a subjective statement of opinion.

The phrases "no significant impact" and "no significant impacts" are used in Section H - Summary of Air Quality Analysis (see Appendix C to this ATSD), based on the results of the Hazardous Air Pollutants (HAPs) cumulative risk analysis and the secondary PM<sub>2.5</sub> and ozone formation analysis. The HAP cumulative risk analysis shows that the cumulative impact from the modeled HAPs are below the U.S. EPA excess cancer risk threshold level of 1.0E-04, which would require action or investigation, and below the non-cancer Hazard Index (HI) risk threshold of 1.0. The secondary PM<sub>2.5</sub> and ozone formation analysis shows that the emissions from the proposed plant are not expected to exceed the significant impact level (SIL) for the 8-hour Ozone NAAQS or cause or contribute to a violation of the 24-hour PM<sub>2.5</sub> NAAQS and the annual PM<sub>2.5</sub> NAAQS.

With respect to the entire air quality analysis, significant impacts were modeled from Riverview for 1-hour NO<sub>2</sub>; 1-hour, 3-hour, 24-hour, annual SO<sub>2</sub> and 24-hour and annual PM<sub>2.5</sub>, and those impacts were stated in both the Significant Impact Levels table (Table 2) and Section D of the Air Quality Analysis (Appendix C to this ATSD, pages 5 and 6). The modeled results of the pollutants mentioned above, exceeded the significant impact levels, established by U.S. EPA and enforced by state and federal regulations. These modeled results triggered additional air quality dispersion modeling to determine whether or not the cumulative impacts from Riverview, nearby sources and background concentrations would exceed the NAAQS or PSD increments. The NAAQS and PSD increment modeling results, found in the NAAQS Analysis table (Table 6), Section D of the Air Quality Analysis, showed the NAAQS for all applicable pollutants and time-averaged periods were protected with combined impacts falling below the health-based NAAQS threshold values. The PSD increment modeling results found in the PSD Increment Analysis table (Table 7), Section D of the Air Quality Analysis, indicated 80% of the available PSD increment in the county would not be exceeded. 326 Indiana Administrative Code (IAC) Article 2, Rule 2, Section 6(a) requires the PSD increment be protected beyond what U.S. EPA has established, thus Indiana allows only 80% consumption of the available PSD increments for that pollutant. The U.S. EPA established PSD increments (with Indiana's 80% limitation) for SO<sub>2</sub> are 80% of 512 µg/m<sup>3</sup> for 3-hour (409.6 µg/m<sup>3</sup>), 80% of 91 µg/m<sup>3</sup> for 24-hour (72.8 µg/m<sup>3</sup>) and 80% of 20 µg/m<sup>3</sup> (16 µg/m<sup>3</sup>) for annual time-averaged periods and for PM<sub>2.5</sub>, the PSD increments are 9 µg/m<sup>3</sup> for 24-hour (7.2µg/m<sup>3</sup>) and 4 µg/m<sup>3</sup> (3.2 µg/m<sup>3</sup>) for annual time-averaged periods.

Based on comments and additional information received during the public notice period, IDEM, OAQ made changes to the hazardous air pollutants (HAP) modeling and risk analysis (see Appendix C to this ATSD for the revised modeling and risk analysis in its entirety). The cumulative cancer risk estimate from all HAPs is well below the U.S. EPA excess cancer risk threshold of one in ten thousand (1.0E-04) and the cumulative non-cancer health effects were below a Hazard Index (HI) of 1.

No changes were made as a result of this comment.

**General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring:**

Many commenters expressed concern over ozone monitoring.

**IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring:**

Spencer County does not have an ozone monitor in the county; however a total of five ozone monitors are located in the adjacent counties of Perry and Warrick as well as Vanderburgh County. The most current 8-hour ozone design values for each of these monitors from 2015 through 2017 are below the 8-hour ozone NAAQS of 70 parts per billion. Therefore, the airshed for Spencer County and Southwest Indiana meets the current 8-hour ozone standard.

There is a PM<sub>2.5</sub> monitor located in Dale which has monitored values well below the annual and 24-hour PM<sub>2.5</sub> NAAQS thresholds. Other pollutants are monitored within the airshed as required by U.S. EPA ambient air monitoring regulations.

Kentucky operates an NO<sub>2</sub> monitor in Owensboro that is located approximately 28 miles (45 kilometers) southwest of the proposed site, considered upwind of Riverview as prevailing winds blow from the southwest. The 98<sup>th</sup> percentile of the daily maximum 1-hour NO<sub>2</sub> values at Owensboro are lower than the Evansville and South Bend 1-hour NO<sub>2</sub> values. IDEM opted to use the higher/more conservative South Bend NO<sub>2</sub> monitoring data even though the lower Owensboro background data would be more representative of NO<sub>2</sub> background in the area surrounding Dale.

**General Statement 13 - Ozone Alert Days:**

Many commenters expressed concern over ozone alert days.

**IDEM Response to General Statement 13 - Ozone Alert Days:**

Ozone Alert Days or Air Quality Action Days (AQADs) are issued based on conducive weather conditions for the formation of ozone or PM<sub>2.5</sub> as local weather forecasts and monitoring data from the area are reviewed by local and state officials. Therefore, the issuance of Ozone Alert Days or AQADs are driven more by meteorology while taking into account region-wide emissions and transport of pollutants into the area. The Riverview emissions would be factored into the decision making process but are not anticipated to play a significant role in the issuance of an Ozone Alert Day or AQAD based on the results of the secondary analysis.

IDEM conducted an analysis on secondary formation of ozone and PM<sub>2.5</sub>, as found in Section F of the Air Quality Analysis (see Appendix C to this ATSD for the Air Quality Analysis), which evaluated the maximum permitted NO<sub>x</sub>, VOC and SO<sub>2</sub> emissions from Riverview. This approach is recommended by U.S. EPA in evaluating a source's emissions and is based on photochemical modeling results to determine whether a source's primary and secondary impacts contribute to an exceedance of the ozone or PM<sub>2.5</sub> NAAQS. The analysis concluded that the emissions from Riverview will fall below conservative threshold values and will not cause or contribute to a violation of the 8-hour ozone or 24-hour or annual PM<sub>2.5</sub> NAAQS.

**General Statement 14 - Pollutant Travel Distance:**

Many commenters expressed concern over pollutant travel distance.

**IDEM Response to General Statement 14 - Pollutant Travel Distance:**

For the Air Quality Analysis, IDEM, OAQ used the U.S. EPA developed American Meteorological Society Environmental Protection Agency Regulatory Model (AERMOD) and the EPA mandated policies and guidance to replicate weather conditions in order to predict the air pollution

concentrations, travel distances, and resulting impact of Riverview's worst case scenario air pollution emissions on the surrounding area. AERMOD is an air dispersion model based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. For a detailed explanation of the methodology used in the Air Quality Analysis see Appendix C to this ATSD and IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis.

IDEM's modeling results focused on the maximum modeled values in order to compare to each pollutant's respective health-based standard. Review of Riverview's impacts for PM<sub>10</sub> and PM<sub>2.5</sub> showed their maximum modeled impacts, evaluated over the 43,800 hours of meteorological data, occurred just outside Riverview's northern property line with a rapid drop in concentrations further out from the source. Modeling PM<sub>2.5</sub> did not show a concentration above the 0.2 µg/m<sup>3</sup> Significant Impact Level (SIL) beyond 500 m (1,640 ft, slightly more than 1/4 mile) from the property line. It should be noted that the maximum PM<sub>10</sub> impacts were below the SIL, meaning PM<sub>10</sub> impacts are well below the PM<sub>10</sub> National Ambient Air Quality Standards. All other pollutants modeled had maximum impacts along the property line or within 1 mile of the proposed source with the exception of 1-hour CO maximum impacts which occurred approximately 2 miles (3 kilometers) east-northeast of the proposed source. These impacts were below the SIL and not anticipated to cause or contribute to any health concerns.

Wind rose analysis, showing the direction winds are blowing from at the Evansville Regional Airport-National Weather Service station shows prevailing winds blow from the southwest. Therefore, concentrations are typically dispersed to the northeast. The far eastern portion of the receptor grid used for the dispersion modeling included the western outskirts of Ferdinand. The modeled concentrations of criteria pollutants near Ferdinand were well below Significant Impact Levels and are not anticipated to have any health related impacts in that area.

Hazardous Air Pollutants emissions were modeled with maximum concentrations occurring along the northern Riverview property line, immediately south of I-64. The concentration gradient decreased rapidly from the maximum impact receptor out from the source as the pollutants were dispersed and remained well below the individual HAP and cumulative cancer and non-cancerous risk factors. The cumulative cancer risk estimate from all HAPs was well below the U.S. EPA excess cancer risk threshold of one in ten thousand (1.0E-04) and the cumulative non-cancer health effects were below a Hazard Index (HI) of 1.

### **Mr. David Boggs Comments and IDEM Responses**

On December 7, 2018, Mr. David Boggs of Mount Vernon, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. David Boggs Comment 1:**

Commenter's review of the DRAFT Permit documents noted applicable requirements pursuant to 40 CFR 61, Subpart BB (National Emission Standard for Benzene Emissions From Benzene Transfer Operations). Commenter neither identified 40 CFR 61, Subpart BB as an applicable requirement in REC's application nor found evidence that the proposed source will contain loading racks at which benzene is loaded in accordance with the applicability provisions of §61.300(a).

#### **IDEM Response to Mr. David Boggs Comment 1:**

The loading rack will be used to load naphtha product into railcars. Based on information provided by the licensor, the naphtha product is expected to have a benzene content of less than 2% by weight. Because determinations by U.S. EPA with regard to the applicability of 40 CFR 61, Subpart BB, found in the Applicability Determination Index (ADI) (<https://cfpub.epa.gov/adi/>) do not address this situation and in an abundance of caution, IDEM, OAQ has chosen to include 40 CFR 61, Subpart BB, as an applicable requirement for the loading rack. Since the product is

expected to contain less than 2% benzene by weight, the source would be subject to only to the record keeping and reporting requirements specified under 40 CFR 61.305(i). IDEM, OAQ will retain these requirements in the permit until such time as the source obtains a specific determination of nonapplicability from the U.S. EPA. No changes were made as a result of this comment.

#### Mr. David Boggs Comment 2:

IDEM, OAQ has combined several lettered paragraphs of the commenter's letter that make similar observations about the descriptive information.

The DRAFT Permit appropriately incorporates many standards; however, multiple instances exist where the permit language inaccurately, or incorrectly, attempts to incorporate applicable requirements.

DRAFT Permit page 144 describes the Amine Regeneration Unit as part of sulfur recovery operations. The description provides "Under the NESHAP, 40 CFR 63, Subpart CC, the Amine Recovery Unit is an affected source." Pursuant to 40 CFR 63.640(d)(4), sulfur plant vents are excluded from the scope of a Subpart CC affected source; therefore, it is necessary to identify boundaries for the sulfur plant vents in order to clarify applicability 19,20. Specifically, IDEM should clarify whether the Amine Regeneration Unit is covered by 40 CFR 63 Subpart CC or UUU.

The DRAFT Permit has multiple statements in description boxes with text similar to "Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the ... [e.g., Sour Water Stripper, Sulfur Recovery Unit A, Sulfur Recovery Unit B, HP Absorber and LP Absorber] ...is an affected source."

#### IDEM Response to Mr. David Boggs Comment 2:

IDEM agrees with the types of changes recommended. The permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

- (a) Statements regarding the applicability of 40 CFR 60, Subpart GGGa have been changed throughout the permit:

Under the NSPS, 40 CFR 60, Subpart GGGa, the **group of all the equipment (defined in § 60.591a) associated with the ... is part of** an affected facility

As noted in the original Technical Support Document, the definition of "process unit" at §60.591a was stayed at 73 FR 31376, June 2, 2008. While the definition of "process unit" is stayed, owners or operators should use an alternate definition that does not include product transfer racks. The stay is incorporated in the permit by the citation of §60.590a in its entirety.

- (b) Upon review, IDEM, OAQ finds that the because applicability of 40 CFR 60, Subpart NNN is described by §60.660(b)(3) as two or more distillation units and the common recovery system into which their vent streams are discharged, statements regarding the applicability of Subpart NNN have been changed throughout the permit:

... NNN, the ... tower is **part of** an affected facility.

The amine absorber system is taken to be the common recovery system to which the distillation processes discharge and has been added to the affected facility, as follows:

...

(d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:

(1) ...

(17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:

(A) ...

**Under the NSPS, 40 CFR 60, Subpart NNN, the amine absorber system is part of an affected facility.**

...

The inclusion of the amine absorber system in the affected source has also been incorporated in the Section E.7 emissions unit description box.

(c) Upon review, IDEM, OAQ finds that because applicability of 40 CFR 60, Subpart RRR is described by §60.700(b)(2) as each combination of a reactor process and the recovery system into which its vent stream is discharged, statements regarding the applicability of Subpart RRR have been changed throughout the permit:

... RRR, ... is **part of** an affected facility.

The hot separator and cold separator are considered to be the recovery devices to which the reactor processes discharge and have been added to the affected facilities, as follows:

...

(d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:

(1) ...

(10) One (1) hot separator, identified as Hot Separator, approved in 2019 for construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

...

**Under the NSPS, 40 CFR 60, Subpart RRR, the hot separator is part of an affected facility.**

...

(14) One (1) cold separator, identified as Cold Separator, approved in 2019 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

...

**Under the NSPS, 40 CFR 60, Subpart RRR, the cold separator is part of an affected facility.**

...

The inclusion of the hot separator and cold separator in the affected sources has also been incorporated in the Section E.9 emissions unit description box.

Finally, the citation to §§60.700(b) in Condition E.9.2 - Standards of Performance for Volatile Organic Compound Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Reactor Processes NSPS has been corrected to par. 60.700(b)(2) because the affected source is defined as each reactor process and the recovery system into which its vent stream is discharged, as follows:

E.9.2 Standards of Performance for Volatile Organic Compound Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Reactor Processes NSPS [326 IAC 12] [40 CFR Part 60, Subpart RRR]

---

The Permittee shall comply with the following provisions of 40 CFR Part 60, Subpart RRR (included as Attachment J to the operating permit), which are incorporated by reference as 326 IAC 12, for the emission unit(s) listed above:

- (1) 40 CFR 60.700(a)
- (2) 40 CFR 60.700(b)(~~3~~2)
- (3) ...

- (d) Statements regarding the applicability of 40 CFR 60, Subpart IIII have been changed throughout the permit because the regulation does not use the term "affected facility" commonly applied in New Source Performance Standards, as follows:

Under the NSPS, 40 CFR 60, Subpart IIII, **provisions of the subpart are applicable to ... ~~is an affected facility.~~**

- (e) Statements regarding the applicability of 40 CFR 61, Subpart BB have been changed throughout the permit because the regulation uses the term "affected facility" rather than "affected source", as follows:

Under the NESHAP, 40 CFR 61, Subpart BB, the Product Loading Rack is an affected ~~source~~ **facility**.

- (f) Statements regarding the applicability of 40 CFR 61, Subpart FF have been changed throughout the permit because the regulation does not use the terms "affected facility" or "affected source", as follows:

Under the NESHAP, 40 CFR 61, Subpart FF, **provisions of the subpart are applicable to ... ~~is part of an affected facility.~~**

- (g) Statements regarding the applicability of 40 CFR 63, Subpart CC have been changed throughout the permit, as follows:

Under the NESHAP, 40 CFR 63, Subpart CC, the ... is/are **part of** an affected source.

- (h) Statements regarding the applicability of 40 CFR 63, Subpart WW to certain tanks have been changed throughout the permit the regulation does not use the terms "affected facility" or "affected source", as follows:

~~Under~~ **Provisions of** the NESHAP, 40 CFR 63, Subpart WW, **apply to** T3 - T6 and T10 - T14 ~~are affected sources.~~

- (i) Typographical errors in the applicability statements for tanks regarding Subpart CC and Subpart WW were corrected in the Section D.6 and Section E.4 emissions unit description boxes, as follows:

... T10 - ~~T14~~ **T14**, ...

- (j) Upon review, IDEM, OAQ finds that the affected source of 40 CFR 63, Subpart UUU consists of "The process vent or group of process vents on Claus or other types of sulfur recovery plant units or the tail gas treatment units serving sulfur recovery plants that are associated with sulfur recovery." (§63.1562(b)(3)). The regulation does not define the term *sulfur recovery plant unit*, however the definition of *sulfur recovery unit* at 63.1579 is a "process unit that recovers elemental sulfur from gases that contain reduced sulfur compounds and other pollutants, usually by a vapor-phase catalytic reaction of sulfur dioxide and hydrogen sulfide." The combination of conjunctions in the definition of the affected facility and lack of clarity in definitions is somewhat confusing, but IDEM, OAQ recognizes the affected source of the subpart as limited to process vents and bypass lines on the Claus train and the tail gas treatment units (Sulfur Recovery Units A and B). Pursuant to 40 CFR 63.1562(b)(4), which is cited in Condition E.15.2 - National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units NESHAP, affected sources include each bypass line that could divert an affected vent stream away from a control device used to comply with the requirements of Subpart UUU.

The amine absorber system, amine regeneration unit, and sour water stripping system do not recover elemental sulfur and their process vents are therefore not affected streams. Bypass lines for the amine absorber system, amine regeneration unit, and sour water stripping system process vents are not affected sources because those bypass lines do not divert an affected vent stream away from a control device.

Descriptive information about the amine absorber system, amine regeneration unit, and sour water stripping system has been revised throughout the permit to remove applicability statements about Subpart UUU, as follows:

- (d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:

(1) ...

- (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:

(A)...

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the HP Absorber and LP Absorber is an affected source.~~

(18) ...

- (e) Sulfur recovery operations, identified as Block 3000, consisting of:

- (1) Amine Regeneration Unit, consisting of:

(A) ...

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Amine Recovery Unit is an affected source.~~

- (2) Sour Water Stripping System, consisting of:

(A) ...

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Sour Water Stripping System is an affected source.~~

(3) ...

The amine absorber system, amine regeneration unit, and sour water stripping system do not recover elemental sulfur and their process vents are therefore not affected streams for Subpart UUU. Therefore, the units have been deleted from the Section E.15 emissions unit description box, as follows:

~~(d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:~~

~~(17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:~~

~~(A)...~~

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the HP Absorber and LP Absorber is an affected source.~~

(e) Sulfur recovery operations, identified as Block 3000, consisting of:

~~(1) Amine Regeneration Unit, consisting of:~~

~~(A)...~~

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Amine Recovery Unit is an affected source.~~

~~(2) Sour Water Stripping System, consisting of:~~

~~(A)...~~

~~Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Sour Water Stripping System is an affected source.~~

(3) ...

### Mr. David Boggs Comment 3:

DRAFT Permit Condition D.12.1 provides that the leak detection and repair program specified in 40 CFR 60, Subpart GGGa shall serve as BACT for VOC fugitive emissions. The technology and work practices established in Subpart GGGa are over a decade old. Such practices do not incorporate use of low-emission (Low-E) valves (defined in Attachment B) (*of the commenter's letter*) in light liquid service and lowered leak definitions for valves and pumps. Commenter is aware of EPA Compliance Initiatives that have mandated use of Low-E valves and packings, and lowered leak definitions to 500 ppm for valves and 2000 ppm for pumps. As indicated by the footnote references, these practices represent enhancements to the LDAR programs otherwise applicable to multiple implementing facilities. Such work practices may not have been specifically considered when evaluating BACT selection; however, the practices should be considered as part of BACT for LDAR programs and included in the Permit PSD BACT requirements (Condition D.12.1) for control of VOC fugitive emissions.

### IDEM Response to Mr. David Boggs Comment 3:

The compliance initiatives cited by the commenter are consent decrees for a number of sources. Consent decrees may involve enforcement actions or other issues that are outside BACT concerns, therefore OAQ considered the BACT determinations that are in the RACT/BACT/LAER Clearinghouse (RBLC) database for petroleum refineries. The technology review was not limited

to the RBLC database but included permits and supporting documentation for sources in other states. The RBLC included entries as recent as 2016 and, despite some differences in wording, are not substantially different from the requirements of 40 CFR 60, Subpart VVa as it is incorporated in Subpart GGGa, which was determined to be BACT for the proposed source. IDEM, OAQ considers that the leak detection and repair program is the control technology, not the leak detection threshold.

Specification of "Low Emission" valves as an element of BACT for the source is not considered to offer any significant advantage and is not supported by determinations that were reviewed. First, the plant design does not include very many valves in light liquid service, a total of 66 in Blocks 2000 and 4000, so emissions reductions over what is already specified could total no more than about two and one half tons per year. Second, it is not clear how widely available low emission designs may be in the marketplace. While industry standards for fugitive emissions tests for packing and valves (e.g., API 622, API 624, and API 641) may be established, those standards may not yet be fully incorporated into design standards for all categories and classes of valves such that low-emissions design can be considered universal.

The situation with pumps is somewhat similar to valves. Leak-free or low-fugitive-emission designs are available in the market, and recognized in the LDAR testing requirements for pumps at 40 CFR 60.482-2a that are incorporated into Subpart GGGa. However, it is not appropriate for IDEM, OAQ to specify a particular pump design as BACT when that design may not actually be suitable for the service.

With regard to the use of technology or work practices that may reduce fugitive emissions, 40 CFR 60.592a expressly provides a mechanism for owners and operators subject to Subpart GGGa to establish a determination of equivalency for any means of emission limitation that achieves a reduction in emissions of VOC at least equivalent to the reduction in emissions of VOC achieved by the controls required in the subpart. There should also be no restriction on the source applying a lower leak detection threshold for any device if the lower threshold is supported by the device design and manufacturer's warranty. No changes were made as a result of this comment.

#### Mr. David Boggs Comment 4:

The DRAFT Permit refers to both an "Amine Regeneration Unit" and an "Amine Recovery Unit". Each identifier is used multiple times in the DRAFT Permit and TSD; however, it is not clear whether IDEM intends each to describe the same unit or different units.

#### IDEM Response to Mr. David Boggs Comment 4:

IDEM, OAQ has revised the unit description throughout the permit, as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

... amine ~~recovery~~ **regeneration** unit ...

#### Mr. David Boggs Comment 5:

The DRAFT Permit (page 166) identifies the Product Loading Rack as an affected facility under NSPS 40 CFR 60, Subpart GGGa and as an affected source under NESHAP, 40 CFR 63, Subpart CC. The Product Loading Rack may include "equipment" subject to equipment leak requirements under both Subpart GGGa and Subpart CC (e.g., valves and connectors); however, loading racks (often identified as transfer racks in some regulations), as such, do not constitute an "affected facility" under Subpart GGGa or an "affected source" under Subpart CC.

IDEM should clarify whether it has determined that the loading rack is the origin of a miscellaneous process vent subject to requirements of 40 CFR 63, Subpart CC. Additionally, IDEM should clarify whether specific control requirements apply to the Loading Flare under 40 CFR 63, Subpart CC and/or NSPS, 40 CFR 60, Subpart Ja.

### **IDEM Response to Mr. David Boggs Comment 5:**

Much of Mr. Boggs' Comment 5 as relates to the applicability of 40 CFR 60, Subpart GGGa to the Product Loading Rack is discussed in paragraph (a) of the IDEM Response to Mr. David Boggs Comment 2.

40 CFR 63.640(c)(5) designates gasoline loading racks as part of the affected source. However, upon review, IDEM, OAQ finds that the products loaded, diesel fuel and naphtha, are not gasoline as defined at 40 CFR 63.641 because the products are not petroleum distillates or petroleum distillate/alcohol blends having a Reid vapor pressure of 27.6 kilopascals or greater that is used as a fuel for internal combustion engines. Based on process modeling information provided by the source, the Reid Vapor Pressure of the product naphtha is on the order of 0.3 kPa. Based on vapor pressure information for diesel fuel in AP-42 Table 7.1-2 the Reid Vapor Pressure of diesel fuel is on the order of 0.003 kPa.

Descriptive information about the Product Loading Rack has been revised throughout the permit as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

(f) Offsites operations, identified as Block 4000, consisting of:

(1) ...

(3) Loading operations, as follows:

(A) One (1) 8-spot railcar loading rack ...

~~Under the NESHAP, 40 CFR 63, Subpart CC, the Product Loading Rack is part of an affected source.~~

The Section E.13 emissions unit description box has been revised as follows:

(d) ...

(f) Offsites operations, identified as Block 4000, consisting of:

(1) ...

~~(3) Loading operations, as follows:~~

~~(A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.~~

~~Under the NSPS, 40 CFR 60, Subpart GGGa, the Product Loading Rack is an affected facility.~~

~~Under the NESHAP, 40 CFR 61, Subpart BB, the Product Loading Rack is an affected source.~~

~~Under the NESHAP, 40 CFR 63, Subpart CC, the Product Loading Rack is an affected source.~~

Because the Product Loading Rack is not part of the affected source for Subpart CC, the Loading Flare is then not a control device for emission points subject to the subpart. Statements regarding the applicability of Subpart CC to the flares have been changed throughout the permit as follows:

Under the NESHAP, 40 CFR 63, Subpart CC, the ~~flares~~ **HP Flare, LP Flare, and SB Flare** are ~~affected sources-control devices for emission points subject to this subpart.~~

**Mr. David Boggs Comment 6:**

DRAFT Permit Condition E.13.3 at page 192 has been inadvertently designated E.13.2. This should be corrected.

**IDEM Response to Mr. David Boggs Comment 6:**

IDEM agrees with the recommended changes. The permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

...

E.13.23 Testing Requirements [326 IAC 2-1.1-11] [326 IAC 2-7-6(1)] [326 IAC 2-7-5(1)]

...

**Mr. David Boggs Comment 7:**

IDEM, OAQ has combined several paragraphs of the commenter's letter that make similar observations about the descriptive information.

Some DRAFT Permit descriptions reference emission units that are inadvertently missing. For example, product storage tanks, identified as part of the Block 4000 offsite operations, are in a table at DRAFT Permit page 133 and at the top of page 134; the tables list ID T1-T6 on page 133 and T13-T16 on page 134. Text below the table provides that, under NESHAP 40 CFR 63, Subpart CC, T10-T14 are part of an affected source. However, the tanks T10-T-14 are not included in the table.

The discussions of NSPS and NESHAP requirements for specified tanks following tank listing tables in some sections (e.g., Section E.14 at page 194) are not consistent in specifying tanks that are included in the table list. Such inconsistencies should be corrected.

**IDEM Response to Mr. David Boggs Comment 7:**

The table of tanks subject to conditions in Section D.12, cited by the commenter as appearing at pages 133 and 134 in the draft permit does not refer to the applicable requirements of 40 CFR 63, Subpart CC. Those NESHAP requirements are in Section E.13. It is standard IDEM, OAQ practice to include the NSPS and NESHAP applicability statements for a paragraph of descriptive information when that paragraph appears, in whole or in part, in an emissions unit description box. Section D.12 incorporates PSD BACT requirements for petroleum refinery units and state petroleum refinery requirements found at 326 IAC 8-4-2.

IDEM, OAQ has reviewed the applicability of federal rules and updated descriptive language (see IDEM Response to Mr. David Boggs Comment 2) as appropriate. With regard to tanks listed in the emissions unit description box at Section E.14, there is no inconsistency. Tanks listed in the table are those noted in the applicability statement as subject to requirements of 40 CFR 63, Subpart WW. As noted in the original Technical Support Document, however, tank T6 is subject to provisions of Subpart CC that reference Subpart WW only when containing diesel fuel.

No changes were made as a result of this comment.

**Mr. David Boggs Comment 8:**

DRAFT Permit Condition D.4.7(a) references the emissions limits established in Condition D.4.1(n). Condition D.4.1 does not include requirement (n); this error should be resolved.

**IDEM Response to Mr. David Boggs Comment 8:**

IDEM agrees with the recommended changes. The permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

...

**D.4.7 Record Keeping Requirement**

- 
- (a) To document the compliance status with Condition D.4.1~~(f)~~**(1)**, the Permittee shall maintain records in accordance with (1) through (3) below. Records maintained for (1) through (3) shall be taken monthly and shall be complete and sufficient to establish compliance with the emission limits established in Condition D.4.1~~(f)~~**(1)**.

(1) ...

**Mr. David Boggs Comment 9:**

The outline hierarchy in many description boxes does not follow a logical sequence and contains many sequential gaps. This complicates understanding completeness, implementation and enforcement of the Permit; this is particularly problematic when the description boxes are referenced to define the scope for an applicable requirement.

**IDEM Response to Mr. David Boggs Comment 9:**

Paragraph lettering and numbering in the emissions unit description boxes is not intended to establish any sort of an outline. Instead, the paragraph lettering and numbering from Section A are maintained in the description boxes for units and insignificant activities subject to requirements in the D- and E-sections. No changes were made as a result of this comment.

**Mr. David Boggs Comment 10:**

DRAFT Permit Condition D.3.7 addresses continuous monitoring to demonstrate compliance with Condition D.3.1(b)(2), which limits SO<sub>2</sub> emissions, measured in tons/year (i.e., mass emissions). DRAFT Permit Condition D.3.7(a) requires continuous monitoring of fuel gas total sulfur concentration. DRAFT Permit Condition D.3.7(b) provides "The SO<sub>2</sub> emissions shall be calculated based on the conversion of one mole of sulfur in the fuel gas to one mole of SO<sub>2</sub>."

However, the permit is silent on monitoring the volume of fuel gas consumed, which is a necessary parameter to convert concentration data to mass emissions. The DRAFT Permit must specify acceptable methods or sources of data for fuel usage volume data to be used in the calculation to demonstrate compliance.

**IDEM Response to Mr. David Boggs Comment 10:**

Condition D.3.13 requires keeping records of fuel gas usage. In combination with the continuous fuel gas sulfur content monitoring at Condition D.3.7 and concentration-based limits found in Conditions D.3.1(b)(2) and D.3.2 this data is considered sufficient to demonstrate compliance. No changes were made as a result of this comment.

**Mr. David Boggs Comment 11:**

EPA finalized amendments to both 40 CFR 60, Subpart Ja and 40 CFR 63, Subpart CC in the Federal Register on November 26, 2018 beginning at page 60696. The amendments became effective immediately. IDEM should include the amendments in the final Permit by both including an updated Attachment N to the Permit and appropriately revising (or adding) applicable requirement citations within the body of the Permit to reflect any amendments deemed applicable.

**IDEM Response to Mr. David Boggs Comment 11:**

The November 26, 2018 notice (83 FR 60696), which was published while the draft permit was on public notice, included revisions to 40 CFR 60, Subpart Ja, 40 CFR 63, Subpart CC, and 40 CFR 63, Subpart UUU. IDEM, OAQ has reviewed the November 26, 2018 Federal Register notice and found that the NSPS and NESHAP revisions do not affect the applicable requirement citations in the permit. No changes were made as a result of this comment.

Attachments D, N, and P have been revised to incorporate the November 26, 2018 final rule.

**Mr. David Boggs Comment 12:**

IDEM should clarify whether the Permit already includes (or needs to have added) applicable requirements pertaining to aniline use.

**IDEM Response to Mr. David Boggs Comment 12:**

According to information provided by the source, aniline will be used only when commissioning process catalyst in the VCC unit (Block 2000) which is expected to take place once every two years.. Aniline is not one of the HAPs listed in Table 1 of Subpart CC of Part 63, and the VCC unit is not an affected source or part of an affected source for another subpart of Part 63. The commenter referred to Subpart EEEE, National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline). The definition of *organic liquid* in Subpart EEEE (at 40 CFR 63.2406) excludes any non-crude oil liquid with an annual average true vapor pressure less than 0.7 kilopascals (0.1 psia) determined at standard conditions of 77°F and 29.92 millimeters of mercury. As determined using information in Table 3-8, Perry's Chemical Engineers' Handbook, 6th ed. (McGraw-Hill, New York, 1984), the vapor pressure of aniline at 77°F is <0.1 kPa and the compound is therefore not an organic liquid for the purposes of Subpart EEEE. No changes were made as a result of this comment.

**Mr. David Boggs Comment 13:**

The scope of the 40 CFR 63, Subpart CC affected source 40 (see 40 CFR 63.640(c)(8)) includes heat exchange systems, as defined in 63.641. Commenter did not find the Subpart CC requirements applicable to heat exchange systems appropriately incorporated in the DRAFT Permit. The final Permit must include all requirements applicable to the heat exchange systems.

**IDEM Response to Mr. David Boggs Comment 13:**

The source has provided additional information identifying blocks where petroleum refinery process unit heat exchangers subject to Subpart CC are expected to operate. These include Blocks 2000, 3000, and 7000. The cooling tower (EU-6001) is also part of a heat exchange system as defined at 40 CFR 63.641. The emission unit descriptions in Condition A.2 and Section E.13 have been revised as follows, with deleted language as ~~strikeouts~~ and new language **bolded**:

A.2 Emission Units and Pollution Control Equipment Summary [326 IAC 2-7-4(c)(3)][326 IAC 2-7-5(14)]

---

This stationary source consists of the following emission units and pollution control devices:

- (a) ...
- (d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
  - (1) ...

- (18) Block 2000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.**

**Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.**

- (e) Sulfur recovery operations, identified as Block 3000, consisting of:

(1) ...

- (4) Block 3000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.**

**Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.**

(f) ...

- (h) Utilities operations, identified as Block 6000, consisting of:

(1) ...

- (2) One (1) three-cell crossflow mechanical draft cooling tower, identified as EU-6001, approved in 2019 for construction, with a maximum capacity of 32,000 gallons per hour, equipped with mist eliminators and exhausting to stacks EU-6001, EU-6002, and EU-6003.

**Under the NESHAP, 40 CFR 63, Subpart CC, the three-cell cooling tower is part of an affected source.**

(3) ...

- (j) Hydrogen unit operations, identified as Block 7000, as follows:

(1) ...

- (3) Block 7000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.**

**Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.**

No change is being made to the list of applicable requirements at Condition E.13.2 - National Emission Standards for Hazardous Air Pollutants From Petroleum Refineries NESHAP at this time because the Permittee has indicated that it does not intend to claim the exemption at 40 CFR 63.654(b) for any heat exchange systems. The condition continues to cite 40 CFR 63.654 in its entirety.

**Mr. David Boggs Comment 14:**

TSD page 42 states "The treat gas heater, EU-2002, is not in VOC service. The fluid stream heated in the unit can be reasonably expected always to exceed 50 percent hydrogen by volume. Therefore, Subpart GGGa is not applicable to this unit." This is an example of considering applicability for a unit operation (treat gas heater) that is not an affected facility under Subpart GGGa. The Commenter believes the 50 percent hydrogen basis to exclude the unit from Subpart GGGa may be a misapplication of the exemption provided in 40 CFR 60.593a that applies to exempt compressors (which are affected facilities under Subpart GGGa) from requirements in 40 CFR 60.592a. The consideration of applicability for compressors does not apply to other affected facility equipment (e.g., valves, relief devices, connectors, etc.). If IDEM evaluated the equipment (e.g., valves, relief devices, connectors, etc.) associated with the treat gas heater, EU-2002, for Subpart GGGa applicability, the standard that must be used is whether the equipment is "in VOC service" pursuant to 40 CFR 60.481 (i.e., equipment contains or contacts process fluid that is at least 10 percent VOC by weight). A fluid that contains greater than 50 percent by volume hydrogen may or may not contain less than 10 percent VOC by weight. IDEM should reconsider its assessment of Subpart GGGa applicability for the treat gas heater, EU-2002 and clarify its intent

**IDEM Response to Mr. David Boggs Comment 14:**

Pursuant to 40 CFR 60.590a(a)(3), the group of all the equipment within a process unit is an affected facility. Equipment is defined at §60.591a as each valve, pump, pressure relief device, sampling connection system, open-ended valve or line, and flange or other connector in VOC service. §60.591a does not define the term "in VOC service", but incorporates the definitions in Subpart VVa, where "in VOC service" is defined as "... piece of equipment contains or contacts a process fluid that is at least 10 percent VOC by weight." According to R.N. Shreve and J. A. Brink, Chemical Process Industries, 4th Ed. (McGraw Hill, New York 1977), the product of a typical water gas shift reaction contains 75% H<sub>2</sub>, 8% CO, and 15% CO<sub>2</sub>, with the remainder nitrogen and methane. None of those named components of the product stream are VOC. Expressing those volume percentages as weight percent and considering all of the nitrogen and methane fraction as propane as a worst case for the light hydrocarbon overhead from the VCC process, shows that the VOC content of the water gas shift reaction product stream is less than 8% by weight. The treat gas heater (EU-2002) is therefore not in VOC service and is not part of the affected source for subpart GGGa. No changes were made as a result of this comment.

**Mr. David Boggs Comment 15:**

If the liquid phase hydrocracker section (LPH), gas phase hydrotreater section (GPH), vacuum distillation tower, and fractionator tower are part of a petroleum refining process unit, why are requirements of CFR 60, Subparts NNN and RRR applicable? The TSD attempts to address this at TSD page 48: "...because the units are part of a process unit that produces one or more of the chemicals listed in 40 CFR 60.667 as a product, co-product, byproduct, or intermediate." However, if true, this raises two more questions:

- (1) Because 40 CFR 60, Subparts NNN and RRR were developed to regulate the Synthetic Organic Chemical Manufacturing Industry (SOCMI) distillation and reactor processes in a process unit that produces any of the chemicals listed in 40 CFR 60.667 and 60.707, respectively, do operations assigned applicability under Subparts NNN and RRR constitute separate SOCMI operations process units that are typically regulated under MACT standards in 40 CFR 63, Subparts F, G, H and/or FFFF?
- (2) If 40 CFR 60, Subparts NNN and RRR apply, why does 40 CFR 60, Subpart VVa not apply, and if Subpart VVa does not apply, why do Subparts NNN and RRR apply?

**IDEM Response to Mr. David Boggs Comment 15:**

For purposes of applicability in 40 CFR 60, Subparts NNN and RRR, "*Product* means any compound or chemical listed in §60.707 which is produced for sale as a final product as that chemical, or for use in the production of other chemicals or compounds. By-products, co-products, and intermediates are considered to be products." The review of Subpart NNN in the TSD did not identify the listed chemical produced in the process unit, although it was named in the review for Subpart RRR. The distillation operations subject to Subpart NNN and reactor processes subject to Subpart RRR are part of a process unit that will produce benzene, a chemical listed in §60.707 as a byproduct.

With regard to the interaction of Subpart NNN and Subpart RRR applicability with the other federal regulations questioned in the numbered sub-paragraphs of the comment, as noted in the original Technical Support Document:

- (a) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry, 40 CFR 63, Subpart F and 326 IAC 20-11 are not included in the permit for this source, since the source does not manufacture as a primary product one or more of the chemicals listed in 40 CFR 63.100(b)(1)(i) or (ii). Note that this subpart does not include byproducts in its definition of product.
- (b) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry for Process Vents, Storage Vessels, Transfer Operations, and Wastewater, 40 CFR 63, Subpart G and 326 IAC 20-11 are not included in the permit for this source, since the source is not subject to 40 CFR 63, Subpart F.
- (c) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry for Equipment Leaks, 40 CFR 63, Subpart H, 326 IAC 20-11, and 326 IAC 20-12 are not included in the permit. The source is not subject to provisions of 40 CFR 63, Subpart CC that reference this subpart.
- (d) The requirements of the National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing, 40 CFR 63, Subpart FFFF and 326 IAC 20-84, were not discussed in the original Technical Support Document. The requirements of this subpart are not included in the permit for this source, because the source does not produce any material or family of materials described in 40 CFR 63.2435(b)(1)(i) through (iv) and because organic chemical manufacturing process units at the source are affected sources or parts of affected sources under other subparts of Part 63.
- (e) The requirements of the Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006, 40 CFR 60, Subpart VVa and 326 IAC 12, are not included in the permit for the source, because the source is not in the synthetic organic chemical manufacturing industry as defined at 40 CFR 60.481a. The source does not produce, as an intermediate or final product, one or more of the chemicals listed in 40 CFR 60.489. Note that, again, this subpart does not include byproducts in its definition of product.

Because determinations by U.S. EPA regarding applicability of the subparts listed in the basic comment that are found in the ADI (see link at Comment 1) are not specific to the present case, IDEM, OAQ has chosen to include the subparts in applicable requirements for the source. IDEM, OAQ will retain the requirements until such time as the source may request a specific determination of applicability from the U.S. EPA. No changes were made as a result of this comment.

**Mr. Michael Langman Comments and IDEM Responses**

On December 10, 2018, Mr. Michael Langman, U.S. EPA Region 5, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

Permit Comments

**EPA Permit Comment 1:**

Condition D.1.1 incorporates PM, PM<sub>10</sub>, and PM<sub>2.5</sub> best available control technology (BACT) requirements for the coal handling operations. The BACT determination requires 0% visible emissions from the entrance and exit doors of the unloading enclosure at any time. However, the permit does not appear to include monitoring or recordkeeping requirements to determine compliance with this BACT requirement. 326 IAC 2-7-5(3) and 40 C.F.R. 70.6(a)(3) require the part 70 permit to include monitoring and sufficient recordkeeping to obtain reliable data representative of the source's compliance with the permit. We request that you either add periodic visible emissions monitoring requirements to the permit or explain how the draft permit currently requires the source to demonstrate compliance with the limit.

**IDEM Response to EPA Permit Comment 1:**

Condition D.1.4 - Testing Requirements, includes opacity testing for the baghouse (EU-1000) that maintains the negative pressure conditions in the coal unloading enclosure. Such opacity testing includes both the BACT requirement at Condition D.1.1(b) and the NSPA requirements at 40 CFR 60, Subpart Y. IDEM, OAQ considers that the compliance monitoring requirements for the baghouses and enclosures and the inspection requirements for the enclosure demonstrate compliance with the opacity limit. IDEM, OAQ notes that the Idaho permit (PTC P-2008.0066, February 10, 2009) referenced in determining BACT for the enclosures does not include periodic visible emissions monitoring other than testing as incorporated in the draft PSD/New Source Construction and Part 70 Operating Permit. No changes were made as a result of this comment.

**EPA Permit Comment 2:**

Condition D.1.8 requires daily recordkeeping of the negative pressure and inward velocity of the unloading enclosure, but not the coal storage enclosure. Condition D.1.6 requires the source to either maintain negative pressure or maintain a minimum inward flow velocity through each opening. We request that you include similar coal stockpile enclosure recordkeeping requirements to determine compliance with condition D.1.6.

**IDEM Response to EPA Permit Comment 2:**

IDEM, OAQ agrees that record keeping requirements for the coal storage enclosures were unintentionally left out of Condition D.1.8. In addition, because the term "door" may suggest an intermittent barrier to passage, the term in paragraph D.1.8(a) and paragraph D.1.11(b) has been changed to "opening." IDEM added a word unintentionally not included in paragraph D.1.11(c). IDEM has also changed the titles of Conditions D.1.5 and D.1.6 to "... Enclosure Control" consistent with the typical usage in compliance determination conditions. Section D.1 has been revised as follows, with deleted language as ~~strikeouts~~ and new language **bolded**:

...

D.1.5 Coal Unloading Enclosure ~~Monitoring~~ **Control**

---

...

D.1.6 Coal Storage Enclosure ~~Monitoring~~ **Control**

---

...

D.1.8 Enclosure Monitoring

---

- (a) The Permittee shall record the negative pressure or velocity at each unloading enclosure ~~door~~ **opening** at least once per day when the associated emissions unit is in operation. When, for any one reading, a measured value is outside the following specifications, the Permittee shall take a reasonable response.

Parameter	Range
Negative Pressure	Equal to or Greater than 0.013 millimeters or seven-thousandths (0.007) inches of water
Inward Velocity	200 feet per minute (1.016 m/sec)

- (b) **The Permittee shall record the negative pressure or velocity at each coal storage enclosure opening at least once per day when the associated emissions unit is in operation. When, for any one reading, a measured value is outside the following specifications, the Permittee shall take a reasonable response.**

Parameter	Range
<b>Negative Pressure</b>	<b>Equal to or Greater than 0.013 millimeters or seven-thousandths (0.007) inches of water</b>
<b>Inward Velocity</b>	<b>200 feet per minute (1.016 m/sec)</b>

- (bc) ...

D.1.11 Record Keeping Requirement

---

- (a) ...
- (b) To document the compliance status with Condition D.1.8(a), the Permittee shall maintain daily records of negative pressure across each unloading enclosure ~~door~~ **opening** or air velocity. The Permittee shall include in its daily record when a measurement is not taken and the reason for the lack of a measurement (e.g. the process did not operate that day).
- (c) To document the compliance status with Condition D.1.8(b), the Permittee shall maintain daily records of negative pressure across each storage enclosure **opening** or air velocity. The Permittee shall include in its daily record when a measurement is not taken and the reason for the lack of a measurement (e.g. the process did not operate that day).
- (d) ...

**EPA Permit Comment 3:**

Condition D.1.8(a) requires the Permittee to take a reasonable response when a monitored enclosure parameter is outside of the established range. However, condition D.1.8(a) does not establish reasonable response requirements. We understand that section C.16 of the draft permit (Responses to Excursions and Exceedances) is typically referred to whenever a reasonable response is required. If section C.16 applies, we suggest referring to it in this condition. Otherwise, we request that you specify any reasonable response requirements, such as the expected response, when the permittee must reasonably respond, and any appropriate recordkeeping requirements to demonstrate that a reasonable response was taken.

**IDEM Response to EPA Permit Comment 3:**

IDEM, OAQ agrees that a reference to Section C - Response to Excursions and Exceedances is consistent with other compliance monitoring provisions. A new paragraph (d) is added to Condition D.1.8, as follows with new language **bolded**:

#### D.1.8 Enclosure Monitoring

---

- (a) ...
- (d) **If abnormal negative pressure or velocity measurements are observed, the Permittee shall take a reasonable response. Section C - Response to Excursions and Exceedances contains the Permittee's obligation with regard to the reasonable response steps required by this condition. Failure to take response steps shall be considered a deviation from this permit.**

#### EPA Permit Comment 4:

Condition D.1.9 generally requires the Permittee to inspect the unloading enclosure and storage enclosure once per month. However, this condition does not specify what constitutes a failed inspection nor does it establish any response requirements to a failed inspection. We note that conditions D.1.5(a) and D.1.6(a) require each enclosure to be free of cracks, gaps, corrosion, or other deterioration. If these the conditions necessitate the inspection requirement, then the inspection requirement should require the source to take timely, appropriate action if the enclosures are cracked, have gaps, are corroded, or are otherwise deteriorated.

#### IDEM Response to EPA Permit Comment 4:

IDEM, OAQ agrees with the recommended clarification of Condition D.1.9 - Enclosure Inspection. The condition has been revised as follows with new language **bolded**:

#### D.1.9 Enclosure Inspection

---

- (a) The Permittee shall inspect the unloading enclosure and structure at least once per month **to verify that it is free of cracks, gaps, corrosion, or other deterioration.**
- (b) The Permittee shall inspect each storage enclosure and structure at least once per month **to verify that it is free of cracks, gaps, corrosion, or other deterioration.**
- (c) **If abnormal conditions are observed, the Permittee shall take a reasonable response. Section C - Response to Excursions and Exceedances contains the Permittee's obligation with regard to the reasonable response steps required by this condition. Failure to take response steps shall be considered a deviation from this permit.**

#### EPA Permit Comment 5:

Condition D.3.1(a)(2), (c)(2), (d)(2), (e)(2), and (f)(3) and D.4.1(l) require the Permittee use good combustion practices. This includes flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature monitoring and maintaining each parameter within the manufacturer's recommended operating guidelines or in a range otherwise indicative of proper operation of the emissions unit.

- a. Combustion air flow and flue gas temperature monitoring and recordkeeping requirements do not appear in the permit. We request that you either include air flow and flue gas temperature monitoring in the permit or explain how air flow and flue gas temperature monitoring already occurs as part of the permit.
- b. We request that you specify how the permittee may establish alternate operating parameters that indicate of proper operation of the emissions unit. As written, the permit appears to allow the Permittee to establish alternate operating guidelines in any way and at any time. Further, the permit does not appear to require the Permittee to maintain records showing how the alternate parameters were established.

#### **IDEM Response to EPA Permit Comment 5:**

IDEM, OAQ reviewed permits from a number of states to complete the BACT determinations for fuel gas combustion units and SRU tail gas incinerators. Most permits considered (examples from Ohio, Illinois, Wyoming, Montana, and Idaho), included nothing to define "good combustion practices." The most extensive definition was found in multiple Louisiana PSD permits that provided the language applied in the draft PSD/New Source Construction and Part 70 Operating Permit. Permits from Oklahoma and Texas used definitions of "good combustion practices" between the two extremes.

While the number of Louisiana PSD permits considered was rather extensive, IDEM found that many of the Louisiana documents did not establish BACT for Riverview Energy Corporation. The most common reason that a Louisiana permit was found not useful in the present analysis was that the source, while similar in some respects to the proposed Riverview Energy source, was in a different SIC code. In some instances, the Louisiana sources found in the RBLC search had not been constructed and were thus not suitable for establishing BACT in the current analysis because compliance with the BACT limits could not be demonstrated. Nevertheless, IDEM did adopt the Louisiana good combustion practices language as the most detailed found in the BACT research process.

Upon further review, IDEM finds that the operating permits issued in associated with the cited Louisiana PSD permits do not appear to include monitoring and sufficient record keeping to obtain reliable data representative of the source's compliance with the permit. This observation is applicable to permit number 2840-V4, Alliance Refinery, RBLC ID No. LA-0283, cited in the Step 4 VOC table for fuel gas combustion units >100 MMBtu/hr and permit number 2520-00027-V8, St Charles Refinery, RBLC ID No. LA-0213, cited in the Step 4 VOC table for fuel gas combustion units <100 MMBtu/hr. IDEM considers therefore that these RBLC entries do not establish BACT for units at Riverview Energy Corporation and the definition of "good combustion practices" in the Louisiana PSD permits is considered not applicable to the proposed source.

Although the Louisiana definition of "good combustion practices" is not supported in permit conditions, the requirement to apply good combustion practices appears in some other references. Other states include good combustion practices in BACT determinations for particulate matter, SO<sub>2</sub>, CO, and greenhouse gases. Examples of explanatory language about good combustion practices include;

- Excess oxygen monitoring and annual burner tuning and heater inspection (Ohio)
- Furnace excess air control (Texas)
- Good combustion practice includes operational and design elements to control the amount and distribution of excess air in the flue gas (Oklahoma)

IDEM, OAQ finds that a requirement to apply good combustion practices is a consistent element of BACT for particulate matter, SO<sub>2</sub>, CO, and greenhouse gases. Based on a review of language applied in other states, good combustion practices are defined as the installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit and compliance with the tune-up requirements of 40 CFR 63.7540(a)(10), (11) or (12) that are applicable to the unit. The determination of NO<sub>x</sub> and VOC BACT for the fuel gas combustion units therefore does not include a requirement to apply good combustion practices.

Condition D.3.1 - Prevention of Significant Deterioration (PSD) BACT of the draft PSD/New Source Construction and Part 70 Operating Permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

D.3.1 Prevention of Significant Deterioration (PSD) BACT [326 IAC 2-2-3]

---

...

(a) ...

(2) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit **installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**

(3) ...

(b) The Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the fuel combustion units shall be as follows:

(1) The units shall burn only natural gas and process off-gas.

(2) The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month.

(3) SO<sub>2</sub> emissions shall not exceed:

SO <sub>2</sub> Emission Limitations	
Unit ID	tpy
EU-1007	0.35
EU-2001	0.80
EU-2002	0.33
EU-2003	0.06
EU-2004	0.97
EU-6000	0.42

(4) **The units shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**

(c) ...

~~(2) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.~~

~~(3) The units shall use ultra-low-NOx burners.~~

(43) NOx emissions shall not exceed:

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-1007	0.030	1.67

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-2001	0.030	3.85
EU-2002	0.030	1.58
EU-2003	0.030	0.27
EU-2004	0.030	4.68
EU-6000	0.030	2.06

(d) ...

(2) ~~The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.~~

(32) VOC emissions shall not exceed:

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-1007	0.0054	0.30
EU-2001	0.0054	0.69
EU-2002	0.0054	0.29
EU-2003	0.0054	0.05
EU-2004	0.0054	0.84
EU-6000	0.0054	0.37

(e) ...

(2) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit **installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**

(3) ...

(f) ...

(3) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit **installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**

(4) ...

- (g) Oxygen trim systems for fuel gas combustion units shall be installed and operated in accordance with the system or burner suppliers' specifications or the most recent valid compliance demonstration.**

The above paragraphs are specific to the application of "good combustion practices" as BACT for fuel gas combustion units. Upon further review, IDEM finds that the Montana permit cited as determining PM/PM<sub>10</sub>/PM<sub>2.5</sub> BACT for the tail gas treatment units (number 2619-24, Conoco Phillips, RBLIC ID No. MT-0030) also appears to include no definition of the term "good combustion practices" and no monitoring and record keeping terms that demonstrate compliance with a requirement to apply such practices. As with the Louisiana permits discussed above, IDEM concludes that the lack of definition and absence of monitoring and record keeping provision make this Montana example (RBLIC ID No. MT-0030) unsuitable for the purpose of determining BACT for tail gas treatment units at the proposed source. The determination of PM/PM<sub>10</sub>/PM<sub>2.5</sub> BACT for the tail gas treatment units therefore does not include a requirement to apply good combustion practices.

Condition D.4.1 - Prevention of Significant Deterioration (PSD) BACT of the draft PSD/New Source Construction and Part 70 Operating Permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

D.4.1 Prevention of Significant Deterioration (PSD) BACT [326 IAC 2-2-3]

---

...

- ~~(l) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.~~
- (m)** Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.

**EPA Permit Comment 6:**

Condition D.4.1(d) incorporates an SO<sub>2</sub> concentration BACT limit applicable to the tail gas treatment unit (TGTU) stacks. For clarity, we suggest that you specify that the limit applies to each stack separately. As written, it appears that the limit may apply to both stacks combined.

**IDEM Response to EPA Permit Comment 6:**

IDEM, OAQ considered a concentration limit not subject to a distinction between an "each" or "combined" basis. IDEM agrees with the recommended clarification, since it involves no change to the meaning of the limits. Paragraph D.4.1(d) has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

D.4.1 Prevention of Significant Deterioration (PSD) BACT [326 IAC 2-2-3]

---

...

- (d)** The SO<sub>2</sub> emissions from ~~the~~ **each** tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).
- (e)** ...

**EPA Permit Comment 7:**

Condition D.4.1(k) incorporates an opacity requirement as BACT. However, the permit does not require opacity monitoring or testing. Both 326 IAC 2-7-5(3) and 40 C.F.R. § 70.6(a)(3) require the permit to include monitoring and sufficient recordkeeping to obtain reliable data representative of the source's compliance with the permit. We request that you either add periodic opacity monitoring and testing to the permit or provide justification demonstrating that opacity monitoring is not required.

**IDEM Response to EPA Permit Comment 7:**

IDEM agrees with the recommended changes, since opacity testing was unintentionally not included in the testing requirements in Section D.4. Condition D.4.3 - Testing Requirements has been revised as follows with new language **bolded**:

D.4.3 Testing Requirements [326 IAC 2-1.1-11]

- (a) In order to demonstrate compliance with Condition D.4.1(a), (b), (c), (g), (h), (i), and (j), not later than 180 days after the startup of EU-3001, the Permittee shall perform PM, PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub>, VOC, CO, **opacity**, and sulfuric acid mist testing of EU-3001 utilizing methods approved by the commissioner at least once every five years from the date of the most recent valid compliance demonstration.
- (b) In order to demonstrate compliance with Condition D.4.1(a), (b), (c), (g), (h), (i), and (j), not later than 180 days after the startup of EU-3002, the Permittee shall perform PM, PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub>, VOC, CO, **opacity**, and sulfuric acid mist testing of EU-3002 utilizing methods approved by the commissioner at least once every five years from the date of the most recent valid compliance demonstration.
- (c) ...

**EPA Permit Comment 8:**

Condition D.4.6(b)(1) requires alternate SO<sub>2</sub> monitoring during SO<sub>2</sub> CEMS downtime. We request that you clarify what this condition means when it says "as required". Based on our discussion with your staff, we understand that this requirement only applies to the emission unit with the failed SO<sub>2</sub> CEMS. The other emission unit with an operational SO<sub>2</sub> CEMS is still required to use the CEMS to determine compliance with the SO<sub>2</sub> limits.

**IDEM Response to EPA Permit Comment 8:**

IDEM agrees with the recommended changes. Condition D.4.6 - SO<sub>2</sub> Continuous Emissions Monitoring (CEMS) Equipment Downtime has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

D.4.6 SO<sub>2</sub> Continuous Emissions Monitoring (CEMS) Equipment Downtime

- (a) ...
- (b) ...
  - (1) The Permittee shall measure and record Draeger tube sampling of the hydrogen sulfide (H<sub>2</sub>S) concentration in amine absorber T-602A or T-602B (~~as required~~ **whichever serves the SRU with a malfunctioning CEMS**) offgas to incinerator. These parametric monitoring readings shall be recorded at least once per hour until the primary CEMS or backup CEMS is brought online. **If the primary or backup CEMS for the other SRU is operating while the Permittee conducts downtime monitoring for a SRU, the Permittee shall continue operating the functioning CEMS.**

(c) ...

**EPA Permit Comment 9:**

Condition D.9.2 establishes annual operating requirements for both the emergency generator and emergency fire pump. These requirements are being included to ensure the assumptions made in the air quality analysis are enforceable. 40 C.F.R. 51 Appendix W Table 8-2 states that the operating factor must be modeled for all hours of each time period under consideration. Appendix W Table 8-2 footnote 2 further states that the modeled emission rate may be adjusted if it is constrained by a federally enforceable permit condition for all hours of the time period of consideration. We request that you either include a daily limit on the number of hours the generator and the fire pump may operate to allow for an adjusted modeled emission rate in the short-term analysis or provide justification explaining why a short-term limit is not necessary.

**IDEM Response to EPA Permit Comment 9:**

Emergency Generators have been included in the modeling and are limited in permit Condition D.9.2 to operate no more than 100 and 200 hours per twelve (12) consecutive month period, respectively, for each of EU-6006 and EU-6008. These units are treated as intermittent emission units, meaning the units do not operate continuously enough or frequently enough to contribute significantly to the annual distribution of maximum daily 1-hour concentrations. Therefore, IDEM references U.S. EPA's March 1, 2011 memo "Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1-hour NO<sub>2</sub> National Ambient Air Quality Standard" and "SO<sub>2</sub> NAAQS Designations Modeling Technical Assistance Document" dated August 2016 in its treatment of the emergency generators and startup/shutdown emissions as intermittent sources.

As part of the ATSD, 24-hour PM<sub>10</sub>, and PM<sub>2.5</sub> modeling was changed due to increased modeled emissions from emergency equipment (see Appendix C to this ATSD for the revised air quality analysis in its entirety). Because the 24-hour and annual PM<sub>2.5</sub> modeling was conducted within the same model run, annual PM<sub>2.5</sub> concentrations also increased as a result of the emergency generators running at their maximum hourly rate. The annual PM<sub>2.5</sub> concentration in Table 2 of Appendix C is likely an overestimate, however, as these units are limited to a maximum of 100 and 200 hours respectively of operation within a given year. IDEM, OAQ considers that a short-term limit is not necessary because modeling the emergency engines at their maximum hourly rates for all pollutants did not cause or contribute to any NAAQS violations. See Appendix C to this ATSD for the revised air quality analysis in its entirety.

**EPA Permit Comment 10:**

Condition E.1.2 incorporates the requirements of 40 C.F.R. Part 60 Subpart Db. We request that you verify whether the following requirements apply.

- a. Condition E.1.2(7) and (8) refer to 40 C.F.R. Part 63, not 40 C.F.R. Part 60.
- b. Condition E.1.2(18) should also include 40 C.F.R. 60.48b(e)(3). This requirement describes how span values calculated in 40 C.F.R. § 60.48b(e)(2) should be rounded.

**IDEM Response to EPA Permit Comment 10:**

- (a) Typographical errors in Condition E.1.2 have been corrected as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

E.1.2 Standards of Performance for Industrial-Commercial-Institutional Steam  
Generating Units NSPS [326 IAC 12][40 CFR Part 60, Subpart Db]

---

...

- (7) 40 CFR ~~63~~ **60.44b(c)**

- (8) 40 CFR ~~63~~ **60.44b(e)**
- (9) ...

(b) IDEM agrees with the recommended changes. The permit has been revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

E.1.2 Standards of Performance for Industrial-Commercial-Institutional Steam  
Generating Units NSPS [326 IAC 12][40 CFR Part 60, Subpart Db]

---

...

- (19) 40 CFR 60.48(e)(3)**
- ~~(1920)~~ 40 CFR 60.48b(f)
- ~~(2021)~~ 40 CFR 60.49b

**EPA Permit Comment 11:**

Condition E.5.2(5) incorporates 40 C.F.R. § 60.252(b)(2). However, TSD page 41 states more specifically that 40 C.F.R. § 60.252(b)(2)(iii) applies. We request that you verify whether the permit should contain the requirements as described in the TSD.

**IDEM Response to EPA Permit Comment 11:**

Upon review, IDEM, OAQ finds that the discussion of Subpart Y applicability in the TSD was not updated to incorporate the most recent equipment details of the coal drying loop. Pursuant to 40 CFR 60.252(c), thermal dryers receiving all of their thermal input from an affected facility covered under another 40 CFR Part 60 subpart must meet the applicable requirements in that subpart but are not subject to the requirements in Subpart Y. The Coal Dryer Heater is an affected facility, a fuel gas combustion device, under 40 CFR 60, Subpart Ja and supplies all of the heat input to the Coal Dryer. The standards for various pollutants in §60.252(b) are superseded by the general exclusion at §60.252(c).

The Coal Dryer, Coal Dryer Heater, and Drying Loop Condenser are parts of an indirect thermal dryer that is an affected facility under Subpart Y. However, pursuant to 40 CFR 60.252(c), because the thermal dryer receives all of its heat input from an affected facility subject to another subpart of Part 60, the Coal Dryer, Coal Dryer Heater, and Drying Loop Condenser are not subject to the requirements in Subpart Y. The Coal Mill & Pulverizer and Coal Dryer Baghouse are considered coal processing and conveying equipment and are still subject to the requirements of Subpart Y.

Condition E.5.2 - Standards of Performance for Coal Preparation and Processing Plants NSPS is revised as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

E.5.2 Standards of Performance for Coal Preparation and Processing Plants NSPS  
[326 IAC 12][40 CFR Part 60, Subpart Y]

---

...

- ~~(4)~~ 40 CFR ~~60.252(b)(1)~~
- ~~(5)~~ 40 CFR ~~60.252(b)(2)~~

- (41) Table 44 to Subpart UUU of Part 63**

**EPA Permit Comment 16:**

40 CFR Part 63, Subpart CC, at 40 CFR § 63.648(a), requires each owner or operator of a new source subject to the provisions of Subpart CC to comply with the National Emission Standards for Hazardous Air Pollutants (NESHAPs) from the Synthetic Organic Chemical Manufacturing Industry for Equipment Leaks, 40 CFR 63, Subpart H, except as provided in 40 CFR 63.648(c) through (j). TSD Page 55 states *"The requirements of ... 40 CFR 63, Subpart H ... are not included in the permit. The source is not subject to provisions of 40 CFR 63, Subpart CC that reference this subpart. Pursuant to 40 CFR 63.640(p)(2), equipment leaks subject to 40 CFR 63, Subpart CC that are also subject to 40 CFR 60, Subpart GGGa are required to comply only with the provisions specified in 40 CFR 60, Subpart GGGa."*

However, the permit indicates the T16 Slop Tank and Biological wastewater treatment bioreactor exhausting to EU-8001 are affected facilities under 40 CFR 63 Subpart CC and are not subject to 40 CFR 60 Subpart GGGa. We note that TSD calculations (Appendix A, pages 27 and 39) indicate these units have the potential to emit HAPs, though it is unclear whether they meet the definition of being "in organic HAP service". We request that IDEM review whether 40 CFR 63, Subpart H applies to these emission units, and revise the permit, if needed.

**IDEM Response to EPA Permit Comment 16:**

IDEM, OAQ has reviewed the applicability of 40 CFR 63.348 equipment leak standards to the slop tank and wastewater treatment bioreactor. Pursuant to 40 CFR 63.640(c)(3), the units are part of an affected source for Subpart CC of 40 CFR Part 63. Equipment leaks from the slop tank and wastewater treatment bioreactor are not subject to Subpart GGGa or to provisions of 40 CFR Parts 60 and 61 standards promulgated before September 4, 2007. Pursuant to 40 CFR 63.648(a), therefore, the units shall comply with the provisions of Subpart H of 40 CFR Part 63. According to 40 CFR 63.160, the provisions of Subpart H apply to pumps, compressors, agitators, pressure relief devices, sampling connection systems, open-ended valves or lines,

valves, connectors, surge control vessels, bottoms receivers, instrumentation systems, and control devices or closed vent systems required by Subpart H that are intended to operate in organic hazardous air pollutant service 300 hours or more during the calendar year within a source subject to the provisions of a specific subpart in 40 CFR part 63 that references Subpart H.

IDEM, OAQ finds that the slop tank and the wastewater treatment bioreactor do not operate in organic hazardous air pollutant service as defined at 40 CFR 63.161. While the product naphtha may contain greater than 5% by weight of organic hazardous air pollutants, the organic HAP concentration in the wastewater streams present in the units is less than 5% by weight under the operating conditions that may reasonably be expected for the units. The provisions of Subpart H are therefore not applicable to the slop tank and wastewater treatment bioreactor.

For clarity, IDEM, OAQ has added 40 CFR 63.648 to the applicable requirements for Subpart CC. Changes to Condition E.13.2 resulting from this comment are incorporated with the response to EPA Permit Comment 14, above.

#### **EPA Permit Comment 17:**

Permit conditions D.1.7, D.2.5 and D.8.5 require the source to monitor the pressure drop across several fabric filter control devices at least once per day when the associated emissions unit is in operation. This monitoring is conducted to assure continuous compliance under Part 70 for BACT particulate limits. We recommend that IDEM and the source consider using bag leak detection systems (BLDS) for compliance monitoring instead of daily monitoring of pressure drop for each baghouse. For the reasons below, more stringent monitoring might be appropriate to assure continuous compliance under Title V and CAM.

The emission units are subject to PM, PM10 and PM2.5 BACT limits ranging from 0.002 to 0.0022 gr/dscf. The TSD calculations appear to imply a very high control efficiency from the fabric filters must be maintained for certain units to assure compliance with the BACT limits (e.g., refer to the pre- and post-control PM, PM10 and PM2.5 emissions from EU-1008, on TSD Appendix A, pages 10-11). Some emissions units (EU-1008, EU-1504 and EU-2005) are also subject to Compliance Assurance Monitoring under 40 C.F.R. Part 64. BLDS may be appropriate for these emission units to assure the baghouses are operating at a level that achieves continuous compliance.

BLDS is utilized by facilities with similar operations. For example, the BACT analysis indicates that the selected particulate BACT emission limits for several processes were established from facilities that also utilize leak detection systems. Refer to the coal milling/drying (EU-1008) system, the additive preparation system (EU-1504), and various additive conveyors (see TSD, Appendix B, pages 28-30). Furthermore, continuous performance data provided by BLDS may have other ancillary benefits to the source with respect to proactive and predictive maintenance - reducing maintenance costs and avoiding critical baghouse failures.

#### **IDEM Response to EPA Permit Comment 17:**

A concentration limit of 0.002 gr/dscf is applied very widely among coal and mineral handling and processing operations controlled by fabric filters. Determination that this level and type of control represents BACT is considered broadly representative of the class of operations. Baghouse particle collection is primarily a function of the filter cake formed on the exterior of the baghouse filters, and secondarily a function of the baghouse filter media and the mechanical integrity of the baghouse and filter media.

In the Step 4 table for the coal milling and drying operations (page 28 of Appendix B), review of the permit (Essar Steel Minnesota LLC, Minnesota PCA 06100067-004) referenced in the single citation of fabric filter with leak detection shows that the requirement to use leak detection is an element of monitoring, citing 40 CFR 63.9632, rather than a characteristic of the control technology. The NESHAP section cited is in Subpart RRRRR, the National Emission Standards

for Hazardous Air Pollutants: Taconite Iron Ore Processing, which is not applicable to Riverview Energy Corporation.

The Step 4 table for additive preparation (page 30 of Appendix B) cites the same Minnesota permit (Essar Steel), where leak detection appears as a monitoring practice rather than a characteristic of the control technology. The same is true of other permits cited in the Step 4 additive preparation table (US Steel Corp., Minnesota PCA 13700063-004 and Alliant Energy, Wisconsin DNR 17-DCF-070). The US Steel reclaim conveyor cited to represent BACT in the Step 4 table for conveyor transfer - coal (page 25 of Appendix B) without a statement about leak detection actually is the same permit and unit that appears in the additive preparation table. In all of the material handling BACT determinations the application of bag leak detection systems is a monitoring requirement rather than an essential characteristic of the control technology.

Several of the emissions units referred to in the comment have exhaust flow rates one or two orders of magnitude less than units named in the Essar Steel, US Steel, and Alliant Energy permits as requiring bag leak monitoring. The notable exception among the Riverview Energy units is the drying loop purge baghouse that is a secondary control device treating a stream that has already passed through the coal dryer baghouse. IDEM, OAQ considers that the compliance monitoring provisions included in the draft PSD/New Source Construction and Part 70 Operating Permit are adequate to establish continuous compliance with the applicable limits. No changes were made as a result of this comment.

#### **EPA Permit Comment 18:**

Permit conditions D.12.1(a), E.6.1 and E.6.2 indicate that emission units are subject to the general provisions of NSPS Subpart A and the leak detection and repair program requirements of NSPS Subpart GGGa (refer to 40 CFR § 60.592a). We wish to highlight that the NSPS general provisions give owners/operators the option to identify leaking equipment using an optical gas imaging instrument instead of leak monitoring as prescribed in 40 CFR part 60, appendix A-7 (i.e., using a Method 21 instrument). This alternative work practice (AWP) is described in 40 CFR § 60.18(g) through (i). This AWP is also an option for NESHAP rules that require monitoring of equipment with a Method 21 instrument, as described in 40 CFR § 63.11(c) through (e).

Additional information about the AWP can be found in the Federal Register at <https://www.gpo.gov/fdsys/pkg/FR-2008-12-22/pdf/E8-30196.pdf> (73 FR 78199, December 22, 2008). EPA assessed that the AWP provides equivalent control as the existing Method 21-based LDAR work practice standards and appears to be less burdensome to implement.

#### **IDEM Response to EPA Permit Comment 18:**

IDEM, OAQ appreciates the clarification provided in this comment. The specific applicability of the referenced alternative work practice is incorporated into the permit by conditions that incorporate the general provisions of the NSPS and NESHAPs. No changes were made as a result of this comment.

#### TSD Appendix B - BACT Comments

##### **EPA BACT Comment 1:**

TSD Appendix B page 27 shows that the proposed coal stockpile BACT is the use of a negative pressure enclosure and baghouse. However, the BACT determination on TSD Appendix B page 32 does not identify the use of a negative pressure enclosure as BACT. The emission unit description in section D.1 of the draft permit and the storage enclosure monitoring and inspection requirements in conditions D.1.6 and D.1.9 of the draft permit appear to require the use of a negative pressure enclosure for each coal stockpile. We request that you provide justification for not identifying the use of a negative pressure enclosure as BACT for the coal stockpiles. If a negative pressure enclosure is determined to be BACT, then we request that you consider adding

a 0% visible emissions limit from openings in the coal stockpile to further show that the negative pressure enclosure routes all emissions to the baghouse.

**IDEM Response to EPA BACT Comment 1:**

IDEM, OAQ agrees with the recommended changes to descriptive information regarding the coal stockpiles because updated information was unintentionally not copied throughout the BACT analysis. See Appendix B to this ATSD for the revised BACT analysis in its entirety.

For clarity, IDEM, OAQ has added the negative pressure enclosure control description to the railcar unloading facility descriptions throughout the permit, as follows with new language **bolded**:

...

- (a) Coal handling operations, identified as Block 1000, consisting of:
  - (1) One (1) shelter-type railcar dump unloading facility, identified as EU-1000, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by **a negative pressure enclosure and** baghouse EU-1000, exhausting to stack EU-1000, consisting of:
    - (A) ...

The recommended change and clarification are incorporated into the Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis Material Handling BACT determination table in Condition D.1.1 - Prevention of Significant Deterioration, paragraph (a), as follows:

D.1.1 Prevention of Significant Deterioration (PSD) [326 IAC 2-2-3]

- (a) Pursuant to 326 IAC 2-2-3, the Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the coal handling operations shall be as follows:

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Railcar unloading, including: Receiving Pits 1 & 2 Receiving Bins 1 & 2 Drag Flight Feeders 1 & 2 (EU-1000)	<b>Negative pressure enclosure and</b> Baghouse EU-1000 (stack EU-1000) Water spray dust suppression (bins & feeders only)	PM	0.0022	0.12
		PM <sub>10</sub> <sup>1</sup>	0.0022	0.12
		PM <sub>2.5</sub> <sup>1</sup>	0.0022	0.12

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
...				
Coal storage enclosure 1, including Conveyor 1, Stacker 1 Boom/Chute, Stockpiles #1A & #1B, Reclaimer 1	<b>Negative pressure enclosure and Baghouse EU-1006 (stack EU-1006)</b>	PM	0.002	0.11
Coal storage enclosure 2, including: Conveyor 2, Stacker 2 Boom/Chute, Stockpiles #2A & #2B, Reclaimer 2		PM <sub>10</sub> <sup>1</sup>	0.002	0.11
Reclaim transfer station, including: Conveyor 6, Conveyor 7, Conveyor 9		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.11
...				

IDEM considers the comment regarding visible emissions monitoring of the storage enclosures to be the same as EPA Permit Comment 1. See IDEM Response to EPA Permit Comment 1.

**EPA BACT Comment 2:**

TSD Appendix B pages 46-52 is the NOx BACT analysis for process fuel gas-fired heaters and boilers. In steps 1 and 2 of the BACT analysis, selective catalytic reduction (SCR) is identified as a technically feasible control option. Step 3 of the analysis ranks control technologies by control effectiveness and appears to rank SCR below ultra-low NOx burners (ULNB). From step 3, SCR has an expected control efficiency of 70-90% while ULNB has an expected control efficiency of 40-85%. Based on the expected control efficiencies for each NOx control technology, it is not clear whether ULNB has a higher control efficiency. We request that you verify the rankings in step 3 of the analysis. If, for these processes, SCR has a higher control efficiency than ULNB alone, then we request that you continue to evaluate SCR in step 4 of the NOx BACT analysis. If SCR is correctly ranked below ULNB, then we request that you provide justification for ranking the control effectiveness of SCR below ULNB.

**Response to EPA BACT Comment 2:**

As is noted in the BACT Analysis Process fuel gas-fired heaters and boiler Step 1 analysis for NOx, the minimum target flue gas temperature for the application of SCR to process fuel gas-fired heaters is 750°F. Based on process design information provided by the source, flue gas temperatures for units other than EU-2003 range from 400°F to 525°F. The design flue gas temperature for EU-2003 is 800°F. Because the flue gas temperature for all of the units is not optimum for SCR, IDEM assigns a low control efficiency to SCR in this application.

The following changes have been made to the BACT analysis in Appendix B to this ATSD:

- (1) The discussion of good combustion practices as a potential NO<sub>x</sub> control technology was unintentionally not included in the Step 1 analysis for the process fuel gas-fired units. The analysis of good combustion practices has been added to the Step 1 text.
- (2) Paragraph 2 of the BACT Analysis Process fuel gas-fired heaters and boiler Step 1 analysis for NO<sub>x</sub> has been revised to incorporate clarifying language about flue gas temperatures and control efficiency.

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

**EPA BACT Comment 3:**

TSD Appendix B pages 55-59 is the CO BACT analysis for process fuel gas-fired heaters and boilers.

- a. It is not clear whether the CO control technologies identified in step 1 are technically feasible. From the discussion in step 2 of the analysis, it appears that all of the identified control technologies are technically feasible. If each of the controls identified in step 1 are technically feasible, then the analysis should rank the remaining control technologies by control effectiveness in step 3. Economic factors should then be considered in step 4 for each technically-feasible control technology to determine whether the control is effective.
- b. All identified control technologies are eliminated in step 2 since they were all determined to not be cost effective. However, the BACT analysis does not appear to include information about the cost of the controls to support the determination. To ensure the BACT determination is fully supported, we request that you provide justification showing that each control technology is not cost effective.

**IDEM Response to EPA BACT Comment 3:**

IDEM agrees with the recommended changes. The CO Step 2 text for process fuel gas-fired units was revised to indicate clearly that post-combustion controls are considered technically infeasible.

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

**EPA BACT Comment 4:**

TSD Appendix B page 63 states that GHG BACT requires each process fuel gas-fired heater and boiler to be designed and operated to achieve the highest practical energy efficiency. We request that you explain how the source should operate each emissions unit with the highest practical energy efficiency. It is not clear from the determination what steps the source should take to ensure compliance with this part of the BACT determination.

**IDEM Response to EPA BACT Comment 4:**

IDEM agrees with the recommended changes. The Step 2 text for GHGs in the BACT Analysis Process Fuel Gas-Fired Heaters and Boiler section was revised to more clearly define energy efficiency and good combustion practices.

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

**EPA BACT Comment 5:**

TSD Appendix B pages 63 - 69 includes the BACT analysis and determination for the sulfur recovery units (SRUs) and TGTUs. We request that you verify that the BACT analysis for the SRU and TGTU is complete.

- a. Steps 1-3 of the SRU/TGTU BACT analysis appears to begin addressing NOx control technologies. In step 1 of the analysis, low-NOx burners (LNB) are identified as the only available control. However, in step 2 of the analysis, thermal oxidizers are eliminated from the analysis based on cost effectiveness. If thermal oxidizers are technically feasible, then step 3 should rank available control technologies by control effectiveness and evaluate cost and other factors in step 4 of the analysis. We request that you determine whether thermal oxidizers are technically feasible. If thermal oxidizers are technically feasible, then we request further justification showing that the control option is not cost effective.
- b. For PM10, PM2.5, SO2, VOC, CO, GHGs, and H2SO4, the BACT analysis does not appear to discuss or identify available control technologies. We request that you determine whether any control technologies are available to control each pollutant triggering PSD requirements. If any identified control technologies are infeasible due to cost, then we request that you provide specific justification demonstrating that the controls are economically infeasible.

#### **IDEM Response to EPA BACT Comment 5:**

IDEM agrees with the recommended changes because text does not appear to have clearly expressed explanatory material that IDEM had included in other sections. The BACT Analysis Sulfur Recovery/Tail Gas Treatment Unit (TGTU) section was revised to more closely follow the format of other sections and to incorporate explanatory material.

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

In addition, IDEM, OAQ finds that the arrangement of terms in Condition D.4.1 - Prevention of Significant Deterioration (PSD) BACT may not have made clear the conditions and work practices determined to be BACT for each pollutant. Condition D.4.1 has been reformatted to follow the format of similar conditions, as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

#### **D.4.1 Prevention of Significant Deterioration (PSD) BACT [326 IAC 2-2-3]**

---

Pursuant to 326 IAC 2-2-3 (Control Technology Review; Requirements), the Permittee shall comply with the following requirements for the sulfur recovery units:

- (a) ~~PM (filterable) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0019 lb/MMBtu and 0.10 lb/hr, each.~~
- (b) ~~PM<sub>10</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.~~
- (c) ~~PM<sub>2.5</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.~~
- (d) ~~The SO<sub>2</sub> emissions from the tail gas treatment unit stack (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).~~
- (e) ~~The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 26.30 lb/hr, each.~~
- (f) ~~The tail gas treatment units (TGTUA and TGTUB) shall each use low-NOx burners.~~
- (g) ~~NOx emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.10 lb/MMBtu and 5.28 lb/hr, each.~~

- ~~(h) VOC emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0054 lb/MMBtu and 0.28 lb/hr, each.~~
- ~~(i) CO emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 65 ppmv @ 0% O<sub>2</sub>, shall not exceed 0.082 lb/MMBtu and 4.33 lb/hr, each.~~
- ~~(j) Sulfuric Acid Mist (H<sub>2</sub>SO<sub>4</sub> mist) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0244 lb/MMBtu and 1.29 lb/hr, each.~~
- ~~(k) Opacity shall not exceed ten percent (10%) on a six-minute average.~~
- ~~(l) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.~~
- ~~(m) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.~~
- (a) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the sulfur recovery units shall be as follows:**
  - (1) PM (filterable) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0019 lb/MMBtu and 0.10 lb/hr, each.**
  - (2) PM<sub>10</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.**
  - (3) PM<sub>2.5</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.**
  - (4) Opacity shall not exceed ten percent (10%) on a six-minute average.**
  - (5) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**
- (b) The Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the sulfur recovery units shall be as follows:**
  - (1) The SO<sub>2</sub> emissions from each tail gas treatment unit stack (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).**
  - (2) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 26.30 lb/hr, each.**
- (c) The Best Available Control Technology (PSD BACT) for NO<sub>x</sub> for the sulfur recovery units shall be as follows:**
  - (1) The tail gas treatment units (TGTUA and TGTUB) shall each use low-NO<sub>x</sub> burners.**

- (2) **NO<sub>x</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.10 lb/MMBtu and 5.28 lb/hr, each.**
- (d) **The Best Available Control Technology (PSD BACT) for VOC for the sulfur recovery units shall be as follows:**
  - (1) **VOC emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0054 lb/MMBtu and 0.28 lb/hr, each.**
- (e) **The Best Available Control Technology (PSD BACT) for CO for the sulfur recovery units shall be as follows:**
  - (1) **CO emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 65 ppmv @ 0% O<sub>2</sub>, shall not exceed 0.082 lb/MMBtu and 4.33 lb/hr, each.**
  - (2) **Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**
- (f) **The Best Available Control Technology (PSD BACT) for carbon dioxide equivalent (CO<sub>2e</sub>), as defined at 40 CFR 98.6, for the sulfur recovery units shall be as follows:**
  - (1) **Carbon dioxide equivalent (CO<sub>2e</sub>) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.**
  - (2) **Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.**
- (g) **The Best Available Control Technology (PSD BACT) for sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) mist for the sulfur recovery units shall be as follows:**
  - (1) **Sulfuric Acid Mist (H<sub>2</sub>SO<sub>4</sub> mist) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0244 lb/MMBtu and 1.29 lb/hr, each.**

IDEM, OAQ updated references to BACT limits in other Section D.4 conditions, as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

#### D.4.5 Greenhouse Gases (GHGs)

---

To determine the compliance status with Condition D.4.1~~(f)~~**(1)**, the following equation shall be used to determine the CO<sub>2e</sub> emissions from EU-3001 and EU-3002:

...

#### D.4.9 Reporting Requirements

---

A quarterly report of CO<sub>2e</sub> emissions and a quarterly summary of the information to document the compliance status with Condition D.4.1~~(f)~~**(1)** shall be submitted not later than thirty (30) days after the end of the quarter being reported. Section C - General Reporting Requirements contains the Permittee's obligation with regard to the reporting required by this condition. The report submitted by the Permittee does require a certification that meets the requirements of 326 IAC 2-7-6(1) by a "responsible official," as defined by 326 IAC 2-7-1(35).

Correction of related paragraph citations in Condition D.4.7 - Record Keeping Requirements is discussed in IDEM Response to Mr. David Boggs Comment 8.

**EPA BACT Comment 6:**

TSD Appendix B page 69-84 is the flare BACT analysis. The BACT determination establishes requirements on each flare during sweep and pilot mode operations. For NOx, VOC, and CO, the BACT determination also includes certain limits while flaring a process stream. We request that you clarify whether any of the flares are expected to operate during periods of startup and shutdown of the associated emissions units. If so, we request that you either determine whether startup and shutdown BACT requirements are required or provide justification explaining why the current BACT determination would cover startup and shutdown flaring.

**IDEM Response to EPA BACT Comment 6:**

Based on the flare operating scenarios modeled, IDEM, OAQ considers the description used in the permit, "... when flaring a process stream ..." as including startup and shutdown of the associated emissions units. No changes were made in the BACT analysis as a result of this comment.

**EPA BACT Comment 7:**

TSD Appendix B page 95 summarizes the BACT determination applicable to each tank. As part of the BACT determination, a specific storage temperature is identified for each tank. We request that you clarify whether the storage temperature for each tank is a BACT limit. If the storage temperature is not part of the BACT determination, then we suggest removing the storage temperature from the BACT requirements. Otherwise, we request that you include temperature monitoring for compliance.

**IDEM Response to EPA BACT Comment 7:**

The determination of BACT for the storage tanks intends to maintain emissions from those tanks at or below levels that were modeled. Because estimating tank emissions is strongly dependent on the vapor pressure of materials contained in those tanks, including the value of the vapor pressure used in the emissions estimate is considered necessary for identifying the material to demonstrate that tank emissions are at or below levels that were modeled. Vapor pressure is so dependent on temperature that expressing the vapor pressure without the temperature is all but meaningless. Monitoring the temperature of materials stored in the tanks is not considered necessary or informative because the modeled potential to emit is conservatively based on historical meteorological data. Storage temperature and vapor pressure values are retained for tanks without throughput limits as an element of descriptive information.

IDEM, OAQ agrees that tanks with throughput limits rather than characteristic vapor pressure do not require storage temperatures in the Step 4 proposed BACT table and Step 5 (d) table were revised,

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

In addition, paragraph (g) of Condition D.6.1 - Prevention of Significant Deterioration (PSD) Best Available Control Technology (BACT), was revised as follows with deleted language as ~~strikeouts~~:

D.6.1 Prevention of Significant Deterioration (PSD) Best Available Control Technology (BACT)[326 IAC 2-2-3]

---

Pursuant to 326 IAC 2-2-3 (Control Technology Review; Requirements), the Permittee shall comply with the following:

- (a) ...

(g) Tanks shall comply with the following limitations:

Tank ID	Product Stored	Storage Temperature (°F)	Vapor Pressure <sup>1</sup> (psia)	Throughput Limit <sup>2</sup> (kgal/yr)
...				
T16	Slop tank <sup>4</sup>	ambient-	-	305,467
T17	Diesel Fuel	ambient	1.14E-02	-
T18	Non-Phenolic Sour Water <sup>5</sup>	ambient-	-	462,829
T19	Non-Phenolic Sour Water	ambient-	-	462,829
T20	Non-Phenolic Sour Water	ambient-	-	462,829
T21	Phenolic Sour Water	ambient-	-	4,628
...				

**EPA BACT Comment 8:**

TSD Appendix B page 116 summarizes the BACT determination for the emergency diesel generator and emergency diesel firewater pump. The BACT determination (and condition D.9.1(e), accordingly) requires the use of energy efficiency. However, it is not clear from the BACT determination of the permit what is meant by using energy efficiency. We request that you clarify this portion of the BACT determination to further describe what must be done to ensure the emergency generator and emergency fire pump are energy efficient.

**IDEM Response to EPA BACT Comment 8:**

IDEM agrees with the recommended changes. Clarifying language was added to paragraph (c) of the Step 5 BACT analysis for emergency engines.

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

In addition, paragraph (e) of Condition D.9.1 - Prevention of Significant Deterioration (PSD) Best Available Control Technology (BACT), was revised as follows with new language **bolded**:

**D.9.1 Prevention of Significant Deterioration (PSD) Best Available Control Technology (BACT)[326 IAC 2-2-3]**

Pursuant to 326 IAC 2-2-3 (Control Technology Review; Requirements) , the Permittee shall comply with the following:

- (a) ...
- (e) Emergency generator (EU-6006) and emergency fire pump (EU-6008) shall use good combustion practices and shall use energy efficiency. **Use of good combustion practices and energy efficiency is defined as operation of engines certified to meet applicable emissions standards in accordance with the manufacturers' recommendations for operation and maintenance or according to a maintenance plan that complies with 40 CFR 60.4211(g). Good combustion practices may include but are not limited to the following:**
  - (1) **Prepare and maintain a preventive maintenance plan.**
  - (2) **Change oil and filter every 500 hours of operation or annually, whichever comes first.**
  - (3) **Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary.**

- (4) Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.**
- (5) During periods of startup the Permittee must minimize the engine's time spent at idle and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes.**

### Modeling Comments

#### **EPA Modeling Comment 1:**

The air quality analysis appears to consider the impacts associated with normal operations and several flaring scenarios. Page 4 of the air quality analysis report explains that the facility operates at a diminished operating capacity during each flare event, but it is not clear how the modeled emission rates for emission units operating at a diminished capacity were determined. Particularly, EU1007, EU2001-EU2004, EU3001 and EU3002 (TGTUA and TGTUB), EU6000, and EU7001 and EU7002 are modeled at a reduced emission rate during flaring operations. HP flare EU4006 is modeled at a higher emission rate while flaring, but the flaring emission rate may differ depending on the flaring scenario, such as the two considered in the SO<sub>2</sub> analysis. We request that you show how the modeled emission rates were determined for the flaring scenarios.

#### **IDEM Response to EPA Modeling Comment 1:**

KBR provided IDEM's modeling staff with approximations for the various flaring scenarios and IDEM requested that the consultant submit a revised modeling report which outlines the flaring scenarios and the appropriate rates to be used. IDEM reviewed each of the scenarios and the worst case scenarios were modeled as a percentage of the full rate. Please see the updated Riverview modeling report (dated October - 2018) for their detailed flaring scenarios. The emissions values for the units that are expected to operate during each of the flaring scenarios are based on a percentage of their emissions during normal conditions.

No changes were made as a result of this comment.

#### **EPA Modeling Comment 2:**

TSD pages 23-24 includes a stack summary listing the stack parameters for the proposed emissions units. However, in some cases, the modeled stack parameters differ from the stack summary. We request that you verify the following modeled stack parameters for each listed stack ID and either correct the modeled stack parameters or explain why the modeled stack parameters are correct.

- a. Ambient stack temperatures modeled with fixed stack temperatures: EU1000, EU1001, EU1006, EU1501 - EU1504, EU2005 - EU2008, EU5009 - EU5011, EU6501.
- b. Fixed stack temperatures modeled with temperatures a fixed amount above ambient temperature: EU6001 - EU6003.
- c. Stack flow rates differ from modeled flow rates: EU1502, EU2003.

#### **IDEM Response to EPA Modeling Comment 2:**

IDEM's modeling files used values derived from the consultant and reviewed by IDEM. The table presented on pages 23-24 of the TSD has been updated to include the stack parameters that were modeled. The difference in the flow rates between the modeling files and the table in the TSD for EU-1502 was due to the use of actual cubic feet per minute (ACFM) vs dry standard cubic feet per minute (DCFM) flow rates in the calculation. Modeled flow rates were based on the

dry standard cubic feet per minute calculation. The difference between these values, based on DCFM and ACFM calculations, was 2.95 feet per second. Revised modeling shows no appreciable change in the results and all health-based standards continue to be protected.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

The stack summary table is revised to show the modeling inputs, as follows with deleted language as ~~strikeouts~~ and new language **bolded**:

Notes:

1. EU-5001 - 5004 were not modeled, values included for comparison.
2. Dispersion modeling software uses negative values to instruct the software to apply a positive 6 K correction to the ambient temperature.
3. EU-8001 - 8003 were not modeled, values included for comparison.

**EPA Modeling Comment 3:**

Air quality analysis table 1 summarizes the emission rate of the proposed source. However, the NO<sub>x</sub>, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, and VOC emission rates included in the table differ from the values given in both TSD page 25-26 and TSD Appendix A pages 1-3. We request that you verify the table 1 emission rates and correct the table as necessary.

**IDEM Response to EPA Modeling Comment 3:**

The Significant Emission Rates for PSD table (Table 1) in the Air Quality Analysis, Appendix C to this ATSD, has been revised to reflect and match pages 25-26 of the TSD and TSD Appendix A, pages 1-3.

See Appendix C to this ATSD for the revised air quality analysis in its entirety.

**EPA Modeling Comment 4:**

Air quality analysis table 3 presents the results of the preconstruction monitoring analysis. Annual NO<sub>2</sub>, 24-hour PM<sub>10</sub>, and 24-hour SO<sub>2</sub> maximum modeled impacts in table 3 differ from the significant impact level (SIL) analysis results provided in table 2. We request that you verify the table 3 maximum modeled impacts and correct the table as necessary.

**IDEM Response to EPA Modeling Comment 4:**

The values in the Preconstruction Monitoring Analysis table (Table 3) of the Air Quality Analysis, Appendix C to this ATSD, has been checked and corrected. These appeared to be transposition errors from the values in the Significant Impact Levels table (Table 2). The values in Table 2 and Table 3 now match.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

**EPA Modeling Comment 5:**

Page 6 of the air quality analysis report explains that CEMS data was used to determine the operating level and modeled emission rate for Indiana-Michigan Power - Rockport, ALCOA Power Plant, and IPL Petersburg consistent with 40 C.F.R. Part 51 Appendix W Table 8-2. It is not clear whether the information used to determine the modeled emission rate for each source with CEMS data is available within the permit record. It is also not readily clear from the report how the modeled emission rates for sources without CEMS data were determined. We request that you include as part of the permit record the nearby source CEMS data, actual operating level calculations, and a brief explanation of how the modeled emission rates for sources without CEMS data were determined.

**IDEM Response to EPA Modeling Comment 5:**

IDEM has made continuous emissions monitoring (CEMS) data available for the inventory sources whose modeled emissions were based on actual operating level conditions. Actual operating level calculations were taken as a simple average of the operating level over the most recent two years of CEMS data. These values were then multiplied by the permitted rate for each pollutant to get the pound per hour (lb/hr) rate. Sources without CEMS data were modeled using permitted conditions and estimates from previous modeling.

IDEM requested that the source find major emission sources in Kentucky to be included in the modeling. These sources are relatively small and located nearly 50 km away from the facility. The consultant was able to find the most recent actual emissions from these Kentucky sources which were used in the modeling.

One commenter mentioned an email from KBR that suggested the use of U.S. Energy Information Administration (EIA) data to determine the actual operating levels in order to determine the emission rates for the inventory sources. The commenter also suggested that this method uses actual emissions. Use of actual operating levels over the most recent two year period is supported in the Revisions to the Guideline on Air Quality Models, Appendix W, Table 8-2 "Points Source Model Emission Inputs for NAAQS Compliance in PSD Demonstrations". The actual operating levels are not synonymous with actual emissions. Actual operating levels, rather, are used in conjunction with the permitted limit for the inventory sources to derive the modeled emission rates for the inventory sources. Please see the updated Table 8-2 of the Revisions to the Guideline on Air Quality Models, Appendix W, for more detailed guidance on modeling nearby sources and the preferred U.S. EPA approach for addressing actual operating levels and operating factors.

IDEM agreed that operating levels should be used to determine emission rates and consulted with U.S. EPA in using the EIA data to derive these values. After discussing with U.S. EPA, IDEM recommended to the consultant to use the operating levels found within the CEMs data for the inventory sources in lieu of the EIA data.

**EPA Modeling Comment 6:**

Pages 10-13 of the air quality analysis includes the ozone and secondary PM<sub>2.5</sub> impact analysis. The analysis appears to rely on NO<sub>x</sub>, SO<sub>2</sub>, and VOC emission rates that do not match the values given on TSD pages 25-26 and TSD appendix A page 3. We request that you verify the NO<sub>x</sub>, SO<sub>2</sub>, and VOC emission rates used in the analysis and update the analysis as necessary to account for emissions from the proposed source.

**IDEM Response to EPA Modeling Comment 6:**

IDEM received a comment about emission units EU-3001 and EU-3002 as being modeled at a lower emission rate than the permitted limit of 26.30 lb of SO<sub>2</sub> /hr. Because of a misunderstanding between IDEM permit and modeling staffs, these units were modeled at a rate representative of somewhat more than the loading for each unit expected under normal plant-wide full load conditions. After the comment, a model was run with both sulfur recovery trains operating at an emission rate of 26.30 lb SO<sub>2</sub> /hr, each, representing the maximum sulfur load that each tail gas treatment units can handle. Although the combination of two sulfur recovery units operating at this level cannot be achieved in practice, it is considered a conservative approach for modeling.

Describing the capacity relationships of the Veba Combi Cracker (VCC, Block 2000) and the two sulfur recovery units requires careful language. When the VCC Unit is operating at 100% capacity, each sulfur recovery unit will handle approximately 50% of the incoming sulfur load, which results in a maximum combined emission rate of 36.70 lb SO<sub>2</sub>/hr. The sulfur recovery capacity of the entire source is bottlenecked by the coal processing capacity of the VCC unit and the maximum sulfur content of the coal supply. To accommodate startup, shutdown, and turndown operating conditions, each sulfur recovery train is sized for 70% of the full-load VCC capacity, representing an emission rate of 26.30 lb SO<sub>2</sub>/hr. Combined emissions of the two sulfur recovery trains greater than 36.70 lb SO<sub>2</sub>/hr cannot be achieved in practice because of the VCC capacity and coal sulfur content bottleneck. The table below shows the operating scenarios and sulfur loading potentials for each unit.

Scenario No.	Operating Mode	Sulfur Loading from VCC	Number of SRP's Operating	% Sulfur Loading for Operating SRP(s)
1	100% VCC Operation (Normal Operations)	100%	2	Both SRP's operating, each handling ~50% of the incoming load from VCC Unit

2	70% VCC Operation (During VCC Unit Turndown, Start-up, Shutdown)	≤ 70%	1	The operating SRP handles the incoming load from VCC Unit
3	70% VCC Operation (During VCC Unit Turndown, Start-up, Shutdown)	≤ 70%	2	The total sulfur loading is limited to ≤ 70% to both SRP's. The two SRP's could split the incoming load in a 50-50, 60-40 or 70-30 ratio, i.e., within SPR capacity & turndown limits.
4	70% VCC Operation (One SRP is not available or shutdown)	≤ 70%	1	The operating SRP handles the incoming load from VCC Unit

Annual emissions of NO<sub>x</sub>, VOC, and SO<sub>2</sub> used in the Section F secondary analysis for PM<sub>2.5</sub> and ozone were updated. Updated emissions values remain below the values for Indiana provided in U.S. EPA MERPS Guidance.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

**EPA Modeling Comment 7:**

Pages 13-14 of the air quality analysis provides IDEM's HAP modeling results. As part of our review, we note that the estimated aggregated hazardous air pollutant (HAP) in the air quality analysis report is 30 tons/yr and methanol emissions is 24 tons/yr. However, TSD appendix A page 7 states that total HAPs after issuance will be 60.30 tons/yr and methanol emissions, while still the highest HAP emitted, is 28.03 tons/yr. We request that you verify and correct the highest single HAP and total HAP emission rates cited in the analysis. We also request that you verify the emission rates used to generate the results in Table 11 to ensure the analysis considers the proposed source's HAP emission rates.

**IDEM Response to EPA Modeling Comment 7:**

IDEM has verified the input files and determined that Methanol was modeled appropriately at 28 tons per year (tpy) in the final modeling files. The modeled concentration in the Hazardous Air Pollutant Modeling Results table (Table 11) reflects the 28 tpy rate. The remainder of the difference between total tonnage modeled and the value listed in the TSD - Appendix A, page 7 is the result of fugitive leaks. IDEM modeled volume sources which represented fugitive HAP emissions to account for the fugitive leaks emissions in order to achieve a more conservative HAPs modeling analysis.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

**EPA Modeling Comment 8:**

The annual NO<sub>2</sub> SIL analysis does not appear to model 2012 impacts. Instead, the 2012 annual NO<sub>2</sub> analysis uses 2013 meteorological data to drive the model. Similarly, the 2013, 2014, and 2015 annual NO<sub>2</sub> analysis uses meteorological data from the following year to drive the model. The 2016 annual NO<sub>2</sub> analysis uses 2016 meteorological data, ultimately resulting in concentrations based on 2016 met data to be repeated twice in the analysis. We request that you revise the modeled meteorological data to ensure the modeled year matches the year of the analysis. If the corrections result in a higher modeled annual NO<sub>2</sub> concentration, then we also request that you update the reported concentration provided in tables 2 and 3 of the air quality analysis.

**IDEM Response to EPA Modeling Comment 8:**

IDEM reviewed the NO<sub>2</sub> SIL analysis files and confirmed that the year 2012 does not seem to have been modeled. The file labeled "2012" uses 2013 meteorological data and 2013 uses 2014 data etc. These files were associated with the Emergency Fast Depressure Test flaring scenario which is the worst case modeling scenario. IDEM has re-run AERMOD with the meteorological files corresponding to the correct year. The revised annual NO<sub>2</sub> modeled results went from 0.68 µg/m<sup>3</sup> to 0.71 µg/m<sup>3</sup>, still well below significant impact level and preconstruction monitoring thresholds.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

**EPA Modeling Comment 9:**

The short term and annual SO<sub>2</sub> SIL analyses appear to include the emissions from EU-7001, the steam-hydrocarbon reformer furnace for hydrogen plant 1, and not EU-7002, the reformer furnace for hydrogen plant 2. It is not clear why only one reformer furnace is included in the analysis. We request that you either include both reformer furnaces in the analysis or provide justification explaining why it is appropriate to only include one reformer furnace in the analysis.

**IDEM Response to EPA Modeling Comment 9:**

The analysis does not include Hydrogen Reformer #2 because the modeling inputs represent a flaring scenario under which many of the units will not be operating or operating at a reduced rate. IDEM modeled both of the reformers when the facility is operating under normal conditions and found that the highest concentrations under normal conditions were less than the flaring scenario concentration. IDEM used the flaring scenario for the SIL and NAAQS analysis as this represented the worst case.

**EPA Modeling Comment 10:**

For the 24-hour and annual PM<sub>10</sub> and PM<sub>2.5</sub> analysis, EU6000 is modeled at 0.51 lb/hr. However, condition D.3.1(a)(3) limits EU6000 to 0.53 lb/hr. We request that you verify the modeled emission rate for this emission unit and update the analysis as necessary.

**IDEM Response to EPA Modeling Comment 10:**

IDEM has checked the PM<sub>2.5</sub> analysis, and the rate in the modeling is 0.53 lb/hr. The SIL and NAAQS values reported in the TSD reflect this rate. For PM<sub>10</sub>, the rate in the modeling was 0.51 lb/hr, based on a previous emission calculation. IDEM has updated its modeling for EU-6000 to 0.53 lb/hr and found no change in the maximum impact value.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

<b>Earthjustice Comments and IDEM Responses</b>
---

On December 10, 2018, Earthjustice, of Philadelphia, Pennsylvania; on behalf of Southwestern Indiana Citizens for Quality of Life, Inc., of Dale, Indiana; Valley Watch, Inc., of Evansville, Indiana; Sierra Club, Hoosier Chapter, of Indianapolis, Indiana; and Citizens Action Coalition, of Indianapolis, Indiana; submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Valley Watch, Inc. and Southwestern Indiana Citizens for Quality of Life, Inc. each submitted additional comments by email on December 10, 2018.

The Earthjustice letter includes a very large number of footnotes. Notes citing reference materials, decisions, or guidance documents are not incorporated into this ATSD. Notes internal to the comment document and its attached supporting reports from consultants are adapted to the numbering system of this ATSD. Comments derived from the consultant reports are answered in this Earthjustice section where the Earthjustice comment clearly incorporates the consultant's work. Elements of the consultants'

comments that are not clearly incorporated into this Earthjustice letter are discussed in sections of this ATSD that present the full text of the consultants' comments. Elements of the combined work that are presented in substantially more detail in the consultant's report than in the Earthjustice letter, for example, comments relating to modeling, are also discussed in sections of this ATSD that present the full text of the consultants' comments.

### **Earthjustice Comment 1:**

#### **I. The Permit Is Unlawful Because IDEM Has No Basis to Determine the Impacts of an Untested Technology.**

As proposed, the Refinery would use VEBA Combi Cracking technology, which is not used by any other facility in the United States. Through this technology, the Refinery would pollute the surrounding community with hazardous air pollutants, volatile organic compounds, particulate matter, and many other pollutants.

Indiana law requires IDEM to base its decisions on "substantial evidence" and prohibits IDEM from issuing an air permit until it has "approved the plans and specifications" and "determined that the facility, equipment, or device meets the requirement[s]" of Indiana's air permit regulations. Thus, if IDEM decides that a new source will satisfy the requirements of Indiana's air permit regulations and that issuing a permit is lawful, IDEM must support that decision with substantial evidence. Failure to do so is grounds for reversing IDEM's decision.

Federal law and sound approaches to air quality permitting require no less. Congress designed the Prevention of Significant Deterioration program with the goal of "assur[ing] that any decision to permit increased air pollution ... is made *only after careful evaluation of all the consequences of such a decision.*" In furtherance of that goal, EPA permitting guidance requires state agencies to make independent determinations about necessary emissions controls and not to rely solely on applicant information. EPA retains oversight authority over state permitting decisions.

Here, the stark challenge presented by the Refinery—tons of toxic pollution—requires an exacting and detailed response from IDEM in order to comply with Indiana's "substantial evidence" standard. IDEM must understand the air quality impacts and technology choices at the Refinery, and not abdicate air quality modeling or engineering evaluations to the applicant.

Instead, the proposed permit is based on incomplete plant design. Dr. Ranajit Sahu, whose report is Attachment A to these comments ("Sahu Report"), has identified many examples from the permit application and related communications demonstrating that the plant design is not mature enough to support the permit and its underlying analysis, including:

- Coal size reduction processes for which "detailed engineering or equipment procurement for the Riverview plant has not been initiated," and the definition of additives to be used "will be established during later engineering studies" (Dr. Ranjit Sahu (Sahu) Comment 1, example b);
- For acid gas and natural gas burners "there will be one burner, however there could be multiple burners" (Sahu Comment 1, example c);
- "Formal engineering and procurement activities to solicit multiple equipment bids and supporting the next refined level of project scope and cost estimation will be initiated in the next phase of engineering" (Sahu Comment 1, example d);
- "The cooling water treatment program is not defined" (Sahu Comment 1, example e);
- Modeling was based on a list of structures and their physical parameters "at the time of permit application drafting" (Sahu Comment 1, example f);

- Emissions estimates regarding the hydrogen plant were based on the “vendor’s initial conceptual approach. Discussion regarding hydrogen plant design are not finalized” (Sahu Comment 1, example g);
- Emissions estimates “will be refined with vendor information as it becomes available” (Sahu Comment 1, example h);
- Firing rates for natural gas were uncertain (Sahu Comment 1, example i);
- The plant did “not have a good estimate of expected flare events such as startups, shutdowns, etc.” (Sahu Comment 1, example j)

These many examples demonstrate that with the plant's design far from complete, and processes and emission levels unknown, IDEM had no basis to issue the permit. Further, as demonstrated in the Sahu Report, this incomplete information and other errors have led to underestimates of expected emissions (footnote citing, possibly incorrectly, several pages of the Sahu attachment, including Comment 2 (in part), 3, 4, and 5 (in part)). The predicted emissions from the Refinery are in some cases barely below applicable regulatory thresholds that, if reached, would trigger additional pollution control requirements (footnote citing modeling submitted June 2018, which has been updated). But the current emissions predictions are dependent upon certain aspects of the Refinery’s design that have not yet been determined, like those identified in the examples above. That means IDEM’s emissions predictions are unreliable and susceptible to significant changes.

IDEM has no basis for issuing a permit to the Refinery until the Refinery’s design specifications are finalized. Yet, after processing Riverview’s permit application for nearly a year, IDEM still has neglected to make a full assessment of the existing technology choices for, and air quality impacts of, the Refinery. IDEM has delayed making several key decisions about which pollution controls are necessary to comply with applicable requirements under the Clean Air Act and the Indiana Plan, and has instead used unsupported assumptions about the Refinery’s design specifications and technologies to support its conclusion that the Refinery would not degrade Spencer County’s air quality (footnote cited Mr. Howard Gebhart (Gebhart) Comment 16 (fugitive VOC)). IDEM also has yet to incorporate into its permit the monitoring requirements necessary to ensure compliance with the Refinery’s permitted emissions limits (footnote citing Gebhart Comments 12 (FDCP requirements) and 16 (fugitive VOC)).

As Dr. Sahu notes in his report, complete information on these issues could result in emissions impacts over regulatory thresholds (footnote citing introductory material in Sahu and June 2018 modeling report). Such information is especially important where, as here, the technology proposed for this massive Refinery has no precedent in the United States. Thus, the permit must be withdrawn and reconsidered based on the plant’s final technology, process design, and emissions impacts.

### **IDEM Response to Earthjustice Comment 1:**

IDEM, OAQ has not delayed any decisions regarding the source. The process design is sufficiently detailed to establish that the potential to emit exceeds the thresholds of the Part 70 and PSD programs. Each component of the process, e.g., coal handling, is well documented with regard to potential to emit and BACT. The draft permit includes limitations to ensure that the source will employ the best available control technology for emissions that exceed the thresholds for Prevention of Significant Deterioration. Each limitation is supported by testing, monitoring, record keeping, and reporting requirements sufficient to demonstrate continuous compliance with the limitations.

Conclusions about the effect on air quality are supported by modeling of the source-wide emissions after application of the limits in the draft permit. The claim that emissions of any pollutant represent some fraction of the NAAQS ignores that fact that the modeled emissions are the maximum allowable under the permit. Any increase in emissions, whether demonstrated by inability to comply with permit conditions or caused by physical changes at the source such as changes in unit capacity, are subject to source modification requirements at 326 IAC 2-7-10.5, permit modification requirements at 326 IAC 2-7-12, and PSD requirements at 326 IAC 2-2. No changes were made as a result of this comment.

With regard to the fugitive VOC (equipment leaks), see IDEM Response to Mr. Howard Gebhart Comment 16

With regard to the Fugitive Dust Control Plan monitoring requirements, see IDEM Response to Mr. Howard Gebhart Comment 12

With regard to paragraph 6 as it relates to the sentence including "... incomplete information and other errors ...", see IDEM Responses to :

- Earthjustice Comment 2
- Earthjustice Comment 3
- Dr. Ranajit Sahu Comment 3
- Earthjustice Comment 4
- Earthjustice Comment 5
- Earthjustice Comment 6

With regard to the VEBA Combi Cracker (VCC) technology, see IDEM Response to Valley Watch Comment 12.

### **Earthjustice Comment 2:**

II. The Permit Is Unlawful Because It Relies on Deficient and Erroneous Calculations.

Similarly, the permit must accurately analyze plant processes and emissions to provide a complete and accurate picture of what activities the permit is regulating and the impacts on the surrounding community. IDEM's Technical Support Document fails to support a valid permit by offering deficient and incorrect calculations in many regards, including the following issues identified by Dr. Sahu:

- Describing emissions of particulate matter fractions that exceed the total particulate matter emissions, which is impossible (Sahu Comment 2, example a);
- Describing controlled emissions of sulfur dioxide that are greater than uncontrolled emissions, which again makes no sense (Sahu Comment 2, example b);
- Using outdated global warming potentials for greenhouse gas emissions, and failing to apply the correct time period for the impacts of these emissions (Sahu Comment 2, example c).

Further, the permit application and IDEM's Technical Support Document make several fundamental errors with their use of EPA guidance for calculating emissions, known as AP-42. Many of the emission calculations contained in Appendix A of IDEM's Technical Support Document rely on AP-42 as the source of emission factors used to develop the Refinery's potential-to-emit calculations. This reliance on AP-42 is in error because AP-42 provides long-term average emissions for plants in a source category as opposed to estimates of the maximum emissions that could result from a particular facility. Thus, wherever the application or IDEM's analysis rely on AP-42 for potential to emit calculations, this is wrong and the resulting emission levels are underestimates, with important consequences for potential emission controls.

Second, the application and IDEM fail to mention the reliability ratings of the AP-42 factors on which they rely. These ratings provide information on the robustness of emission factors; lower ratings rely on data from fewer facilities, which may not be a random and thus more reliable sample of the industry. Here, as Dr. Sahu demonstrates in his report, the application and KBR, the Texas construction company that prepared the application, rely on emission factors that EPA itself has rated as having little or no reliability (this and previous paragraph, Sahu Comment 2, example d).

Similar to the AP-42 errors, the application and IDEM incorrectly use average emission factors to calculate potential to emit for volatile organic compounds from fugitive leaks, a significant portion of overall plant emissions of this type of pollutant. Additionally, in relying on an EPA estimate of control efficiency, IDEM does not consider the significant caveats in an EPA guidance document, resulting in a considerable understating of emissions from component leaks. Further, IDEM has improperly underestimated emissions from tanks by making improper assumptions about vapor pressure and by using obsolete AP-42 factors (Sahu Comment 2, examples e, f, g, and h).

Finally, the application and IDEM attempt to address flaring scenarios based on the sort of incomplete plant engineering information discussed in Section I above. KBR concedes that determining the duration of flaring events is "problematic." When IDEM then attempts to model flaring events, it relies on a series of unsupported assumptions, including the number of events, how long they last, the flow rate of the flare, and properties of the flare gas. As Dr. Sahu notes, it is "impossible to reconcile the lack of design detail with the highly detailed assumptions on flare gases used by IDEM in its emissions calculation and modeling." (Sahu Comment 2, example i)

The erroneous and deficient emissions calculations described in the preceding paragraphs currently serve as the basis for IDEM's conclusions regarding the Refinery's environmental and health effects. That means IDEM's conclusions are at best insufficiently supported, and at worst, inaccurate.

The consequences of reaching inaccurate conclusions with respect to the Refinery are significant. First, as stated in the preceding section, even small changes to IDEM's potential-to-emit calculations could mean that the Refinery would in fact cause Spencer County to exceed national ambient air quality standards (NAAQS). Second, inaccuracies in the Refinery's emissions projections for certain hazardous air pollutants could mean that Spencer County residents and Refinery workers would be at an elevated risk of developing cancer, compared to current IDEM estimates. Because the Refinery has the potential to emit certain pollutants with significant carcinogenic potential, like benzene, errors in cancer risk assessment pose special concerns. Currently, some of these cancer-causing pollutants, like polycyclic aromatic hydrocarbons, are entirely excluded from IDEM's cancer assessment.

By basing its conclusions in incomplete and potentially inaccurate emissions information, IDEM cannot ensure that the Refinery will not cause Spencer County to fall out of attainment or cause serious harm to the public. IDEM therefore has failed to satisfy its obligations under state and federal law and must withdraw the permit so that it can address these fundamental errors in its emissions projection.

## **IDEM Response to Earthjustice Comment 2:**

With regard to the use of emission factors and the reliability of those emission factors, please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

With regard to flare emissions, please see the following:

- IDEM Response to Mr. Howard Gebhart Comment 9
- IDEM Response to Mr. Howard Gebhart Comment 10

With regard to small changes in potential to emit, see IDEM Response to Earthjustice Comment 1.

With regard to the VEBA Combi Cracker (VCC) technology, see IDEM Response to Valley Watch Comment 12.

The magnitude of uncontrolled emissions has value in this permitting process only so far as those uncontrolled emissions determine whether the source may exceed thresholds for the Part 70 and PSD programs. The limitations in the permit, and the associated testing, monitoring, record keeping, and reporting requirements, ensure that either PSD requirements do not apply to a pollutant or that the source is applying BACT to PSD pollutants. With regard to particular statements in the comment:

- Differences between PM and PM<sub>10</sub>/PM<sub>2.5</sub> emission factors, which commonly occur in combustion processes, appear because of the way the U.S. EPA defines the pollutant emissions. Particulate matter (PM), predating the fine fraction regulations that appeared later, is defined as the result of the Method 5 filter procedure. Fine particulates, PM<sub>10</sub> and PM<sub>2.5</sub>, are defined as the sum of the Method 5 result and the condensable particulate matter determined by Method 202. Therefore, possibly counterintuitively, the PM<sub>10</sub>/PM<sub>2.5</sub> result is greater than the PM result the fine fractions should be a subset of.
- Lower "uncontrolled" sulfur dioxide (SO<sub>2</sub>) emissions are a function of both the definition of the process and the reliability of certain AP-42 emission factors. The source intends to recover sulfur for sale as a product. The uncontrolled emissions are therefore defined as emissions from Claus units with scrubbing-type tail gas treatment units. The 99.9% recovery attached to the process in AP-42 Table 8.13-1 is conditional on a high H<sub>2</sub>S concentration in the feed gas (ref: note c to Table 8.13-1), so a lower feed concentration could increase the uncontrolled emissions. However, as noted in the introductory paragraph, after establishing that uncontrolled emissions exceed 100 tons per year, what becomes significant is the levels of emissions achieved by other sources in the BACT review. BACT for the process is determined as limitations on the sulfur concentration in the exhaust gas.
- Global warming potentials applied in the calculations are the values from Table A-1 in 40 CFR 98. Source-wide carbon dioxide equivalent (CO<sub>2</sub>e) emissions are well above the threshold and different GWP values will not change the determination of BACT for CO<sub>2</sub>e-producing units.

The source provided additional information about HAPs early in the public notice period, including updated emissions from one of the emission units and data on pollutants not considered earlier. In addition, IDEM's modeling review determined HAPs impacts increased due to revised downwash considerations as a result of the updated data. As part of the revised modeling,

additional HAPs (including polycyclic aromatic hydrocarbons (PAHs)) are now included in Table 12 of Appendix C. See Appendix C to this ATSD for the revised modeling analysis in its entirety. Changes to the modeled HAP emissions did not require changes to any applicable requirements in the permit. IDEM, OAQ notes that the source is subject to a number of National Emission Standards for Hazardous Air Pollutants that incorporate requirements, such as emissions limits and operating standards, specifically directed toward reducing emissions of HAPs.

No additional changes were made as a result of this comment.

### Earthjustice Comment 3:

#### III. The Permit Unlawfully Relies on Deficient and Inaccurate Air Quality Modeling.

IDEM's air quality modeling analysis for the proposed Refinery is also incomplete and inadequate. In contravention of federal regulations on air quality modeling, IDEM has modeled the air quality impacts of the Refinery using data that is not representative of the proposed Refinery site. Specifically, the meteorological data and data on background concentrations of pollutants that are used in IDEM's models comes from monitors that are far away from the proposed Refinery site—in some cases from South Bend, roughly *270 miles* (emphasis in the original) from the site—and from locations with different wind-flow patterns than the site. These air quality monitoring sites also fail to account for the fact that the Refinery would be constructed near a major highway with vehicle traffic emitting significant amounts of NAAQS pollutants. All of these factors undermine the accuracy of IDEM's modeling results. (multiple footnotes citing Gebhart Comments 7 and 15 and Sahu Comment 5)

IDEM's models also include inaccurate emissions data for several pollutants and sources of emissions. First, because a reasonably advanced design does not yet exist for the Refinery, all of the modeling inputs for the Refinery's projected pollutant emissions are—at best—guesses as to the Refinery's actual potential to emit such pollutants. Second, there are inconsistencies between the modeling inputs and the actual permitted emissions limits for certain pollutants. For example, IDEM modeled the Refinery's SO<sub>2</sub> emissions from its tail gas stacks and other emissions units using numbers that were lower than the SO<sub>2</sub> emissions limits contained in the permit, meaning the models showed less impact on air quality from the Refinery's SO<sub>2</sub> emissions than what would occur in reality. Third, IDEM incorrectly modeled emissions from certain nearby sources of significant air pollution by modeling a snapshot of the sources' observed emissions rather than the maximum allowable emissions of such sources. Finally, IDEM's air quality models entirely failed to account for significant emissions of NO<sub>x</sub> and SO<sub>2</sub> from start-up, shutdown, and malfunction events, which can cause significant short-term emissions and accompanying health risks, and from rail and truck traffic and several nearby power plants. (multiple footnotes citing Sahu Comment 5 and Gebhart Comments 8, 9, 18, and 19)

Additional inaccuracies and oversights in IDEM's modeling are highlighted in the commenting organizations' modeling report, which is Attachment B to these comments. One especially troubling oversight is IDEM's failure to use consistent emissions values for PM<sub>10</sub> in its modeling, which has left the commenting organizations' air modeling expert, Dr. Gebhart, with "zero confidence that the PM<sub>10</sub> modeling has been done correctly." (multiple footnotes citing Gebhart Comments 11, 13, 14, and 18)

Under federal and Indiana law, IDEM must make its decisions and determinations based on substantial evidence and careful evaluation, not guesswork. In the absence of such evidence and evaluation, neither the public nor IDEM can be sure that the Refinery will meet all applicable requirements under the Clean Air Act and the Indiana Plan. Because IDEM has failed in its fundamental duty to determine *based on substantial evidence and careful evaluation* (emphasis in the original) that the Refinery will not contribute to the deterioration of Spencer County's air quality, the Permit is unlawful under Sections 7475 and 7661a of the Clean Air Act and Title 326, Article 2 of the Indiana Code, and must be withdrawn.

The incompleteness of IDEM's data and analysis are sufficient to warrant the withdrawal of the draft permit. However, even the deficient decision-making record reveals flaws that render the permit illegal under the Clean Air Act and the Indiana Plan, as detailed below.

### **IDEM Response to Earthjustice Comment 3:**

This comment appears to summarize comments provided by the consultants, Dr. Sahu and Mr. Gebhart. See the following IDEM Responses:

### **Earthjustice Comment 4:**

- IV. The Permit is Unlawful Because It Does Not Require BACT for Certain Regulated Pollutants.
- a. IDEM Must Select The "Most Stringent" Technology for Controlling Regulated Pollutants at The Refinery or Reasonably Explain Its Decision Not to Do So.

Major stationary sources regulated by the Prevention of Significant Deterioration program must apply the "Best Available Control Technology," or BACT, for all regulated pollutants that the source has the potential to emit in "significant amounts." Major stationary sources are sources that have the "potential to emit" one hundred tons per year (or in some cases two hundred and fifty tons per year) of any regulated air pollutant. Regulated pollutants are those "for which a national ambient air quality standard has been promulgated" or that are "subject to regulation" under the Clean Air Act." The amount of emissions that is considered "significant" is determined by regulation on a pollutant-by-pollutant basis. BACT applies to each regulated pollutant that a major source has the potential to emit in significant amounts.

BACT is "an emission limitation based on the maximum degree of reduction of each [regulated] pollutant" emitted from a major stationary source, "which the permitting authority, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is *achievable* for such [source]." As this definition suggests, "Congress intended BACT to perform a technology-forcing function."

The proposed Refinery must comply with BACT requirements because it qualifies as a major stationary source and will be located in an attainment or otherwise unclassifiable area subject to the Prevention of Significant Deterioration program. Thus, the Refinery must apply BACT to each pollutant that it has the potential to emit in significant amounts.

IDEM applies EPA's "top-down approach" for determining BACT for regulated pollutants. The first step in this approach requires IDEM to identify all available control technologies for regulated

pollutants by reviewing a variety of sources, including technical articles, EPA and state air permits, and EPA's RACT/BACT/LAER Clearinghouse ("Clearinghouse"), among others.

IDEM must do its homework by consulting a variety of sources, and cannot rely solely on EPA's Clearinghouse to identify available technologies. This requirement is due in part to the forward-looking, "technology-forcing" aspect of an adequate BACT analysis (footnote citing Sahu Comment 4). Because the Clearinghouse only contains examples of what technology has been applied in the past, it provides insufficient information about what technology is *currently achievable* for a particular facility, as the BACT analysis requires. Moreover, the information contained in the Clearinghouse is notoriously incomplete. Indeed, EPA itself has noted "incomplete data" as an "ongoing problem" with the Clearinghouse, and IDEM has commented with respect to data in the Clearinghouse "that obtaining [BACT] information from other states can be difficult." EPA and IDEM agree that agencies must diligently consult other sources to obtain a full picture of technology options.

After identifying all available control technologies for regulated pollutants, IDEM then must rank those technologies in descending order and select the most stringent option as BACT "unless the applicant demonstrates, and [IDEM] in its informed judgment agrees, that technical considerations, or energy, environmental or economic impacts justify a conclusion that the most stringent technology is not achievable." Once IDEM determines that an emission unit is subject to BACT and that the most stringent technology is technologically and economically feasible, the Prevention of Significant Deterioration program does not allow IDEM to impose a less stringent technology.

If IDEM does *not* select the "most stringent" technology as BACT, it must develop a sufficient record to support the reasonableness of its determination that such technology is not achievable. Failure to provide a reasoned justification is grounds for federal intervention in IDEM's permitting decisions.

The U.S. Supreme Court addressed this very issue in *Alaska Department of Environmental Conservation v. EPA* ("ADEC"), when it upheld EPA's decision to halt issuance of an air permit on grounds that Alaska's Department of Environmental Conservation unreasonably rejected selective catalytic reduction as BACT for NOx emissions. In that case, the Department followed EPA's top-down approach for determining BACT and concluded that selective catalytic reduction was the most stringent control technology for NOx emissions and was both technically and economically feasible. Despite this conclusion, the Department ultimately rejected selective catalytic reduction in its permit and allowed the source to control NOx emissions through low-NOx burners instead. EPA found this decision unreasonable, and the Supreme Court affirmed EPA's conclusion. In its reasoning, the Supreme Court explained that the Department provided no record evidence that selective catalytic reduction was infeasible and therefore the Department "lacked cause for selecting Low NOx as BACT" instead.

#### **IDEM Response to Earthjustice Comment 4:**

IDEM, OAQ considers that the BACT analysis is in conformance with the requirements. The technology review was not limited to the RBLC database but included permits and supporting documentation for sources in other states. With specific regard to the example of the case that the commenters cited, *Alaska Department of Environmental Conservation v. EPA*, IDEM, OAQ does not consider the Alaska case similar to the BACT analysis for the proposed source. As discussed in the IDEM Response to EPA BACT Comment 2, IDEM found that low-NOx burners offer higher control efficiency than SCR could reasonably be expected to achieve under the expected operating conditions. The selection of BACT is therefore based on the highest control efficiency and consideration of cost effectiveness is not subject to review. No changes were made as a result of this comment.

#### **Earthjustice Comment 5:**

IV. The Permit is Unlawful Because It Does Not Require BACT for Certain Regulated Pollutants.

b. IDEM's BACT Analysis for the Refinery Does Not Meet State and Federal Requirements.

Despite the requirements for a proper BACT analysis enumerated above, IDEM's BACT analysis is a backward-looking, incomplete assessment of the pollution-control options that are currently achievable for the Refinery. As the commenting organizations' engineering expert, Dr. Sahu, explained, IDEM's BACT analysis for the Refinery relies entirely on information from EPA's Clearinghouse and "seems to begin and end with a discussion of what BACT determinations have been made in the past." (footnote citing Sahu comment 4) This approach leads to an incomplete BACT analysis that contravenes the goal of BACT requirements, which seek to ensure that new sources of air pollution adopt the best pollution-control technologies that are available *and achievable* for the source. Moreover, IDEM's analysis contains no assessment of the cost-effectiveness of available pollution controls, which is a central requirement of a proper BACT analysis.

Because of these significant flaws, IDEM's BACT analysis is insufficient under federal and state law and EPA guidelines.

#### **IDEM Response to Earthjustice Comment 5:**

See IDEM Response to Earthjustice Comment 4.

#### **Earthjustice Comment 6:**

IV. The Permit is Unlawful Because It Does Not Require BACT for Certain Regulated Pollutants.

c. IDEM Did Not Select the Most Stringent Technology for Controlling Fugitive VOC Emissions or Flaring Emissions and Did Not Explain This Decision.

As explained above, IDEM is obligated to adopt the most stringent available control technologies that are achievable at the Refinery, or explain its decision to adopt less effective alternatives. IDEM has failed to adhere to these requirements.

With respect to fugitive Volatile Organic Compound ("VOC") emissions, the most stringent available control technology is a combination of an enhanced Leak Detection and Repair program and Optical Gas Imaging technologies. Enhanced Leak Detection and Repair programs include lower leak thresholds, more frequent inspections, and quicker repair times for leaking components. Optical Gas Imaging also represents the state of the art technology for detecting leaking components. Together, enhanced Leak Detection and Repair Programs and Optical Gas Imaging indisputably provide the maximum degree of fugitive VOC reduction that is achievable at the Refinery. (multiple footnotes citing Sahu Comment 4, example b)

As for flaring emissions, the most stringent available control technology is flare gas recovery, which reutilizes flare gases in the refinery process or as fuel in order to minimize flaring emissions (footnote citing Sahu Comment 4, example a).

Despite the fact that these technologies and programs are available for controlling fugitive VOC and flaring emissions from the Refinery, IDEM does not require the Refinery to apply these technologies and opts instead for outdated and less-effective alternatives.

Critically, neither the Permit nor the technical support documents provide any reasoned justification for IDEM's decision to adopt less stringent pollution controls. Indeed, IDEM does not even include Optical Gas Imaging in its list of potential control technologies and simply proclaims

that BACT for fugitive VOCs emissions “shall be” the less-efficient, standard Leak Detection and Repair Program without Optical Gas Imaging.

In addition, IDEM provides an entirely unreasonable explanation for its conclusion that flare gas recovery is not achievable for the Refinery and justifies its decision on a baseless assumption that flare gas recovery only applies to certain flares. IDEM’s BACT analysis rejects flare gas recovery as “not a feasible option” on grounds that the Refinery’s flares would “not operate constantly” and thus “there would not be anything to recover,” but this conclusion relies entirely on the assumption that flare gas recovery is viable for only those flares that operate constantly. As Dr. Sahu notes, that assumption is “unsupported and, frankly, astounding.” (multiple footnotes citing Sahu Comment 4, example b)

Moreover, because almost every flare gas stream has hydrocarbons (which in turn have heating value as fuel), the Refinery would almost always have flare gas streams that could be reutilized. (footnote citing Sahu Comment 4, example b)

Because IDEM has failed to provide any reasoned justification for its adoption of less stringent pollution controls, IDEM must require the Refinery to adopt enhanced Leak Detection and Repair and Optical Gas Imaging for its fugitive VOC emissions and flare gas recovery for its flaring emissions. IDEM’s failure to do so renders the permit unlawful.

#### **IDEM Response to Earthjustice Comment 6:**

The source intends to utilize gas streams with recoverable value that could otherwise be discharged to a flare. Light hydrocarbon overhead from the VCC process is a carbon source for the steam hydrocarbon reforming reaction and fuel gas for the boiler and process heaters. The flares may be expected to operate only when processes will be incapable of recovering value from streams diverted to the flares. In that sense, then, IDEM, OAQ considers that the concept of “flare gas recovery” does not exist because streams with recoverable value are not discharged to a flare.

IDEM, OAQ considers that the Leak Detection and Repair program itself is the control technology applicable to fugitive leaks from valves, pumps, and other components. Leak detection thresholds and work practices are specified by applicable regulations, e.g., 40 CFR 60, Subpart GGGa. See also, IDEM Response to Mr. David Boggs Comment 3.

IDEM, OAQ considers that Optical Gas Imaging is an alternative work practice that is available to the source under the provisions of 40 CFR 60.18(g) through (i). See IDEM Response to EPA Permit Comment 18.

No changes were made as a result of this comment.

#### **Earthjustice Comment 7:**

V. The Permit is Unlawful Because It Does Not Adequately Address Emissions from Flares.

As detailed above, operating permits issued in Indiana must comply with “all applicable requirements” of Title V of the Clean Air Act, the Prevention of Significant Deterioration program, and the Indiana Plan. These requirements include emission limitations, monitoring, recordkeeping, and reporting requirements. Pursuant to both federal and state law, IDEM is only authorized to issue permits to sources that “will not cause, or contribute to, air pollution in excess of any . . . maximum allowable increase or maximum allowable concentration for any pollutant” or any National Ambient Air Quality Standard. That means IDEM can issue permits only if they contain emissions limitations and other requirements that ensure compliance with state and federal laws.

With respect to flaring emissions, federal and state law require sources to comply with certain reporting requirements. Specifically, federal New Source Performance Standards and Indiana law

require petroleum refineries constructed after May 14, 2007 to “report excess emissions [from flares] no less frequently than quarterly ”*unless a “permit specifies or a rule requires more frequent reports.”* In order to implement these reporting requirements, the federal standards empower IDEM to determine on a case-by-case basis whether “more frequent reporting is necessary to accurately assess the compliance status of the source.”

If built, the Refinery would have three flares servicing overpressure, two of which will also service emergency relief from the Refinery’s VEBA Combi Cracking and Sulfur Recovery units. The permit sets emissions limit for all three flares that are achievable only if the overpressure and emergency relief events occur in infrequent, emergency-like situations. For example, the permit sets flaring emissions levels based on the assumption that the flares will process certain streams only once or twice—or at most, six times—per year for a limited number of hours. IDEM also makes assumptions about the flow rate of the flares and the flare gas properties of the flares.

In addition, the permit’s emissions limits for flares are based upon inaccurate air quality modeling data that omits critical emissions data for start-up, shutdown, and malfunction events at the Refinery. IDEM’s modeling data reveals that the agency modeled SO<sub>2</sub> emissions from the Refinery’s flares, but not NO<sub>x</sub> or carbon monoxide emissions. This is a significant oversight, and a violation of federal air quality monitoring regulations, because the Refinery’s flares will emit NO<sub>x</sub> and carbon monoxide during start-up.

Compounding concerns with the permit’s flawed assessment of the Refinery’s flaring events, the Permit also does not require the Refinery to report emissions exceedances from these flares more frequently than quarterly.

IDEM’s assumptions regarding the annual number of flaring events at the Refinery and the resulting emissions are unsupported. Indeed, as Dr. Sahu notes, it is “simply impossible to reconcile the lack of design detail [for the Refinery] with the highly detailed assumptions on flare gases used by IDEM in its emissions calculations and modeling.” What is more, IDEM’s quarterly reporting schedule for excess flaring emissions would preclude IDEM from correcting its baseless assumptions about the Refinery’s flaring events and instituting the necessary pollution controls until it is too late to prevent or mitigate unauthorized flaring events. (multiple footnotes citing Sahu Comment 2, example i)

Unless IDEM makes a more reasonable and supported estimate of the likely number of annual flaring events from the Refinery, IDEM cannot satisfy its obligation to ensure the Refinery will comply with state and federal laws. IDEM must revise its estimates of flaring scenarios based on the Refinery’s design specifications if and when those specifications exist. Only then can IDEM properly assess the flares’ emissions potential and determine what pollution controls are necessary. IDEM also must require the Refinery to submit reports on excess emissions more frequently than quarterly so that IDEM can ensure “continuous compliance” with the Refinery’s permitted emissions limits for its flares. Without making these changes, neither IDEM nor the public can be certain that the Refinery will not violate air quality standards. Therefore, issuing the permit is a violation of the Clean Air Act 118 and the Indiana Plan.

It is worth noting that continuous, unauthorized flaring is a practice that refineries frequently use to avoid pollution control requirements. Indeed, EPA has singled out petroleum refineries as sources that frequently violate new source performance standards for their “routine reliance on flaring to control” emissions. Even the Applicant and IDEM have expressed concerns about the Refinery’s ability to use its flares for only infrequent emissions relief. Sustained, unauthorized flaring events can have profound environmental and public health consequences.

Given the frequency and risks of unauthorized flaring, and the Applicant’s and IDEM’s knowledge that such events are likely to happen, IDEM’s failure to require the Refinery to report excess flaring emissions more frequently than *once a quarter* is an “abuse of discretion” under Ind. Code Ann. § 4-21.5-5-14 in addition to the aforementioned violations of federal and state air quality laws. The Permit’s existing reporting schedule would prevent IDEM from discovering excess

flaring emissions until long after those excess emissions have polluted the surrounding community.

#### **IDEM Response to Earthjustice Comment 7:**

The commenters are generally correct in the broad observation that IDEM may issue permits to sources "that 'will not cause, or contribute to, air pollution in excess of any . . . maximum allowable increase or maximum allowable concentration for any pollutant' or any National Ambient Air Quality Standard". The Air Quality Analysis shows that the source, with the emissions limitations and other requirements of the permit, will not contribute to a violation of the NAAQS or the PSD increment. See Appendix C of this ATSD for the revised Air Quality Analysis in its entirety.

IDEM, OAQ does not agree with the commenters' statements that emissions limits for flares are based on inaccurate air quality modeling data and that assumptions about the annual number of flaring events are unsupported. Modeling of flare emissions is discussed in Section C and Appendix A of the Air Quality Analysis (Appendix C to this ATSD) and in IDEM Response to EPA Modeling Comment 1, above. Modeling the flare emissions, expressly including SO<sub>2</sub>, NO<sub>x</sub>, and CO in flaring situations, is based on the best available information about the number of events and the characteristics of the gas streams that may be flared. Alternatives presented in Appendix A of the Air Quality Analysis are worst case scenarios among start-up, shutdown, and malfunction conditions. As is explained in Section C of the Air Quality Analysis, the highest hourly rate was modeled for each hour over the 5 years of meteorological data. IDEM, OAQ considers therefore that the provisions of the permit are sufficient to demonstrate that the source will not cause or contribute to a violation of the National Ambient Air Quality Standards. See Appendix C of this ATSD for the revised Air Quality Analysis in its entirety.

IDEM, OAQ considers the commenters' statements about flaring as a practice and the likelihood of unauthorized flaring to be not representative of Riverview Energy Corporation. The Enforcement Alert (published October 2000) cited by the commenters goes on to cite "(a)dequate capacity at the back end of the refinery to process acid gas" as a good pollution control practice. IDEM notes that the sulfur recovery units planned are, in combination, 40% over the expected acid gas production based on specifications for incoming coal.

IDEM, OAQ considers the estimate of annual flare events at the source to be reasonable and supported by design and operations experience in the petroleum refining industry. Changes in the facility design or method of operation that increase the potential to emit are subject to source modification provisions of 326 IAC 2-7-10.5 and permit modification requirements at 326 IAC 2-7-12. Changes may also be subject to the PSD modification provisions in 326 IAC 2-2.

Under 40 CFR 60, Subpart Ja, the source is required to develop and implement a flare management plan including, for example, procedures to minimize or eliminate discharges to the flare during the planned startup and shutdown of the refinery process units. The requirement for quarterly reporting is consistent with requirements applicable to other sources, including oil refineries. In the absence of demonstrated need or any other benefit, a requirement for monthly reporting would be an abuse of discretion.

No changes were made as a result of this comment.

#### **Earthjustice Comment 8:**

VI. The Permit Is Unlawful Because Its Issuance Violated Public Participation Requirements.

Indiana regulations require IDEM to provide the public with "information sufficient to notify the public as to the emissions implications" of an air permit prior to issuing that permit. For the many reasons identified in these comments, including (among others) missing plant information and erroneous calculations, the "emission implications" of the Refinery are not clear. Therefore, the permit should be withdrawn until the public is notified.

Additionally, IDEM has not fully responded to the commenting organizations' records requests. The commenting organizations filed requests regarding the Riverview Energy Corporation on June 19, 2018 and November 14, 2018 (Attachments C and D). While IDEM has posted some documents regarding the Refinery to the Virtual File Cabinet, IDEM has never sent requestors a complete response or a description of documents withheld. Further, as we noted in our letter to IDEM of November 21, 2018:

"[N]o notes, including from meetings and telephone calls, have been posted in the Virtual File Cabinet, despite the fact that IDEM has been preparing the proposed permit and other documents throughout 2018, and has been in contact with representatives of Riverview Energy Corporation during that time. By this omission, and possibly others, IDEM fails to respond to our request. IDEM's omission impairs our ability to gather information regarding the basis for IDEM's action that is necessary to fully prepare our comments on the proposed permit."

Attachment E of our letter requested that IDEM: (1) provide a complete and final response to our requests, including a full description of each document withheld, if any; (2) for any documents (including but not limited to notes) responsive to our request that had not yet been posted in the Virtual File Cabinet, provide these documents or post them in the Virtual File Cabinet; (3) extend the comment period on the permit by 20 days from (a) the date a complete and final response to our request is provided, or (b) the date the last document is provided or posted, whichever is later.

On November 15, 2018, we received a communication from IDEM suggesting that we submit detailed search terms for an e-mail search in response to our records request. We submitted such search terms by letter to IDEM dated November 21, 2018. However, we have not received a response to our two letters dated November 21, 2018, nor, as noted above, a complete response to our records requests of June 19, 2018 or November 15, 2018.

Finally, IDEM updated its air quality monitoring analysis of PM-10 after the start of the public comment period and has failed to make the corresponding data publicly available (footnote citing Gebhart Comment 14). Thus, IDEM has not provided sufficient information to the public regarding the emissions implications of the Refinery.

For these reasons, the permit should be withdrawn until IDEM discharges its duty to notify the public of its emissions implications in accordance with Title 326 of the Indiana Code. The commenting organizations reserve the right to supplement our comments if IDEM responds to our record requests in compliance with its obligations under Indiana's Code.

#### **IDEM Response to Earthjustice Comment 8:**

The draft PSD/New Source Review and Part 70 Operating Permit complies with the public participation requirements at 326 IAC 2-1.1-6, 326 IAC 2-2-15, and 326 IAC 2-7-17. In its records request response tendered on September 5, 2018, IDEM directed the commenters to responsive documents on IDEM's Virtual File Cabinet (VFC), and further provided a Sharepoint hyperlink ([https://ingov-my.sharepoint.com/:f/g/personal/dschilli\\_idem\\_in\\_gov/Eqf6wk61dBNLiQQOIMJpEgcBc9SDuliNTJVpom4fsMef0Q?e=kc3aV2](https://ingov-my.sharepoint.com/:f/g/personal/dschilli_idem_in_gov/Eqf6wk61dBNLiQQOIMJpEgcBc9SDuliNTJVpom4fsMef0Q?e=kc3aV2)) hosting certain modeling files that are not housed on VFC. IDEM also notified the requester that it was adding documents, including correspondence with the applicant, to the VFC on a weekly basis. To the extent that the commenters request that IDEM extend the comment period until IDEM has completed responding to all of the commenters' records requests, neither the Access to Public Records Act (APRA) nor the permit regulations require IDEM to complete records requests within the timeframe for public comment on a particular permit. APRA requires a state agency such as IDEM to respond to public records requests within a reasonable time. Also, the voluminous materials contained on the VFC and Sharepoint during the public comment period provide sufficient information to allow for public participation in the permit review process.

The commenters appear to conflate their public records request with the issue of updates to PM<sub>10</sub> modeling. As noted in IDEM Response to Mr. Howard Gebhart Comments 4 and 14, the source has corrected and updated information for PM<sub>10</sub> modeling. As new material has been provided or developed, IDEM has added files to the Sharepoint hyperlink cited above. Therefore, IDEM, OAQ considers the commenters' claim that "... IDEM has not provided sufficient information to the public..." to be incorrect.

No changes were made as a result of this comment.

#### **Earthjustice Comment 9:**

VII. The Permit Is Unlawful Because It Allows the Refinery to Emit Pollution That Will Injure the Public Health and Welfare.

IDEM ignores the fact that the Refinery will produce odor, noise, and other pollutants that will injure residents' health and welfare, and incorrectly states in its public notice that it "does not have legal authority to regulate . . . odor or noise."

Indiana law prohibits "nuisances," which are "[w]hatever is injurious to health; indecent; offensive to the senses; or an obstruction to the free use of property; so as essentially to interfere with the comfortable enjoyment of life or property." Businesses that subject neighbors to odors or hazardous air pollutants can be liable for nuisance. This is true even if those businesses conduct their operations in accordance with regulations.

Just as regulators cannot excuse nuisances, IDEM also cannot issue air permits that will create a nuisance. A key purpose of Indiana's environmental laws is to maintain Indiana's air quality "consistent with protection of the public health and welfare and the public enjoyment of the air resource, physical property and other resources." In furtherance of this goal, Indiana law prohibits any person from emitting or threatening to emit "any contaminant or waste, including any noxious odor" into the air "in any form that causes or would cause pollution that violates or would violate rules, standards, or . . . emission requirements" contained in environmental regulations. Environmental regulations prohibit IDEM from issuing permits unless those permits contain emissions limitations that assure "the public health will be protected." Contrary to IDEM's claim, then, IDEM is *obligated* to regulate odor, noise, and other emissions in the process of issuing an air permit when the permitted source will cause emissions that injure public health or otherwise undermine the public's welfare and enjoyment of natural resources.

Despite its obligation, IDEM entirely failed to consider how the odor, noise, and toxic pollution from the Refinery would injure nearby residents. The permit currently allows the Refinery to emit roughly 60 tons per year of hazardous air pollutants ("HAPs"), including carcinogenic substances like polycyclic aromatic hydrocarbons and benzene. The permit also allows the Refinery to emit five tons of hydrogen sulfide per year, which is an "extremely hazardous gas" that produces a "rotten egg" smell and significant health effects. On top of that, the permit approves significant increases in local truck traffic, which will churn up dust and cause substantial, near-continuous noise.

This noise, odor, and hazardous air pollution will be emitted within feet of Dale residents' doorsteps, subjecting residents to an onslaught of emissions that will injure their health and interfere with the enjoyment of the environment. Because the permit allows the Refinery to emit these pollutants, it does not contain the requisite emissions limits to ensure "the public health will be protected" and therefore is unlawful under Title 326, Article 2 of Indiana's Administrative Code.

### **IDEM Response to Earthjustice Comment 9:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

One of the Indiana environmental laws referenced by the commenters is codified under Indiana Code IC 13-30-2-1 (Specific acts prohibited). Pursuant to IC 13-30-2-1,

#### **IC 13-30-2-1 Specific acts prohibited**

Sec. 1. A person may not do any of the following:

(1) Discharge, emit, cause, allow, or threaten to discharge, emit, cause, or allow any contaminant or waste, including any noxious odor, either alone or in combination with contaminants from other sources, into:

(A) the environment; or

(B) any publicly owned treatment works;

in any form that causes or would cause pollution that violates or would violate rules, standards, or discharge or emission requirements adopted by the board under the environmental management laws.

The draft permit contains all health-based and technology-based standards established by the U.S. EPA and the Indiana Environmental Rules Board, which will limit the amount of emissions from the facility to the very lowest level allowed by law. In addition, IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety). If the information provided by the applicant in an air permit application indicates that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

There are nuisance laws in Indiana that are both public and private. IC 16-20-1-25 provides:

"A person shall not institute, permit, or maintain any conditions that may transmit, generate, or promote disease. A health officer, upon hearing of the existence of such unlawful conditions within the officer's jurisdiction, shall order the abatement of those conditions. The order must: be in writing if demanded; specify the conditions that may transmit disease; and name the shortest reasonable time for abatement. If a person refuses or neglects to obey an order issued under this section, the attorney representing the county of the health jurisdiction where the offense occurs shall, upon receiving the information from the health officer, institute proceedings in the courts for enforcement. An order may be enforced by injunction. If the action concerning public health is a criminal offense, a law enforcement authority with jurisdiction over the place where the offense occurred shall be notified."

Pursuant to the above statute in conjunction with IC 16-20-1-26, if the Permittee creates a situation that promotes disease, a local health officer may issue an order for abatement, and if not complied with may seek to have the order enforced in the appropriate circuit or superior court in Indiana.

Private Indiana nuisance law is codified under Indiana Code IC 32-30-6 (Chapter 6. Nuisance Actions). Under IC 32-30-6-6, "Nuisance described and considered subject to an action" is defined. Under IC 32-30-6-7, any person whose property is injuriously affected or whose personal enjoyment is lessened by a nuisance can bring an action to abate or join the

nuisance. Indiana nuisance law does not require IDEM, OAQ to make a determination whether a source could be a "nuisance" as defined by IC 32-30-6, and does not authorize IDEM, OAQ to deny an air permit based on a determination of possible future nuisance.

Air pollution control laws are contained under Indiana Code IC 13-17. As specified under IC 13-17-1-1 (Purpose; air resource purity), "it is the intent and purpose of air pollution control laws to maintain the purity of the air resource of Indiana, which shall be consistent with protection of the public health and welfare and the public enjoyment of the air resource, physical property and other resources, flora and fauna, maximum employment, and full industrial development of Indiana. The board and the department shall safeguard the air resource through the prevention, abatement, and control of air pollution by all practical and economically feasible methods."

IDEM's mission is to implement federal and state regulations to protect human health and the environment while allowing for environmentally sound operations of industrial, agricultural, commercial, and government activities vital to a prosperous economy.

This proposed permit for Riverview Energy Corporation is protective of human health and the environment and will allow for environmentally sound operations that may support a prosperous economy.

No changes to the draft permit were made as a result of this statement.

#### **Earthjustice Comment 10:**

VIII. The Refinery Qualifies as a Petroleum Refinery, Contrary to the Applicant's Claims.

IDEM has categorized correctly the Refinery as a petroleum refinery, despite the Applicant's contrary claims in the decision-making record. Pursuant to federal New Source Performance Standards, a "petroleum refinery" is "any facility engaged in producing gasoline, kerosene, distillate fuel oils, residual fuel oils, lubricants, or other products through distillation of petroleum or through redistillation, cracking or reforming of unfinished petroleum derivatives." Naphtha and vacuum gas oil are both considered unfinished petroleum derivatives. The Refinery will "hydro-crack" vacuum gas oil in its VEBA Combi Cracking unit to produce naphtha and diesel products, and therefore will create products through the cracking of a petroleum derivative. Because the Applicant's VEBA Combi Cracking technology renders the Refinery a petroleum refinery under federal regulations, any subsequent permits must retain the provisions in the draft permit that require compliance with the federal standards for petroleum refineries.

#### **IDEM Response to Earthjustice Comment 10:**

The commenters appear to refer to a characterization of the source in the original permit application as in the Standard Industrial Classification (SIC) code 2999, products of petroleum and coal, not elsewhere classified. Some confusion about SIC codes is understandable because the system was replaced by the North American Industrial Classification System in 1987 and the SIC code manual has not been updated since that year. Several agencies, however, including OSHA, SEC, and EPA continue to use the SIC code.

The commenters' own justification for claiming that the source is a petroleum refinery hinges on an observation that the VCC process will hydro-crack vacuum gas oil, which the commenters describe as a petroleum derivative. IDEM, OAQ has made a determination that the source's products meet the NSPS definition of petroleum: "(T)he crude oil removed from the earth and the oils derived from tar sands, shale, and coal." However, the SIC code definition does not include the extension to derived oils and from that point of view therefore, the source was not without justification for considering that vacuum gas oil produced from coal and the products derived from cracking the VGO were not petroleum.

IDEM, OAQ suggested rather early in the permitting process that the SIC code 2911, petroleum refineries, may be more appropriate than the applicant's choice, and more significantly, that the

source clearly was a petroleum refinery as the term is defined in Standards of Performance for New Stationary Sources (commonly called NSPS, 40 CFR 60) and National Emission Standards for Hazardous Air Pollutants (NESHAP, 40 CFR 63). While an April 14, 2018 email from Mr. Gregory Merle, Riverview Energy Corporation, continued to challenge the determination that the source is a "petroleum refinery", the source acknowledged its intention of complying with the requirements of 40 CFR 60, Subparts Ja and GGGa, NSPS applicable to petroleum refineries. The source has not challenged any determinations IDEM, OAQ made regarding Subparts Ja and GGGa, or determinations about the applicability of NESHAPs that apply to petroleum refineries, including 40 CFR 63, Subparts CC and UUU.

IDEM, OAQ will retain requirements of the NSPS and NESHAP in the permit as long as the source is subject to the provisions of those regulations. No changes were made as a result of this comment.

### Dr. Ranajit Sahu Comments and IDEM Responses

On December, 2018, Dr. Ranajit Sahu, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Dr. Sahu's comments were included as an attachment to the comments submitted by Earthjustice, et al.

#### Dr. Ranajit Sahu Comment 1:

While it may seem like an obvious statement, key items noted above, including the emissions estimates and source characteristics are completely dependent on the design of the facility: including the facility layout; the sizes of various equipment proposed at the facility; the compositions of many of the underlying process streams; the count of various fugitive volatile organic compound (VOC) release points; operational details which, in turn, drive emissions due to flaring; and individual source characteristics such as release heights, temperatures, velocities, etc. Thus, if the facility design is not complete or stable - i.e., it might change in the future before the plant is actually constructed - current estimates of emissions and source characteristics will also change, rendering the analyses supporting permit issuance obsolete.

Unfortunately, a review of the record makes it clear that the facility's design is far from complete - thus, making it more than likely that what is being proposed in the permit will, in all likelihood not be what is actually constructed once additional engineering design, equipment selection, and equipment procurement are completed. It is not enough therefore to simply rely on a very preliminary version of the design, often just conceptual, as a basis for the permit, as is the present case.

I present examples below confirming that the facility design is not mature enough to support the permit and its underlying analyses - especially when predicted air impacts are barely below applicable thresholds. As noted above, it is entirely likely that if the analyses are done after facility design is completed that the impacts would be greater than certain applicable thresholds. Of course, additional technical deficiencies, which I discuss below, further undermine confidence in the supporting analyses.

#### Example (a)

From a March 28, 2018 email from KBR [REC's consultant], discussing coal piles:

"The modeling of fugitive PM from the coal stacks was proposed in our Modeling Protocol provided to IDEM as a "volume source" for analyses and diameter is not an input for those dispersion calculations. Note there are other designs which could reduce the diameter of each circle further, which will be evaluated during later engineering phases. Thus consider the circles as "indicative" for any general discussion of size of coal storage." (emphasis added)

Example (b)

From another March 28, 2018 email from KBR:

“While detailed engineering or equipment procurement for the Riverview plant has not been initiated, I assume a vertical mill with a static classifier could be specified as a 3rd party engineered package unit for the coal size reduction process.” (emphasis added)

“It should be noted that the fine and coarse additives can be a variety of materials, as may be discovered in open literature, see attached patent. The definition of the best fine and coarse additives to be used at the Riverview VCC will be established during later engineering studies. As fine additive may be the same material as coarse additive, i.e., only differing in size distribution, a ‘Fine Additive Production System’ package was provided in the scope as backup for separate direct delivery. This 3rd party engineered package unit is currently envisioned to have an independent emission point for intermittent startup and shutdown service, however it should be able to be controlled during normal operations by the additive transfer baghouse (an edit is needed to the Block Flow Diagram).” (emphasis added)

By its own admission above, some two months after the late-January 2018 submission of the permit application, KBR notes that detailed engineering has not been initiated.

Example (c)

From a March 29, 2018 email from KBR:

“One (1) burner, identified as A-602a burner, combusting acid gas and natural gas. [SAL [Steven A Lang] Comment: Depending on expected supplier offering there will be one burner, however there could be multiple burners, one for start-up heating on natural gas and one for normal firing of the SRU’s H2S/H2O gaseous feed.]” (emphasis added)

Example (d)

From a May 7, 2018 email from KBR:

“Please note that at the present stage of engineering for the DCH Facility, there are preferred equipment suppliers, i.e., those whom have supplied information and aided in Riverview’s ‘project definition,’ but none have been selected. Formal engineering and procurement activities to solicit multiple equipment bids and supporting the next refined level of project scope and cost estimation will be initiated in the next phase of engineering.” (emphasis added)

Example (e)

From a May 9, 2018 email from KBR:

“In regard to Q7, addressing cooling tower issues, I must first note that the cooling tower makeup supply is not likely to be entirely fresh Ohio River water. There may be both lower and higher TDS content streams recycled to the cooling tower as makeup, i.e., from Block 6500 Water Supply and Treatment and perhaps from Block 8000 NPDES Wastewater Facilities which will impact water usage and disposal. Also, at this time the cooling water treatment program is not defined and it will add to TDS levels in the cooling tower as well.” (emphasis added)

Example (f)

From the June 2018 Modeling Protocol (p. 14):

“A list of buildings, large tanks, and other major structures which will be modeled and assessed for downwash effects is given in Attachment G; modeled input is based on available definition of each structure’s physical parameters at the time of permit application drafting.” (emphasis added)

The above statement rightly recognizes that all of the information relied upon in the modeling can change - once detailed engineering, equipment procurement, etc., are conducted.

Example (g)

Footnote 4 to the updated Table 1 Emissions Inventory sent from KBR to IDEM on June 4, 2018 states:

“Hydrogen plant emission information has been provided by an outside vendor, based upon vendor’s initial conceptual approach. Discussion regarding hydrogen plant design are not finalized.” (emphasis added)

Table 1 itself is titled as “Preliminary.” I note that the permit application had been submitted to IDEM by KBR in late January 2018.

Example (h)

Footnote 8 to the updated Table 1 Emissions Inventory sent from KBR to IDEM on June 4, 2018 states:

“Emissions estimates utilize AP-42 emission factors extensively. These factors provide conservatively high emissions estimates that will be refined with vendor information as it becomes available.” (emphasis added)

Setting aside the fact that the characterization of AP-42 emission factors in footnote 8 above is flat wrong (i.e., that they provide “conservatively high emissions estimates”), it is clear that even as late as June 2018, actual emissions data for the processes at the proposed plant were not available from vendor(s).

Example (i)

IDEM asked the following to KBR on July 2, 2018:

“Steve’s March 29 email about the sulfur recovery units indicated that the burner arrangement in the acid gas furnace stage was not finalized at that time. Can you provide capacities for the startup heating burner now? Will there be any capacity for firing natural gas during normal operations and if so, what is that expected to be?”

KBR’s Mr. Lang, reply included the statement that:

“[T]he firing rates will have to come from the vendor/supplier or I will have to calculate or try to find a default value from other similar projects.”

Clearly, KBR’s statement above confirms that the answers to IDEM’s questions were not available because vendor selection had not been completed by July 2018 even though the permit application had been submitted by KBR to IDEM in late January 2018.

Example (j)

From a July 27, 2018 email from KBR

“At this stage of the project we do not have a good estimate of expected flare events such as startups, shutdowns, etc., however we are developing a default basis, using the attached template which will be revised in later phases of engineering. Any comments or suggestions on the format are welcome.”  
(emphasis added)

The above statement regarding flaring is particularly instructive. While KBR later provided a laundry list of potential flaring scenarios, some of which were modeled by IDEM, it is clear that the underlying bases of almost all of the flaring scenarios are nothing more than guesswork, given the preliminary process design used in the permit application.

In sum, on this point and based on the examples provided above, it is inarguable that important and central aspects of the permit such as emissions estimates and air dispersion modeling, which have been used as the basis of permit issuance, simply cannot be relied upon.

**IDEM Response to Dr. Ranajit Sahu Comment 1:**

IDEM, OAQ considers example (a) moot because the source has chosen to use enclosed storage for coal instead of open piles.

IDEM, OAQ considers the balance of this comment to be incorporated in Earthjustice Comment 1. See IDEM Response to Earthjustice Comment 1.

**Dr. Ranajit Sahu Comment 2:**

Here again, I provide examples of technical deficiencies rather than an exhaustive list of each and every deficiency.

Example (a)

IDEM's TSD Appendix A Emissions Summary (page 2 of 43 - "PTE After Controls") shows that the facility's annual PM, PM10, and PM2.5 emissions, excluding fugitives, are, respectively, 53.04 tons/year, 66.51 tons/year, and 66.03 tons/year.

PM10 and PM2.5 are, respectively, the mass fractions of overall PM emissions, with sizes below 10 and 2.5 microns. Therefore, PM10 and PM2.5 mass cannot exceed the PM mass.

Example (b)

Comparing IDEM's Appendix A Emissions Summary provided on pages 1 of 43 (Uncontrolled PTE) and 2 of 43 (Controlled PTE), SO2 PTE emissions are estimated to be 208.2 tons/year for the uncontrolled case and 225.13 tons/year for the controlled case. How can uncontrolled PTE emissions be smaller than controlled PTE emissions? Again, on its face this makes no sense.

Example (c)

Greenhouse gas (CO2, CH4, and N2O) emissions are estimated from various combustion (and fugitive VOC) processes. As is customary, the collective emissions as CO2-equivalent (or CO2e) are then estimated using the so-called Global Warming Potentials (GWP) for CH4 and N2O (the CO2 GWP is assumed to be 1).

In all cases, the emissions calculations (see, for example, TSP Appendix A page 12 of 43), assume that the GWP of CH4 is 25 and for N2O is 298. These are 100-year GWP values and they are outdated.

First, I note that these are now outdated values since they are based on older assessments of climate science by the Intergovernmental Panel on Climate Change (IPCC). Second, I note that these are the so-called 100-year GWP values, although there is literally no mention or discussion of this. GWP values depend on the future time horizon of interest - typically either 20 or 100 years. Recent consensus GWP values for CH<sub>4</sub> are different: 34 (100-year) and 86 (20-year).

Given the short half-life of methane as compared to CO<sub>2</sub>, GHG CO<sub>2</sub>e emissions should be calculated on both a short-term (i.e., 20-year) as well as a long-term (100-year) basis, using the current and not older values of the respective GWP.

#### Example (d)

The emission calculations (whether by KBR in its application or by IDEM in its TSD, Appendix A) rely, on many occasions, on AP-42 as the source of emission factors. As noted earlier, KBR seems to think that using AP-42 emission factors results in conservative (i.e., higher) estimates of emissions.

They are mistaken. There are at least two major problems with using AP-42 inappropriately as has been done in the proposed permit action, discussed below.

First, AP-42 emission factors are inappropriate for developing PTE estimates, since PTE, by design, is supposed to represent the “potential” or high-end emission estimate value while AP-42 emission factors represent “average” and not maximum emission rates. AP-42 makes this very clear:

“In most cases, these factors are simply averages of all available data of acceptable quality, and are generally assumed to be representative of long-term averages for all facilities in the source category (i. e., a population average).” (emphasis added)

“Emission factor ratings in AP-42 (discussed below) provide indications of the robustness, or appropriateness, of emission factors for estimating average emissions for a source activity.” (emphasis added)

Thus, in each instance that REC’s or IDEM’s PTE calculations rely on AP-42 emission factors, they are simply wrong and the resultant PTE emissions (all other criticisms aside) are underestimates. This has material consequences, especially for estimating short-term impacts. For example, NO<sub>x</sub> emissions, when underestimated, result in underestimated 1-hour NO<sub>x</sub> modeled impacts from the facility, etc. Again, exceeding such impacts will require better and more stringent controls to limit short term NO<sub>x</sub> emissions, which have not been discussed in the record.

Clearly, KBR’s statement earlier that use of AP-42 results in conservative emissions estimates has no basis in fact. In fact, it is the opposite when AP-42 is used to calculate PTE values.

Second, neither the KBR nor IDEM emissions calculations mention or discuss the reliability (i.e., accuracy) of AP-42 emission factors. AP-42 uses a rating system, quoted below, to provide the user with a sense of how accurate a particular emission factor is:

“Each AP-42 emission factor is given a rating from A through E, with A being the best. A factor’s rating is a general indication of the reliability, or robustness, of that factor. This rating is assigned based on the estimated reliability of the tests used to develop the factor and on both the amount and the representative characteristics of those data. In general, factors based on many observations, or on more widely accepted test procedures, are assigned higher rankings. Conversely, a factor based on a single observation of questionable quality, or one extrapolated from another factor for a similar process, would probably be rated much lower....

The AP-42 emission factor rating is an overall assessment of how good a factor is, based on both the quality of the test(s) or information that is the source of the factor and on how well the factor represents the emission source. Higher ratings are for factors based on many unbiased observations, or on widely accepted test procedures. For example, ten or more source tests on different randomly selected plants would likely be assigned an "A" rating if all tests are conducted using a single valid reference measurement method. Likewise, a single observation based on questionable methods of testing would be assigned an "E", and a factor extrapolated from higher-rated factors for similar processes would be assigned a "D" or an "E".

AP-42 emission factor quality ratings are thus assigned:

A — Excellent. Factor is developed from A- and B-rated source test data taken from many randomly chosen facilities in the industry population. The source category population is sufficiently specific to minimize variability.

B — Above average. Factor is developed from A- or B-rated test data from a "reasonable number" of facilities. Although no specific bias is evident, it is not clear if the facilities tested represent a random sample of the industry. As with an A rating, the source category population is sufficiently specific to minimize variability.

C — Average. Factor is developed from A-, B-, and/or C-rated test data from a reasonable number of facilities. Although no specific bias is evident, it is not clear if the facilities tested represent a random sample of the industry. As with the A rating, the source category population is sufficiently specific to minimize variability.

D — Below average. Factor is developed from A-, B- and/or C-rated test data from a small number of facilities, and there may be reason to suspect that these facilities do not represent a random sample of the industry. There also may be evidence of variability within the source population.

E — Poor. Factor is developed from C- and D-rated test data, and there may be reason to suspect that the facilities tested do not represent a random sample of the industry. There also may be evidence of variability within the source category population."

Note, in particular, the very poor reliabilities of "D" and "E" rated factors.

Consider IDEM's TSD Appendix A calculations, for example, for all combustion equipment. These include: the coal dryer heater (p. 12/43); feed heater and fractionation heater (p. 17/43); treat gas heater and vacuum column feed heater (p. 18/43); natural gas combustion in the flare pilots (p. 22/43 and p. 25/43); and boiler (p. 29/43). For each of these sources, IDEM relied on AP-42 emission factors for criteria pollutants and hazardous air pollutants (HAP). The TSD Appendix A calculations pages in each instance reference AP-42, Chapter 1.4 [for Natural Gas combustion], Tables 1.4-1, 1.4-2, and 1.4-3, as well as metal HAP emission factors in Table 1.4-4. I show, in Attachment B, these very tables relied upon by IDEM, taken directly from AP-42, Section 1.4. In Attachment B (*not included in this ATSD*), I have highlighted the emission factor ratings for most of the pollutants - and they are generally rated at C, D, or E - indicating little to no accuracy.

Yet, without commentary, KBR and IDEM have used these poor/useless emission factors to estimate PTE emissions, no less, and then used those emission estimates as input to the air dispersion modeling.

There is simply no reason to believe that the air dispersion modeling results are at all reliable.

Example (e)

Similar to the inappropriateness of using average emission factors (of little reliability) to estimate PTE emissions, as discussed above, the KBR and IDEM calculations make the same error in estimating fugitive VOC emissions. I note that 176.22 tons/year of controlled "PTE" emissions are attributed to fugitive leaks by IDEM - not an insignificant portion of the overall 484 tons/year overall facility VOC emissions for this controlled PTE case. Details of the emission calculations are provided on page 40/43 of the TSD, Appendix A. The source of the emission factors is stated as "Emission factor source Protocol for Equipment Leak Emission Estimates, EPA-453/R-95-017, November 1995), Table 2-2 (Refinery), except as noted." I have excerpted this table below for ease of reference.

TABLE 2-2. REFINERY AVERAGE EMISSION FACTORS<sup>a</sup>

Equipment type	Service	Emission factor (kg/hr/source) <sup>b</sup>
Valves	Gas	0.0268
	Light liquid	0.0109
	Heavy liquid	0.00023
Pump seals <sup>c</sup>	Light liquid	0.114
	Heavy liquid	0.021
Compressor seals	Gas	0.636
Pressure relief valves	Gas	0.16
Connectors	All	0.00025
Open-ended lines	All	0.0023
Sampling connections	All	0.0150

First, a simple comparison of the emission factors noted in the referenced table above with those used in the IDEM calculations (excerpted below from page 40/43 of the TSD Appendix A) shows that they are identical.

Second, as noted in the very title of the referenced document table above, these are ALL average emission factors - confirming that their use in estimating VOC PTE emissions is simply wrong.

Fugitive Equipment	Physical Service	Emission factor (NMOE taH (kg/hr/source))
Valves	Gas	0.0268
	Light liquid	0.0109
	Heavy liquid	0.00023
Pump seals	Light liquid	0.114
	Heavy liquid	0.021
Flanges/connectors	All	0.00025
Pressure Relief Valves <sup>3</sup>	Gas	0.16
	Liquid	0.16
Compressor seals	Gas	0.636
Open-Ended Lines/Valves <sup>4</sup>	All	0.023
Sampling Connections <sup>5</sup>	all	0.015
Water Seal Process Drains <sup>5</sup>	all	

Example (f)

Sticking to the VOC emission estimate from leaking fugitives, IDEM compounds its error in calculating the PTE by using control efficiencies (likely due to the assumed effectiveness of a Leak Detection and Repair (LDAR) program proposed as BACT for these fugitive components), as follows:

1. VOC

Fugitive Equipment	Physical Service	Emission Factor <sup>1</sup> (NMOC taken as VOC)		Control Efficiency <sup>2</sup> %	count
		(kg/hr/source)	(lb/hr/source)		
Valves	Gas	0.0268	0.059	70%	3
	Light liquid	0.0109	0.024	61%	32
	Heavy liquid	0.00023	0.001		153
Pump seals	Light liquid	0.114	0.251	45%	18
	Heavy liquid	0.021	0.046		19
Flanges/connectors	All	0.00025	0.00055		1036
Pressure Relief Valves <sup>3</sup>	Gas	0.16	0.353	70%	19
	Liquid	0.16	0.353	61%	90
Compressor seals	Gas	0.636	1.402	0%	1
Open-Ended Lines/Valves <sup>4</sup>	All	0.023	0.051	100%	90
Sampling Connections <sup>5</sup>	all	0.015	0.033	100%	205
Water Seal Process Drains <sup>6</sup>	all		0.07	0%	205
<b>Total</b>	-		-		

IDEM states that the control efficiency values are taken from Tables 5-1 and 5-3 of EPA's 1995 document I reference above. However, IDEM does not consider the considerable caveats in the EPA document, footnoted in each of the tables it relies upon. For example, in Table 5-3 in this reference, EPA notes that it has no available data to estimate the control effectiveness for connectors while still arriving at a numerical value of control effectiveness. Similarly, Table 5-1 states that control effectiveness for pressure relief devices may be lower than stated. It is therefore incorrect to simply use a control effectiveness value from a reference forgetting attached restrictions and caveats. The net result is that fugitive emissions from component leaks at the facility are considerably understated.

Of course, given the conceptual nature of the design as noted earlier, the fact that the component counts noted in the table above will change as the design matures makes these calculations even more suspect.

Example (g)

Tank emission calculations are provided by IDEM in the TSD Appendix A on page 27/43. Curiously, the emissions table does not provide a critical parameter, namely the vapor pressure of the stored compounds on that table. And, even more curiously, emissions from many of the tanks are simply noted as zero.

What IDEM does not explicitly discuss as part of the tank calculation is the information provided to IDEM in a May 9 email from Mr. Lang of KBR, which simply states "TBD" for the vapor pressure for many of the tanks - likely because of the preliminary status of the design.

If IDEM has simply equated TBD to be zero, and thereby clearly underestimated tank VOC emissions, that is obviously an error.

#### Example (h)

An additional and significant error related to tank emission calculations discussed above is the very method KBR and IDEM have used to estimate such emissions - i.e., by using EPA's TANKS program - see page 27/43 of the TSD Appendix A.

It is now well known (and has been for almost a decade) that VOC emissions calculated using equations provided in AP-42 (or in the EPA TANKs program), underpredict actual emissions from storage tanks by multiples as high as 3 to 7 or even more depending on the properties of the material being stored and the type of tank. Therefore, IDEM needs to enhance the TANKs-based PTE emission estimates to account for the greater emissions from tanks at the facility.

#### Example (i)

Like most of the emissions estimates discussed above, I also note that estimated emissions from flaring are likely significantly underestimated

Of course, to reiterate the point once again, estimates of process gases that will need to be flared at each of the flares - especially the HP and LP flares at the proposed facility - can only be properly assessed after completion of detailed engineering, which has simply not been done at this time. The inability to properly assess the many potential flaring scenarios is made explicit by KBR, REC's consultants, in an August 27, 2018 email (which is over 7 months after submittal of the late-January 2018 permit application). KBR states:

"In regard to Flaring scenarios, we've built a listing, but didn't get a chance to discuss with Doug how the air permit was going to handle the expected event types beyond meeting NSPS and the Refinery Sector Rule guidance. We assume that Riverview will at some time need to address minimizing event types listed below, using a Flare Management Plan or event reporting as a special term or condition of the Air permit." (emphasis added)

KBR concedes:

"The flaring scenarios that are expected include those listed below. Establishing flare event durations is very problematic..." (emphasis added)

It is absolutely clear from the above that KBR is figuratively throwing up its hands with regards to flaring and its emissions. Note the reference to "will at some time need to address..." and the reference to a "Flare Management Plan" as yet undeveloped, for understandable reasons, given the immaturity of the whole process design.

Yet, the significant uncertainty notwithstanding, IDEM seems to have modeled a few difference flaring scenarios as noted in Appendix C to the TSD.

"The consultant for the source, KBR, has stated that when the flares are operating, the rest of the facility will be at a diminished operating capacity. IDEM has modeled the facility at or near full capacity for NO<sub>2</sub> and CO. The consultant presented a worst case flaring scenario for SO<sub>2</sub> during which the facility will be at partial capacity. The consultants' worst case SO<sub>2</sub> flaring scenario is reflected in Table 2."

Digging deeper, despite the complete absence of design information and purely in an attempt to model some aspect of flaring, IDEM (whether or not with the assistance of KBR) seems to have made a wide range of unsupported assumptions with regards to the various flares and their likely uses as shown. I provide an excerpt below from the TSD Appendix A, page 23/43 (please see original for the full table):

**2. Flare Operations<sup>1</sup>**

Plant Area	Source	Stream Type	Routed to	Flare Operating Conditions					
				Events /yrr	Duration hr/event	Annual Period h/yr	Flow Rate lb/hr	Stream Mol. Wt. lb/lbmol	Heating Value Btu/scf
Block 2000	VCC CCSU - 50 Bar Case Leak Test	N2	HP Flare EU-4004	2	2.5	5	96595	28.0	5
	VCC CCSU - 150 Bar Case Leak Test	N2 + H2	HP Flare EU-4004	2	7.5	15	45902	19.4	94
	VCC CCSU - 225 Bar Case Leak Test	N2 + H2	HP Flare EU-4004	2	11.25	22.5	21068	13.8	157
	VCC CCSU - 300 Bar Case Leak Test	N2 + H2	HP Flare EU-4004	2	15	30	12555	10.7	199
	VCC CCSU - Emergency Fast Depressure Test - 1000 psig	N2 + H2	HP Flare EU-4004	1	15	15	106231	4.3	368

This includes unsupported assumptions on the number of flaring events per year, the event duration, the flow rate of the flare, and flare gas properties such as molecular weight and heating value. But not a single process support document is provided as the source of these many variables.

It is simply impossible to reconcile the lack of design detail with the highly detailed assumptions on flare gases used by IDEM in its emissions calculations and modeling.

In sum, as shown via the many examples above (and remembering that these are in fact, just examples, and the above is not meant to be a comprehensive critique of each and every technical deficiency), it is without question that the emissions calculations provided in the TSD (which were used in modeling air impacts) are completely unreliable and significantly understate the likely PTE for the various pollutants that will be emitted from this facility.

**IDEM Response to Dr. Ranajit Sahu Comment 2:**

IDEM, OAQ considers this comment to be incorporated into Earthjustice Comment 2. See IDEM Response to Earthjustice Comment 2. With specific reference to paragraph (i) regarding flares, note that the IDEM Response to Earthjustice Comment 2 references Mr. Howard Gebhart Comments 9 and 10 on that issue.

Expanding on paragraph (g), IDEM, OAQ notes that the commenter may have failed to recognize that quite a few of the tanks listed in the original permit application contain inorganic materials or water solutions, e.g., molten sulfur tanks and soda ash mix tanks. Other tanks, such as the amine and sour water tanks, are known or can reasonably be considered to contain organics at such low partial pressures that VOC emissions are essentially zero. Finally, vapor pressures predicted by process modeling for vacuum gas oil and the VCC residue are so low that the emissions of those tanks are calculated with TANKS to be essentially zero. Emissions calculations for tanks with observable VOC emissions - product storage tanks and the slop oil tank - used the TANKS default products, jet naptha and No. 2 distillate fuel oil - to provide higher worst case potential to emit values than lower vapor pressures for the products proposed by the source based on process modeling.

**Dr. Ranajit Sahu Comment 3:**

As noted in the previous discussion, the emission calculations provided in the record by KBR and IDEM are unreliable. And, as even a cursory glance at the details of these calculations in Appendix A of the TSD will show, they rely on myriad and many assumptions.

The criticisms noted above notwithstanding, if the IDEM emissions estimates (and modeling, which relies, in part, on these emissions estimates) are to have any meaning at all, each of the underlying assumption for each emission estimate needs to be made enforceable in the permit. This means, a thorough listing identifying each assumption - whether explicit or implicit. Next, for each assumption the permit needs to have a method of compliance - whether based on recordkeeping, testing, monitoring, or similar, depending on the assumption.

Only then is there any continuity between the emissions estimated and the modeled impacts.

Since the proposed permit does not provide even an identification of all of the assumptions that IDEM has made, and simply does not include practical enforceability provisions for each such assumption, it is fatally deficient.

### **IDEM Response to Dr. Ranajit Sahu Comment 3:**

IDEM, OAQ considers that any assumptions regarding operating conditions or properties that affect the potential to emit calculations are adequately described in the calculations. It is not the potential to emit calculations, if that is what the commenter means by "emission estimates", that require practical enforceability in the permit. Instead, the emissions limitations and requirements of applicable regulations demand enforceable provisions. The permit contains all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis. The potential to emit, as limited by the permit, was modeled in the Air Quality Analysis. No changes were made as a result of this comment.

### **Dr. Ranajit Sahu Comment 4:**

As with the other critiques above, I will provide examples of flawed BACT analyses that IDEM has relied upon in the proposed permit.

First, however, a general critique, applicable to all sources and pollutants, is in order. The entire BACT analysis, in each instance, seems to begin and end with a discussion of what BACT determinations have been made in the past for similar sources - as available in EPA's

RACT/BACT/LAER Clearinghouse. However, this approach, in which BACT is simply determined based on what BACT was (in the past) at a different facility - misses the point. BACT is not merely what has been achieved; its very definition includes the word "achievable." In addition, it is my experience that the RBLC database is often incomplete.

By using a methodology that simply looks backward, IDEM's BACT analysis completely misses the critical, forward-looking, technology-forcing aspect of a proper BACT analysis. In fact, in many instances, IDEM reverts to an applicable NSPS limit or standard and simply declares that to be BACT, without any effort at justifying a more stringent level that might also be cost-effective.

In fact, the entire BACT analysis provided in Appendix B of the TSD contains no cost effectiveness analysis, which is critical to setting a BACT level at a proper level of stringency - i.e., at the point just below when it is not cost-effective.

Thus, IDEM's BACT analysis, based on a methodology which is constrained and backwards looking, is simply flawed and therefore cannot result in a correct BACT determination.

I provide a few examples below.

#### **Example (a)**

As noted earlier, flaring emissions have been understated. In fact, like in most operating chemical plants and refineries, etc., significant emissions from flaring occur not from the routine pilot flame, but when large quantities of flare gases are generated during planned or unplanned outage events at process units. Since, by nature, these are stochastic events, the best method of minimizing flaring emissions is to develop and implement a flare management plan (alluded to earlier by KBR). Most flare management plans rely on preventing flaring to the maximum extent possible using flare gas recovery - i.e., reutilizing flare gases (which have heating value) in the process or as fuel, supplemented as need be by natural gas, etc. Yet, surprisingly, and in somewhat incomprehensible words, IDEM dismisses flare gas recovery in its TSD Appendix B page 70/132 as follows:

"Flare gas recovery is not a feasible option. These flares do not operate constantly; only the pilot flame does. There would not be anything to recover

except in the rare case of a process upset - which would preclude the use of any heat recovered.”

IDEM's assumption that flare gas recovery only applies to continuous flares (i.e., those that operate constantly) is unsupported and, frankly, astounding. And, IDEM's statement that “[T]here would not be anything to recover...” makes little sense. Almost every flare gas stream has hydrocarbons, which have heating value as fuel - so, yes, there is always something to recover.

IDEM's reasoning rejecting flare gas recovery makes no sense.

#### Example (b)

For fugitive VOC emissions from leaking components, IDEM discusses the BACT analysis starting on page 127/132 in Appendix B of its TSD, and notes that LDAR with 98% effectiveness is the top rank BACT (see page 128/132). Yet, as discussed earlier, IDEM does not use 98% as the control efficiency for its various VOC controls for specific fugitive components.

As far as the type of LDAR that would be BACT, IDEM simply states (see page 129/132) that the LDAR provided in NSPS Subpart GGGa shall be BACT. IDEM does not provide any further discussion as to why more stringent (“enhanced”) LDAR - with lower leak thresholds, more frequent inspections, and quicker repair times for components that are found to be leaking - would not be BACT.

Going further, IDEM literally provides zero discussion on Optical Gas Imaging (OGI) technologies that represent the current state of the art for efficiently detecting leaking components and their recognized superiority over LDAR methods. It is my opinion that OGI, using IR cameras, would be far more effective as BACT for leaking fugitive components than LDAR of any type. If need be, LDAR can be used as a secondary means of verification that components are not leaking.

As such, IDEM's BACT determination for leaking components, a large source of VOC emissions, is incomplete and deficient.

Again, these are but two examples, cited to make the general point that IDEM's BACT analysis is methodologically so flawed that it cannot possibly result in a proper BACT determination for any of the source/pollutant combinations. At the very least, without addressing what is “achievable,” IDEM impermissibly constrains the BACT analysis.

#### **IDEM Response to Dr. Ranajit Sahu Comment 4:**

IDEM, OAQ considers this comment to be incorporated in Earthjustice Comments 4, 5, and 6. See IDEM Responses to Earthjustice Comments 4, 5, and 6.

To develop the point about cost-effectiveness further than may be apparent in the Earthjustice comments that incorporate this comment, IDEM, OAQ notes that BACT is defined first as the most stringent level of control. When one technology choice is determined to be the highest level of control, analysis of cost effectiveness is not necessary. If competing technologies offer the same level of control, then the choice between them may be on a cost basis. Since each determination of BACT for Riverview Energy Corporation is considered to be the most stringent level of control, evaluation of cost effectiveness is not necessary.

#### **Dr. Ranajit Sahu Comment 5:**

As noted earlier, proper PTE emissions, supported by a reasonably advanced engineering design, is one of the key inputs for any air dispersion modeling. And, since neither the proper design basis nor the PTE emissions are available, that alone renders the modeling analysis flawed.

In this section, I will address some additional modeling assumptions that are either unsupported or are simply incorrect, further exacerbating the errors in the modeling analysis.

#### Example (a)

Use of representative meteorological (hereafter "met") data - i.e., that properly represents the wind field at the proposed plant site - is a critical input for the modeling analysis. PSD rules therefore rightly require the collection of at least 1 year of onsite met data, unless representative met data is otherwise available.

In the present instance, KBR and IDEM have made no showing whatsoever that the surface met data from Evansville, some 40-50 miles distant from the site, with considerable terrain differences, which was used in the modeling, is representative of site conditions. No onsite data (even for periods of less than a year, which could have been collected to show comparisons to Evansville data) was required to be collected.

In a circular argument, REC justifies not collecting onsite met data by noting that specified preconstruction monitoring thresholds were not exceeded - forgetting to state that this very exercise used met data from Evansville. KBR's justification for avoiding pre- construction onsite monitoring is therefore unavailing.

It is impossible to simply assume (as KBR has done and as IDEM has accepted), by fiat, that Evansville met data is representative of the Dale plant site. IDEM should provide a technical basis for this fundamental assumption. Since it likely cannot, IDEM should require the applicant to conduct the requisite one year of onsite met data collection and then use that data, properly validated, in the dispersion model.

#### Example (b)

Another fatal flaw in the modeling analysis is the use of unsupported background data (i.e., current concentrations of various pollutants, over specified averaging times) representative of the Dale plant site. Here is the relevant discussion:

"Representative background concentrations used in the NAAQS analysis are listed in Table 4. The background monitors used for the NAAQS analysis were monitor ID number 18-141-0015, located in South Bend, IN for 1-hour NO<sub>2</sub>, monitor ID number 18-163-0021, located in Evansville, IN, for 1-hour, 3-hour, 24-hour, and annual SO<sub>2</sub> and finally monitor number 18-147-0009 located in Dale, IN, for annual and 24-hour PM<sub>2.5</sub>. The latest 3-year design value (2015-2017) for each of these monitors was used in the modeling analysis. These sites are considered the most representative sites with complete data relative to REC. For NO<sub>2</sub> background values, there are only two monitors within the state that have complete and quality assured data, both of which are in northern Indiana. The monitor in South Bend, Indiana is located in a more rural area than the Gary IITRI monitor industrialized area. The more rural location of the NO<sub>2</sub> monitor in South Bend is comparable to the proposed location for REC."

The Dale site is located near a major highway (Hwy 64), as shown in the figures provided in the Modeling Protocol. Significant emissions of relevant pollutants including NO<sub>x</sub>, PM<sub>10</sub>/PM<sub>2.5</sub>, SO<sub>2</sub>, VOCs, CO, and others obviously affect the site due to emissions from the highway. Given this, it is completely improper to simply use data from Evansville as being representative of the Dale site. Compounding the error, using data from South Bend, far from the Dale site for the 1-hour NO<sub>x</sub> background level simply makes no sense.

As with pre-construction met data collection, the applicant should be required to collect onsite pollutant data for a sufficient period of time - at least one year - which should be used in the modeling analysis. It is clear that there is no justification for simply grabbing available monitoring data from other sites, with no regard to representativeness at the Dale site.

Example (c)

The modeling analysis attempts to include the impacts of existing, nearby large sources. The table below shows how such sources were handled (from a KBR email dated April 13, 2018):

Emission Source Characterization Basis for NAAQS Modeling					
Facility	Source	SO2 Emission Factor Source	NO2 Emission Factor Source	Operating Heat Release Rate Source	Remarks
AEP Rockport	MB1	EIA-923	Permit	EIA-923	SO2 EF from EIA
	MB2	EIA-923	Permit	EIA-923	SO2 EF from EIA
Alcoa Generation, Warrick	Boiler 1	EIA-923	Permit	EIA-923	SO2 EF from EIA
	Boiler 2	EIA-923	Permit	EIA-923	SO2 EF from EIA
	Boiler 3	EIA-923	Permit	EIA-923	SO2 EF from EIA
	Boiler 4	EIA-923	EIA-923	EIA-923	SO2 EF from EIA NO2 EF from EIA
IPL Petersburg	Boiler 1	Permit	Permit	EIA-923	
	Boiler 2	Permit	EIA-923	EIA-923	NO2 EF not in permit. EF based on EIA-923 reflecting use of SCR
	Boiler 3	Permit	EIA-923	EIA-923	
	Boiler 4	Permit	Permit	EIA-923	

Emissions from sources above are based on Department of Energy, Energy Information Administration form EIA-923 data - that is they are not maximum or allowable emissions but rather snapshot actual emissions.

This is incorrect. Maximum allowable emissions from these nearby large sources should have been modeled instead of actual emissions, per the appropriate regulatory guidance. In summary, there are significant and fatal flaws associated with the modeling analysis that accompanies the proposed permit.

**IDEM Response to Dr. Ranajit Sahu Comment 5:**

IDEM, OAQ considers this comment to be the same as Earthjustice Comment 3. See IDEM Responses to Earthjustice Comment 3.

**Mr. Howard Gebhart Comments and IDEM Responses**

On November 15, 2018, Mr. Howard Gebhart of Fort Collins, Colorado, emailed questions to IDEM, OAQ regarding the draft PSD/New Source Construction and Part 70 Operating Permit and associated air quality modeling. IDEM, OAQ Technical Support and Modeling Section replied to Mr. Howard Gebhart in an email on November 29, 2018. These email correspondences are available in the public record. The questions contained in Mr. Howard Gebhart email are included as public notice comments in this ATSD (see Mr. Howard Gebhart Comment 1 through Comment 6 below). IDEM, OAQ's 11/29/18 email responses Mr. Howard Gebhart's questions are included below (see IDEM Response to Mr. Howard Gebhart Comment 1 through Comment 6 below).

**Mr. Howard Gebhart Comment 1:**

Please provide the minor source PSD baseline dates for the Riverview Project location.

**IDEM Response to Mr. Howard Gebhart Comment 1:**

The minor source baseline dates established for Spencer County:

NOx: September 30, 1996 (AK Steel)  
PM10: September 30, 1996  
PM2.5: September 30, 1996  
SO2: Not established

**Mr. Howard Gebhart Comment 2:**

I found an inventory for nearby NAAQS sources in the modeling inventory, but not a similar inventory for PSD-increment sources. Can a PSD increment inventory be provided? How did IDEM determine which nearby sources were PSD-increment consuming?

**IDEM Response to Mr. Howard Gebhart Comment 2:**

A spreadsheet of PSD increment consuming sources can be found on IDEM's website. The following is a link to IDEM's Modeling webpage: <https://www.in.gov/idem/airquality/2375.htm>. PSD increments can be found on the [PSD Inventory \[XLS\]](#) spreadsheet on the modeling page. The spreadsheet takes into account major and minor source baseline dates. IDEM determined which pollutants required a PSD increment analysis based on the Significant Impact Analysis (SIL) determination. Increment sources were determined using this spreadsheet to identify sources nearby the facility and then included in the PSD increment modeling.

**Mr. Howard Gebhart Comment 3:**

Were any NAAQS and/or PSD-increment sources identified by IDEM but excluded from the cumulative impact modeling? If so, please indicate those sources, their associated emissions, and list the reason for excluding these sources from the modeling analysis.

**IDEM Response to Mr. Howard Gebhart Comment 3:**

IDEM conducted an analysis of all nearby sources for PSD and NAAQS modeling. The largest sources were explicitly included in the modeling and are listed in Table 5 of the modeling TSD. One source was not included in the final NAAQS modeling, AK Steel. This source was considered to be small and distant enough to be captured by conservative background concentrations. In addition, this source was located outside of the receptor grid. The final numbers used for the NAAQS modeling for PM<sub>2.5</sub>, are found in the "PM2.5\_SIAONLY\_24hr" and "PM2.5\_SIAONLY\_annual" files.

For PM<sub>2.5</sub> PSD increment modeling, the only sources listed in the PSD inventory spreadsheet, were AK Steel and Ohio Valley Resources. IDEM did not include Ohio Valley Resources (Emissions of about ~ 40tpy) in any modeling but did look at impacts from AK Steel to gauge its impact on the PSD increment analysis. Modeling results showed the combined impact from AK Steel and Riverview to be much less than the final NAAQS results. These results can be found in the compressed file called "PM<sub>2.5</sub>\_IDEM\_24hr\_Annual\_SIL." As a conservative value for the PSD increment analysis, and because Ohio Valley Resources was not included, IDEM used the NAAQS values as the PSD increment results. Even with the use of these higher values, the increment was not close to being consumed. For SO<sub>2</sub>, the only increment consuming sources in the vicinity were ALCOA Operations and I & M Rockport. Both of these emissions sources were already included in the modeled NAAQS and therefore, as a conservative estimate, the NAAQS values were used in the PSD modeling as well. This is a conservative estimate because other large emitters in addition to ALCOA Operations and I & M Rockport were included in the NAAQS inventory modeling. PM<sub>10</sub> PSD increment modeling was not necessary since the PM<sub>10</sub> values were not above the 24-hour and annual SILs.

**Mr. Howard Gebhart Comment 4:**

In reviewing the PM-10 and PM-2.5 modeling files, I found that the emissions for fugitive dust traffic were significantly higher for the 24-hour modeling compared to the annual modeling. However, I did not find any explanation or documentation regarding why higher emissions were

input for the 24-hour modeling. Can you provide the calculation spreadsheet supporting the 24-hour PM-10 and PM-2.5 calculations for the road dust emissions or otherwise provide an explanation of how these calculations were different?

**IDEM Response to Mr. Howard Gebhart Comment 4:**

The consultant (KBR) provided IDEM with a spreadsheet containing the estimated PM emissions by activity type. These activities were grouped together into road segments. IDEM reviewed its modeling files and found that the compressed file named "PM2.5\_IDEM\_Annual\_NAAQS" contains files for both the 24-hour and annual PM<sub>2.5</sub> fugitive emissions used in the final NAAQS result. The values for each of these averaging times were the same. IDEM did, however, find that updates to the annual PM<sub>10</sub> fugitives were not made. (An) attached spreadsheet (note: provided in the 11/29/2018 reply to the commenter and available in the public record, essentially the paved road fugitive emissions calculation tab from Appendix A to the Technical Support Document with added road segment labels) shows IDEM's estimates and calculations for the roads. IDEM has since re-run the modeling for PM<sub>10</sub> and determined that the PM<sub>10</sub> modeling is below the SIL of 1. The updated PM<sub>10</sub> modeling use the same emission rates from the PM<sub>10</sub> 24-hour fugitive rates, which are considered the correct values.

See the revised Air Quality Analysis, Appendix C to this ATSD.

**Mr. Howard Gebhart Comment 5:**

My understanding is that the worst-case SO<sub>2</sub> modeling for the short term averages (less than 24-hours) is based on one of the flaring scenarios. During flaring, the documents in the record state that the plant operates at reduced rates during flaring. I would like more information about the flaring scenarios and why these scenarios might lead to reduced operational rates in the plant. How much reduction in overall plant operations was assumed during flaring and how was this rate determined? Since I recognize that there are a large number of flaring scenarios, if needed, this explanation can be limited to what has been described as Flaring Scenario #1 which resulted in the worst-case short-term SO<sub>2</sub> impacts.

**IDEM Response to Mr. Howard Gebhart Comment 5:**

Please see, Modeling for Intermittent Flaring and Riverview Flaring Scenarios for modeling documents (provided in the 11/29/18 response to the commenter and available in the public record) for more information about the facility during each of the flaring scenarios.

**Mr. Howard Gebhart Comment 6:**

Please provide the VISCREEN output file for the modeling that corresponds with the IDEM Air Quality Analysis - Table 9. I found the applicant's VISCREEN file in the record, but those results don't match the results listed in Table 9. I am most interested in the background visual range assumed for the IDEM VISCREEN analysis along with some of the other modeling inputs.

**IDEM Response to Mr. Howard Gebhart Comment 6:**

Please see the attached "summary" and "results" files (provided in the 11/29/18 response to the commenter and available in the public record) from the VISCREEN application. The VISCREEN modeling is consistent with U.S. EPA guidance for conducting visibility impact analysis for PSD sources.

On December 10, 2018, Mr. Howard Gebhart, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Mr. Gebhart's comments were included as an attachment to the comments submitted by Earthjustice, et al.

**Mr. Howard Gebhart Comment 7:**

The dispersion modeling relies upon meteorological data inputs from the Evansville Regional Airport (EVV), located more than 30 miles (50 km) from the proposed project site. EVV is located in Vanderburgh County, while the Riverview project site is in Spencer County.

The IDEM modeling fails to conform to the US Environmental Protection Agency (EPA) Guideline on Air Quality Models (USEPA 2017), codified at 40 CFR 51 Appendix W (Guideline) in part because the modeling report submitted on behalf of the applicant and the associated IDEM technical review of the modeling failed to provide any documentation that the EVV data are adequately representative of the Riverview project site. Air dispersion modeling that does not conform to the Guideline cannot be used to support issuance of a PSD permit.

The requirements for meteorological data inputs are described at Section 8.4 of the Guideline. For data representativeness, the Guideline states:

*The meteorological data used as input to a dispersion model should be selected on the basis of spatial and climatological (temporal) representativeness as well as the ability of the individual parameters to characterize the transport and dispersion conditions in the area of concern.*

The documentation in the IDEM file supporting the Riverview AERMOD dispersion modeling is silent on the topic of data representativeness.

In this situation, the EVV data representativeness is negatively influenced by two factors: 1) the EVV meteorological data are not in proximity to the proposed project site, and 2) the EVV meteorological data are measured at or near the surface whereas the major emission points at Riverview have stack heights of up to 200 feet.

As noted before, the EVV meteorological data are from the Evansville Regional Airport, located more than 30 miles (50 km) from the proposed plant site. As per the Guideline: *the spatial representativeness of the data can be adversely affected by large distances between the source and receptors of interest.* In this case, there are micrometeorological features at the proposed Riverview site which are not captured by the EVV data, namely a creek drainage that extends to the south of the plant site that induces local windflow patterns which tend to follow these drainages. The local project area also has rolling terrain that does not occur at or near the EVV airport site, with some of the intervening terrain occurring between the project site and EVV airport. These local topographic features influence the on-site meteorology. Since these features are not captured by the EVV data, my professional opinion as a meteorologist is that EVV data are not adequately representative of the Riverview project site.

Another problem with the EVV data is that the data are collected at or near ground level, whereas the major emission stacks at Riverview extend upwards of 200 feet in the air. Wind speed and wind direction are key parameters for accurately describing atmospheric transport and dispersion. Important meteorological parameters such as wind speed, wind direction, and others vary in their vertical profile, and data collected at or near the surface mischaracterize the atmospheric conditions that influence turbulence and dispersion from elevated stack sources. The surface-based meteorological data from EVV introduces an unknown error into the results.

Fortunately, a remedy to this problem exists under the PSD regulations and the associated EPA Guideline on Air Quality Models (Guideline), which allows for the applicant to collect site-specific meteorological data for a period on one year or more to be used as input to the air dispersion modeling. IDEM should withhold final approval of the Riverview PSD permit until onsite meteorological data is collected and then used in an adequate modeling demonstration. In order to collect the required meteorological data at or near the stack height level (200ft), the on-site monitoring program should either utilize a tall tower or Doppler acoustic SODAR.

#### **IDEM Response to Mr. Howard Gebhart Comment 7:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model

No changes were made as a result of this comment.

#### **Mr. Howard Gebhart Comment 8:**

For the Riverview tail gas treatment unit stacks, the sulfur dioxide (SO<sub>2</sub>) emissions limit proposed in the draft PSD permit is 26.3 lb/hr at each stack. In the modeling files, these units are identified as EU3001 and EU3002.

However, after reviewing the accompanying modeling files in the record, there were no modeling runs where the tail gas SO<sub>2</sub> emissions were input at the allowable emissions rate (26.3 lb/hr). All of the AERMOD modeling runs listed the EU3001 and EU3002 SO<sub>2</sub> emissions at something less than 26.3 lb/hr. For this analysis, I have relied on the IDEM-conducted modeling that matches the concentrations reported in IDEM's Air Quality Analysis (IDEM 2018a), which is appended to the Riverview Technical Support Document (TSD), i.e., the IDEM "sharepoint" directory files.

Based on my review of the record, IDEM addressed SO<sub>2</sub> modeling by including emissions during occasional flaring episodes, which is appropriate since such episodes produce higher short-term emissions. The IDEM analysis also indicates that Riverview would operate some sources at less than maximum rates during emergency flaring. However, there does not appear to be any limitation in the draft permit that would restrict Riverview's SO<sub>2</sub> emissions from the tail gas treatment stacks and other emission points to a lower emissions rate during flaring. Absent such a limit, the modeling should have been conducted assuming SO<sub>2</sub> emissions at the maximum allowable rate (i.e., 26.3 lb/hr at the tail gas treatment stacks), even during flaring episodes.

Also troubling is that the modeling files, even during non-flaring operating scenarios, have not modeled the tail gas treatment stacks at the maximum allowable SO<sub>2</sub> emissions rate (26.3 lb/hr). The file SO<sub>2</sub>\_5yrs\_SO<sub>2</sub>.LST within folder SO<sub>2</sub>\_IDEM\_1hr\_NAAQS appears to be the AERMOD output for the "Normal Operations" modeling scenario listed in Appendix A of the IDEM Air Quality Modeling Report (Max SO<sub>2</sub> 1-hour concentration = 23.57 micrograms per cubic meter). However, in this file, the modeled SO<sub>2</sub> emissions for EU3001 and EU3002 are 2.4003 g/sec, which converts to approximately 19.0 lb/hr, not the maximum allowable SO<sub>2</sub> permit limit of 26.3 lb/hr. There is no explanation or justification for modeling SO<sub>2</sub> emissions at 19.0 lb/hr for the "normal operations" scenario modeling. As per EPA's Guideline (USEPA 2017, Table 8-2), all emissions need to be modeled at their federally enforceable emissions limit.

IDEM should correct this error and perform new AERMOD modeling using the enforceable SO<sub>2</sub> emissions limit (26.3 lb/hr) at the tail gas stacks and other emission units, or the SO<sub>2</sub> permit limit should be reduced to match the modeled emissions rate (e.g., 19.0 lb/hr for the tail gas stacks). Similar restrictions would also be required at any other source which was not modeled at its maximum allowable SO<sub>2</sub> emissions rate. Even during flaring, SO<sub>2</sub> emissions should be modeled at the maximum allowable emissions rate, unless a more restrictive permit limit is added to the permit for these events.

#### **IDEM Response to Mr. Howard Gebhart Comment 8:**

See IDEM Response to EPA Modeling Comment 6.

**Mr. Howard Gebhart Comment 9:**

Based on the modeling files provided by IDEM in the “sharepoint” directory, no modeling for flaring scenarios was conducted for pollutants other than SO<sub>2</sub>. However, my understanding is that there are flaring scenarios that produce short-term elevated emissions for both carbon monoxide (CO) and nitrogen oxides (NO<sub>x</sub>). Based on data in the Docket, elevated CO emissions occur during flaring of reformer vent gasses to the LP flare during commissioning and/or cold startup of the hydrogen plant. Also, elevated NO<sub>x</sub> emissions can occur during flaring of purge gasses to the HP flare during commissioning and/or cold startup of the VCC Unit.

Similar to the SO<sub>2</sub> flaring analysis, modeling that addressed peak NO<sub>x</sub> and CO emissions during flaring should have been performed by IDEM. Without such an analysis, there is no confidence that the short-term NAAQS for NO<sub>x</sub> and CO will be protected. Please note that any comments above related to the SO<sub>2</sub> flaring analysis would also be applicable to any NO<sub>x</sub> and CO flaring analysis; i.e., all sources should be modeled at their maximum allowable emissions rates, even during flaring, unless the permit otherwise restricts such emissions during flaring events.

**IDEM Response to Mr. Howard Gebhart Comment 9:**

IDEM conducted modeling for CO and NO<sub>x</sub> for the flaring scenarios at the same time it modeled flaring scenarios for SO<sub>2</sub>. Appendix A of the Air Quality Analysis (Appendix C to this ATSD) lists the flaring scenarios for all pollutants affected by flaring. IDEM identified the worst case flaring scenarios and conducted modeling to compare impacts for the significant impact level analyses.

Files for modeling the flaring scenarios have been provided at the sharepoint hyperlink ([https://ingov-my.sharepoint.com/:f/g/personal/dschilli\\_idem\\_in\\_gov/Eqf6wk61dBNLiQQOIMJpEgcBc9SDuliNTJVpom4fsMef0Q?e=kc3aV2](https://ingov-my.sharepoint.com/:f/g/personal/dschilli_idem_in_gov/Eqf6wk61dBNLiQQOIMJpEgcBc9SDuliNTJVpom4fsMef0Q?e=kc3aV2)). The flaring files for CO are contained in the folder entitled “CO\_IDEM\_1hr\_8hr\_Emerg\_Fast\_SIL.zip”. The flaring files for NO<sub>x</sub> are contained in the folder entitled “NO<sub>2</sub>\_IDEM\_Flaring\_Emerg\_1hr\_SIL.zip”.

No changes were made as a result of this comment.

**Mr. Howard Gebhart Comment 10:**

Like flaring, startup, shutdown, and malfunction (SSM) events can lead to elevated emissions over short-term periods. The modeling analysis fails to address possible short-term emissions from SSM outside of the flaring analysis discussed previously. Examples of a possible SSM event would be during startup of equipment where the NO<sub>x</sub> emissions are controlled using selective catalytic reduction (SCR). Because the SCR unit does not come on-line until the catalyst beds reach the proper temperature, NO<sub>x</sub> emissions normally bypass the SCR emission controls during startup. At Riverview, SCR NO<sub>x</sub> emissions control will be employed at the Hydrogen Plant. The modeling analysis needs to address these types of SSM events; otherwise, there is no confidence that the short-term NAAQS will be protected.

**IDEM Response to Mr. Howard Gebhart Comment 10:**

The startup/shutdown emissions are treated as intermittent sources meaning the startup/shutdown emissions do not occur continuously enough or frequently enough to contribute significantly to the annual distribution of maximum daily 1-hour concentrations. Therefore, IDEM references U.S. EPA’s March 1, 2011 memo “Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1-hour NO<sub>2</sub> National Ambient Air Quality Standard” and “SO<sub>2</sub> NAAQS Designations Modeling Technical Assistance Document” dated August 2016 in its treatment of startup/shutdown emissions as intermittent sources.

IDEM reviewed modeling rates for each of these units for 24-hour PM<sub>10</sub> and PM<sub>2.5</sub>. As the commenter mentioned, the flaring scenarios were examined. During the flaring scenarios, much of the facility will be shut down or operating at only partial capacity. IDEM received a lengthy list

of the various flaring scenarios and modeled the worst case emission rate for each pollutant. The commenter also mentioned that the selective catalytic reduction (SCR) equipment associated with the hydrogen plant would be an example of a Startup, Shutdown, and Malfunction (SSM) event. During the startup of the emission unit, the SCR equipment would not be operating at full capacity because the SCR catalyst beds take time to reach proper temperatures to achieve the appropriate control efficiency and higher emissions would occur during this period. Those events are accounted for in the worst-case scenario determinations. IDEM has calculations from the consultant (KBR) of the emissions from the hydrogen plants during a cold start-up. During a cold startup of the hydrogen plant units, the emissions are expected to be less than the operations at 100% capacity even though the SCR equipment has not reached the temperature required for maximum control.

No changes were made as a result of this comment.

**Mr. Howard Gebhart Comment 11:**

IDEM has included the formation of secondary PM-2.5 from precursor emissions of sulfur dioxide (SO<sub>2</sub>) and nitrogen oxides (NO<sub>x</sub>) in the Riverview modeling analysis. The procedure appears to follow the EPA Modeled Emission Rates for Precursors (MERP) Guidance (USEPA 2016). However, the IDEM assessment appears to be based on the annual average emissions rates for SO<sub>2</sub> and NO<sub>x</sub>. For SO<sub>2</sub> and NO<sub>x</sub>, the peak daily emissions are influenced by episodic flaring and SSM events, when short-term emissions will be significantly higher.

Since PM-2.5 is evaluated on a 24-hour basis, the secondary PM-2.5 formation needs to be based on the peak short-term emissions during flaring. This can be done using the MERPs approach applied by IDEM; however, the SO<sub>2</sub> and NO<sub>x</sub> emissions input should instead reflect the worst-case daily emissions and not the annual emissions. The IDEM analysis already recognized the importance of periodic episodes of flaring when evaluating NAAQS/PSD increment compliance for SO<sub>2</sub> and the same concept should also be applied for the PM-2.5 modeling. SSM events should also be considered when applying the MERPs if the duration of the SSM event approaches 24-hours and/or otherwise significantly impacts the peak daily emission totals.

**IDEM Response to Mr. Howard Gebhart Comment 11:**

IDEM has followed U.S. EPA's "Guidance on the Development of Modeled Emission Rates for Precursors as a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program" (MERPS Guidance) in its secondary PM<sub>2.5</sub> analysis. U.S. EPA conducted the photochemical modeling that supported the MERPS Guidance using annual emission rates for hypothetical facilities. MERPS themselves are expressed in tons per year, making them an annual measurement. Hypothetical examples listed in the MERPS Guidance detail scenarios of annual emissions that are then compared to the significant emission rate, expressed as an annual emission rate. It would not be appropriate to compare short term emissions to a value that has an annual definition. Episodic (short term) modeling was conducted for hypothetical sources in California, which do not apply to Indiana facilities, therefore IDEM used conservative MERPS values most closely associated with the location of the proposed facility to determine secondary impacts. The primary (modeled) impacts included modeling of the HP, LP, sulfur block, and loading flares. The primary modeled impacts were added to the secondary impacts as part of the MERPS analysis.

No changes were made as a result of this comment.

**Mr. Howard Gebhart Comment 12:**

The air emissions inventory and supporting dispersion modeling have a claimed 90% reduction credit for fugitive dust emissions on paved roads leading in and out of the proposed Riverview plant. Based on the fugitive dust mitigation measures described in the applicant's Fugitive Dust Control Plan, the proposed mitigation measures would only be applied "as needed". However, the 90% mitigation credit is a very high level of fugitive dust control. If a 90% credit is assumed for

the purposes of the emissions inventory and modeling, then the Fugitive Dust Control Plan needs to specify an appropriate frequency that fugitive dust controls would be applied by Riverview. Given the level of emissions credit assumed, the permit should require that fugitive dust mitigation measures be applied on a daily basis and not "as needed". Also, some measurement of the effectiveness of the fugitive dust controls should be required, such as monitoring for the silt content of the dust material on the roads. Only through frequent application of mitigation measures, backed by actual compliance monitoring of the resulting silt loading, can the public be assured that the road dust emissions will be minimal, as implied by the draft permit.

Also, in terms of the fugitive dust calculations, the assumed "silt loading" for the emission calculations is 9.7 g/sq meter, which is the mean value from AP-42 for plant roads in the iron and steel industry. However, the IDEM emissions documentation incorrectly implies that its calculations used a "worst-case" AP-42 value. If the "worst-case" AP-42 value were used from the iron and steel industry, the silt loading value would have been 79 g/sq meter. If all industry groups listed in AP-42 were considered, the worst-case silt loading value would be 400 g/sq meter. Given the wide range of potential silt loading values, a silt loading value higher than 9.7 g/sq meter should have been used for the Riverview calculations.

Also, the IDEM record does not indicate whether Riverview intends to apply sand and other measures for traction control during wintertime driving conditions, nor does the permit prohibit or restrict such applications. Any such material applied to plant roads for traction control increases the silt loading for those periods and must be accounted for in the permit.

#### **IDEM Response to Mr. Howard Gebhart Comment 12:**

IDEM, OAQ considers the description of fugitive dust sources at the proposed source, control measures, and the effectiveness of those control measures to be consistent with the descriptions and control measures required at other sources. Any comparison of fugitive dust sources and control measures is suspect because the substantial differences in the materials, practices, and weather conditions that affect fugitive dust emissions. It is the normal practice within IDEM, OAQ to consider a silt loading of 9.7 g/m<sup>2</sup> to be representative of conditions at most industrial sites. As the commenter points out, this is the mean value for iron and steel production facilities presented in AP-42 Table 13.2.1-3 and the highest mean value other than certain highly specific industries (e.g., sand and gravel processing) that use materials and practices expected to generate more fugitive dust than the proposed source. The iron and steel production category is also based on the largest numbers of sites and samples presented in Table 13.2.1-3. Because winter weather conditions in Southern Indiana are generally wet and characterized by frequent freeze-thaw cycles, application of traction aids to industrial roads is considered unlikely and subject to mitigation by frequent wet conditions.

IDEM, OAQ agrees that more explicit requirements for monitoring visible emissions of fugitive dust are appropriate. A new Condition D.13.3 - Visible Emissions Monitoring is added to the permit as follows with new language in **bold**:

#### **Compliance Monitoring Requirements [326 IAC 2-7-5(1)][326 IAC 2-7-6(1)]**

##### **D.13.3 Visible Emissions Monitoring**

---

**Employees responsible for attending truck loading and unloading and other employees with opportunities to observe traffic on plant roads shall be instructed to report visible emissions that may exceed the limit in Condition D.13.1(b) to the individual or supervisor responsible for implementing the control measures in the Fugitive Dust Control Plan. Instructions for observing and reporting visible emissions shall be posted at appropriate locations such as gates and loading or unloading points. Employees who may receive notification of fugitive dust emissions shall be instructed to retain records, including but not limited to internal emails or notes of telephone calls, sufficient to demonstrate that control measures are implemented in a timely manner and in accordance with the Fugitive Dust Control Plan.**

**Mr. Howard Gebhart Comment 13:**

In the IDEM modeling included in the Docket, I discovered that the PM-10/PM-2.5 road dust emission inputs for the 24-hour modeling appeared to be higher than the same emission inputs for the annual average modeling. After calling this to IDEM's attention, I received updated modeling information from IDEM covering the annual mean PM-10 concentrations (IDEM 2018b). Although IDEM provided the updated modeling results, the backup AERMOD modeling files were not provided, nor could I find any corresponding PM-10 modeling files in the IDEM "sharepoint" directory. IDEM should provide access to any updated PM-10 modeling files and provide sufficient time for public review of any new modeling information which was posted after the public comment period started.

Based on my understanding of the updated modeling information provided, IDEM's PM-10 and PM-2.5 modeling now uses the same fugitive dust traffic emissions inputs in the annual average and 24-hour average modeling. However, this is not technically appropriate. The worst-case 24-hour emissions should be higher than the respective annual mean emissions. For example, the "silt loading" value for the 24-hour modeling should represent a worst-case value including the effects of any traction mitigation that might be applied by the source. Also, the road traffic volumes (i.e., vehicle miles travelled) should represent a worst-case day. In its emissions calculations, IDEM included an assumption that a small percentage (5%) of the plant inputs and output would leave by truck, which accounts for possible interruptions in rail service to the plant. However, any rail interruptions are likely to extend over only a limited number of days, so the truck traffic volumes should account for a sharp increase in potential daily traffic and not be spread out evenly over the year. In the case of Riverview, the traffic volumes for the worst-case day are likely to be substantially higher than the long-term average. Lastly, the precipitation mitigation factor should be excluded when computing 24-hour fugitive dust emissions, e.g., the worst-case day would have no precipitation. IDEM needs to correct the 24-hour fugitive dust calculations as described above and repeat the dispersion modeling effort using the revised emission inputs.

**IDEM Response to Mr. Howard Gebhart Comment 13:**

IDEM, OAQ considers this comment to be the same as the Mr. Howard Gebhart Comment 4. See IDEM Response to Mr. Howard Gebhart Comment 4.

**Mr. Howard Gebhart Comment 14:**

As noted above, IDEM corrected the annual mean PM-10 modeling, apparently because when asking for additional modeling data from IDEM in the preparation of these comments, my questions identified a potential modeling input error, i.e., inconsistent emission inputs for the fugitive dust sources between the 24-hour and annual mean PM-10 modeling.

However, my findings is that the new annual mean PM-10 modeling results provided by IDEM are inconsistent with the 24-hour average PM-10 modeling files previously posted by IDEM in the docket. These inconsistencies are such that I have little confidence that the PM-10 modeling as updated by IDEM provides accurate and realistic results.

Specifically, IDEM's updated PM-10 annual mean modeling (IDEM 2018b) identified a concentration of 0.993 micrograms per cubic meter, with the "ROAD251 source" contributing up to about 0.85 micrograms per cubic meter to the annual mean total. In the original IDEM modeling presented in the Docket, the annual mean PM-10 concentration was listed at 0.41 micrograms per cubic meter. Also, the supporting modeling files for the PM-10 annual mean modeling showed virtually zero contribution from the fugitive dust sources. By comparison, the peak 24-hour average PM-10 concentration is listed by IDEM as 2.18 micrograms per cubic meter (IDEM 2018a, Table 2). To my knowledge, IDEM has not revised the 24-hour PM-10 modeling. However, in the supporting modeling files found in the "sharepoint" directory, the ROAD251 contribution is listed as having a maximum 24-hour value of 0.078 micrograms per cubic meter.

This is about one order of magnitude less than the contribution of ROAD251 to the annual mean PM-10 concentration. The maximum 24-hour concentration should never be less than the annual mean concentration in the modeling. IDEM needs to recheck the emission inputs for the annual mean and 24-hour mean PM-10 modeling and resolve this inconsistency. Until this occurs and the modeling results are internally consistent, I have zero confidence that the PM-10 modeling has been done correctly.

Likewise, IDEM should also review the PM-2.5 modeling inputs to assure that a similar error is not present in the PM-2.5 modeling.

With respect to both Comment #7 and #8, IDEM should review the daily PM-10/PM-2.5 data for fugitive dust emissions to ensure that the emission inputs are correct and that the worst-case daily PM-10/PM-2.5 emissions are appropriately captured. IDEM should also provide the basis for its revised calculations to the public and allow an opportunity for public comment and review prior to finalizing the permit. Lastly, because the updated annual PM-10 modeling listed concentrations at over 99% of the SIL, the SIL would likely be exceeded after any secondary PM-10 formation is considered following the MERPs approach. Exceeding the SIL would trigger a cumulative PM-10 modeling analysis, which to date has not been performed by IDEM or the applicant.

#### **IDEM Response to Mr. Howard Gebhart Comment 14:**

IDEM reviewed the files for both 24-hour and annual PM<sub>10</sub> averaging times. While the annual PM<sub>10</sub> modeling values were the same in both the input and output files, the values were not the same in the output and input files for 24-hour PM<sub>10</sub>. IDEM updated its modeling files multiple times during the review process as KBR provided updated information. Revised 24-hour PM<sub>10</sub> modeling concentrations in the Air Quality Modeling TSD reflected results from September 2018. More recent PM<sub>10</sub> fugitive emissions information has since been made available to IDEM after the initial modeling was conducted and the proposed permit was on public notice. IDEM has conducted a model run to update the 24-hour PM<sub>10</sub> fugitive values and the maximum modeled results of 4.58 µg/m<sup>3</sup> remain below the SIL for 24-hour PM<sub>10</sub>.

ROAD 251 emissions for 24-hour and annual values are both modeled at 0.05182 lb/hr in the updated modeling. The commenter suggested that a secondary analysis for PM<sub>10</sub> should be performed alongside the secondary analysis for PM<sub>2.5</sub> and ozone. The federal MERPS guidance does not require or describe secondary analysis for PM<sub>10</sub>, only for PM<sub>2.5</sub> which is formed from complex atmospheric reactions from sulfur dioxide and nitrogen oxides. IDEM considers that the primary PM<sub>10</sub> modeling analysis is a sufficient demonstration that clearly shows the 24-hour and annual PM<sub>10</sub> NAAQS will not be violated.

See the revised Air Quality Analysis, Appendix C to this ATSD.

#### **Mr. Howard Gebhart Comment 15:**

Based on the IDEM Air Quality Analysis (IDEM 2018a, Table 4), the background concentration for nitrogen dioxide (NO<sub>2</sub>) was taken from an IDEM monitor located near South Bend, IN. My understanding is that IDEM also monitors NO<sub>2</sub> at its Evansville monitoring site (1110 West Buena Vista Road). The Evansville site also appears to be the location for the background SO<sub>2</sub> monitoring data selected by IDEM. Furthermore, IDEM's website indicates that NO<sub>2</sub> data at the Evansville site date back to July 2009 and the IDEM website also suggests the availability of historical NO<sub>2</sub> monitoring data for a location near Hope, IN.

IDEM should reevaluate the background NO<sub>2</sub> concentrations and use a more representative site, or at least provide some explanation as to why the South Bend data was the best choice for the Riverview project site.

In lieu of background data from monitoring collected some distance from the Riverside site, IDEM should instead require that the applicant install on-site monitoring to collect one year of ambient concentration data for all pollutants where the Riverview project exceeds the PSD "significance"

levels. This monitoring could coincide with the meteorological monitoring recommended previously in my comments. I note that since VOC emissions exceed 100 tpy, Riverside does not qualify for the “deminimis” monitoring exemption for ozone allowed under 40 CFR 52.21(i)(8). Compliance with 40 CFR 51.21(i)(8) has not been addressed by IDEM in its air quality analysis.

**IDEM Response to Mr. Howard Gebhart Comment 15:**

IDEM considers this comment to be the same as General Statement 9 - Modeling Background Concentrations and Monitoring. See IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring.

**Mr. Howard Gebhart Comment 16:**

In the volatile organic compound (VOC) emission calculations for fugitive leaks (TSD Appendix A, Page 40 of 43), a 100% control efficiency is assigned on the basis of installing specific emission mitigation strategies for selected equipment, such as closed loop sampling on sampling connections and installation of blinds, caps, plugs, or second valves on open ended lines.

IDEM claims that the 100% control value is supported by other documentation (EPA 1995). However, a 100% control level is by all common sense measures, unrealistic. All equipment is subject to failure and potential leaks, even when such equipment is designed to high engineering standards. IDEM should choose a realistic control level other than 100% to account for the potential that leaks will occur in the future, especially as equipment ages.

Notwithstanding the above concerns, if a VOC control factor at or near 100% is assigned in the IDEM permit review, the permit itself needs to also specifically require that any mitigation practices assumed in the emission calculations will actually be installed by Riverview, i.e., closed loop sampling on sampling connections and installation of blinds, caps, plugs, or second valves on open ended lines. Also, any failure of the equipment that results in any leakage of VOCs/HAPs to the environment should constitute a permit violation if the 100% control value is retained.

**IDEM Response to Mr. Howard Gebhart Comment 16:**

IDEM, OAQ considers that the requirements for control of equipment leaks applicable to the source, including but not limited to provisions of 40 CFR 60, Subpart GGGa, demonstrate an appropriate level of control. The requirements of the subparts are incorporated in the permit, in Section E.6, and failure to comply with the applicable requirements is then a violation both of the permit and the regulation. No changes were made as a result of this comment.

**Mr. Howard Gebhart Comment 17:**

The VOC calculations for HAPs are based on the assumed weight percent of the VOCs for selected HAPs. In fact, the HAP emissions from fugitive leaks total up to around 20 tons per year, making such emissions potentially significant. How will the HAP percentage assumptions used in the emission calculations be verified? The final permit should require appropriate sampling and monitoring to assure that the HAP emissions for leaking equipment do not exceed the calculated values.

**IDEM Response to Mr. Howard Gebhart Comment 17:**

As was discussed in IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis and IDEM Response to Earthjustice Comment 1, calculations of uncontrolled potential to emit determine the applicability of PSD and Part 70 requirements. Limitations on emissions, such as BACT and NSPS or NESHAP requirements established the levels of emissions that were modeled. Equipment leaks of hazardous air pollutant emissions from the refinery processes are subject to the requirements of 40 CFR 63, Subpart CC (NESHAP From Petroleum Refineries), which requires that units also subject to 40 CFR 60, Subpart GGGa (Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006) shall comply only with Subpart GGGa (See IDEM Response to EPA Permit Comment 16 for additional detail). Subpart GGGa then references the requirements of 40 CFR 60, Subpart VVa (Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006). Generally speaking, the equipment leak monitoring requirements do not include identification of HAPs.

However, as a new source subject to 40 CFR 63, Subpart CC, the source is subject to the organic HAP limitation at 40 CFR 63.642(h). Compliance with 40 CFR 63.642(h) is demonstrated in accordance with 40 CFR 63.642(k) which references other sections, including 40 CFR 63.658 - Fenceline monitoring provisions. Requirements of Subpart CC that are applicable to the source are listed in Condition E.13.2 - National Emission Standards for Hazardous Air Pollutants From Petroleum Refineries NESHAP. IDEM, OAQ considers that compliance with the applicable requirements of Subpart CC will verify assumptions in the potential to emit calculations.

No changes were made as a result of this comment.

**Mr. Howard Gebhart Comment 18:**

The IDEM Air Quality Analysis (Table 9) lists the results of a local (Class II) visibility analysis performed by IDEM. Upon request, IDEM provided the VISCREEN model output files upon which Table 9 was based. The background visual range used in the IDEM VISCREEN modeling was 25 km, which implies a very hazy background visual condition. Using a background visual range of only 25 km underestimates the true visibility effects from any new emission sources.

IDEM provided a citation for their background visual range (USEPA 1992). However, this document is outdated and the information presented does not reflect current visibility conditions, which have improved greatly over the last 20-plus years as emission controls have been instituted on coal-fired electric generating units and other large emission units.

My recommendation is to use a mean visual range based on nearby visibility monitoring data. There is an IMPROVE visibility monitor at Mammoth Cave National Park that provides such information for the current environmental conditions. Based on IMPROVE visibility data obtained at <https://views.cira.colostate.edu>, the mean visual range at Mammoth Cave NP is around 70 km. Any visibility analysis should use the mean visual range (70 km), otherwise the data are meaningless in terms of describing the actual visibility impact from the proposed Riverview project.

**IDEM Response to Mr. Howard Gebhart Comment 18:**

IDEM used U.S. EPA and Federal Land Manager (FLM) guidance in conducting its visibility analysis. The visibility analysis examines both long-range impacts as well as local impacts. Figure 9 in the U.S. EPA *Workbook for Plume Visual Impact Screening and Analysis* presents a map showing the background visual range. The background visual range was used to conduct the local analysis. While developing the modeling, the source's consultant (KBR) received a comment from the FLM (email from Mr. Don Shepherd, NPS, February 20, 2018) regarding local

visibility impacts on the Lincoln Boyhood National Memorial. The Lincoln Boyhood National Memorial is located south of the proposed Riverview location. IDEM conducted a local visibility analysis on the Lincoln Boyhood National Memorial and determined that the visibility impacts are below the screening criteria for a secondary analysis. IDEM used a 70 km background visual range in the analysis, which is larger than the value recommended in Figure 9 of the U.S. EPA guidance document.

IDEM used a Q/D approach, as recommended by Federal Land Manager guidance, to assess visibility impacts in Mammoth Cave National Park. The Q/D approach is used as a screening technique to determine whether a more detailed long-range impact analysis needs to be conducted. The Q/D approach divides the total emissions of NO<sub>x</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and H<sub>2</sub>SO<sub>4</sub> by the distance between the federally protected class I area (Mammoth Cave National Park) and the proposed facility. The result of the Q/D test determined that emissions from the Riverview facility divided by the distance from Riverview to Mammoth Cave National Park fell well below the threshold ratio of 10. Please see the visibility analysis section of the Air Quality Modeling TSD for the exact values used in the Q/D calculation. The Q/D method is also documented in the following report: [Federal Land Managers' Air Quality Related Values Work Group \(FLAG\)](#).

No changes were made as a result of this comment.

#### **Mr. Howard Gebhart Comment 19:**

The air quality modeling analysis must include all project-related emissions and other nearby emission sources, including any secondary emissions from mobile sources. While mobile source emissions are not regulated by the Riverview PSD permit, they do impact local ambient air quality levels and as such, need to be addressed in the modeling. Based on the EPA Toxic Release Inventory (TRI) Explorer (<https://iaspub.epa.gov>), Spencer County Indiana ranks as the 30th highest county in the United States for toxic releases to the environment. This fact demonstrates that other nearby sources contribute to local environmental contamination and that a comprehensive cumulative impact analysis is critical to the NAAQS/PSD compliance demonstration.

In the case of the proposed Riverview project, mobile source emissions of significance include rail and/or truck traffic entering and leaving the facility. These emissions are new and will occur subsequent to the PSD minor source baseline date. Based on information from IDEM (2018b), the PSD minor source baseline date was triggered in 1996, except for SO<sub>2</sub> where the current Riverview application becomes the PSD minor source baseline date trigger. For background information on minor source baseline dates and PSD increment consumption, please refer to USEPA (1990), aka "The Puzzle Book".

Based on USEPA (1990), PSD increment consumption includes actual emission increases at any stationary source, area source, or mobile source occurring after the minor source baseline date. That definition means that any new source, including any mobile sources, consumes PSD increment if these emissions were new and subsequent to the minor source baseline date.

Riverview plans to supply raw materials and ship out resulting products via rail. The rail traffic emissions are also new and subsequent to the applicable PSD baseline date (including any associated SO<sub>2</sub> emissions) and as such, the rail traffic emissions consume PSD increment. IDEM needs to quantify the associated rail traffic emissions and include these emissions in a revised air dispersion modeling effort. This modeling also needs to address "worst-case" hourly SO<sub>2</sub> and NO<sub>x</sub> emissions tied to rail/truck traffic in order to adequately assess compliance with the 1-hour average SO<sub>2</sub> and NO<sub>2</sub> NAAQS. Furthermore, the increased rail traffic at Riverview constitutes "secondary emissions" under the PSD regulations and any PSD source impact analysis must include any impacts from "secondary emissions". To date, this analysis has not been done by the applicant or by IDEM.

Because these rail/truck traffic SO<sub>2</sub> and NO<sub>x</sub> emissions consume PSD increment, the associated air quality impacts cannot be accounted for using only background concentration measurements.

Lastly, there are several very large coal-fired electric generating stations and other large sources of SO<sub>2</sub> and NO<sub>x</sub> emissions which were not included in the cumulative IDEM modeling assessment for NAAQS and PSD increment compliance, specifically:

- Duke Energy Gibson Station
- TVA Paradise Plant
- Big Rivers DB Wilson Plant
- Vectren's AB Brown plant
- Big Rivers Reid and Henderson MPL
- Big Rivers Coleman Plant

**IDEM Response to Mr. Howard Gebhart Comment 19:**

With regard to comments that regional large coal-fired electric generating units were not included in the modeling, many of the emission sources mentioned by commenters were outside the standard distance used to determine background inventories. This distance is 50 km plus the Significant Impact Area for each pollutant. The Guideline on Air Quality Models (Appendix W) cites AERMOD as the preferred near-field dispersion model of emissions for distances up to 50km. In addition, the Guideline also states in 8.3.3(b)(iii):

*"(T)he number of nearby sources to be explicitly modeled in the air quality analysis is expected to be few except in unusual situations. In most cases, the few nearby sources will be located within the first 10 to 20 km from the source(s) under consideration. Owing to both the uniqueness of each modeling situation and the large number of variables involved in identifying nearby sources, no attempt is made here to comprehensively define a 'significant concentration gradient.' Rather, identification of nearby sources call for the exercise of professional judgement by the appropriate reviewing authority (paragraph 3.0(b)). This guidance is not intended to alter the exercise of that judgement or to comprehensively prescribe which sources should be included as nearby sources"*

Monitored background values account for sources that are too small and/or too distant to be modeled. IDEM believes that the more distant facilities mentioned by the commenters can be represented with background values. Commenters also mentioned that F.B. Culley should have been included in IDEM inventories. IDEM felt that it was prudent to add F.B. Culley in the modeling as an inventory source due to its proximity to the proposed Riverview facility. F.B. Culley is 44 kilometers away from the proposed Riverview location. In developing the modeled values for Culley, IDEM used permitted rates and actual operating levels during the most recent 2-year period (2016-2017). Appendix W allows for this approach as illustrated in Table 8-2 of the Guideline. Adding F.B. Culley did not result in a NAAQS violation for any of the pollutants over the significant impact levels.

The commenter also mentioned that worst case hourly rail and truck traffic are not accounted for in the modeling. As defined at 326 IAC 2-2-1(vv), secondary emissions do not include any emissions which come directly from a mobile source, such as emissions from the tailpipe of a motor vehicle, from a train, or from a vessel. IDEM used conservative background values for SO<sub>2</sub>, and higher NO<sub>2</sub> background values than background concentrations measured from nearby monitors in Evansville and Owensboro. The higher NO<sub>2</sub> background values from the South Bend monitor used in this analysis further ensures that a conservative approach was taken in the analysis.

See the revised Air Quality Analysis, Appendix C to this ATSD.

## Valley Watch, Inc. Comments and IDEM Responses

On December 10, 2018, Valley Watch, Inc. of Evansville, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### Valley Watch Comment 1:

Please accept these comments as one set of comments filed by Valley Watch, Inc., on the above captioned project. Valley Watch will also file joint comments through EarthJustice in a separate filing.

First, I would like to formally file a complaint due to Mr. Logan's refusing to talk with me when I reached out to him earlier this year. It is clear from reading correspondence between Logan and the applicant that he was more than willing to engage them in an extremely cooperative manner throughout the permitting process. That same cooperative spirit should have been afforded to serious inquiries made by a concerned Hoosier who wished to ask some specific questions regarding his and others' discussions with Mr. Merle, Mr. Otte, Mr. Lang and others from Kellogg Brown and Root (KBR), the owners of the technology being proposed.

### IDEM Response to Valley Watch Comment 1:

Communications with a source and consultants during the permit review process, conducted nearly exclusively by email, involves questions and answers to issue that come up in the course of the work. Because of the strong interest in this permit, IDEM undertook the unusual practice of uploading email correspondence on a near-weekly basis to IDEM's on-line Virtual File Cabinet (<https://vfc.idem.in.gov>). While IDEM employees are expected to respond to members of the public with courtesy, agency employees are not required to submit to verbal abuse. After repeated contacts from an officer of the commenting organization, Mr. Logan was instructed to refer future contacts to Jenny Acker, the Permits Branch Chief. No changes were made as a result of this comment.

### Valley Watch Comment 2:

Second, Valley Watch still questions how emissions projections for this plant were assessed, given that there are no operating plants using this technology with coal as a feedstock in the western hemisphere, if not the world. As far as we know, the only operating plants using the Veba Combi Cracker technology are located in the autocratic countries of Russia and China and to date, we have been unable to ascertain anything specific about those emissions or even if they use coal or other feed stock as their feedstock. Riverview and KBR have failed to adequately measure those emissions, let alone measuring them using a feedstock of #6 Illinois Basin Coal which the applicant claims will be the feedstock for their process. To claim that any of the data presented by the applicant and their representatives is verifiable is simply not true.

### IDEM Response to Valley Watch Comment 2:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

With regard to the VEBA Combi Cracker (VCC) technology, see IDEM Response to Valley Watch Comment 12.

No changes to the draft permit were made as a result of this statement.

### **Valley Watch Comment 3:**

Further, we object to the issuance of this permit as a “hybrid” project, part refinery and part a coal conversion process. If there is no classification for this type of unit, then it is incumbent on the applicant to build a much smaller demonstration facility, one that can operate using the same feedstock as the proposed plant and gathering real emissions data from the operation of that demonstration sized project instead of merely speculating on emissions as the applicant and IDEM have done with this draft permit.

### **IDEM Response to Valley Watch Comment 3:**

The draft PSD/New Source Construction and Part 70 Operating Permit is in no sense a hybrid project and the term is not found in a quick search of the earliest correspondence. IDEM determined that the source is a petroleum refinery subject to various Standards of Performance for New Stationary Source (40 CFR 60) and National Emission Standards for Hazardous Air Pollutants (40 CFR 61 and 63). The source is also determined to be a fuel conversion plant as listed at 326 IAC 2-2-1(ff)(1) for determining the emissions thresholds of a major stationary source. It is perhaps true that some elements of this source, such as coal conveying and storage and hydrocarbon distillation, are rarely found in combination, but the potential to emit and appropriate controls for each element of the process are well established. There is no speculation in either the potential to emit calculations or the emissions limitations. No changes were made as a result of this comment.

### **Valley Watch Comment 4:**

Also, we object to the issuance of this draft permit because the applicant failed to provide the necessary full year's worth of air monitoring at the site as required by both the Clean Air Act and its Amendments [42 U.S.C. 7475 Section 165 (e)(2)] and the Code of Federal Regulations [Section 51.166(iv)] as well as the New Source Review Workshop Manual. This was clearly not done as required prior to Riverview making application for their permit. In the absence of this data, especially in an area which is surrounded by so many mega sources of coal pollution including SO<sub>2</sub>, NO<sub>x</sub>, H<sub>2</sub>s, CO, other HAPs, and VOC, it is virtually impossible to predict even accurate emissions impacts on the people and environment surrounding a proposed plant. Sadly, in this case, toxic emissions are huge just south of the proposed site with just two industries emitting nearly FIFTEEN MILLION pounds of toxic chemicals less than twenty miles away.

Congress made the monitoring provision law exactly for situations like this one. This project is proposed for greenfield that is currently agricultural land and there is almost no real data available for this site. IDEM should have required monitors for ozone, fine and course particles, SO<sub>2</sub>, NO<sub>2</sub>, lead, and a regimen of HAPs before they ever accepted an application for this facility. IDEM simply ignored Congress' wishes, the Code of Federal Regulations and the New Source Workshop Manual in an effort to claim “no data, no problem.”

### **IDEM Response to Valley Watch Comment 4:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

Review of the Toxics Release Inventory (TRI) for 2017 shows total air releases (fugitive and point source) for Spencer County represented 2.6% of the 15.4 million pounds of total on-site and off-site releases (including water and land releases). When evaluating only air releases in 2017, Spencer County was ranked as the 345th highest county out of 3234 counties (including county equivalent areas) in the United States.

No changes to the draft permit were made as a result of this statement.

**Valley Watch Comment 5:**

Modeling issues abound

All statistics classes admonish students that models are only as good as the input data they use. "Garbage in-Garbage out" is often the way it is referred. In this case, it is clear that the input data were in fact, "garbage."

First, the modelers summarily failed to even input a number of significant sources of emissions. They did cherry pick the sources they wanted, including the emissions from the giant Rockport power plant in Rockport. They failed to acknowledge that this source has emissions mostly from a smokestack that is 1,040 feet above the ground. Those emissions are unlikely to have any impact on the proposed site since even when the wind blows from that source toward the plant site, those emissions will travel far overhead and not fall to the earth for some additional distance from the site. The Rockport plant (2600MW) was the last plant in the USA to be granted permission to use a "tall stack." Under the Clean Air Act Amendments of 1977 tall stacks were declared illegal and stack height was severely restricted.

The Riverview site sits near the middle of the largest concentration of coal fired power plants in the western hemisphere. More than a dozen sources contribute to a chronic air pollution problem for the region. The entire area is inadequately served by any sort of monitoring network with only the Evansville metro area having monitors to really assess various ambient levels of pollution.

KBR and IDEM modelers failed to include significant sources including: the Duke Energy Gibson power plant- 70 KM (3340 MW), TVA Paradise Fossil plant 100 KM (1150 MW), Big Rivers Electric Coleman Station 30 KM (443 MW), Big Rivers Green and Reid Stations 76 KM (584 MW), Big Rivers DB Wilson plant 73 KM (417 MW), Vectren FB Culley power plant 41 KM (265 MW), Vectren AB Brown power plant 70 KM (530 MW).

All these sources reside upwind of the site some or most of the year and contribute to the overall ambient air quality of the Dale community. Of course the inclusion of these sources would add significantly to the model results and to leave them out is tantamount to total misrepresentation of the model if not actual fraud in our view. EPA should consider withdrawing the delegation they have given IDEM to administer air permitting for EPA since IDEM plays so loose and fast with data and other aspects of the permitting process in favor of applicant and polluters.

**IDEM Response to Valley Watch Comment 5:**

IDEM, OAQ considers this comment to be the same as Mr. Howard Gebhart Comment 19. See IDEM Response to Mr. Howard Gebhart Comment 19.

**Valley Watch Comment 6:**

To more clearly understand the apparent obfuscation practiced by IDEM and KBR in their modeling, it is important to note that for NO<sub>2</sub>, they chose/allowed a monitor more than 400 KM away to be used for model inputs. Apparently, the modelers simply chose to ignore the NO<sub>2</sub> monitor in Evansville, just 56 KM from the proposed plant site. It is anyone's guess as to why this sort of thing would happen but Valley Watch suspects the worst on the part of IDEM and their modelers since, in the past, we have caught IDEM actually altering the source code of the model to get the results they desired (See Exhibit 1-an affidavit by Dr. Howard Dunn that shows the incorrect data manipulation by IDEM).

*Editorial note: Exhibit 1, which followed the signature of the commenter's letter is inserted at the point of reference*

Exhibit Number 1

BEFORE THE ENVIRONMENTAL APPEALS BOARD  
UNITED STATES ENVIRONMENTAL PROTECTION AGENCY  
WASHINGTON, D.C.

IN THE MATTER OF: CONAGRA SOYBEAN PSD APPEAL NOS. 98-27 and 98-28  
PROCESSING COMPANY

PSD Permit No. CP-129-8541-00039 )

AFFIDAVIT

Howard E. Dunn, being duly sworn under oath, says and deposes as follows:

1. The Affiant, Howard E. Dunn, is an adult and is competent to testify on the matters stated herein.

2. The Affiant resides at 728 Magnolia Drive, Mt. Vernon, Indiana 47620.

3. The Affiant has received a Doctorate of Philosophy in organic chemistry from the University of Illinois. He is employed as a professor of chemistry at the University of Southern Indiana, located in Evansville, Indiana.

4. Approximately 9 to 10 years ago, the Affiant and several other scientists having a strong interest in environmental science issues formed an informal association known as ChemQuery. ChemQuery presently comprises 15 scientists.

5. In 1998, Affiant became aware of public announcements of the plans of ConAgra Soybean Processing Company ("ConAgra") to locate a large soybean processing facility in Posey County, Indiana, in the vicinity of Mt. Vernon.

6. As Affiant and certain other members of ChemQuery learned more of ConAgra's plans for the soybean processing plant, their concern grew over the potential adverse environmental impacts posed by the project. One of the particular concerns involved the projected potential emissions of volatile organic compounds (VOCs) and nitrogen oxides (Nox) from the proposed plant's operations, since these air pollutants are generally recognized as precursors of ozone formation. These concerns arose, in part, from the historical difficulties experienced by Vanderburgh and Posey Counties in achieving compliance with the U.S. Environmental Protection Agency's former one-hour National Ambient Air Quality Standard (NAAQS) for ozone of 120 parts per billion (ppb).

7. The PSD permit for the proposed ConAgra plant was issued by IDEM in mid-August, 1998. The permit, as issued, would allow 937 tons per year of VOC emissions. This represents a very substantial increase above allowable VOC emissions from other stationary sources in or affecting Vanderburgh County, Indiana.

8. As Affiant investigated the proposed PSD permit for the ConAgra plant and the technical information concerning the projected ozone impacts, his concerns grew. Affiant became aware of questions over the technical validity of the air quality modeling employed by the Indiana Department of Environmental Management (IDEM) to assess the projected ozone impacts. One source of these questions was a technical review of the IDEM modeling by a technical consulting firm known as ENVIRON. The ENVIRON review concluded, among other things, that certain inputs to the RPM-IV air quality model used by IDEM were not correctly stated, with the result that ambient ozone concentrations would be underpredicted by the model.

9. Affiant and others from ChemQuery raised their concerns, as described above, to officials at the IDEM over a period of several months during late 1998 and early 1999. Among other actions,

With regard to the commenter's Exhibit 1, the affidavit submitted in the ConAgra appeal, the Environmental Appeals Board (the Board) in Washington D.C. reviewed appeals 98-27 & 98-28 (including Dr. Howard Dunn's deposition) concerning a Prevention of Significant Deterioration permit IDEM issued to ConAgra Soybean Processing Company (ConAgra) in 1998. The Board reviewed and addressed each of the petitioners' four contentions. The first contention was the National Ambient Air Quality Standard for Ozone and the air quality analysis conducted by IDEM. The Board reviewed all the facts and depositions and found IDEM did not clearly err in concluding that ConAgra's facility would not cause or contribute to an exceedance of the NAAQS for ozone. This review was based on the fact that there was no U.S. EPA guidance for addressing a facility's contribution to ozone concentrations at that time. The Board issued an order denying review of this issue. In fact, with the revision to Appendix W: Enhancements to the AERMOD Dispersion Modeling System and Incorporation of Approaches to Address Ozone and Fine Particulate Matter, effective February 16, 2017, U.S. EPA developed Modeled Emission Rates for Precursors (MERPS) as a demonstration tool to evaluate source contribution to ozone. If conducted today, a MERPS review of the ConAgra source would fall below the most conservative MERPS values for VOC and NOx emissions throughout Indiana and would not be expected to threaten any critical air quality thresholds.

The commenter's charge that IDEM altered source code in any model is almost too vague for response. Based on discussions with IDEM employees involved in the ConAgra appeal discussed above, the issue seems to be to a line of code in that model that referenced a flexible parameter. The RPM-IV model run described in affidavit paragraph 12 set that parameter to the commenter's preferred value instead of the default value IDEM had used. Nevertheless, the Environmental Appeals Board found as described in the paragraph above. The accusation of altering source code was not sustained.

No changes were made as a result of this comment.

#### **Valley Watch Comment 7:**

On another occasion, in 2008, IDEM petitioned USEPA to redesignate Evansville and Vanderburgh County as attainment of the NAAQS for fine particles. Sadly, and what we believe to be fraudulent, IDEM simply left out days when the region was under air quality alerts for fine particles according to AirNow in offering their petition to EPA to claim attainment (See Exhibit 2).

*Editorial note: Exhibit 2, which followed the signature of the commenter's letter is inserted at the point of reference*

#### **Exhibit Number 2**

The first part of this exhibit is a narrative from comments filed by Valley Watch, Inc. dated March 27, 2008 regarding a petition by the Indiana Department of Environmental Management to redesignate Vanderburgh County as "attainment" of the NAAQS for fine particles that year. After the narrative there are four spreadsheets showing the missing data discussed in the narrative for 2004-2007. Together, they show what Valley Watch believes is corrupt intent on the part of IDEM to use extremely cherry picked data to make their case. And if they did it then, they are likely to do the same now.

"Serious Data Gaps in this analysis

IDEM would have us believe that actual data shows that over the last several years fine particle levels have improved to the point that we can be considered in "attainment" of the NAAQS for PM2.5.

Unfortunately, the data they seek to base that determination on has serious gaps which should stop this action in its tracks until at least another year of data is collected in order to see a valid picture of the trends IDEM suggest will make and keep our air clean and healthy.

First, IDEM has chosen to use data from 2004, 2005 and 2006 to prove their case. That, by itself is faulty since data is available for 2007 and it is well known that 2004 was a year that had an exceptionally cool

summer. EPA guidance, which is usually not followed, demands that periods of "unusual meteorological conditions" should not be used in determining the designation of attainment status for the NAAQS.

Because 2004 was exceptionally cool, the conditions for build up of fine particles simply did not happen. That resulted in reduced output of the numerous power plants in the region to run air conditioners, etc.

But, that is only a minor aspect of the serious data gaps we have identified. If data for 2005, 2006 and 2007 is used, which is appropriate, it is easy to find huge gaps that make any determination to attainment dubious if not fraudulent.

IDEM claims to have data to back up this petition but when 13% of the data is missing in 2006 and 16% in 2007, mostly during periods when high levels of fine particles are historically formed, their whole data set must be thrown into question.

In 2006 and 2007 numerous readings from the "official" monitor located at the Evansville Civic Center were missing entirely. In fact, during the months of June and August, two months when fine particle formation has historically been at its peak, more than half of the data is missing from this analysis.

In June, six out of ten measurements are missing. In August, five out ten measurements are also missing.

But it is not simply the fact that the data is missing that is a problem, it is also a problem that on nine of the eleven missing days during those months, PM 2.5 levels at the other Evansville monitors showed values in excess of the Annual NAQSS for PM 2.5 with several reaching levels that doubled the standard. Please see Exhibit 3 a spreadsheet of missing data from 2006 and 2007.

Who knows what the reading on the Civic Center monitor would have been? We feel that this significant data gap is sufficient reason to stop this process before it goes any further.

What caused the data gaps is uncertain. Malfeasance, ineptitude, even intent could be responsible. For years the monitors have been the responsibility of the Evansville EPA. Over those same years, the local EPA has been an advocate of relaxed air pollution rules and has shown a distinct bias toward increased economic activity instead of the protection of people's health. They have been unusually slow in alerting the public when pollution increases to unsafe levels.

The head of the Evansville EPA, the person responsible for collecting the data is a former member of the "Environmental Committee" of the local Chamber of Commerce. Now, she is married to another Committee member.

The Chamber is presided over by a man, who just last year very publicly complained about our PM 2.5 designation as somehow being unfair. Specifically, Chamber president, Matt Meadors declared at the Energy Summit of Southwest Indiana on August 31, 2007, "Personally, I believe the designation is unfair and shortsighted, I do not believe the region deserves to be punished and penalized simply because we have been blessed with an abundance of coal and the corresponding coal generating power facilities that locate here on top of these deposits."

We do not like the appearance of all this. The connections between the regulators and those they are supposed to regulate should be above even the appearance of impropriety. In this case they clearly are not.

What is the reason so many days of data are missing, especially when evidence is available to show that particle levels were high enough to raise the overall design value that pertains to air quality designations. There is no explanation attached to anything we have read to explain why any data is missing. Who knows? Was it lost? Was it contaminated? Are the filer samples still available for analysis? Have the been tampered with? These are questions that need answers before we can claim air quality is now safe.

If our design value was approaching the level recommended by CASAC of 14  $\mu\text{g}/\text{m}^3$ , a level that is considered "safe," data missing on days of high levels would not be such an issue. But, in this case,

became effective on October 27, 2011. PM<sub>2.5</sub> values have continued to decline at all three Evansville monitors and continue to meet the current (2012) annual PM<sub>2.5</sub> standard of 12.0 micrograms per cubic meters. No changes were made as a result of this comment.

No changes were made as a result of this comment.

**Valley Watch Comment 8:**

We feel that IDEM has little regard for actual facts when it comes to giving permission for a new source to pollute and distrust them greatly. Further, we were told by a State Representative shortly after a new Commissioner took office that the new Commissioner told him very directly that IDEM from that point on (2005) was now to be considered "an economic development agency." Since then, they have proven that statement true repeatedly, especially when it comes to coal either for mining or for its use as fuel or in this case feedstock.

**IDEM Response to Valley Watch Comment 8:**

IDEM does not "give permission for a new source to pollute". IDEM issues permits that may or may not include limits on emissions, but always include the monitoring, record keeping, and reporting requirements necessary to demonstrate compliance with applicable requirements.

IDEM, OAQ cannot consider hearsay about statements from an unnamed source regarding statements of another unnamed source as in any way relevant to the draft PSD/New Source Construction and Part 70 Operating Permit.

No changes were made as a result of this comment.

**Valley Watch Comment 9:**

It should also be noted that a recent study, published by Resources for the Future (<http://www.rff.org/valuable/research/publications/using-satellite-data-fill-gaps-us-air-pollution-monitoring-network> linked due to size) makes a credible case that satellite data and a lack of empirical data from monitors on the ground indicates that Spencer County should already be considered as non-attainment of the fine particle NAAQS (see testimony of Jean Webb). If that credible evidence is taken into account, it could be that Riverview Energy would be forced to find "offsets" for all of their criteria pollutants. This is clearly another example of IDEM failing to do their due diligence to actually predict the overall impact of a new facility in Spencer County. This is yet another reason why Congress required a full year's worth of pre-construction monitoring prior to filing an application for a TV or Operating Permit. IDEM requires no pre-construction monitoring and thus, cannot do much more than speculate on the impacts a new source will have.

**IDEM Response to Valley Watch Comment 9:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring

IDEM appreciates the information concerning use of satellite data to determine air quality concentrations in areas with no monitors in a specific location. Despite the research and work conducted for the Sullivan/Krupnick research abstract, this technology is yet unproven to determine concentrations or provide reliable information that meets U.S. EPA standards for monitoring data to be credibly used in designation, state/federal permitting or rulemaking processes. IDEM relies on the Clean Air Act and U.S. EPA regulations and guidance to assess the air quality concentrations from ambient air monitors. U.S. EPA continues to work with National Oceanic and Atmospheric Administration (NOAA) and other entities to use satellite imagery and other technologies for analyzing air pollutants in the future.

No changes to the draft permit were made as a result of this statement.

#### **Valley Watch Comment 10:**

##### Carbon Dioxide

In the last six weeks, citizens of the world and the USA have been informed of a pending disaster from the increased and continual emissions of carbon dioxide. The UN Intergovernmental Panel on Climate Change (<http://www.ipcc.ch>) and the Federal Government's, National Climate Assessment (<https://nca2014.globalchange.gov/report>) both warned of dire impacts on human health, agriculture, disaster preparedness, global economies, species extinction and more. Both reports, prepared by distinguished groups of actual scientists, called for the immediate reduction in emissions of greenhouse gases including CO<sub>2</sub>.

While the draft permit allows for the direct emission of 2,276 tons per year of CO<sub>2</sub>, it fails to address the huge emissions of carbon dioxide from the burning of the product coming from the plant which is 3,777,312 tons per year assuming all of the product is actually consumed. Additionally the CO<sub>2</sub> emitted from consuming the Naphtha product is 983,813 tons each year. That then totals 4,763,401 tons of CO<sub>2</sub> emissions emanating from the facility and the product it will produce each year.

Of course there are other emissions that will impact climate as well. Those include the CO<sub>2</sub> emissions from coal mining for the feedstock of the plant, those CO<sub>2</sub> emissions from transporting coal and other products to the site, the operation generated emissions of the electrical usage of the plant as well as plant illumination and pumps for water input to the plant and wastewater from the plant, etc. There are also methane emissions from fugitive leaks from the plant as well as any of the naphtha, which is highly volatile.

If we are warned that we must reduce our CO<sub>2</sub> and other greenhouse emissions by scientists across the world, it seems fool hardy to allow this facility to introduce nearly five million additional tons of CO<sub>2</sub> to the atmosphere each year it is in operation.

IDEM claims it has zero legal authority to address the massive new emissions of CO<sub>2</sub> this plant will cause. But the original law that set up the Agency, passed by the Indiana Legislature gives them broad, but mostly unused, authority to protect the health and environment of the entire state. IDEM should exercise this authority for all pollutants in assessing this permit instead of purely relying on the dreams and prognostications of an applicant who sees this proposal as a pathway to riches.

Since IDEM is determined to permit this facility to operate, it must require that those emissions be offset in their entirety in this same region so as to protect the health of the planet and all Hoosiers in the future.

#### **IDEM Response to Valley Watch Comment 10:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

With regard to the commenter's reference to emissions generated by use of the product diesel fuel and naphtha by the final end users (consumers), the draft PSD/New Source Construction and Part 70 Operating Permit is concerned only with the emissions generated by this stationary source. Any use of the products by the final end users (consumers) as motor vehicle fuel is subject to applicable motor vehicle emission and fuel economy standards. Use of product

naphtha by the final end users (consumers) in any other application is outside the scope of the draft PSD/New Source Construction and Part 70 Operating Permit and would be a matter of concern for the final end users (consumers) where such use takes place.

No changes to the draft permit were made as a result of this statement.

#### **Valley Watch Comment 11:**

“No Significant Impacts”

IDEM failed miserably to adequately analyze the impacts this plant will have on the surrounding region. But in their public notice of the issuance of a draft permit, they arrogantly declared the plant would have, “no significant impacts.” That moniker was seen across the USA as the Associated Press reported it in headlines across the country.

First, that defies reason. IDEM apparently does not consider the fact that this plant is being built inside the town limits of Dale and will usurp more than 500 acres of the town’s physical size, not quite doubling the size. Further, it is a coal refinery and even if it was nothing more than handling the huge quantities of coal required, it would have a major impact on the lives, health and environment of the people who now reside in an essentially rural environment that will be forced to live in what will be described as a major industrial undertaking.

Noise, light, dirt and dust, increased traffic, power lines, pipelines, coal laden unit trains, handling coal will irrevocably change their lives, but sadly, they will not be allowed any sort of input into that decision. It is questionable if any IDEM employee had even visited the subject town, or the proposed site prior to the public hearing on this permit on December 5, 2018.

Additionally, IDEM and its staff lack the necessary qualifications to make determinations regarding epidemiological impacts resulting from the operation of this plant. If those people actually do exist, then they should be identified, along with their academic credentials enumerated. This is necessitated since IDEM is claiming expertise they do not have as far as we can tell.

IDEM has a history of being in business to make sure that pollution is permitted any time an applicant desires. They admit as much in the “Permit Summary” they distributed at the Public Hearing December 5, 2018 in Lincoln City, IN, saying they are “required” to issue permits essentially if the applicant crosses their “t”s and dots their “i”s. Valley Watch has been following IDEM since its inception in 1986 and we know of zero applications they have not allowed to get permitted.

And, often, those permits are rewritten by IDEM to accommodate polluters’ needs over the health of the people who are then forced to live next to a major polluter. If a permit holder cannot meet the conditions of their permit, it is common for IDEM to issue a “significant permit modification” to further accommodate their needs even if construction has yet to begin. If a permit holder has a hard time meeting the construction time requirements of a permit due to a variety of reasons, IDEM always issues an eighteen-month extension and has been known to do so more than once without any updates to the BACT or LAER requirements, no matter if significant technological improvements have been made to emission controls.

#### **IDEM Response to Valley Watch Comment 11:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues,

- Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
  - IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

### **Valley Watch Comment 12:**

#### Veba Combi Cracker Technology

The applicant makes a big deal out of the fact that the developer of the original version of this technology was awarded a Nobel Prize. That was in 1931 in Nazi Germany, who was desperate for liquid fuels as they began their military build up which ended with WWII. They do not say why this technology lost out to Fischer -Tropsch technology that achieved the same end product. The Hitler regime chose Fischer -Tropsch over Veba Combi Cracker for reasons Valley Watch suspects are tied to economics, poison and waste.

Additionally, when the Nazi regime ended, many Nazi sympathizers fled to South Africa after the War where they sought to use the Fischer-Tropsch process to keep liquid fuels flowing in that country under apartheid. SASOL, LTD., used the Fischer-Tropsch process to derive liquid fuels because most oil producing countries across the globe sanctioned crude oil sales to South Africa during that dubious time. Veba Combi Cracker technology was available to that company but lost out due to a variety of reasons, including economic costs.

In November, 2018, SASOL announced they were abandoning their entire coal to liquids program because it was no longer competitive and the environmental and health costs were too high for it to be sustained. All along, SASOL had the Veba Combi Cracker technology available to them to alter their business model but chose to abandon coal to liquids technology all together.

Currently, according to IDEM's Doug Logan, the Veba Combi Cracker is not currently operating anywhere in the world although there have been two of them built in the autocratic countries of Russia and China. Why they are no longer operating is anyone's guess but IDEM was not even concerned enough with that fact to investigate why.

Since IDEM has done little to nothing to investigate emissions or operating parameters for the Veba Combi Cracker in either China or Russia, Valley Watch assumes that they are not operating using coal as a feedstock and are more likely to be using cleaner, higher carbon content "petroleum coke" to fuel their process. Pet Coke as it is often referred, is not a perfect fuel but since it is a waste product of petroleum refining, we know that it lacks the quantities and qualities of the contaminants that are found in #6 Illinois coal. Therefore, the emissions even if they were quantified from the existing, but not operating Veba Combi Cracker plants in the communist countries of China and Russia, would likely be considerably less than highly contaminated #6 Illinois coal.

### **IDEM Response to Valley Watch Comment 12:**

IDEM's authority does not allow the air permit to address issues such as The economic viability and political history of coal-to-liquids processes.

The VEBA Combi Cracker (VCC) process is a recent improvement of the hydrogenation reactor. The VCC process is more widely applied to upgrading petroleum residuals and petroleum coke into salable products. Licensing the VCC process for coal hydrogenation is not novel. Use of higher carbon feeds, as the commenter characterizes petroleum coke, is not necessarily an advantage since such feed would demand relatively more hydrogen which is produced in a steam hydrocarbon reforming process that produces carbon monoxide as a coproduct. Combustion of

that additional CO as the energy source for reforming would then incrementally increase the carbon dioxide emissions, which the commenter expressed concern about elsewhere (see Valley Watch Comment 10), of the source.

With regard to the commenter's statement about investigating emissions from similar plants in China and Russia, as noted in Environmental Assessment Report: Solvent Refined Coal (SRC) Systems, (EPA-600/7-79-146, June 1979):

"[The coal conversion] process is, for the most part, an enclosed and pressurized system. Consequently, air emissions during regular plant operations arise primarily from auxiliary parts of the system, such as the cooling towers, boilers, acid gas treatment, and sulfur recovery process. Process related emissions should be limited to leaks in pump seals valves, joints, and flanges and from product handling and storage."

Because methodologies for determining the potential to emit of the categories of emissions units found at the source are well established in IDEM practice, the need for information from foreign sources is not compelling. More recently-updated references such the current edition of AP-42 are also considered more informative than older sources like (for example) the 1979 document quoted above. The SRC process model discussed in the 1979 reference also used somewhat different auxiliary processes than the proposed source including a coal-fired boiler and Stretford rather than Claus sulfur recovery.

IDEM, OAQ is not in a position to question a source's business model. The proposed permit is strictly based on the potential to emit air pollution and applicable state and federal rules and regulations. See IDEM Response to General Statement 3 - Issuance of the Permit.

### **Valley Watch Comment 13:**

Financial Considerations not considered

This plant, once it commences construction, will irrevocably alter the physical nature of the Dale community and town. Even if construction begins and is not finished, as Valley Watch feels is likely to be the case, the visual and physical landscape of the community will be significantly and permanently changed. Valley Watch would assert that IDEM should require the applicant to restore the site to its original topography as agricultural land if the applicant begins but does not finish the project as planned in a timely fashion. Indiana greenfield availability is a serious issue for new developments and across the nation as climate change and a host of other environmental issues challenge developers, especially for issues like ample fresh water.

IDEM should undertake a thorough examination of the financial resources and responsibility of the applicant to assure that once they begin construction, they are financially capable of finishing it, including inflationary factors impacting steel, and other components used in the plant. This analysis should also include all the pollution controls required in the permit and accurate cost analysis of the project. Currently, the applicant claims the plant will cost \$2.5 billion to construct but that figure has not changed since the applicant first proposed building this plant in Vermillion County in 2010. Several aspects of the proposal have experienced significant cost increases both due to inflation as well as the recent tariffs imposed on steel and aluminum by the Trump Administration just this year.

IDEM should not issue a final permit until they are fully confident this applicant has the financial resources to build and finish the project in a timely manner or else make, as a condition of the permit the provision Valley Watch has requested above.

In this regard, it should be noted that the Dale, IN Zoning Board stated during public discussion of the zoning change from agriculture to major industrial that if the plant is not built, the industrial zoning would be withdrawn and the land zoned back to agriculture. IDEM should reflect the same if they actually issue a Final Permit for Riverview to construct and operate.

### **IDEM Response to Valley Watch Comment 13:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

Any requirement for restoration of the property in the event of a halt in construction is outside the scope of the draft PSD/New Source Construction and Part 70 Operating Permit. For information about brownfields and links to the Indiana Finance Authority program, please see <https://www.in.gov/idem/cleanups/2353.htm>. Local zoning agencies may also have authority related to restoration of the site to agricultural use in the future, however any decisions of local zoning authorities are also outside the scope of this draft PSD/New Source Construction and Part 70 Operating Permit.

No changes to the draft permit were made as a result of this statement.

### **Valley Watch Comment 14:**

#### **Conclusion**

This draft permit is close to fraudulent. No data is given to support it but vague assurances from the applicant and possible vendors as to its veracity. In too many cases, IDEM even leaves the choice of technology for emission controls undetermined.

IDEM's "modeling" of potential emissions is seriously flawed and should be redone using sources of real data including requiring the applicant to monitor various air quality parameters for a full year prior to issuing a new draft permit for public review, as required by the Clean Air Act.

IDEM should also include ALL the numerous sources of pollution that were left out of the model runs IDEM and the applicant performed. To use a model absent those sources to determine the impacts to health and the environment is tantamount to fraudulent behavior and IDEM should be ashamed to present such a model for public review.

It is known that numerous phone calls and meetings with the applicant took place but IDEM offers no records of the discussion or decisions that took place in those meetings and calls for the public to review and ascertain for themselves whether IDEM is acting according to established law and regulation.

IDEM has failed to comply with Indiana's Public Records regulations throughout this permitting process. Valley Watch and colleagues have made formal Public Records requests as early as late summer which IDEM has failed to comply with Public Records regulation.

IDEM refuses to extend the comment period for the permit as Valley Watch and colleagues have requested until they actually do comply with the Public Records request. **We continue with that request in these comments.**

IDEM makes hyperbolic statements regarding the impacts this plant will cause and offers near zero proof to support those statements.

This technology has a limited and questionable history. Just because there are two facilities using this technology in two autocratic, dictatorships does not mean that the technology is appropriate for the United States, whose democracy is dedicated to serving all its citizens and not just the

upper economic class. Real emissions data may be available for those two projects but IDEM made no effort to even investigate that possibility, And if they had, the data would not accurately reflect on the likely emissions from the proposed plant due to differences in feed stocks.

This project is little more than an experiment, both for the technology involved but also as to its impact on human health and environment of the surrounding region. IDEM, in this draft permit, almost completely dismisses the experimental nature of the proposal and ignores the fact that there is almost zero actual data to be used to determine the levels of control necessary to adequately maintain safe air quality in the region. This is especially true in the BACT and LAER analyses of the proposal.

Last, Valley Watch has serious problems with the below picture of Indiana Governor Eric Holcomb and Riverview president, Greg Merle exchanging pleasantries outside the American Embassy in Switzerland last Spring, at a time when IDEM was supposed to be undertaking a serious review of the project unfettered by political considerations. Since the Governor was out of the State and the Country at the time, we are unsure if laws regarding conflicts of interest, political donations, agreements, and a multitude of other corrupt possibilities would apply to such a meeting. But at the very least, knowing that this meeting even took place raises serious questions as to the influence the Governor may have exerted in issuing this Draft Permit. The Governor, at a minimum, raised a red flag allowing this meeting to take place in a foreign land with someone who had direct business (this Draft Permit) with the state at the same time.

We look forward to your complete response to our concerns and hope that you will refuse to issue a Final Permit to this plant until those answers are given and verified.

Sincerely,

(signed)  
John Blair, president

Select Local and State Officials

Enclosures

#### **IDEM Response to Valley Watch Comment 14:**

Although the heading of this portion of the commenter's letter is "Conclusion", the text introduces some new opinions as well as repeating specific comments discussed above.

IDEM, OAQ considers the first and ninth paragraphs of this conclusion, relating to data and technology choices, to be the same as Valley Watch Comment 2. See IDEM Response to Valley Watch Comment 2.

IDEM, OAQ considers the second, third and seventh paragraphs of this conclusion, relating to modeling, to be the same as Valley Watch Comment 5. See IDEM Response to Valley Watch Comment 5.

IDEM, OAQ considers the fourth, fifth, and sixth paragraph of this conclusion, relating to public participation, to be the same as Earthjustice Comment 8. See IDEM Response to Earthjustice Comment 8.

IDEM, OAQ considers the eighth paragraph of this conclusion, relating to the process technology, to be the same as Valley Watch Comment 12. See IDEM Response to Valley Watch Comment 12.

With regard to the final paragraph of this conclusion referencing an image of the Governor posing with the president of Riverview Energy Corporation, the permit writer has felt no pressure from any official of IDEM or other elements of the state government during this permit review process.

#### **Southwestern Indiana Citizens for Quality of Life, Inc. Comments and IDEM Responses**

On December 10, 2018, Southwestern Indiana Citizens for Quality of Life, Inc. submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Southwestern Indiana Citizens for Quality of Life, Inc. Comment 1:**

I represent Southwestern Indiana Citizens for Quality of Life in Dale, Indiana. We are currently in possession of petitions against Riverview Energy's refinery totaling 1632 signatures and counting. We are gravely concerned about the long-term environmental, health, and economic implications Riverview Energy's proposed coal-to-diesel refinery will have on Dale and surrounding communities.

#### **IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 2:**

After, reviewing the air quality draft permit, our concerns have become a reality as we digest what is in the draft permit.

If you approve this permit, you will be putting the health and quality of life of Dale residents and residents in surrounding areas, at extreme risk. This plant is unproven technology in the Western Hemisphere and to my knowledge, there is no model of the refinery and according to some of the statements in your virtual file, the refinery plans are not complete. We do not understand how you can approve a permit that does not have detailed information on the construction and design of the refinery. This leaves us to wonder if a lot of the information in this draft permit is conjecture. Can you please provide us with more detailed information about the design of this refinery?

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 2:**

IDEM, OAQ considers this comment to be the same as Earthjustice Comment 1. See IDEM Response to Earthjustice Comment 1.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 3:**

Of course, our big concern is that of the over 60 tons of Hazardous Air Pollutants that the permit will allow Riverview Energy to emit into our atmosphere annually. These, according to the permit, include Benzene, Hexane, Toluene's, and Xylenes. All are known carcinogens. How can release of such harmful pollutants not have a significant impact on the residents of Southwestern Indiana? The Hazardous Air Pollutants aren't the only concern. How can you approve a permit that will create noxious odors (rotten egg smell) from hydrogen sulfide, noise pollution and visual-light pollution? All of these will drastically change the quality of life in our area.

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 3:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 4:**

The Carbon Dioxide that you are going to allow Riverview Energy to release, if this permit is approved, will be over 2.2 million tons per year. Have you read the UN and U S Government's dire reports that insists we must reduce Carbon emissions by 2030? Does this not concern you that when the rest of the world is trying to correct the problem, you want to allow the state of Indiana to contribute to the problem? The claim by Riverview Energy that this is a cleaner way to produce diesel fuel is, according to the U S Energy Information Administration (headed by Energy Secretary Rick Perry), a falsehood. They state that producing diesel fuel from coal emits nearly twice as much carbon as crude oil-to-diesel production, and 15 times as much carbon as biodiesel production. Does this make since to you, besides being more expensive to produce, it will add twice as much carbon? We should be better stewards of our world and the citizens of Indiana.

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 4:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change

No changes to the draft permit were made as a result of this statement.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 5:**

According to the EPA Toxic Release Inventory, Spencer County is 23rd out of over 3000 counties in the country. How can you justify allowing a permit that will increase the toxins released in Spencer County? We have only one monitor in our county and sits atop of David Turnham Elementary School (one mile from the proposed refinery site) it monitors fine particulates. We understand according to a letter received from your office that monitors are placed according to population. Do we understand, since we are not a very populated county that our lives or not as precious as those in heavily populated counties? We also see that you used monitors in South Bend, Indiana, 282 miles away, to get readings on SO<sub>2</sub>. To our understanding, there is a monitor in Vanderburgh County that also measures SO<sub>2</sub>. Although using that monitor would still not be accurate as the landscape is different, we are concerned as to why that monitor was not used. Was it because it was not operational (having the permit for 9 months the monitor should have been available and, if not, this is very concerting? If this permit is approved, can you tell us where and what type of additional monitors will be used? Why was there no monitoring done on site of this proposed refinery months before the permit application process was started? Why NO BASELINE MONITORING DATA?

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 5:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 6:**

We are fortunate to have one of the best amusement parks in the country in Spencer County. 5 miles from Dale is Holiday World. We can only imagine how this refinery will effect the thousands of visitors to Holiday World each season as they inhale the noxious rotten eggs smell. We are just a few miles from Lincoln State Park, Lincoln Boyhood National Memorial (speaking of, why was Mammoth Cave used as the closest National Park?), Hoosier National Forests, Ferdinand Monastery, and local festivals. All beautiful landscapes and full of our heritage. These parks are used by thousands of people annually. This refinery will sit at the intersection of I-64 and US 231. It is the Northern Gateway to Spencer County. If this refinery is allowed to be built, it will demolish our tourism industry and many people will suffer economic consequences. Do you really think a picture of this refinery on the front of a Visit Indiana Magazine would draw more of a crowd than Holiday World? All for 225 permanent Jobs?!

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 6:**

IDEM, OAQ considers that so much of this comment as relates to the visibility analysis for Mammoth Cave National Park and the Lincoln Boyhood National Memorial is the same as Mr. Howard Gebhart Comment 18. See IDEM Response to Mr. Howard Gebhart Comment 18.

For the remainder of the comment, please see IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 7:**

A large part of our economy is from farming. We have beautiful farmland and there are organic farmers in the area that would be greatly affected by the daily release of pollutants from this refinery. There have been many studies on the effects of CO<sub>2</sub> and Ozone on soybeans. Please refer to the comment about soybeans and corn in the agriculture section of this document. <https://www.epa.gov/sites/production/files/2016-09/documents/climate-change-in.pdf> Our main crops are soybeans and corn, are you willing to jeopardize the livelihood of the farmers in our communities?

**IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 7:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Southwestern Indiana Citizens for Quality of Life, Inc. Comment 8:**

How is it you can make a blanket statement [State: \\$2.5B coal-to-diesel project won't harm air quality](#) about the effects of this refinery on our health when there are no health professionals on staff and you do not correlate any of your information with the health department? Please provide us the pollution medical research that prompted you to make this statement. There are so many people who move here and complain of new breathing issues and they find no relief until they leave the area. You should also be aware of the affects of pollution on the developing bodies of children and high rates of infant mortality. Why are our special education rates higher than the national average? And the biggest question of all: Why, if you approve this permit, will you allow Hoosiers to be guinea pigs of the unproven technology of Riverview Energy?

We ask for your responses from our questions and we ask you review all spoken and written responses and help us to maintain or improve our quality of life. Please do as it states on your website: We Protect Hoosiers and Our Environment. Southwestern Indiana Citizens for Quality of Life ask that you reject Riverview Energy's Air Quality Permit. Thank you for your time and your reconsideration of this draft permit.

### **IDEM Response to Southwestern Indiana Citizens for Quality of Life, Inc. Comment 8:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

Regarding infant mortality in Indiana and southwest Indiana, please see the IDEM Response to Dr. Norma Kreilein Comment 1.

Regarding the 2017 special education enrollment for southwest Indiana schools, please see the IDEM Response to Mr. Rock Emmert Comment 1.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Thomas Brown Comments and IDEM Responses</b>
---

On October 29, 2018, Mr. Thomas Brown, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Thomas Brown Comment 1:**

Please be advised that I would like to make a public comment in favor of the Riverview energy project. This project will bring a large boost to our economic future. As a member of the Lincolnland Economic Development Corporation, it is our mission to bring jobs to our County that will have a positive impact on our tax base. By targeting the high-wage, value-added jobs for which we ferociously compete with other counties, we increase opportunities for wealth and prosperity of the people of Spencer County. Economic development is needed to create those high-wage primary jobs, and to expand the tax base, to diversify the economy and to better control our destiny in this competitive world.

Seldom does an opportunity the size of Riverview Energy come along in Indiana. Our world economy is rapidly changing. We must stay on the leading edge of innovation to secure our share of economic advantages for our citizens. Riverview Energy is an innovation that will provide high quality, cleaner fuel for America's transportation system, as well as products for other industries. We need to continue the enhancement of what we are doing well to foster more business growth in Spencer County.

I urge IDEM'S approval of this permit.

#### **IDEM Response to Mr. Thomas Brown Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### Mr. Josh Meyer Comments and IDEM Responses

On October 30, 2018, Mr. Josh Meyer of St. Anthony, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Josh Meyer Comment 1:

I am a lifetime resident of southwestern Indiana. I am a husband and a father of three wonderful young kids. I strongly oppose the construction of the proposed coal to diesel refinery in southern Indiana. I am the first to support economic growth in our area, but I have yet to see how this will be accomplished with this project. In my opinion, the risks of this project far outweigh the potential gains in an area that is already struggling to fill available jobs. The environmental impact scares me and is of grave concern to my children and their children. I think Indiana can do better than agreeing to be a "Guinea pig" for such new and unproven technology. Please protect beautiful, rural, Indiana!!

#### IDEM Response to Mr. Josh Meyer Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

On December 7, 2018, Mr. Josh Meyer, submitted additional comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Josh Meyer Comment 2:

Thank you for taking the time to read my concerns and allow me to voice my opinion. I am a father of three wonderful children and a husband. I am not from Spencer County but live a short 15 minute drive northeast in Dubois county. I feel as though it is my duty to let you know that my family and I strongly oppose the construction of this plant in southern Indiana. I have done quite a bit of reading and had many conversations with people regarding this issue and can't come close to wrapping my head around the idea of building this plant at this location let alone anywhere in the United States. None of it makes sense to me. The proposed location is absolutely terrible. The proximity to communities, schools, tourist destinations, recreational properties makes absolutely no sense whatsoever. To locate this in a county and state that already has record low employment numbers with nearly every existing company struggling to fill jobs eliminates the "job creation" proposal entirely. The fact that this is old technology and it would be the first of its kind in the western hemisphere should raise numerous flags to anyone with a conscience.

Because this is something completely new and there isn't any real world data to support the pollution that will be created, I am honestly dumbfounded that its construction is even being considered. I feel betrayed by the fact that it has even made it this far in the process. I feel like the local elected officials intentionally went out of their way to get this project started without making any attempt to allow the public to weigh in.

I believe an outside organization should also be consulted to analyze the impacts of a plant like this being located in a county and state that already top the charts statistically in pollution. It really is mind blowing to me that anyone would consider adding to an already existing problem. We should be actively be taking steps to do better and solve our pollution problem and reliance on a non-renewable energy rather than make it worse. The lack of monitoring devices in this area is a huge oversight. There is NO WAY the conclusion you have arrived at can be accurate without more air quality monitoring devices being located on-site. The number of oversights with this project are just astounding to me. The fact that it is even a consideration makes me believe that it is being done so with an intentional disregard for the quality of life, and the health of people living in southern Indiana. The laws you are abiding by do not apply to this coal conversion process! This is a matter of doing the right thing or the wrong thing. Please ask yourself if you are doing the right thing!

**“We do not inherit the earth from our ancestors, we borrow it from our children”**

**IDEM Response to Mr. Josh Meyer Comment 2:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

IDEM, OAQ considers so much of this comment as relates to "real world data" to be the same as Earthjustice Comment 2 regarding potential to emit calculations. See IDEM Response to Earthjustice Comment 2.

No changes to the draft permit were made as a result of this comment.

**Mr. Randy Vaal Comments and IDEM Responses**

On November 1, 2018, Mr. Randy Vaal of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. On November 26, 2018, Mr. Randy Vaal of Santa Claus, Indiana, submitted additional comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Randy Vaal Comment 1:**

The IDEM Notice of Period for Public Comment and Part 70 Operating Permit for Riverview Energy's proposed coal-to-diesel plant in Dale IN, recently issued, contains the blanket statement, "No significant impacts are expected from the proposed facility." This statement should have been qualified to state that you do not believe any significant, regulated pollutants would exceed the levels that would impact health.

As it stands, the permit contains a totally false statement. IDEM does not address impacts from land use, odor, noise, rail and truck traffic, sound, light or visual pollution. For your office to simply claim there are no significant impacts is simply false. I ask that the release be corrected to state the limits of IDEM's purview with regard to your permit.

**IDEM Response to Mr. Randy Vaal Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

**Mr. Randy Vaal Comment 2:**

Page 2 of 50, TSD Appendix A contains a table with number of cells shown as #REF! Importantly, these cells are for total emissions for particulate matter. Please let me and the public know what the real numbers are.

**IDEM Response to Mr. Randy Vaal Comment 2:**

On November 26, 2018, Doug Logan replied by email to the commenter, as follows:

Good morning,

I am not sure where you found the version of the calculations you refer to in this email. If you found it in the Virtual File Cabinet, it is likely to be an unfinished draft that was under discussion with the source. The public notice version, dated October 19, 2018, is 43 pages and does not seem to have any invalid links that generate the cell entry you described.

I suggest looking at the public notice documents that are on line and at the local library for up to date information. The preliminary findings are available on the Internet at: <http://www.in.gov/ai/appfiles/idem-caats/>.

Thank you for your interest in the draft permit.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Sarah Winner Comments and IDEM Responses</b>
---

On November 2, 2018, Ms. Sarah Winner of Spencer County, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Sarah Winner Comment 1:**

I am a 60 year old employed resident of Spencer County, Indiana. I have asthma and so does one of my daughters. I know so many people who live in this area who have cancer. I am STRONGLY opposed to the proposed coal to diesel plant. This county has many jobs available already. There are many signs advertising for workers. PLEASE do not add to the already polluted environment in our area. No C2D!!! Thank you for the opportunity to add my voice to this serious issue.

### **IDEM Response to Ms. Sarah Winner Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Linda Greene Comments and IDEM Responses</b>
---

On November 3, 2018, Ms. Linda Greene of Unionville, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Ms. Linda Greene Comment 1:**

The following article (link below) constitutes my comment on the Dale, IN, coal-to-diesel plant. Thank you.

<https://www.counterpunch.org/2018/09/28/dale-indiana-a-tiny-town-fights-a-massive-coal-to-diesel-refinery/>

Dale, a town in Spencer County, southwest Indiana, is under siege. Set in farming country, with a population of 1,593 that's 84.6% white and an annual median income of \$34,000, Dale is a close-knit, peaceful community. Riverview Energy Corp., based in Delaware, wants to build a \$2.5 billion coal-to-diesel refinery in Dale on 512 acres of what is today a huge cornfield. The proposed refinery would be a massive plant with smokestacks belching toxic air pollution and pumping out greenhouse gases and the associated poisonous chemical odors and noise of heavy industry. Resistance to the project is mounting.

#### **Background**

With its rolling hills dotted with woods, southwest Indiana is a tourist destination. Among its attractions are the Hoosier National Forest and its lakes, Holiday World, Lincoln State Park, Lincoln Boyhood National Monument, Marengo Cave, Patoka Lake, Wyandotte Caves, the Lincoln Amphitheater, the Ohio River front, two historic monasteries in Ferdinand and St. Meinrad, the town of Santa Claus and eight wineries.

But Indiana is ranked sixth most toxic of the 50 states. According to the Sierra Club, Indiana releases more greenhouse gases, the main driver of global climate breakdown, than 187 countries do. Indiana has five super polluters. Super polluters is an academic term for both the top 100 releasers of greenhouse gases and top 100 releasers of toxic air pollutants. Twenty-two facilities nationwide meet the criteria for being top releasers of both pollution and greenhouse gases, and four of them are in coal country in southwest Indiana. All are coal-fired power plants. Indiana also has more coal ash lagoons than any other state. Those lagoons are pits adjacent to coal plants, usually unlined and filled with water and the toxic waste products from burning coal, which include lead, mercury, arsenic and boron, causing cancer and damaging organs. The chemicals contaminate groundwater.

Spencer County ranks 23rd among the nation's 3,000 counties, parishes and reservations in the release of toxic substances into the air. Rockport, also in southwest Indiana, is ranked the 18th city in the U.S. for air pollution.

### **The Refinery**

The refinery would be less than a mile from Dale's town center, six miles downwind from the town of Ferdinand and five from the town of Santa Claus. An elementary school, nursing home, organic farm and animal hospital are within a mile of the site. A wholesale food distributor is located across the railroad tracks from the property line, and people live 60 yards from the line.

The site of the proposed refinery is owned privately and was originally in Spencer County and zoned for agricultural use. Last year Dale officials quietly annexed the acreage from the county. The town's zoning board, an advisory agency, rezoned the site industrial and voted 4-3 for the refinery. The town council, a governing body, voted 5-0 for the facility. It was a deal cooked up on the sly by Riverview Energy, town officials and the local economic development corporation, with the blessing of Indiana's governor. When rumors of the proposed refinery first reached Dale residents and they asked public officials about it, the officials' answers were always the same: they denied any knowledge of the project. When a local resident asked about the hush-hush manner in which the project was moving forward, a public official told her they were acting quietly to avoid public opposition.

In this country, ordinarily diesel fuel is refined directly from crude oil at a petroleum refinery. Coal-to-diesel plants like the one Riverview Energy Corp. is proposing for Dale exist nowhere in the United States or the rest of the western hemisphere, though there is one such plant each in China and Russia. The technology of converting coal into a liquid fuel was pioneered in Nazi Germany in World War II when that country was short on diesel fuel but coal was plentiful. This type of refinery was popular in apartheid South Africa for the same reasons. Greg Merle, president of Riverview Energy, wants to market the technology widely and sees the Dale plant as only the first of many in the United States. He claims that such plants will revitalize the nation's fading coal industry—this at a time when it's critical to leave fossil fuels in the ground and immediately begin transitioning to renewable energy to mitigate global climate breakdown.

The plant would use a process called hydrogenation to convert coal into ultra-low-sulfur diesel fuel. Heat and pressure would liquefy pulverized coal, with hydrogen added to create the fuel. The plant would process 1.6 million tons of coal annually, or 100 rail cars of coal each day. Every year the process would produce an estimated 4.8 million barrels of diesel fuel and 2.5 barrels of naphtha, used to make gasoline and plastics. As to toxic air pollution, the facility would have annual emission rates of 225 tons of carbon monoxide and 120 tons of sulfur dioxide. Each year it would emit 2.2 million tons of carbon dioxide, the main greenhouse gas responsible for global climate breakdown.

The coal-to-diesel process would require water, and Riverview Energy plans to pump 1.8 million gallons of it each day from an aquifer of the Ohio River. A 20-mile pipe would transport the water to the plant from the aquifer, and another pipe of equal length would bring the wastewater, supposedly treated, back to the aquifer to be dumped. Riverview Energy hasn't specified how it would extract the contaminants from the wastewater or how it would dispose of them. The company isn't offering to pay for the pipes; presumably the Indiana taxpayers would foot the bill.

For a retired chemical engineer who has examined Riverview's air permit application in detail and lives in Santa Claus, converting coal into diesel fuel makes no sense. He points out the outlook for coal and oil is bleak. As oil prices drop, the plant would become less economical. The refinery would be quite simply an anachronism.

Riverview Energy has no plans to mitigate the 2.2 million tons of carbon dioxide it would emit. The plant would also release hydrogen sulfide, a gas highly toxic to humans at even low levels.

As is nearly always the case with proposed polluting facilities, Riverview Energy is promising to bring Dale jobs—2,000 construction and 225 permanent jobs. However, Dale has an unemployment rate of only 2.6%, with "now hiring" signs common in the windows of local industries and retailers.

### **The Resistance**

The Indiana Department of Environmental Management (IDEM) began examining Riverview's air permit application in January and is expected to release its decision any day. By law, IDEM is required to give the public 30 days to comment after the results of its analysis are made public and then to hold a public hearing.

Concerned residents of Dale came together in April to start a grassroots organization, Southwestern Indiana Citizens for Quality of Life, to fight the plant. For Mary Hess, a retired postal worker and president of the organization, the struggle is about saving lives now and in the future.

Southwestern Indiana Citizens for Quality of Life held two public forums on the plant, one in May and the second in June. One of the speakers at both forums was Erin Marchand, M.D., a board-certified family physician and resident of Santa Claus. She studied the air pollution permit application in depth and points out that the plant would be another super polluter, with concomitant health effects. The plant would release 139 tons per year of volatile organic compounds (VOCs). VOCs combine with nitrous oxide, also to be released by the plant, to form ozone, or smog. Spencer County has no monitor to measure ozone, but the surrounding counties do and are known to have ozone problems.

Dr. Marchand points out that the plant would release tons of particulate matter. According to the International Agency for Research on Cancer, particulate matter causes preterm birth and bladder cancer and slows lung development in children. According to Dr. Marchand, exposure to ozone and particulate matter results in visits to hospital emergency rooms for allergies, asthma, chronic obstructive pulmonary disease, heart attack, angina, atrial fibrillation and premature death. Pollution, she says, causes death in both the long term and short term. Air pollution causes cancer, preterm birth, infant mortality, deficits in lung development, heart attack, stroke, asthma, chronic obstructive pulmonary disease, shortened life span, cognitive deficits and dementia. The plant would release known carcinogens, including benzene, which is linked to anemia, leukemia, and liver and bone marrow cancer. People in Dale would also be at risk from pollution in the water and soil.

The obstacles to stopping the refinery are formidable, seemingly insurmountable. No one expects any help from IDEM; it almost always sides with industry in struggles over corporate pollution. The Indiana Department of Health and Indiana Medical Association are silent on the issue. The Environmental Protection Agency, which has to weigh in on the project, has a history of siding with the industries it's tasked with regulating and has proven to be no friend of public health or the environment.

Polluting facilities like the coal-to-diesel refinery are usually sited in poor communities and communities of color, with little political clout. Riverview Energy seems to think that a bunch of Hoosier hicks wouldn't have the wherewithal to oppose its plan to place a refinery in their midst, but the corporation underestimated the solidarity among rural southwest Indiana residents.

What the resistance to the refinery has is collective people power. The strength of the resistance lies in the fact that the Dale residents opposing the plant are not doing so in isolation. The best thing going for them is their connectedness to others in the region. People in southwest Indiana have come together to create a network, a true coalition of disparate groups from different locations in the same region. The towns around Dale, accurately perceiving that the refinery would adversely affect all of them, are rallying around Dale. Some of those towns, such as Jasper, have had their own struggles against polluting facilities (in Jasper's case, a biomass incinerator). Grassroots environmentalists in Ferdinand, six miles downwind from Dale, and Santa Claus are involved in fighting the plant, as is Valley Watch in Evansville. A local winery donated its space for a fundraiser. Project ACORN, a grassroots environmental group in Ferdinand, sponsored the June public forum and benefit concert.

Dale opponents of the coal-to-diesel refinery and their allies are doing all in their power to raise awareness—canvassing door to door; creating a presence at local fall and folk festivals and

county fairs; passing out yard signs, bumper stickers, petitions and fliers; creating a Web site (noc2d.com) and Facebook page; putting up a billboard; deluging the local newspapers with letters to the editor. And talking to everyone they encounter. Their immediate goal is to pack the IDEM hearing on the air permit application and, ultimately, to stop the plant. As one opponent of the refinery put it, "We're fighting an uphill battle but making sure our voices are heard."

#### **IDEM Response to Ms. Linda Greene Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change

No changes to the draft permit were made as a result of this statement.

#### **Mr. Paul McInturf Comments and IDEM Responses**

On November 7, 2018, Mr. Paul McInturf of Chrisney, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Paul McInturf Comment 1:**

I want to voice my support of this project and encourage you to not listen to the tree huggers against it too much. We trust the US EPA and the state EPA. The locals here want to keep this area as their own and don't welcome outside companies too much I am told. Wife and I moved here from APPALACHIA -SE Ohio in 2015 when AEP closed down a bunch of coal power plants. I worked at Muskingum River for 35 years and transferred out here to I&M Rockport where I hope to retire from in 2021. Most of the fellows at the power plant support this project. Plus if this product, Coal to Diesel is truly 25% more efficient than petro diesel then this shows me their ignorance that emissions from diesel vehicles will drop correspondingly 25%. I say GO FOR IT.

#### **IDEM Response to Mr. Paul McInturf Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### Ms. Paulita Pund Comments and IDEM Responses

On November 9, 2018, Ms. Paulita Pund, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Paulita Pund Comment:

Why does IDEM not have an ozone detector in Spencer County? Why are 6 of the 7 pollutants tracked by IDEM not monitored in Spencer County? Perhaps IDEM is afraid of the answer.

It is difficult for me to fathom why IDEM would allow Riverview Energy to dump such huge amounts of pollution on the citizens of Spencer County, Dubois County, Perry County, southern Indiana all of Indiana and surrounding states. If these pollutants are not being monitored in Spencer County, how can you dare to claim the air is safe? Perhaps that is why the company owners prefer to live up North in a rural area much like southern Indiana, with the exception of the toxic air. Apparently, due to IDEM the toxic levels in this area have been allowed to rise to the point of unsafe conditions that have created a rise in infant mortality, learning disabilities, cancer and other health issues.

IDEM is failing in giving accurate information to the citizens of Indiana. Why is it being withheld in this area? Riverview must be paying a high price to restrain such information.

The idea of providing more needed jobs is really not an issue. Indiana has a very low unemployment rate and many businesses are needing people, not pollution.

This company is not welcome here. The amount of coal needed and the number of rail car traffic each day would create long delays at railroad crossings. The two pipelines for the water and waste products that the company would need would also greatly impact the persons whose land would be affected. Those individuals would not have a choice as "Imminent Domain" would be enforced against their will. The withdrawal of such large amounts of water from the aquifer could possibly dry up the aquifer impacting many people that currently depend on that source of water. The huge quantity of waste produced will surely cause many problems with the river and the animals that reside there.

In the event this project is approved for construction by IDEM the hand of God would most surely be pressing down on the shoulders of those who see fit to allow such enormous amounts of pollution to rein havoc on so many innocent people.

Please do not let this happen to your Hoosier neighbors.

#### IDEM Response to Ms. Paulita Pund Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

Regarding infant mortality in Indiana and southwest Indiana, please see the IDEM Response to Dr. Norma Kreilein Comment 1.

No changes to the draft permit were made as a result of this statement.

<b>Sister Mary Lee Hillenbrand Comments and IDEM Responses</b>
--

On November 10, 2018, Sister Mary Lee Hillenbrand of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Sister Mary Lee Hillenbrand Comment 1:**

Dear Doug, Thank you for our conversation yesterday, on 11/9/18. In summary I am grateful for the time you gave to listen to my concerns however I remain unsatisfied regarding your role as the one who issues the permit for companies to build plants that spew more pollutants in our area regardless of the limited amount that regulations allow. It is difficult for me to accept this and a matter of my conscience to challenge decisions made with so little awareness of the impact on health especially those who are vulnerable: the fetus, the children, the elderly. I cannot understand why more research has not been done to prove the impacts that pollutants have throughout the human lifespan. I would hope that the moral fiber of you, all of us, would direct us to work for a better environment rather than one that adds to the already high level of air pollution especially in our area which is surrounded by companies that pollute. I am asking you to challenge your own conscience to seek what would be a better way to regulate permits than to accept the status quo without challenging I for one know that a cleaner environment is possible given the fact that there are solar, water and wind options. Sources that would provide many jobs and safer ones. In the words of Louie Armstrong's song "What a Wonderful World" "it would be if our creative minds could work together for the good of the whole, our neighbors, our state, our nation, rather than to focus on just ourselves and meeting our individual wants and comfort. I am attaching a letter I wrote to our local editors to help you understand the concerns I have for our entire world. I hope to come to the December 5 meeting, if not I will send this letter with friends.

The commenter attached the following letter submitted to the Dubois Daily Herald:

**QUESTIONS**

Chief Seattle once spoke this wisdom: "This we know: The earth does not belong to man, man belongs to the earth. All things are connected like the blood that unites us all. Man did not weave the web of life, he is merely a strand in it. Whatever he does to the web, he does to himself." In the struggle between meeting human wants and actual human needs we often forget the importance of not taking from the earth more than is prudent. As Pope Francis notes the earth is "our common home" and requires great care.

After reading a number of articles concerning the proposed coal-to-diesel plant in Dale IN, I have many questions. According to Greg Merle, president of Riverview Energy, The new technology licensed by Kellogg, Brown, and Root Company is a cleaner process than traditional diesel refining. It is unclear to me how he can know this with assurance, given that the technology hasn't been available for license until recently, and apparently has never been used in the U.S. I would like to see the data proving his point, and assurance that the chemicals released from the process would not negatively affect the health of our local population. Steve Hurm, director of training at Boilermakers local 374, claims that if the company were to use well-trained union workers, the plant would be feasible and safe. Again, I ask for the data to back up this statement. Why would any of us choose more air or water pollution, no matter how minimal, no matter how many jobs it would create, given the egregious pollution status of our area? Given what we already know about cancer rates in southern Indiana, why would we want to risk making things worse for the next generation? Can we not think more creatively about better and healthier job options? Perhaps dealing in more sustainable forms of energy?

Respectfully

Mary Lee Hillenbrand

Ferdinand, Indiana

**IDEM Response to Sister Mary Lee Hillenbrand Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

IDEM, OAQ does not have the text of statements attributed to Mr. Merle and Mr. Hurm in the commenter's attached letter and therefore cannot respond to those claims.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Donna Martin Comments and IDEM Responses</b>
---

On November 10, 2018, Ms. Donna Martin of Rockport, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Donna Martin Comment 1:**

As a resident of Spencer County, in Indiana, I am appealing to IDEM to DENY permits for the proposed coal-to-diesel plant in Dale, Indiana. Our county is 23rd in the country in toxic emissions. And IDEM has ONE fine particulate monitor here? YOU DON'T CARE. This C2D plant is next door to an elementary school and nursing home. Would you want your children in that school? Your parents in that nursing home? YOU DON'T CARE. With the current level of toxic emissions in our area already, why could you even THINK it's OK to allow more to be exploded into the air? YOU DON'T CARE. With the current levels of toxic air in our area, I hardly believe Indiana Department of Environmental MANAGEMENT is being MANAGED to protect our citizens. I believe a more accurate title would be Indiana Department of Environmental MISMANAGEMENT.

Treat others as you would like to be treated. Allowing even MORE toxicity in our area is wrong regardless of the amount. You should be charged with assault and murder. Because that's what the poison is doing to us.

**IDEM Response to Ms. Donna Martin Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

### Ms. Linda Goller Comments and IDEM Responses

On November 12, 2018, Ms. Linda Goller of Central, South Carolina, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Linda Goller Comment 1:

As a native Hoosier, I write to request denial of the permit to Riverview Energy in Dale, Indiana. I grew up in southwestern Indiana and hope to return to the Dubois County area for retirement. I am concerned that the state government of Indiana has a skewed perception of what quality of life means for its citizens. Clean air and clean water are at the top of the list. Southwestern Indiana citizens place a high value on sense of place and a rich local history - St. Meinrad Archabbey, the Benedictine monastery in Ferdinand, and outdoor recreation to name a few. I suggest Riverview Energy build its experimental refinery in its home state of Delaware or continue its trend of building in China and Russia. Hoosiers say NO!

#### IDEM Response to Ms. Linda Goller Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Ms. Charlene Hess Comments and IDEM Responses

On November 16, 2018, Ms. Charlene Hess, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Ms. Hess sent a duplicate of this letter on November 18, 2019.

#### Ms. Charlene Hess Comment:

I am opposed to the Riverview Energy's coal-to-diesel plant proposed for Dale, IN. There are many reasons I oppose this plant, the main reason is that my home is just up the road from AEP, AK Steel, Alcoa and F.B. Culley in Warrick Co, and the Paper Mill and Century Aluminum in Hawesville, Ky. I know the toxic pollutants from these plants are harmful to the people who have no choice but to breathe this air.

I have been reading about the top four toxic chemicals emitted by AEP alone:

1. Hydrogen fluoride (57%) - an irritant of eyes, nose, and respiratory tract and, in larger amounts, can damage lung tissue
2. Sulfuric acid (21%) - breathing this in the air can result in respiratory tract irritation
3. Hydrochloric acid (17%) - inhalation exposure may cause eye, nose and respiratory tract irritation, coughing and chest pains.
4. Ammonia (2%) - even very low concentrations can cause coughing and nose, throat irritation.

It is ludicrous to think that no other chemical toxins from the other plants' air emissions are mixing in and adding to the AEP's polluted emissions. It is a known scientific fact that air and gas

molecules move among themselves and for long distances. It is absurd to think that the coal-to-diesel plant will not further impact the already toxic air we breathe.

The Riverview Energy's air quality proposal listed at least 17 pollutants that would be emitted. I am just naming three:

1. Nitrogen Dioxide - can cause respiratory symptoms such as coughing, wheezing and can aggravate asthma leading to ER visits
2. Sulfur dioxide - as like the sulfuric acid being emitted by AEP, can cause irritation of nose, throats, coughing, wheezing, shortness of breath, and /or tight squeezing around chest
3. And then there's more Ammonia.

All of this reminds me of a big pot of soup. At first the cook adds a teaspoon of salt then along comes the husband who adds an additional full tablespoon. The son comes home; he doesn't know the soup has been seasoned yet so adds another tablespoon of salt and on and on so that, all mixed up together it makes a very toxic soup and causes those eating it to become sick. It takes only common sense to know that chemical pollutants from one plant added to air already full of toxic pollutions will certainly have significant impacts!!

Several years ago, I complained that I was having to use allergy medications all year long. I see now, after investigating all of these chemical pollutants, that my upper respiratory difficulties are due to all of the polluted air I breathe and not just to the pollen level.

In fact, I just recently vacationed in Washington, D.C. for ten days. Once I arrived there, I felt my nasal congestion was better so I discontinued my allergy medications for the duration of the trip and felt great. Sure enough, within 6 hours of returning to Santa Claus, the nasal congestion and coughing began.

My grandson from Carmel, IN experiences the same thing. At home he is fine, then he comes to Southern Indiana and must begin allergy medications. It is not just due to pollens. We breathe an accumulation of toxic chemicals. We do not need any more toxic chemicals in our air!

I'd like to suggest that IDEM hurriedly set up a monitor at the AEP plant so you can truly determine ALL of the toxins that are spewing from that plant and the true air quality in this area.

I'd further suggest that some of the members of your department fly to China and/or Russia to investigate this type of plant in order to see just how "clean" this plant really is. You truly need to fully investigate this plant before making a huge decision that could ultimately cause our area to have even more debilitating health problems. You should be wondering why, if this kind of plant is so great, it hasn't been built in the United States before now even though it's been around for the past 90 years or so.

No changes to the draft permit were made as a result of this statement.

### Ms. Jeana Visel Comments and IDEM Responses

On November 20, 2018, Ms. Jeana Visel of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Jeana Visel Comment 1:

I am writing concerning the proposed coal-to-diesel plant in Dale, Indiana. As one responsible for the care of the Indiana environment and the people affected by it, you have a grave responsibility, and I pray that you will be given wisdom in deciding whether an air permit should be granted. Personally, I believe it should be denied.

For religious reasons, I chose to move from another state to live in southern Indiana, and I have made a life commitment to this community. I now work in Spencer County, just ten minutes' drive from Dale. As you well know, the proposed plant is due to process ungodly quantities of coal each day, pulverizing it to dust and submitting it to intense heat and pressure in order to yield sulfur and the compound needed for diesel. While I am not a trained scientist, I have read a portion of the permit request, and have listened to several doctors, chemists, and engineers speak on the nature of the pollution due to be emitted. Their words were not encouraging. As of 2016, Indiana already emits 133 million pounds of pollution per year, the sixth worst in the nation (*Indy Star*, Apr. 9, 2018). Spencer County is already 23<sup>rd</sup> worst in the nation for emitting toxic chemicals (*Forbes*, Nov. 7, 2017). We are home to multiple superpolluters. Why would anyone think it a good idea to add another?

When I moved to southern Indiana in 2003, I was surprised by how many people had cancer, or had had it in the past. I looked at American Cancer Society maps, and saw that all along the Ohio River, cancer rates are higher than elsewhere. I lost first one friend, then another, then another from my community. At a certain point I was so disgusted I contacted a number of different university epidemiologists to see if anyone might be willing to do a local study on why we have so much cancer. Eventually a doctor from Indiana University looked into it, but when I started listing for him all the different kinds of cancer we had experienced, and the different potential sources of pollution that might contribute to it, he gave up. Why try to pinpoint something that is already drowning in carcinogens? Eventually, it was my turn. Eleven years after moving here, though I have no immediate family history of breast cancer, at just age 35, I had my first lumpectomy. While I am grateful to have survived the scare, the follow-up screening medical care has been expensive and sometimes painful. My skin, meanwhile, continues to be more sensitive than ever before, requiring daily hydrocortisone treatment and allergy medicine; allergies in this part of the state are notorious. I ask you: should a religious choice to live in this part of Indiana mean a death sentence?

I am concerned that the IDEM standards for air quality are insufficient as things stand. People are already dying from pollution in this state. Children are being born with birth defects. The standards we have are not strict enough, and adding this plant will only make things worse, even if it promises to stay within the current standards.

From a broader view, I cannot understand why anyone thinks this proposed plant is a good idea. Our unemployment rate is very low, as Baby Boomers head into retirement and are replaced by a smaller generation. Coal is being superseded by more sustainable forms of energy, and everyone knows coal will not last forever. Why invest *billions* of dollars in a plant that most likely would need to be abandoned as a toxic site within a matter of decades? I cannot imagine this plant operating without using at least some coal mined by means of mountaintop removal, an approach that has already proven to poison soil and water, and cause sickness among people affected by it. I have visited these raped lands, and they are not beautiful. We must account for the *whole* environmental impact, including the soil, air, and water of West Virginia and Kentucky, as well as that of Indiana. Is there not a more sustainable alternative for economic development, which does not potentially poison our earth and destroy the health of the people? This proposal seems very short-sighted, aimed at making a few people a lot of money, at the long term expense of many others, whom the highest beneficiaries will never see or know.

Besides all this, I am concerned about the economic impact of such a plant, particularly should the emitted sulfur end up in the air. (How could it not?) The surrounding counties are comprised of state and national forests, and major tourist attractions, as well as several educational institutions. Should the smell of sulfur waft out over the area, these other local economic drivers will suffer. If we could account for the true cost of such pollution to the health, well-being, and livelihood of citizens, it might not appear to be such a good deal.

In light of the already egregious quantities of pollution in southern Indiana air, I beg you to review the air quality standards we have, and consider whether a tighter regulation might be proposed and enforced. Consider the whole quantity of pollution being emitted, and refuse the addition of major polluters, such as this proposed plant. So many of us are at your mercy. We do not have billions of dollars with which to defend ourselves, but we do have common sense, and a desire for the common good, including the good of those who will come after us. Those of us affected by such a proposal deserve to have a say in whether or not it happens. Please follow your conscience and consider the people and the earth you are here to serve. I would like to be notified of your decision.

Thank you for your time,

**IDEM Response to Ms. Jeana Visel Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

### **Citizen for Quality of Life Comments and IDEM Responses**

On November 21, 2018, an anonymous citizen "Citizen for Quality of Life", submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Citizen for Quality of Life Comment:**

Please accept my comments and I also support the comments of "The Southwestern Indiana Citizens for Quality of Life and Earth Justice".

By putting this factory so close to our town, you are exposing us to Black Lung. There has to be a lot of coal dust you can't stop all of it.

You are putting your wastewater back into the Ohio River, if it so clean why are you not reusing it?

You are destroying our homes, and our way of life and making us sick with all the pollutants.

#### **IDEM Response to Citizen for Quality of Life Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With regard to the statement about black lung disease, IDEM notes that according to public sources the condition is most commonly found among long-time underground miners and frequently in combination with the somewhat similar condition, silicosis, caused by exposure to silica (rock) dust. Although recent studies suggest that surface coal miners may also be at risk, there is no reason to suspect risk to the general public around sites where coal is mined or consumed. The source includes enclosed storage for coal on site that are expected to reduce or eliminate fugitive coal dust from storage piles.

No changes to the draft permit were made as a result of this statement.

### **Walter & Janice Thompson Comments and IDEM Responses**

On November 23, 2018, Walter & Janice Thompson, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Walter & Janice Thompson Comment:**

Please accept my comments and I also support the comments of "The Southwestern Indiana Citizens for Quality of Life and Earth Justice".

Refer to permit #T147-39554-00065 Section D.1.1, "Prevention of Significant Deterioration," states that the emission limitation for particulate matter PM2.5 is a total of 0.65 pounds per hour, or 2.9 tons per year. For 2.5 micron particles, this represents 170 quadrillion particles per year released into our area's atmosphere. Studies by the Journal of the American Medical Association and the American Heart Association states that the exposure to PM2.5 causes cardiovascular disease, heart attack, stroke and lung cancer. Other studies establish a link between these

particles and birth defects. And yet IDEM claims, "No significant impacts are expected from the proposed facility." How can we trust IDEM to protect our environment with permits like this? PLEASE, for our quality of life that we deserve, do not issue this permit I pray! When numerous people start dying from exposure and the town and surrounding area stinks from the sulfur smell, and babies being born with birth defects, it will be too late.

#### **IDEM Response to Walter & Janice Thompson Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jeffrey A. Philipps Comments and IDEM Responses</b>
--

On November 26, 2018, Mr. Jeffrey A. Philipps of Dale, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Jeffrey A. Philipps Comment 1:**

I cannot sit idly by and allow the state of Indiana to sanction the wholesale destruction of the area in which I live. It has become clear that many are following behind Trumps' denial of science and climate change. Perhaps the deniers might move to Gary, Indiana and be forced to live in the areas they helped destroy? No one but the land owners and the corporation will ever benefit from this fiasco. It is clear that with their business model on full display that the chances of this plant being economically viable are distant at best. The eyesore that we must endure will be forever. My children attend school not a mile from where this plant is to be built. Who is going to pay for the two million gallons of water to be delivered to this plant daily? Who is going to process the pollutants that are released with this wastewater? Are you going to enforce a bond which will level this facility when it collapses from stupid math? They do it for nuclear power plants, a fund to clean up the stupid? I can tell you without hesitation that if you allow this mistake to be built that I and many others will abandon this town and this state. (I pay Indiana five grand a year in taxes). If you think that building a refinery within a statute mile of a grade school is an example to getting ahead then you need forget all I've said and continue with your stupidity. I will leave Dale and I will leave Indiana and its poisonous policies of greed over people.

#### **IDEM Response to Mr. Jeffrey A. Philipps Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jefferson Lindsey Comments and IDEM Responses</b>
--

On November 27, 2018, Mr. Jefferson Lindsey of Rockport, Indiana, emailed as a comment a resolution adopted by the Spencer County Board of Commissioners to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Mr. Lindsey's letter and the attached resolution were also received by U.S. Mail on November 30, 2018.

**Mr. Jefferson Lindsey Comment 1:**

Enclosed is a resolution adopted by the Spencer County Board of Commissioners in favor of issuance of the Air Permit in favor of Riverview Energy Corporation. Please add this Resolution to the written comment regarding the above referred permit.

RESOLUTION NO. 2018-07

SPENCER COUNTY BOARD OF COMMISSIONERS

RESOLUTION IN FAVOR OF AIR PERMIT APPROVAL FOR RIVERVIEW ENERGY CORPORATION

The Board of Commissioners is in favor of Economic Development projects that provide capital investment and well-paying jobs that comply with all State and Federal guidelines and without significant additional impact on our air and water quality.

The Board of Commissioners necessarily rely on the State and Federal agencies charged with reviewing permit applications in determining whether a project is safe for the local environment.

The Riverview Energy Corporation has obtained property in Spencer County and will be making a 2.5 billion dollar capital investment. In addition to up to 2,000 construction workers, it will provide 220 on-site permanent jobs with hourly wages averaging \$40 per hour. The plant's advanced technologies will help attract new talent and will strengthen and diversify our economy.

Benefits of the project will also include improved infrastructure development and added assessed value to help keep property tax rates low in our county.

The Riverview Energy project has received a draft air permit from Indiana Department of Environmental Management (IDEM) with preliminary findings in favor of the project. As summarized consistently in the media, IDEM has concluded that Riverview Energy Corporation's "coal-to-diesel" plant in Dale will not violate State or Federal regulations or significantly impact air quality and health in the area.

A public hearing is scheduled on the Air Permit at the Heritage Hills High School Auditorium on December 5, 2018.

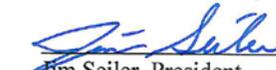

In consideration of the strong economic benefits promised by the Riverview Energy Corporation and IDEM's preliminary findings regarding the air permit, the Spencer County Board of Commissioners resolve that they are in favor of IDEM approving the Riverview Energy Corporation air permit application.

Resolved this 20 day of November, 2018.

BOARD OF COMMISSIONERS  
SPENCER COUNTY, INDIANA

ATTEST:

  
Autumn Winkler, Auditor

  
Jim Seiler, President

  
Tom Brown

\_\_\_\_\_  
Al Logsdon

### **IDEM Response to Mr. Jefferson Lindsey Comment 1:**

IDEM, OAQ has no authority or control over the information or statements made in the resolution adopted by the Spencer County Board of Commissioners. The resolution does not affect IDEM, OAQ's permitting process, determinations, or decisions.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### **Mr. B. Patrick Bauer Comments and IDEM Responses**

On November 27, 2018, Mr. B. Patrick Bauer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. B. Patrick Bauer Comment:**

I am writing to state my opposition to Riverview Energy's construction of a coal to diesel facility in Dale, Indiana. Thank you for considering my thoughts, and I hope you consider them when making your decision.

The proposed facility in Dale, Indiana would pose environmental hazards which could affect air quality, and by extension, public health. According to an October 29, 2018, article published by the Evansville Courier & Press, Spencer County ranks 23rd for toxic releases among all US counties. The current environmental state of Spencer County is among the worst in not only Indiana, but nationally. Given this fact, the public's concern that the proposed facility could adversely affect air quality is merited, and it is IDEM's duty to oppose any such project which could exacerbate the already substandard situation.

#### **IDEM Response to Mr. B. Patrick Bauer Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

### **Mr. Richard Michel Comments and IDEM Responses**

On November 29, 2018, Mr. Richard Michel, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Richard Michel Comment:**

I strongly oppose the construction of the proposed coal to diesel plant within the city limits of Dale, IN for several reasons.

This project is not economically feasible. Riverview Energy with only two employees plans to use taxpayer grants and loans to finance construction of unproven and outdated technology found only in Russia and China. This is a ploy to make a few people rich at taxpayer's expense.

Since pollution has no borders, the entire Southern Indiana would be affected depending on the wind direction. This area already has increased rates of respiratory problems, autism and special needs. These health problems cannot be overlooked and must be taken into consideration before it is too late.

IDEM must put the health of Indiana residents first. Yes, IDEM must change how they have approved air permits in the past. Hoosier health is vastly more important than the desires of big business and politics.

I don't understand how IDEM could approve this air permit if they don't take into consideration the amount of pollutants already here in the Ohio River Valley. If air quality isn't measured, it is like making a major decision with our heads in the sand. We must monitor daily at multiple locations to understand the severity of the problem. IDEM must look at medical studies and include experts from the medical field. What was once considered acceptable levels of harmful pollutants is no longer accepted by medical experts.

I will close with a statement from Dr. Louise Slaughter, "If we ever had proof that our nation's pollution laws are not working, it's reading the list of industrial chemicals in the bodies of babies who have not yet lived outside the womb."

#### **IDEM Response to Mr. Richard Michel Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Paul Kovacs, Ph.D., Comments and IDEM Responses</b>
--

On November 29, 2018, Paul Kovacs, Ph.D. of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. On December 7, 2018 and December 10, 2018, Dr. Kovacs, submitted additional comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit

#### **Paul Kovacs, Ph.D. Comment 1:**

With reference to permit number T147-39554-00065 and in accordance with the "public involvement" phase of the Prevention of Significant Deterioration (PSD) procedures, I'm submitting the attached comment in opposition to the proposed coal-to-diesel plant by Riverview Energy in Dale, IN. The comment is in the form of an article, entitled "Coal-to-Diesel: Economic Development or Not?" It describes my deep concerns about not applying the Cautionary Principle to a project that has the potential of causing significant and irreparable environmental contamination and related health problems in the future. There is a huge difference between risk assessment and alternative management as discussed in "*The Professional Biologist -- Being a*

**scientist means taking sides**", *BioScience*, Vol. 43, No. 10. (Nov., 1993), pp. 706-708.  
(<http://links.jstor.org/sici?sici=0006-3568%28199311%2943%3A10%3C706%3ABASMTS%3E2.0.CO%3B2-M>)

By analyzing data for risk assessments, your air quality analysis subscribes to the process of assimilative capacity assessments and policy making rather than alternatives assessments. Assimilative capacity assessments ask, How much additional air pollution is safe? In alternatives assessments, a question would be: What social and production alternatives do we have to reduce air pollution and related health risk? Asking risk-assessment questions rather than alternatives-assessment questions is to contribute to the currently dominant, assimilative capacity approach and practices of our society. This approach certainly does not serve the public's interest. Because the stated mission of IDEM is that "We Protect Hoosiers and Our Environment," and because the main purpose of the PSD process is to "protect public health and welfare" (<https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information>), I urge IDEM to reconsider its current position and deny the air permit to Riverview Energy.

## **Coal-to-Diesel - Economic Development or NOT?**

By Paul Kovacs, Ph.D.

In a welcome move for the future of our community, the Indiana Department of Environmental Management is about to hold a public hearing on December 5, 2018 at Heritage Hill High school in order to receive input from the public on a controversial economic development project proposed by Riverview Energy. The proposal is on the construction and operation of a massive coal-to-diesel conversion plant in Dale, IN.

A state analysis has concluded that the proposed coal-to-diesel plant in southern Indiana will not significantly affect air quality or residents' health. State environmental officials have said that the facility wouldn't significantly contribute to pollution and poses very little cancer risk. The department found that the plant would emit a total of 30 tons per year of various hazardous air pollutants. According to the company's air permit application, the plant would have annual emissions rates of about 2.2 million tons of carbon dioxide, 225 tons of carbon monoxide and 120 tons of sulfur dioxide. (<https://www.wthr.com/article/state-indiana-coal-diesel-project-wont-harm-air-quality>) "This means if an individual was exposed to these hazardous air pollutants continuously for 70 years, the risk of getting cancer from this exposure would be 4.6 in 10 million," the state's analysis stated.

According to the Greg Merle, CEO of Riverview energy: "The point of this project is not to build one plant," he said, "it's to create a new industry in our country." Creating new industries that resulted in extremely negative environmental consequences is not unprecedented in American industrial history.

Thomas Midgley, Jr. (May 18, 1889 –November 2, 1944) was an American mechanical engineer and chemist. Midgley was a key figure in a team of chemists, led by Charles F. Kettering, who developed the tetraethyl lead (TEL) additive to gasolines as well as some of the first chlorofluorocarbons (CFCs), two of the most talked about chemical pollutants in human history. Many environmentalists consider him to be "the human who has done the most damage to the environment". After all, this was a man known as much for his showmanship as for his achievements in chemistry. Midgley demonstrated the nontoxic and nonflammable properties of Freon by inhaling the gas and softly exhaling it to extinguish a burning candle. He also demonstrated the apparent safety of TEL by pouring TEL over his hands, then placing a bottle of the chemical under his nose and inhaling its vapor for sixty seconds, declaring that he could do this every day without succumbing to any problems whatsoever. This was done after a new plant was plagued by severe cases of lead poisoning, hallucinations, insanity, and then five deaths in quick succession. As a good salesman, Midgely himself was careful to avoid mentioning to the press that he required nearly a year to recover from the lead poisoning brought on by his demonstration.

TEL levels in automotive fuel were reduced in the 1970s under the U.S. Clean Air Act in two overlapping programs: to protect catalytic converters, which mandated unleaded gasoline for those vehicles; and to protect public health, which mandated lead reductions in annual phases (the "lead phasedown"). It is important to note that protecting public health was only second in importance to avoiding catalyst poisoning and serving certain short-term financial interests.

In decision making that requires the consideration of potentially negative environmental impacts, Midgley's story may serve as a cautionary tale. Especially in the light of the growing significance of applying the Precautionary Principle to making far-reaching public policy decisions. The precautionary principle, proposed as a new guideline in environmental decision making, has four central components ("*The Precautionary Principle in Environmental Science*", <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1240435/pdf/ehp0109-000871.pdf>):

1. taking preventive action in the face of uncertainty;
2. shifting the burden of proof to the proponents of an activity;
3. exploring a wide range of alternatives to possibly harmful actions;
4. and increasing public participation in decision making.

As a group of concerned citizens has been voicing their opposition to a \$2.5 billion direct coal-hydrogenation plant proposed for Dale, it is informative to analyze how the precautionary principle is applied in Indiana to the issuance of permits.

1. Taking preventive action in the face of uncertainty:

The State of Indiana does not monitor air quality in the Dale area and does not correlate it with local health statistics. Consequently, additional levels of pollutants may not be adequately entered into computer models assessing related risks, particularly risks of unknown health consequences. Computer models require a fixed set of already known parameters, part of which are parameters of convenience satisfying mathematical needs. Real ecosystems, in contrast, are open, self-modifying systems, which constantly produce novelty and new parameters and which cannot be severed from their environment. Although calibration may adapt models to data sets of the past, it does not assure predictive capacity or validity. Consequently, the State's conclusion that "the risk of getting cancer from this exposure would be 4.6 in 10 million" may not be even remotely accurate.

It is of particular concern that not all prior experience seems to be taken into consideration by the State's risk assessment. An article in *Environmental Health Perspectives* back in 1976 already pointed out:

"At the present time, no commercial scale liquefaction or gasification plants exist in the United States. However, a number of major installations are far advanced into the planning stage. Estimates of total populations who might be associated with these plants, including workers, dependents, and service personnel, vary from 5000 to 16,000. The potential health implications of coal processing plants to these people, and to those who might be affected by water and/or air transport over greater distances, need to be considered at the very outset of planning. Some large-scale liquefaction and gasification facilities exist elsewhere in the world. However, environmental measurements around such plants, if they exist at all, are not readily available. It is also likely that any coal conversion plants constructed in the U.S. will be considerably different than those already in existence. Consequently, analysis of the pollution potential of coal processing currently depends on the evaluation of data collected from pilot plant processes and bench scale reactors. Although this type of consideration is the only one presently available, it is well to point out that many pollution problems will become evident only after a facility has operated continuously for a period of weeks or months." ("*Coal hydrogenation and environmental health*", <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1475092/>)

This article also emphasized that "One study of workers in a hydrogenation process has revealed an incidence of skin cancer 16-37 times that expected in the chemical industry. In addition, a number of high boiling point liquid products were identified as bm3 were reported. Health statistics on occupational groups in other coal conversion industries have shown significantly

higher lung cancer rates, relative to groups without such occupational exposures. .” These findings do not seem to be in support of the conclusions the State of Indiana’s analysis for the proposed Dale plant stated.

The lack of other plants of this kind in the US is another warning sign. Other targeted sites probably have taken preventive actions in the face of uncertainty, and decided on not moving forward with such “developments”.

## 2. Shifting the burden of proof to the proponents of an activity:

Proponents of the proposed Dale plant place the burden of proof of negative consequences on the oppositions, who - in their views -- represent anti-community interests. All the decision-makers, company officials, economic development and environmental management officials, as well as worker union representatives and members are, by default, interested in the approval of the project, based on creative marketing tactics that depicts any opposition as biased and anti-business. In other words, they are claiming immediate economic measures such as investment, job creation, and construction as counterparts of future environmental damages and harmful health effects. Any formal model that converts the precautionary principle into economic terms would help clarify the concept of precaution and decision-making. It would frame a decision problem concerning the prevention and management of risks. It would make an economic analysis of the impact of risks on individual and collective welfare, as well as resolve the conflicts of interest with the purely economic and technical issues-driven proponents of the proposed plant listed below (<https://duboiscountyherald.com/b/residents-seek-more-info-on-coal-to-diesel-plant/>):

### • Economic Development personnel:

Tom Utter, the executive director of the Lincolnland Economic Development Corporation, said the Indiana Economic Development Corporation first contacted him and said Riverview Energy was looking for a site. He’s been recruiting the project ever since. “I want to bring something new to the community,” Utter said. “I got the opportunity to recruit it. I’ve recruited it heavily and I’m still recruiting it heavily. I’m recruiting Riverview Energy very strongly, very aggressively.” He said it’s his role with LEDC to “bring companies, industries, into the community. ... We search and search in a competitive world to find new ways to bring revenues into the community.”

In terms of economic development, he looks for “large projects to bring significant, innovative technologies that will revive some of the jobs that have been lost, and create new jobs.”

“The fact is that what we look at is improvements in technology,” Utter said. “Technologies now produce fewer environmental negatives than older technologies. We do want to keep bringing new investment, jobs, but we are looking at processes like this one that would indeed produce fewer environmental negatives than the older technologies. And we’ll continue to do that to raise the bar in the community.”

Questionable aspects of the above approach:

- New technology does not automatically mean better technology;
  
- Fewer environmental negatives do not offer a solution to an existing problem, but become part of them;

### • State environmental officials:

The “innovative” technology proposed for the plant is mimicking the process that took Mother Nature millions of years and special conditions to accomplish. That process took place in a closed environment, underground, and did not release known toxic substances into the atmosphere at an accelerated rate. The proposed hydrogenation process would produce such compounds at an alarmingly high rate every day. On the other hand, the health of the workers and residents living nearby will not show a sudden decline, and any correlation between certain health problems and environmental factors may take decades to recognize, just as in the cases of asbestos, cigarette smoking, TEL, and CFCs. Computer models with limited understanding of potential issues involved may suggest that “exposure to these hazardous air pollutants continuously for 70 years, the risk of getting cancer from this exposure would be 4.6 in 10 million.” Even if the numbers were true for cancer risk, they only declare that the loss of few human lives due to additional air pollution is acceptable.

- Coal Industry Representatives: ([https://www.upi.com/Top\\_News/US/2018/07/27/Energy-company\\_fights-to-build-Americas-first-coal-to-diesel-plant/6111532627651/](https://www.upi.com/Top_News/US/2018/07/27/Energy-company_fights-to-build-Americas-first-coal-to-diesel-plant/6111532627651/))

➤ Coal-related jobs are quickly disappearing in the Midwest as coal-fired power plants are shut down at record speeds, said Bruce Stevens, the president of the Indiana Coal Council. "We've lost 4 million tons per year of Indiana coal from retired power plants," Stevens said. "This [coal-to-diesel] plant will replace about half of that. We're very hopeful this plant becomes a reality because it will be very helpful to communities in which miners have lost work."

➤ It's not just miners who are losing work as the coal industry declines. Local construction workers who've made a career of building and maintaining coal facilities are also suffering. "We need this for our families, for our futures and for our retirement packages," said Timothy Brunfield, a dispatcher for Boilermakers Local 374, a union that represents skilled construction workers. "This is not just a new plant, it's a new industry."

### 3. Exploring a wide range of alternatives to possibly harmful actions:

It is interesting to see that extending the life of a dying industry is defined as the birth of a new one, considering no other alternatives. According to an article in *Financial Times* ("*Coal is dead; long live the sun*", The transition to renewables is possible if policymakers plan ahead (<https://www.ft.com/content/702822b6-46f0-11e7-8d27-59b4dd6296b8>), "For more than 100 years, coal has driven economic growth, powering the Industrial Revolution and helping much of the world develop. But its best days have passed. Pretty much anywhere you look in the world, coal is no longer the best option for energy or for jobs. In fact, it's become a risky bet."

From an economic development point of view, however, there might be a promising answer to the question: the only thing we have is coal, and lots of it. What can we do? Certainly not what we've been doing - burning it, or turning it into other combustive products. **Challenging times call for challenging our old way of thinking.** Coal is a fantastic natural resource that offer a variety of useful, environmentally positive and economically pursuable developmental opportunities. One of them is the industrial-scale production of activated carbon.

"The activated carbon market was valued at USD 3,124.73 million in 2017 and is expected to expand significantly with an estimated CAGR of 6.24%, mainly due to the growing water treatment industry during the forecast period, 2018-2023. Activated carbon removes the impurities from water primarily through surface adsorption. It is primarily used for purification of gases and liquids in food & beverage processing, industrial pollution control, and environmental recovery." ([https://www.mordorintelligence.com/industry-reports/global-activated-carbon-market?gclid=EAIaIQobChMI6ab6m7XY2gIVkYbACh01OwdCEAAYASAAEgJZUfD\\_BwE](https://www.mordorintelligence.com/industry-reports/global-activated-carbon-market?gclid=EAIaIQobChMI6ab6m7XY2gIVkYbACh01OwdCEAAYASAAEgJZUfD_BwE)) "The United States holds the largest market and accounted for 80.18% in activated carbon market in North America. Growing end user industries, like pharmaceutical, oil & gas is expected to drive the market during the forecasted period. The gradual increase in the number of drilling rigs in the United States is expected to gradually increase the consumption of activated carbon during the extraction process. In addition, the advances in the technology are opening up scope for increasing exploration in the deep-water fields of the Gulf of Mexico. This is expected to open up new opportunities for the usage of activated carbon in oil & gas field."

### 4. Increasing public participation in decision making:

In addition to the significant efforts made by the Spencer County Citizens for Quality of Life and the NOC2D Coalition in opposition to the proposed coal-to-diesel plant on Dale, the December 5 IDEM hearing will provide an excellent opportunity for concerned citizens for letting their voice heard in the decision-making process.

In conclusion, real economic development efforts in finding contemporary use for Indiana's coal resources may benefit from concentrating on truly innovative projects that could also mitigate the negative environmental effects of the past 100 years of industrial pollution and careless use of natural resources. The health and well-being of future generations would also greatly benefit from

a proactive yet restorative economic development policy that balances immediate interests with future ones.

**IDEM Response to Paul Kovacs, Ph.D. Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

**Paul Kovacs, Ph.D. Comment 2:**

Good Evening!

My name is Paul Kovacs. I'm a resident of Santa Claus, Indiana. I have a Ph. D. in Physical Chemistry, have extensive professional experience in orthopaedic implant material research, that is, in how the human body reacts to manmade materials, had technology transfer projects for environmentally friendly technologies, and served for 5 years on the Economic Development Commission of a Memphis, TN suburb.

I moved to the US at the age of 32 in the hope of finding the Land of Common Sense for the Common Good. Now, 32 years later, I find myself in a situation in which neither of those seem to be important.

It pains me to see that the hardworking people of Spencer County are treated by their elected and appointed officials as citizens of a third world country. For their immediate political and financial gains, they implement so called "economic development" projects that endanger the health and wellbeing of the current and future generations. They adopt a so-called assimilative-capacity approach, because the questions asked in that process support extractive and polluting activities and related policy making. The question they ask is this: how much more pollution can be tolerated in exchange for perceived economic benefits?

The proposed Coal-to-Diesel Plant by Riverview Energy is promoted by the following selling points:

1. A \$2.5 billion investment of unknown origin. Is that a declaration of "for money, we do anything?"
2. The first implementation of an advanced technology, which was invented 100 years ago, and only used by oppressive regimes in dire needs. Is it so advanced that no other US community would welcome it? Or is Southern Indiana considered to be a place where no one would notice the difference?
3. It would result in reduced property taxes. But it also would result in fast declining property values, as well. Who would like to live near an industrial age monster?
4. It would create jobs. But what kind of jobs and when? Construction jobs now - and future health care and special education jobs by the thousands. Is this "economic development" we should support and celebrate?

In contrast to marketing brilliance, the EPA calls for a Prevention of Significant Deterioration (PSD) process, which requires the following ("The Letter of the Law" to follow):

1. installation of the "Best Available Control Technology" (BACT);
2. an air quality analysis;
3. an additional impacts analysis; and
4. Public involvement.

This is what Indiana Department of Environmental Management (IDEM) has been doing. Furthermore, IDEM's stated mission reads: "We Protect Hoosiers and Our Environment." While Prevention of Significant Deterioration (PSD) does not prevent sources from increasing emissions, it is designed to ("The Spirit of the Law" to follow):

1. protect public health and welfare;
2. preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value;
3. insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources; and
4. assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decision making process.

Consequently, this opportunity today to speak up against this plant is not an act of kindness by the proponents - it is required by the procedure for granting an Air Quality Permit.

IDEM concludes that despite generating 184.5 tons per year of oxides of nitrogen (NOx), 181.8 tons per year of Volatile Organic Compounds (VOCs), and 120.6 tons per year of sulfur dioxide (SO2) as air pollutants in the area, no significant impacts are expected from the proposed facility. An additional impacts analysis on vegetation, soils, visibility, and wildlife in the area also concluded that no adverse impacts on the surrounding area are expected.

While IDEM do not operate air quality detectors in the area in question, the proposed permit states that existing monitoring is available for all pollutants and averaging times. Pre-construction monitoring is not required since modeled concentrations for the applicable pollutants were below the significant monitoring concentration thresholds. Why do you model concentrations when you say that existing monitoring is available? Why do you need data from a monitoring site in South Bend, IN? Is that the closest or most desired input for the model concentrations? Is a 350% increase in the 3-hour SO2 emission shown by the Air Quality Analysis really insignificant and "Protects Hoosiers and Our Environment?"

Is Mammoth Cave - 120 km away -- the closest area of "special national or regional natural, recreational, scenic, or historic value" to be included in the Air Permit considerations? How about Holiday World and the Lincoln Boyhood National Memorial? How about the rest of Southern Indiana? Southern Indiana has 1 State Fishing Area, 9 State Parks, 1 reservoir, 1 National Memorial, 6 State Memorials, 2 State Wildlife Refuges, 1 National Wildlife Refuge, 1 National Forest, 1 National Historic Park, 5 State Wildlife Areas, 10 State Forests. How is the purpose of PSD met by concluding that "no adverse impacts on the surrounding area are expected?"

Based on the above mentioned deficiencies of protecting public health and welfare as mandated, I urge IDEM to reconsider its position and deny the air permit to Riverview Energy. Thank you for your attention and consideration.

### **IDEM Response to Paul Kovacs, Ph.D. Comment 2:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

With regard to so much of the comment as refers to Mammoth Cave National Park, Class I areas include international parks, national wilderness areas which exceed 5,000 acres in size, national memorial parks which exceed 5,000 acres in size, and national parks which exceed 6,000 acres in size which are in existence as of August 7, 1977. Mammoth Cave National Park, with an area of over 52,000 acres, is the only Class I within a distance that affects the source. Pursuant to Section 162(b) of the Clean Air Act, 42 USC 7472(b), all of the other areas named by the commenter are Class II areas. As noted in IDEM Response to Mr. Howard Gebhart Comment 18, at the request of the Federal Land Manager (FLM) IDEM conducted a local visibility analysis for the Lincoln Boyhood National Memorial and determined that the visibility impacts are below the screening criteria for a secondary analysis. See IDEM Response to Mr. Howard Gebhart Comment 18 for more information.

No changes to the draft permit were made as a result of this statement.

### **Paul Kovacs, Ph.D. Comment 3:**

With reference to permit number T147-39554-00065 and in accordance with the "public involvement" phase of the Prevention of Significant Deterioration (PSD) procedures, I'm submitting the attached comment in opposition to the proposed coal-to-diesel plant by Riverview Energy in Dale, IN. This is my third and final submission of a public comment. Thank you for your attention to this very important matter.

Compliance with the spirit and the letter of the law  
by Paul Kovacs, Ph.D.

Having attended the IDEM public hearing on December 6, 2018 regarding the draft Air Permit for Riverview Energy, I came away with the impression that the majority of comments that addressed legal questions were about whether IDEM should follow the letter of law or the spirit in law to issue the air permit. As I indicated in my comment there, the EPA guidelines for the Prevention of Significant Deterioration (PSD) process requires both.

Spencer County commissioner, Tom Brown, who told IDEM to follow the law to the last letter, has forgotten to mention that he, as an elected official, refused to admit that he had a conflict of interest when the Spencer County Commission voted on a resolution in favor of the proposed coal-to-diesel plant. Being on the board of Lincolnland Economic Development Corp. (LEDC), which recruited the project, Mr. Brown is inherently biased and pushing for the approval of the air permit. He is using his political power to manipulate the legal system in whatever way he can. For

instance, the Agenda of the November 20, 2018 meetings of the Commissioners and the County Council listed the vote on supporting the Riverview Energy air permit application as “Legal Report”. That was another blatant attempt to keep the residents of Spencer County in the dark. It was very obvious that the “Legal Report” was written by Spencer County Commissioner Attorney Jeff Lindsey, a director of LEDC. Lincolnland Economic Development Corp. does not evaluate projects based on technical merits, the only criteria is marketability and the potential for pushing it through the various levels of legislative and regulatory systems. LEDC attracts businesses with the following incentives, as described on their website, <http://www.ledc.org/incentives>:

## **Incentives**

### **Local Incentives**

#### **Tax Phase-In**

Consideration of up to a ten (10) year phase-in of real and personal property taxes is available.

#### **Tax Increment Financing**

TIF will also be considered.

For additional information about local incentives and application processes, please contact Lincolnland Economic Development at 812-649-2119.

#### **Other Local Advantages**

- Low unemployment insurance rates.
- Low worker's compensation insurance premium rates.
- Competitive local utility rates.
- Modest property taxes.
- Competitive land pricing.
- No wheel tax.
- No inventory tax.

### **State Incentives**

#### **Employee Training Grants**

Being implemented in Spencer County by WorkOne.

For Indiana State incentives, feel free to contact Indiana Economic Development Corporation at (800) 463-8081 or by email at [iedc@iedc.in.gov](mailto:iedc@iedc.in.gov)

With regards to health and environmental considerations, County Commissioner Brown was quoted in a recent news article (<https://indianaeconomicdigest.com/main.asp?SectionID=31&subsectionID=352&articleID=94209>) as: “I can only make a decision on the data we have,” he said, adding that nobody wants pollution and that’s why there are agencies like IDEM. In other words, his data does not include opposition by thousands of his constituents or data other than anything related to money. Now he expects IDEM to come up with data to show that the proposed plant will cause no significant health problems or environmental damages. All this under the disguise of lawfulness.

It is the applicant responsibility to demonstrate that it will be able to comply with all federal and state laws regarding air pollution control before IDEM can issue an air permit. IDEM is mandated by law to protect public health and the environment. It would go directly against the spirit of the law if IDEM issued an air permit because economic policy pressure by any local government bodies that are in obvious denial of any other potential issues than loss of investments or job creation opportunities. The coal-to diesel plant project by Riverview Energy is being pushed by its proponents against the spirit of the a Prevention of Significant Deterioration (PSD) process, for

which IDEM has to follow the letter of the law as summarized below, based on <https://www.epa.gov/nsr/prevention-significant-deterioration-basic-information>:

THE SPIRIT OF PSD	THE LETTERS (STEPS) of PSD
1. protect public health and welfare;  2. preserve, protect, and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national or regional natural, recreational, scenic, or historic value;  3. insure that economic growth will occur in a manner consistent with the preservation of existing clean air resources; and  4. assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decision making process.	1. installation of the "Best Available Control Technology" (BACT);  2. an air quality analysis;  3. an additional impacts analysis; and  4. public involvement.

The whole PSD process becomes meaningless if it starts with the end result (an issued air permit) in mind, as local officials would like the process to be run by IDEM. Turning the whole process upside down would require certain modeling and assessment activities to pick and choose data that fits the desired outcome. Unfortunately, the Indiana Administrative Code ([http://www.in.gov/legislative/iac/iac\\_title?iact=326](http://www.in.gov/legislative/iac/iac_title?iact=326)) is vague enough in the Monitoring Requirements (Article 3) to allow for such manipulation. By defining data as it can be practically anything, **modeling can result in conclusions that may have nothing to do with reality:**

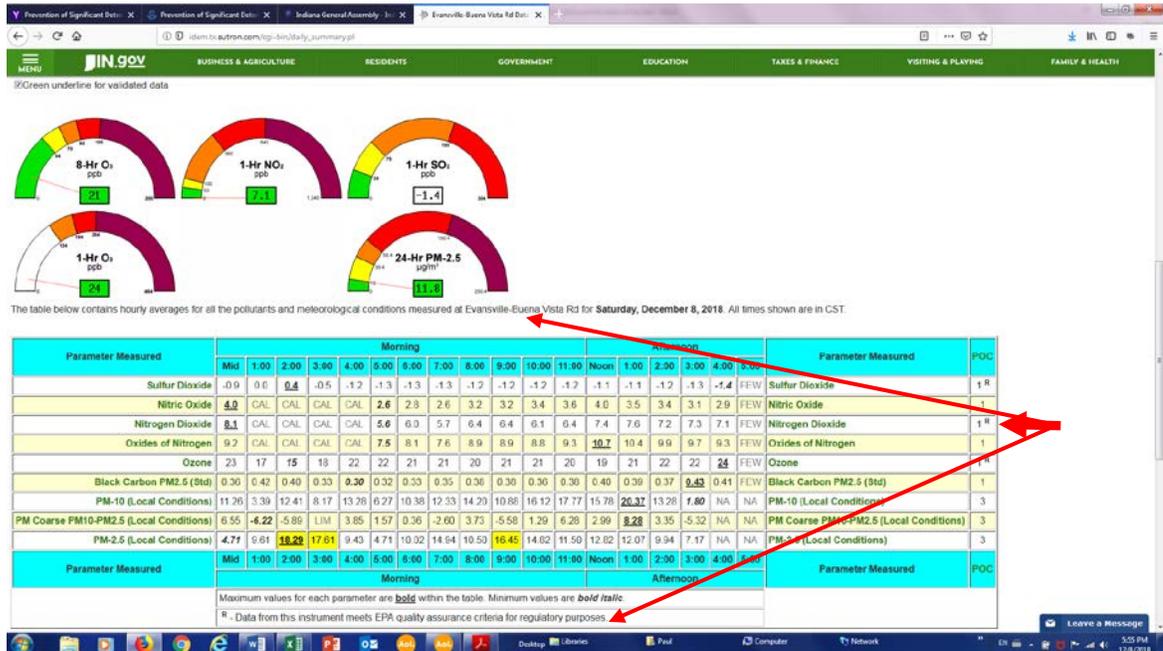

(5) "Data" means the results of any type of monitoring or method, including the results of:  
 (A) instrumental or non-instrumental monitoring;  
 (B) emission calculations;  
 (C) manual sampling procedures;  
 (D) record keeping procedures; or  
 (E) any other form of information collection procedure used in connection with any type of monitoring or method.

While IDEM'S air quality analysis meets the letter of the law specified above, it lacks actual existing air quality data, which can only be obtained by monitors on the site in question. This necessitated to come up with excuses and questionable explanations for how background concentrations were estimated. Specifically, the draft air permit states on page 1211 that:

"The background monitors used for the NAAQS analysis were monitor ID number 18-141-0015, located in South Bend, IN for 1-hour NO2, monitor ID number 18-163-0021, located in Evansville, IN, for 1-hour, 3-hour, 24-hour, and annual SO2 and finally monitor number 18-147-0009 located in Dale, IN, for annual and 24-hour PM2.5. The latest 3-year design value (2015-2017) for each of these monitors was used in the modeling analysis. These sites are considered the most representative sites with complete data relative to REC. For NO2 background values, there are only two monitors within the state that have complete and quality assured data, both of which are in northern Indiana. The monitor in South Bend, Indiana is located in a more rural area than the Gary IITRI monitor, which is located in a more industrialized area. The more rural location of the NO2 monitor in South Bend is comparable to the proposed location for REC."

The NO2 monitor in South Bend seems to discredit the results of the NAAQS analysis in many different ways:

- 1) All other monitors, except for the PM2.5 in Dale, are located in Evansville. Evansville also has an NO2 monitor, which, according to the IDEM monitoring site information on the web, has 1 in the POC column. That would indicate that "- Data from this instrument meets EPA quality assurance criteria for regulatory purposes." Why does then the draft permit state that "For NO2 background values, there are only two monitors within the state that have complete and quality assured data, both of which are in northern Indiana."?

If there was no complete data set for that monitor, that should have been stated - not the implication that Evansville does not have this type of monitor. Apparently, that monitor was in operation before 2015, and the green underlining indicates that the data has been validated.

2) The question why the South Bend monitor was picked over the Evansville one is significant because it opens up the possibility that the South Bend data is more favorable input for arriving at a lower background concentration. The claim that "The more rural location of the NO2 monitor in South Bend is comparable to the proposed location for REC." could have been applied to the SO2 monitor in Evansville as well. Sadly enough, while looking for data from the time period for the NAAQS analysis (2015-2017), I found that the NO2 concentration and other nitrogen oxides for July 15, 2017 contained several negative values:

Month: July Day: 15 Year: 2017 Time Format: 12 Hour (AM/PM)

Ozone Highlights:  Moderate  Unhealthy for Sensitives  Unhealthy  Very Unhealthy  
 Nitrogen Dioxide Highlights:  Moderate  Unhealthy for Sensitives  Unhealthy  Very Unhealthy  Hazardous  
 Green underline for validated data

The table below contains hourly averages for all the parameters and meteorological conditions measured at South Bend-Shields Dr for Saturday, July 15, 2017. All times shown are in EST.

Parameter Measured	Morning											Afternoon											Parameter Measured	POC		
	Mid	1:00	2:00	3:00	4:00	5:00	6:00	7:00	8:00	9:00	10:00	11:00	Noon	1:00	2:00	3:00	4:00	5:00	6:00	7:00	8:00	9:00			10:00	11:00
Nitric Oxide	-1.8	-1.8	-1.8	-2.1	-2.3	-1.4	0.2	0.1	-1.9	-1.9	-2.0	-2.1	-1.9	-1.9	-1.9	-2.0	-1.8	-1.8	-2.0	-2.0	-2.0	-1.9	-1.8	-1.5	Nitric Oxide	1
Nitrogen Dioxide	3.2	2.5	3.2	3.6	1.3	4.2	3.5	2.5	-0.4	-0.2	-0.2	-0.2	0.5	0.8	0.5	0.3	0.8	1.0	0.3	2.1	2.9	4.5	5.5	6.3	Nitrogen Dioxide	1*
Oxides of Nitrogen	4.5	3.8	4.5	4.6	2.1	5.9	6.7	5.6	0.7	0.9	0.9	0.8	1.7	2.0	1.6	1.4	2.0	2.2	1.3	3.2	4.0	5.6	6.8	7.8	Oxides of Nitrogen	1

On July 15, 2017, the daily average concentration for NO<sub>2</sub> in South Bend comes out to be 2.02 ppb because of the lowering effect of the negative values. For the same day in Evansville, the corresponding daily average concentration was 5.91 ppb, that is, almost 3 times higher. Now, based on the South Bend data, the NAAQS analysis showed a rather narrow gap (only 47.72  $\mu\text{g}/\text{m}^3$ ) from "NAAQS VIOLATION":

**TABLE 6  
 NAAQS Analysis**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED CONCENTRATION ( $\mu\text{g}/\text{m}^3$ )	BACKGROUND CONCENTRATION ( $\mu\text{g}/\text{m}^3$ )	COMBINED IMPACT ( $\mu\text{g}/\text{m}^3$ )	NAAQS ( $\mu\text{g}/\text{m}^3$ )	NAAQS VIOLATION
NO <sub>2</sub>	1-hour	73.20	67.68	140.88	188.6	NO

Consequently, if the South Bend monitor systematically underreported the NO<sub>2</sub> concentration, a 1.71 times higher actual background concentration would violate the NAAQS. The spirit of the law would question the validity of the 1-hour NO<sub>2</sub> pollution analysis.

- 3) Additionally, even though with a much higher margin of error, the reliability of the Evansville SO<sub>2</sub> data is also questionable because negative concentration values were found there, too:

The table below contains hourly averages for all the parameters and meteorological conditions measured at Evansville-Buena Vista Rd for Saturday, July 15, 2017. All times shown are in CST.

	x.xx Indicates the data has been validated.																									
	Maximum values for each parameter are <b>bold</b> within the table. Minimum values are <b>bold italic</b> .																									
	<sup>R</sup> - Data from this instrument meets EPA quality assurance criteria for regulatory purposes.																									

What's even more concerning is that the negative concentration values were validated by IDEM personnel - see green underlining. This simply shows that even data from monitoring cannot be trusted in this draft permit.

How about the trustworthiness of modeled data?

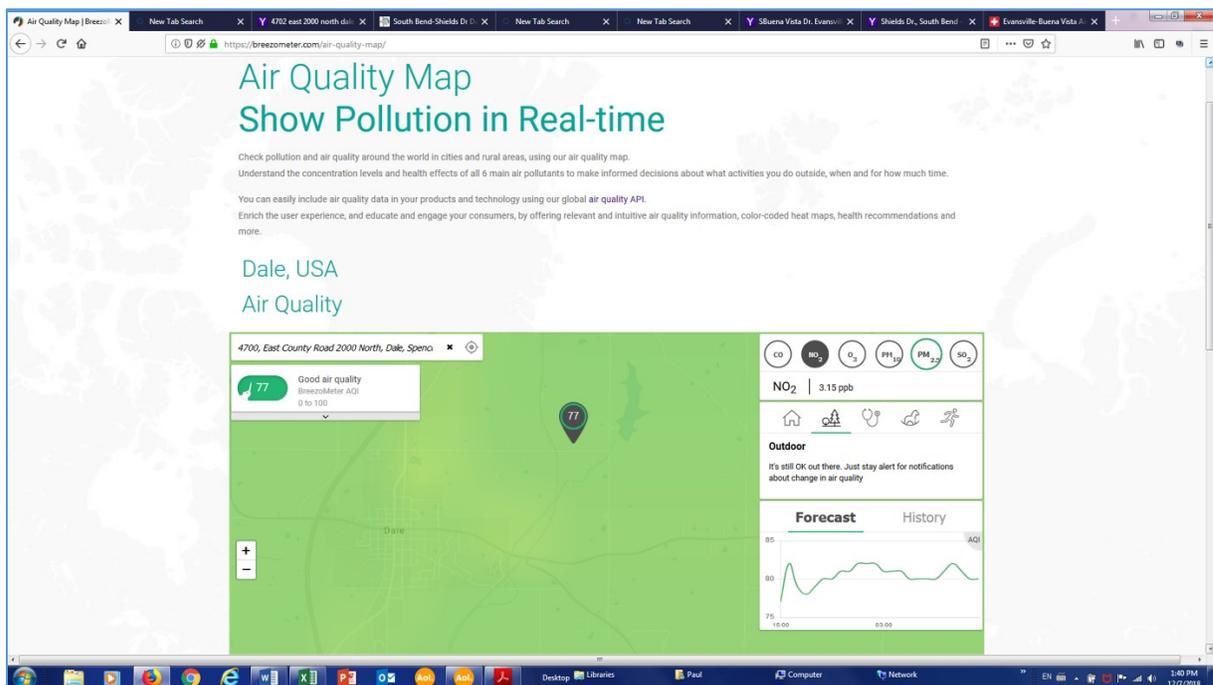

- 4) The NAAQS violation is determined by the sum of two values, the MAXIMUM MODELED CONCENTRATION + the "BACKGROUND CONCENTRATION". Both can be easily underestimated. Nevertheless, their ratio gives an easy indication of potentially significant problems, expressed in percentage change. As shown below in red numbers, the 3-hour SO<sub>2</sub> pollution can be particularly worrisome. A 350% increase over the current estimate means that the air will contain 4.5 times more SO<sub>2</sub> than now:

**TABLE 6  
 NAAQS Analysis**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED CONCENTRATION (µg/m³)	BACKGROUND CONCENTRATION (µg/m³)	COMBINED IMPACT (µg/m³)	NAAQS (µg/m³)	NAAQS VIOLATION	
NO <sub>2</sub>	1-hour	73.20	108.2%	67.68	140.88	188.6	NO
SO <sub>2</sub>	1-hour	110.01	333.4%	33.0	143.01	196.2	NO
SO <sub>2</sub>	3-hour	101.91	450.9%	22.6	124.51	1300	NO
SO <sub>2</sub>	24-hour	27.88	171.0%	16.3	44.18	365	NO
SO <sub>2</sub>	Annual	3.31	91.9%	3.6	6.91	80	NO
PM <sub>2.5</sub>	24-hour	4.77	25.1%	19	23.77	35	NO
PM <sub>2.5</sub>	Annual	0.86	9.89%	8.7	9.56	12	NO

Such huge, negative change in air quality is difficult not to notice, and conclude that it is insignificant. As Dr. Marchand pointed out during her public comment, we are dealing with people, not just numbers. "Protecting Hoosiers and Our Environment" means much more than just meeting - often arbitrarily - set numbers. In this sense, the NAAQS Analysis results are raising red flags in relation to the significance of increased air pollution.

- My understanding is that IDEM is not operating monitors in rural areas because the low density of population does not justify the cost of equipment and operations. I respectfully suggest that getting relevant air quality data may not require substantial financial resources. Having heard that IDEM is not monitoring air quality in the Santa Claus area, I found a web site, where I actually could monitor the air quality at my home address. Breezometer.com (<https://breezometer.com/air-quality-map/>) can show the concentration of the 6 major pollutants. As an example, the location of the proposed coal-to-diesel plant is shown below:

By now, there is an iPhone application also available (<https://itunes.apple.com/us/app/breezometer-air-quality-index/id989623380>), which is promoted as follows:

“Do you really know what is in the air you breathe?  
BreezoMeter is the world leader in location-specific real-time air quality data, already helping more than 5.5 billion people improve their health with actionable data.

For the first time, you can see what is in the air you breathe, wherever you are, with this top-rated air quality App.

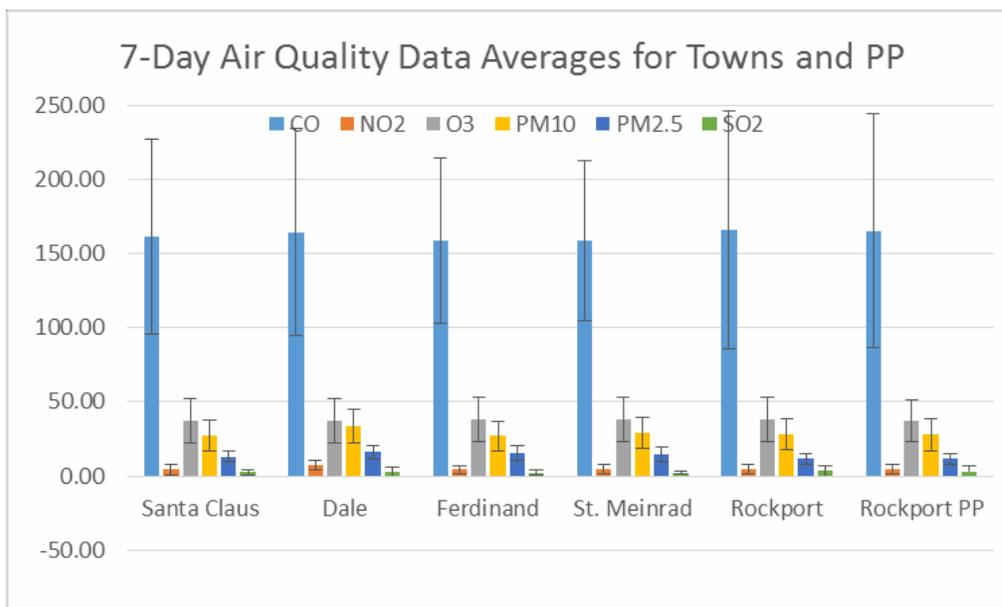

It's never been easier to check air pollution levels with BreezoMeter's app, which offers an intuitive and accurate way to get real-time outdoor air pollution information at your specific location, not just at the nearest governmental monitoring station, which could be far away, and does not take into consideration any other parameters that affect air quality.

----- HOW IT WORKS

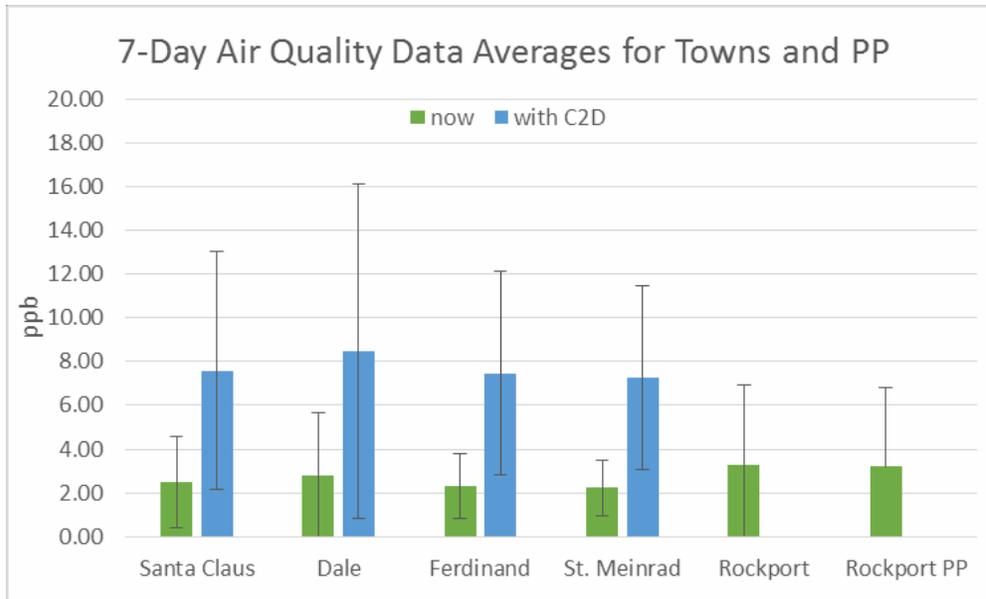

By collecting data from over 40,000 governmental sensors worldwide, traffic patterns, weather dynamics, satellite data and more, BreezoMeter uses BIG DATA infrastructure to validate over 1.8TB of data every hour, producing 440 million geographical data points. 7.5 billion compound calculations are then performed by proprietary dispersion algorithms, using machine learning techniques, to understand how air pollution moves and disperses.

BreezoMeter also provides advanced air quality solutions for businesses & municipalities.”

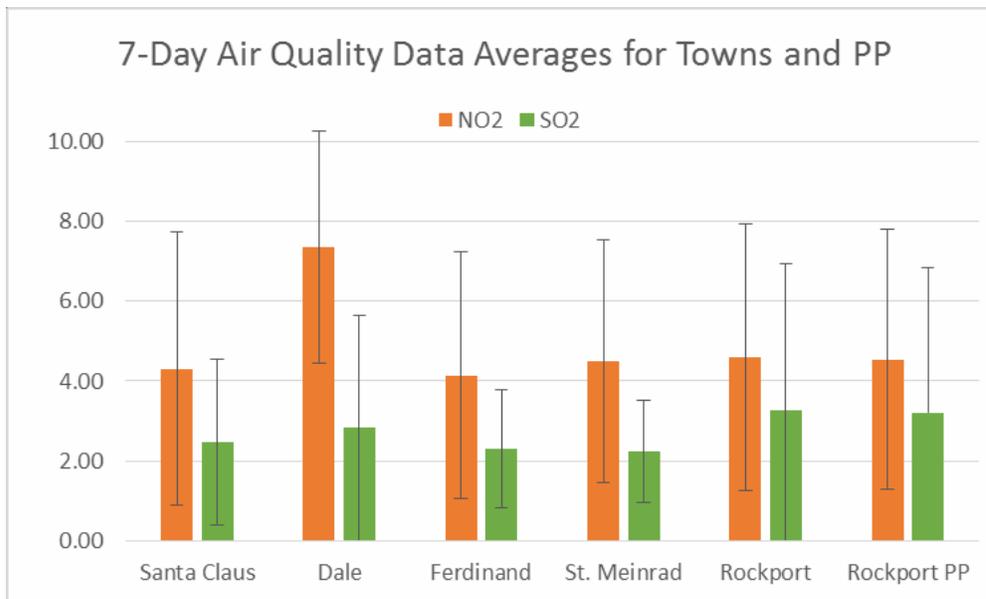

- 6) Between June 14 and June 21, 2018, I monitored the air quality through the BreezoMeter web site at 6 different location: Santa Claus, Dale, Ferdinand, St. Meinrad, Rockport, and the Rockport Power Plant (PP). The 7-day averages looked like this:

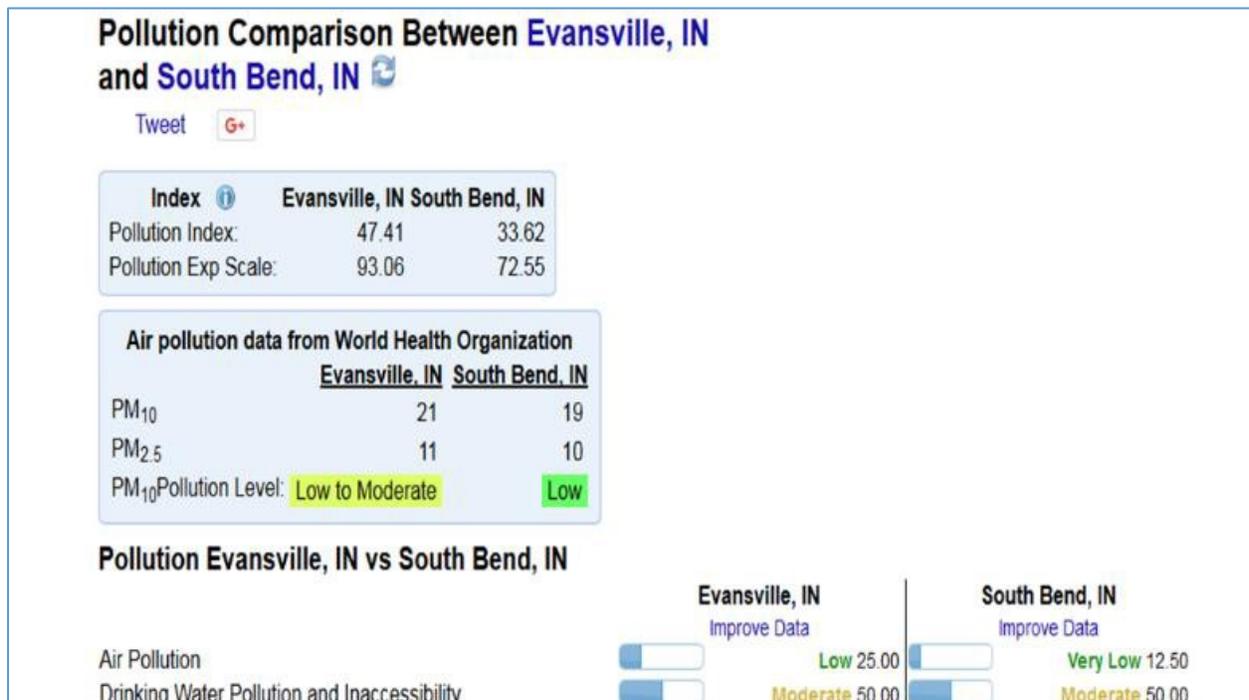

One could only wish that similar monitoring of the proposed REC plant and key nearby locations (school, nursing home) had been conducted by IDEM officials. Having seen the result of the NAAQS Analysis in the draft air permit, I can make the following predictions for the impact on the 3-hour SO2 concentrations in Dale and nearby towns, by adding a 350% increase to the levels observed in June, 2018:

Simply put, the SO2 concentration in these towns will be more than twice as much as the current concentration at the Rockport Power Plant. This is, again, directly contradicts the IDEM conclusion that “the proposed coal-to-diesel plant in southern Indiana will not significantly affect air quality or residents' health.” But even without adding the estimated pollution from the proposed plant to the current levels, it is apparent from the current data that Dale already has an air quality issue, particularly in the NO2 category:

7) Modeling air quality in Dale using data from South Bend or Evansville cannot be expected to provide reliable results according to other comparative sources. For instance, Numbeo.com says that air pollution in Evansville is about twice as high than in South Bend -- 25 vs. 12.5 ([https://www.numbeo.com/pollution/compare\\_cities.jsp?country1=United+States&country2=United+States&city1=Evansville%2C+IN&city2=South+Bend%2C+IN&tracking=getDispatchComparison](https://www.numbeo.com/pollution/compare_cities.jsp?country1=United+States&country2=United+States&city1=Evansville%2C+IN&city2=South+Bend%2C+IN&tracking=getDispatchComparison)):

Several data points taken in a one-day period (12/6/18-12/7/18) using BreezoMeter.com show an average NO<sub>2</sub> concentration of 4.84±2.36 ppb, 11.09±5.10 ppb, and 8.86±3.49 ppb for South Bend, Evansville, and Dale, respectively. The differences do not seem to be negligible.

- 8) Based on concerns about the accuracy and validity of the Air Quality Analysis in the draft air permit to REC, my suggestion is that IDEM delay any decision until a better understanding of the current air quality is gained. IDEM should investigate if the concerns about faulty monitors are valid, and develop a more comprehensive interpretation of the data. A pilot study on the feasibility of using BreezoMeter data should be conducted. BreezoMeter data should be compared with reliable IDEM monitor data, and if they correlate, remote (rural) locations could be monitored, as well as reliable background concentrations could be established.

In conclusion, in its draft form the air permit may comply with the letter of the law, but definitely is not in compliance with the spirit of the law. Therefore, I urge IDEM to either deny or delay the issuance of the air permit to Riverview Energy. Otherwise, I respectfully propose that IDEM become the acronym for In Denial of Environmental Management. Lincolnland Economic Development Corp. has passed this project to IDEM with an attitude that "we don't know and we don't care." IDEM must respond with an attitude that "we know and we care". Riverview Energy is trying to create a precedent for an anti-human technology, using Spencer County's LEDC and IDEM as "partners in crime"

The anti-democratic process demanded by Spencer County Commissioner Tom Brown as the legal way is nothing else than the denial of the legal way to take its intended course. Using Rubik's cubes to illustrate the differences between the two approaches, it is shown below that following the spirit and the letter of the law results in order and predictability, while following wishful thinking and manipulating the law leads to chaos and future problems:

**Air Permit Process as  
intended by law  
(Federal, State, and  
Local)**

**Air Permit Process as  
demanded by LEDC &  
Spencer County  
Commission**

Top level: Public acceptance

Mid-Level:  
Prevention of Significant Deterioration  
(PSD)/New Source Construction and  
Part 70 Operating Permit by IDEM

Bottom level:  
economically viable project selection by  
LEDC

Top level: LEDC priority

Mid-Level:  
Prevention of Significant  
Deterioration (PSD)/New  
Source Construction and Part  
70 Operating Permit by IDEM to  
meet LEDC & Spencer County  
project goals

Bottom level:  
public concerns disregarded/ignored

**IDEM Response to Paul Kovacs, Ph.D. Comment 3:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section.

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

**Ms. Vivian M. Philipps Comments and IDEM Responses**

On November 30, 2018, Ms. Vivian M. Philipps, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Vivian M. Philipps Comment:**

This letter is in regard to the coal to diesel plant that is being considered to be built in Dale, IN. The permit number is T147-39554-00065. I have several concerns about this proposal.

To start off with, I feel it was very underhanded the way the matters were handled by our town board and zoning board. The people of Dale were left in the dark and it was very unprofessional the way the decisive meeting was conducted. I don't understand why a project of this magnitude could be decided by so few people, especially when they were asked about it their response was "I don't know much about it." It appears they evidently didn't do much research.

I am very concerned about the effect such a plant will have on the health of the people. It will not only endanger the citizens of Dale, but all of Southern Indiana. Pollution does not know the boundaries of Dale or Spencer County. We already have such a high incidence of cancer, as well as respiratory diseases in this area. It is planned to be built approximately one mile from an elementary school and a nursing home which I find very appealing and inhuman.

Spencer County is ranked high as one of the most polluted counties in the nation and now they want to contribute to this. We already have an abundance of super polluters in the area. Is this how we want to be remembered as the generation that did this to our children and grandchildren? How do we know what the long term effects of this will be if there has never been such a plant in the United States?

#### **IDEM Response to Ms. Vivian M. Philipps Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Ms. Larita Killian Comments and IDEM Responses**

On November 30, 2018, Ms. Larita Killian of Columbus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Larita Killian Comment 1:**

Please do not grant a permit to this new plant, so close to schools and nursing homes. Please recognize reality: coal is finished. The world can no longer afford the burning of coal. The future of civilization is at stake. The only people who do not recognize that we should eliminate coal are 1) those who sale or burn coal and 2) the politicians they support. Why pollute Indiana's air? Why not let Indiana, yes even Indiana!!, become a forward-looking state that knows that alternative energy is the only hope for our future? Coal has had its day and we can no longer afford to pander to coal interests. Out future is at risk.

#### **IDEM Response to Ms. Larita Killian Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues,

- Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Susan Smith Comments and IDEM Responses**

On November 30, 2018, Ms. Susan Smith, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Susan Smith Comment 1:**

I am opposed to this use of diesel fuel for a new power plant. We should be trying to use alternative fuels in all new endeavors for power plants. Time to use renewable energy to save our planet for our next generations.

#### **IDEM Response to Ms. Susan Smith Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

### **Kimberley Baker, Ph.D., Comments and IDEM Responses**

On December 1, 2018, Kimberly Baker, Ph.D., of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Kimberly Baker, Ph.D., Comment 1:**

I am writing to ask that your committee vote "no" on the proposed Riverview Energy Coal-to-Diesel plant permit. I am a resident of North Spencer County, living about 10 miles east of the proposed Riverview Energy plant. As you and your committee consider this permit request, please think in terms of the overall community and region surrounding the plant and not just the plant itself.

A 2016 EPA study ranks Spencer County at 23rd in terms of high level of toxins released into the air. And the state of Indiana ranks 1st in the amount of total toxic chemicals released per square mile. We cannot afford to have additional toxins released into the air, even if the pollutants from the proposed plant would indeed be below the national standards, as Riverview claims. Some citizens who have studied the proposed plant suggest that the pollution would be at a higher level than Riverview claims, of course.

Since moving to Spencer County in 2012, I have begun to experience respiratory infections and coughs throughout the year at a level I have never experienced. My of my neighbors take for granted that they will have coughs that last for 2-4 weeks each year. It is difficult not to think that the respiratory illness correlate to the high level of toxins released into the air in the county.

I love Spencer County because of the rural setting and the many hiking trails. There is much to do outdoors for recreation, but we need clean air in order to make the most of the opportunities.

Your committee would be aware that air quality is a public health issue and a quality of life issue. Please protect our well-being and vote "no" on this proposed permit. Thank you for your consideration.

**IDEM Response to Kimberly Baker, Ph.D., Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

<b>Mr. Cliff Irvin Comments and IDEM Responses</b>
--

On December 1, 2018, Mr. Cliff Irvin, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Cliff Irvin Comment 1:**

Absolutely no to the refinery. No no no

**IDEM Response to Mr. Cliff Irvin Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

<b>Mr. Robert Alvis Comments and IDEM Responses</b>
---

On December 1, 2018, Mr. Robert Alvis, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Robert Alvis Comment:**

My name is Robert Alvis, and I am a resident of the town of Ferdinand, Indiana. IDEM is currently accepting comments regarding the potential construction of a coal-to-diesel refinery plant in the town of Dale (permit number T147-39554-00065). I am writing to express my strong opposition to the proposed refinery, which would be located just a few miles from my house.

I first moved to southwestern Indiana fourteen years ago, and I am proud to call the region home. It is a wonderful place to live and to raise a family. It has a rich history, the people are friendly, and the natural environment is beautiful.

One feature of the region that concerns me, though, is pollution. We are home to a wide variety of industrial plants, including a number that are classified as "super-polluters." Spencer County, the proposed home of the new plant, is already awash in dangerous pollutants. According to EPA data, it ranks 23rd out of more than 3,000 counties nationwide in terms of the amount of pollution it produces. Although you can't see it, there are particulate matter and chemicals in our air, water, and soil that have serious repercussions for the health of area residents.

The coal-to-diesel plant proposed for Dale would only make matters worse-a lot worse. The amount of resources slated to be processed in the plant each day, including tens of thousands of tons of coal, over a million gallons of "waste water," and untold amounts of sodium sulfide and methyl diethanolamine, is mind-boggling. The dangerous chemicals produced through its processes would include vast amounts of hydrogen sulfide, ammonia, sulfur dioxide, and carbon monoxide.

If construction of this new refinery is allowed to proceed, I fear that the quality of life in this beautiful region would be severely compromised for many years to come. The added pollution would compromise the health of local citizens and shorten lives. The massive plant itself would rise up from our gently rolling hills as a widely visible eyesore, discouraging tourists and potential new residents alike.

Thank you for taking the time to read my concerns. I am far from alone in worrying about the consequences of this new refinery, judging from the "No C2D" signs proliferating across Spencer County and beyond. I beg of you, please take these concerns into account and do what you can to stop this project before it is too late.

**IDEM Response to Mr. Robert Alvis Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

<b>Mr. Greg Kempf Comments and IDEM Responses</b>
---

On December 2, 2018, Mr. Greg Kempf of Avon, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Greg Kempf Comment 1:**

I'm writing to oppose granting permit number T147-39554-00065, Air Permit for Riverview Energy Corporation in Spencer County. I'm opposed due to the added carbon emissions the proposed plant will be emitting into our atmosphere. The millions of tons of added carbon emissions will make Indiana's air pollution even worse than it currently is, one of the worst in the nation. Several scientific reports have been published this year showing the dire consequences of adding more carbon emissions into our atmosphere. The Purdue Climate Change Research Center has issued several reports this year documenting the harmful effects to the state's health,

infrastructure, economics and agriculture. Nationally, the National Climate Assessment documented its harmful effects across the nation. Internationally, the IPCC issued global effects from too much CO<sub>2</sub> in the atmosphere, issuing dire warnings as the Paris Climate Agreement's goal of a 2 degree max rise isn't on track to being met. Statewide, we need to find ways to reduce carbon emissions, not increase them. Please reject this threat to our safety in so many scientifically documented ways.

#### **IDEM Response to Mr. Greg Kempf Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

<b>Ms. Maura Beckman Comments and IDEM Responses</b>
--

On December 2, 2018, Ms. Maura Beckman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Maura Beckman Comment 1:**

I live in Southern Indiana where a company is planning to build a large plant to convert coal to diesel. I understand that this is the first plant of this kind in the US.

Recently the news reported that the plant would emit tons of various chemicals annually. It was reported that IDEM had evaluated the proposed plant and stated that these chemicals would not be harmful to the health of the area residents!

We already suffer from the emissions of two coal fired power plants in Petersburg and a coal fired power plant in Rockport. We frequently have ozone warnings recommending that anyone with breathing problems should remain indoors. How can the chemical emissions from this proposed plant be harmless to the health of the area residents? We already have an overabundance of emissions from the Southern Indiana industries and the three power plants in the area. In addition it has been stated that this plant would also emit rotten egg odors throughout the area.

Are possible jobs in the area sufficient reason to allow this plant to be built? Our area has a very low unemployment rate and many positions remain unfilled in local industries.

Can another evaluation be done before construction is begun on this plant? The lives and health of our children and grandchildren are at stake. Thank you for your consideration!

#### **IDEM Response to Ms. Maura Beckman Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Mr. Donald Brian Abrell and Mrs. Kathleen Ann Abrell Comments and IDEM Responses**

On December 2, 2018, Mr. Donald Brian Abrell and Mrs. Kathleen Ann Abrell, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Donald Brian Abrell and Mrs. Kathleen Ann Abrell Comment 1:**

Please note our strong opposition to the Coal to Diesel plant proposed to be built near Dale, Indiana. As we are both former career IDNR employees, we have spent our lifetimes in natural resources and devoted our careers to protecting and restoring environmental quality in this State. We know all too well the serious environmental problems Indiana already suffers from a history of poor land use practices, particularly southern Indiana as relates to coal production. It is not safe for children or women of child bearing age to eat fish from ANY waters in this state due to heavy metal contamination that can be directly linked to air pollution problems caused by the burning of coal from power plants. It is both ludicrous and a debacle of justice that IDEM would even think of approving a permit for such a plant in a region that is already plagued with air and water pollution problems of severe public health significance. With advanced degrees in the environmental sciences, we can only assume the reasons this permit made it even this far in the approval process are, frankly, illegal payoffs of public officials or indecent bureaucratic politics. Both are simply abominable in a government organization supposedly dedicated to protecting our environment.

**IDEM Response to Mr. Donald Brian Abrell and Mrs. Kathleen Ann Abrell Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Ms. Kristine Schroeder Comments and IDEM Responses**

On December 3, 2018, Ms. Kristine Schroeder, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Kristine Schroeder Comment 1:**

PLEASE CONSIDER THE HEALTH OF THE COMMUNITY AND ITS PEOPLE! PUT HUMAN LIVES AND A BEAUTIFUL COMMUNITY ABOVE THE NEEDS OF COMPANIES. GREED IS DESTROYING OUR NATION. YOU HAVE THE POWER TO MAKE A DIFFERENCE. OUR LIVES HERE ON EARTH ARE SHORT COMPARED TO ETERNITY. PLEASE DO WHAT IS RIGHT AND JUST, NOT WHAT IS JUST PROFITABLE. May God guide you and your constituents in making the right choice for the people of these counties.

**IDEM Response to Ms. Kristine Schroeder Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Bruce Vaal Comments and IDEM Responses</b>
---

On December 3, 2018, Mr. Bruce Vaal of New Albany, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Bruce Vaal Comment 1:**

PLEASE stop this plant! Southern Indiana certainly does not need another super polluter! Spencer County is already once of the most polluted counties in the entire US! We are watching you IDEM!

**IDEM Response to Mr. Bruce Vaal Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Alan Winternheimer Comments and IDEM Responses</b>
---

On December 3, 2018, Mr. Alan Winternheimer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Alan Winternheimer Comment 1:**

With Southern Indiana already leading the nation in pollution, it is unthinking, thoughtless and uncaring to consider placing this coal-to-diesel plant here.

**IDEM Response to Mr. Alan Winternheimer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Mr. Paul Hess Comments and IDEM Responses

On December 3, 2018, Mr. Paul Hess, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Paul Hess Comment 1:

I am a former Hoosier, now scientist involved in the determination of asbestos in building materials. I have family in the area that will be impacted by the coal to diesel plant, the subject of the referenced permit number. Having also worked in the oil & gas arena, I am well aware of the use of asbestos containing materials in piping gasket and insulation materials. Many of which I have viewed under microscope. I am sure this plant will contain a great volume of piping and needed gasket material at pipe junctures and for insulation in its operation. As the below listed products have yet to be banned, I am deeply concerned about the potential use of such in the construction of said coal to diesel plant. Since they have written an OEM plan for dealing with asbestos containing materials, I suspect they intend to use them. In that event, are there any listed procedures for monitoring the emplacement of asbestos containing materials? Weathering and daily use will deteriorate the materials allowing for fiber release. Any such occurrence exterior of containment will allow for downwind dispersal of released fibers. While there are many regulations allowing for "X" amount in a set volume of air over a set time frame, we all know it only takes one fiber to cause an individual a problem. I would hate to have that on my conscience.

The manufacture, importation, processing and use in industry of the following products are not currently banned. All things which could be utilized in construction of the plant.

- Cement corrugated sheet
- Cement flat sheet
- Pipeline wrap
- Roofing felt
- Vinyl floor tile
- Cement shingle
- Cement pipe
- Gaskets
- Non-roofing coatings
- Roof coatings

One other point, I fail to see anywhere that all the rain waters the raw coal will be exposed to, along with the effluent from coal dust control, will be safely contained, cleaned and kept out of the local groundwater supply. These are my concerns as is the obvious potential for lingering environmental issues such as those left by the similar plants constructed and used by the Germans in WWII.

#### IDEM Response to Mr. Paul Hess Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With regard to so much of the comment as concerns asbestos-containing materials, IDEM, OAQ does not consider the presence of Category I or Category II nonfriable asbestos containing

material (as defined at 326 IAC 14-10-2(10) and (11)) within a source to be an emissions unit as defined at 326 IAC 1-2-23.5. Because the source will not manufacture asbestos-containing materials, and because the asbestos-containing products that may be in use will not emit air pollutants under normal conditions of use, emissions unit operation conditions regarding asbestos are not required in the permit. Condition C.7 - Asbestos Abatement Projects includes terms to implement the requirements of 326 IAC 14-10 and 40 CFR 61, Subpart M regarding projects conducted by Indiana-licensed personnel.

No changes to the draft permit were made as a result of this statement.

### David and Elvia Hall Comments and IDEM Responses

On December 3, 2018, David and Elvia Hall, of Dale, Indiana submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. The same comments were received by U.S. Mail on December 6, 2018.

#### David and Elvia Hall Comment 1:

I agree with the comments by Southwestern Indiana Citizens for Quality of Life and Earth Justice.

I am writing to you to share my concerns about the proposed Coal-to-Diesel plant sited in Dale, IN, 2.5 miles from my home. My wife and I, our 2 daughters and 7 grandchildren have resided in Spencer County for the past 44 years.

Appendix A Emission Calculations: This refinery will emit 2.2 million tons of CO<sub>2</sub> per year. However, Riverview has deliberately decided not to sequester carbon, because it would have increased the cost of the plant.

The refinery will produce hydrogen sulfide, which is a deadly poison. And it will emit sulfur dioxide which will smell like rotten eggs.

The refinery will also allow 26 tons per year of Hazardous Pollutants into our air. These include, Benzene, n -Hexane, Toluene, and Xylenes. These are all known carcinogens.

Southern Indiana has been a hot bed for large corporations like this to further pollute the air, land and water. Since IDEM came out with their 'no significant impact statement', how many farms and businesses will shut down? What would this do to our heritage and Lincoln Parks? My wife and I are nearing retirement and have 2 homes on 32 acres. One home is a vacation rental. I fear the devaluation of our home and business will greatly be impacted by this plant. Who wants to live near a poison factory? 44 years of living in Spencer County and saving for our future generation is now threatened, and so is our families' health.

Lincoln Land Development Corp, our County Commissions and the Dale Town Board, in their ignorance, are touting this as 'economic growth', while at the same time destroying our heritage, bringing illnesses to our families with the high probability of shutting farms and businesses down that have been in Southern Indiana for generations.

Please reference the following links: <https://www.cbsnews.com/news/indiana-soybean-farmer-witnesses-effects-of-climate-change-in-ruined-crops/>

<https://www.indystar.com/story/news/environment/2018/11/27/climate-report-spells-impacts-indiana-timber-tourism-agriculture/2123675002/>

After the recent reports from the U.N. and the U S Government, why are we contributing to the problem and not helping?

Thank you for taking time to read this letter, and I ask your consideration for the health and welfare of the citizens of Southern IN and the tri-state area.

### **IDEM Response to David and Elvia Hall Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Mr. Randall L. Philipps Comments and IDEM Responses</b>
--

On December 3, 2018, Mr. Randall L. Philipps, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. Randall L. Philipps Comment:**

This is in reference to permit number T147-39554-00065 pertaining to the coal to diesel plant being proposed to be built at Dale, IN. Please, take into consideration the effect such a plant would have on the people in this whole region.

According to the Riverview application (page B1) the plant could emit 184 tons of nitrogen oxide, 255 tons of carbon monoxide, 120 tons of sulfur dioxide, 139 tons of particulate matter, 2.2 million tons of carbon dioxide and 32 tons of hazardous air particle every year. With this in mind, how can it not make matters worse here? We already have enough super polluters in this area. It would be approximately one mile from an elementary school and nursing home.

Would you want your family exposed to all of this?

### **IDEM Response to Mr. Randall L. Philipps Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### Ms. Angela Rahman Comments and IDEM Responses

On December 3, 2018, Ms. Angela Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Ms. Rahman submitted additional comments by email on December 7, 2018, see below.

#### Ms. Angela Rahman Comment:

I am writing today on behalf of myself, my family, and the citizens in Southwestern Indiana who will be near and downwind of the proposed Riverview Energy Coal-to-Diesel plant.

I disagree with your preliminary finding that this plant will have "no significant impact" on the air quality in our region. With the many TONS of pollutants itemized in the permit application, the Riverview Energy plant will most definitely have a VERY SIGNIFICANT impact on the air quality and on our health in our region. In addition, the EPA has classified Hydrogen Sulfide, which will be produced in significant amounts at this plant, as an "Extremely Hazardous Substance".

The Southwestern Indiana region is already surrounded by super-polluters, so it appears that IDEM considers that locating another super-polluter in the "Sacrifice Zone" of Southwestern Indiana couldn't hurt. As a citizen who lives in the "Sacrifice Zone", I feel that we have sacrificed enough. We do not need or want this plant in our area.

If according to your preliminary draft, the effect of those TONS of deadly materials would not violate state or federal regulations, then those state and federal regulations are woefully inadequate to protect the health and well-being of Hoosiers and American citizens, especially the children at the elementary school or the elderly at the nursing home who are all within one mile of the proposed plant. We feel that the state does not fully appreciate the potential risk to the region for many generations to come.

IDEM based some of their findings on monitors in far northern Indiana because there are no appropriate monitors in Southern Indiana. There are NO monitors in Spencer County to measure ozone, carbon dioxide, carbon monoxide, hydrogen sulfide, or the other chemicals that will be released by this plant. The only monitor in Spencer County is one to measure PM2.5, located at David Turnham Elementary School. How can we trust IDEM to monitor these pollutants and protect us from these hazardous chemicals when no monitors exist?

It is IDEM's responsibility to protect our environment, and to stand up for our right to better health. In order to do that; IDEM needs to DENY the Riverview Energy air permit.

#### IDEM Response to Ms. Angela Rahman Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

### Mr. Steve Krampe Comments and IDEM Responses

On December 3, 2018, Mr. Steve Krampe, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Steve Krampe Comment:

Please see the enclosed article which appeared in our local newspaper on 11/24/18. It is another ominous report on the effects of pollution on our environment. The EPA and IDEM are not doing enough to regulate the continuous dumping of hazardous chemicals into our climate by uncontrolled industry.

Southwestern Indiana Citizens for Quality of Life, in response to the Administration's Climate Report, posted the following on Facebook on 11/24/18:

*"This federal climate change report was released by the White House yesterday on Black Friday and confirms exactly what local authorities Dr. Erin Marchand, chemical engineer Randy Vaal, Dr. Norma Kreilein, and farmer Jerry Steckler stated at our Nov 1 forum at Heritage Hills.*

*According to Riverview Energy's air permit application, the proposed, massive coal-to-diesel refinery in Dale would annually emit 2.2 million tons of the greenhouse gas CO2. Meanwhile, in the midst of growing awareness of the effects of human-caused climate change and our need to shift away from fossil fuels -in stark contrast -IDEM claims the refinery would have "no significant impact" on the region and the broad environment.*

*IDEM officials -appointed by Governor Holcomb -must be accountable to residents and taxpayers"*

Our citizens, governments (including IDEM) and industry must work together to be good stewards of our environment, protect our families and promote our well-being, as well as the well-being of future generations. We must insist that our industry act in a way that places the highest respect on the health and safety of all our citizens, even if this means **exceeding** the letter of the law.

Please deny the Riverview Energy air permit application. Please do your part to help protect the environment in Southern Indiana. It's time to put the health and well-being of Hoosiers ahead of industry.

Administration issues dire climate report  
By BRADY DENNIS and CHRIS MOONEY  
WP News Service

The federal government on Friday released a long-awaited report with an unmistakable message: The impacts of climate change, from deadly wildfires to increasingly debilitating hurricanes and heat waves, are already battering the United States, and the danger of more such catastrophes is worsening.

The report's authors, who represent numerous federal agencies, say they are more certain than ever that climate change poses a severe threat to Americans' health and pocketbooks, as well as to the country's infrastructure and natural resources. And while it avoids policy recommendations, the report's sense of urgency and alarm stand in stark contrast to the lack of any apparent plan from President Donald Trump to tackle the problems which, according to the government he runs, are increasingly dire. The congressionally mandated document - the first of its kind issued during the Trump administration - details how climate-fueled disasters and other types of worrying changes are becoming more commonplace around the country and how much worse they could become in the absence of efforts to combat global warming.

Already, western mountain ranges are retaining much less snow throughout the year, threatening water supplies below them. Coral reefs in the Caribbean, Hawaii, Florida, and the U.S.'s Pacific territories are experiencing severe bleaching events. Wildfires are devouring ever larger areas during longer fire seasons. And the country's sole Arctic state, Alaska, is seeing a staggering rate of warming that has utterly upended its ecosystems, from once ice-clogged coastlines to increasingly thawing permafrost tundras.

The National Climate Assessment's publication marks the government's fourth comprehensive look at climate change impacts on the United States since 2000. The last came in 2014. Produced by 13 federal departments and agencies and overseen by the U.S. Global Change Research Program, it stretches well over 1,000 pages in length and draws more definitive, and in some cases startling, conclusions than earlier versions.

The authors argue that global warming "is transforming where and how we live and presents growing challenges to human health and quality of life, the economy, and the natural systems that support us." And they conclude that humans must act aggressively to adapt to current impacts and mitigate future catastrophes "to avoid substantial damages to the U.S. economy, environment, and human health and well-being over the coming decades."

"The impacts we've seen the last 15 years have continued to get stronger, and that will only continue," said Gary Yohe, a professor of economics and environmental studies at Wesleyan University, who served on a National Academy of Sciences panel that reviewed the report. "We have wasted 15 years of response time. If we waste another 5 years of response time, the story gets worse. The longer you wait, the faster you have to respond, and the more expensive it will be."

That urgency is at odds with the stance of the Trump administration, which has rolled back several Obama-era environmental regulations and incentivized the production of fossil fuels. Trump also has said he plans to withdraw the nation from the Paris climate accord, and questioned the science of climate change just last month, telling CBS' "60 Minutes" that "I don't know that it's man-made" and that the warming trend "could very well go back."

Furthermore, as the northeast faced a cold spell this week, Trump tweeted, "Whatever happened to Global Warming?" This shows a misunderstanding that climate scientists have repeatedly tried to correct - a confusion between daily weather fluctuations and long-term climate trends.

The White House did not immediately respond to a request for comment on Friday's report. However, the administration last year downplayed a separate government report calling human activity the dominant driver of global warming, saying in a statement that "the climate has changed and is always changing."

Given that history, some of the scores of scientists and federal officials who spent months working on the detailed document were frustrated, but not surprised, that the administration chose to release it on the day after Thanksgiving - typically one of the slowest news days of the year. Several people involved in the report said its release originally had been planned for early December, but after a behind-the-scenes debate in recent weeks about when to make it public, administration officials settled on Black Friday.

"This report draws a direct connection between the warming atmosphere and the resulting changes that affect Americans' lives, communities, and livelihoods, now and in the future," the document reads, concluding that "the evidence of human-caused climate change is overwhelming and continues to strengthen, that the impacts of climate change are intensifying across the country, and that climate-related threats to Americans' physical, social, and economic well-being are rising."

The report finds that the continental United States already is 1.8 degrees Fahrenheit warmer than it was 100 years ago, surrounded by seas that are on average 9 inches higher and being wracked by far worse heat waves than the nation experienced only 50 years ago.

But those figures offer only the prelude to even more potentially severe impacts. The report suggests that by 2050, the country could see as much as 2.3 additional degrees of warming in the continental United States. By that same year, in a high-end global warming scenario, coral reefs in Hawaii and the U.S. Pacific territories could be bleaching every single year - conditions in which their survival would be in severe doubt. A record warm year like 2016 would become routine.

Key crops, including corn, wheat, and soybeans, would see declining yields as temperatures rise during the growing season. The city of Phoenix, which saw about 80 days per year over 100 degrees around the turn of the century, could see between 120 and 150 such days per year by the end of the century, depending on the pace of emissions.

And those who face the most suffering? Society's most vulnerable, including "lower-income communities and other marginalized communities," researchers found.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Stephanie Pierce Comments and IDEM Responses</b>
---

On December 4, 2018, Ms. Stephanie Pierce of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Stephanie Pierce Comment 1:**

Please accept my heartfelt comments and know I support the comments by Southwestern Indiana Citizens for Quality of Life and Earth Justice. I am writing you in concern of the Coal to Diesel plant proposed in southern Indiana. I am not an Environmentalist, Scientist, Doctor or Activist, but I am a concerned citizen. I have both the means and the ability to have located or to re-locate my family anywhere in the country that I wish. We CHOOSE to live in southern Indiana because of the adjacencies to cities we love like Indy, Louisville and Nashville but at the same time providing our family the blessed opportunity to grow up in a rural and beautiful small community. I know in this country, these types of close knit communities that offer amenities for families without having to move to subdivisions near metro areas are diminishing, but we certainly have a gem of this down here.

There are enough jobs to support these surrounding communities, actually, there are more jobs than can stay filled with people to work them. There are frequent 'help wanted' or job openings in all the surrounding towns. The draw to get people to continue to move here is the nature and beauty of this area the small town life that currently thrives in these communities and the standard of living available to us. With multiple state forests and parks, tourism and good schools, this is a wonderful place for people who are looking for more casual and rural living yet still want the advantages of adjacencies to metro locations.

If you approve the supposed "economic" development of this refinery and the minimal increasing of around 200 or so jobs at the risk of this pollution raising eyesore as our gateway into these communities, as it will be located on the road through all of these communities... well as sure at the Arch welcomes you to Saint Louis, this refinery will be the harbinger of desolation to this area. Real Estate values will decrease because people don't want to live next to, or near anything like that. With less people moving into the small communities or even staying here and young people leaving and not coming back to live next to that monstrosity, these lovely small communities that enhance the economic power of southern Indiana will die away. You can see this happen in small pollution industrialized towns all across this country. Without people wanting to live in small towns like all of ours, the poor visitation to the parks will cause them to be hideously underfunded and then desolate, the local theme park will become a wasteland and all the local heritage and small town entrepreneurial efforts will all move on to better towns with more opportunity. And I am not only referring to just Dale but rather Huntingburg, Jasper, Ferdinand and Santa Claus... and all the closest communities around who will reap the negative side effects of the selfishly organized industry who thinks not of the community but rather the profits that can be made from the naiveté of those who are uninformed.

I understand the pollution, health and well being risks also associated with this super polluter, and I sadly don't expect the government to have our best interests at heart, considering the people who would approve this don't have a personal stake in our communities well being. But I would think that the lessons you can see all across this country of industry such as this that drives away new generations of small town community building people who can and will choose someplace else to live. It may take a generation or two, but approving this project essentially sentences these communities to a slow death in more ways than with pollution alone. To state that this plant will have no significant impact is ridiculous at best, after all the comments made by the different citizen groups who have formed and/ or signed the petition and as you can read from my own comments, this will certainly have an impact on the quality of life here!

#### **IDEM Response to Ms. Stephanie Pierce Comment 1:**

No changes to the draft permit were made as a result of this comment.

<b>Mr. William Novak Comments and IDEM Responses</b>
--

On December 4, 2018, Mr. William Novak of Huntingburg, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. William Novak Comment 1:**

I wish to weigh in on this proposed plant near Dale, Indiana. I'm old enough to hate 'fail to accomplish'; especially those that are mindless, dangerous, and bereft of caring thought. The approval of this environmentally wretched plant would be something between immoral and criminal. This plant would be ruinous to the area for the next 100 years; a century of pollution. Knowing, and willful pollution. And for what? \$\$\$... killing \$\$\$\$. We have enough cancer around here. I've had cancer and it's horrible. Any enterprise that is contributory toward the cause of a cancer is a horrible, deadly enterprise. What will be piped daily, over good farm ground and forests, into the Ohio River is just inane. Not to mention the air quality impact. It's frightening to those of us live here, and have lived here, and have family that will live here - to be overridden by a company with vast monetary and legal resources, the 15 or 16 unelected IDEM members, and 5 or 6 town board members from Dale, Indiana. Fifty people or less; have the potential to make this plant a reality that's going to screw up life, as we know it, for the next century. There are not enough dollars or jobs to justify such an atrocity. Please pray, pray first, and think about such ruin. Forget about the pecuniary benefits of the shareholders of this company; and their Board of Directors. They aren't going to live here, breathe this air, or watch it roll into our Ohio. They want all the benefits; and none of the responsibility for the intended and unintended consequences of such a plant. The havoc is, and would be ostensible. I implore you to deny this wretched and heinous permit. Thank you.

### **IDEM Response to Mr. William Novak Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### **Ms. Jill Sicard Comments and IDEM Responses**

On December 4, 2018, Ms. Jill Sicard of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Jill Sicard Comment 1:**

I am writing in opposition of the plans to place a Coal to Diesel plant in our area. I am a resident of Ferdinand Indiana and would be directly downwind of the toxins released into our air. I plead you to please have respect and compassion for the health and wellbeing of our community, which is already saturated with a tremendous amount of pollution, by stopping these plans. We are well aware that we have no pollution detection from the state in our area. And are aware of why that is. I feel we are being taken advantage of, by people who will profit monetarily, but do not have to breathe the air that it will produce. I plead for you to choose the wellbeing of humanity over money. It is the decisions we make here on earth, that one day will have to face at a higher level. Please do the right thing. Make these decisions as if this plant were being placed in your hometown. We love our community and are very proud to call it home for us and our families. Please help to protect it. We depend on you....

#### **IDEM Response to Ms. Jill Sicard Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 14 - Pollutant Travel Distance

No changes to the draft permit were made as a result of this statement.

### **Ms. Molly Rupert Comments and IDEM Responses**

On December 4, 2018, Ms. Molly Rupert of Jasper, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Molly Rupert Comment 1:**

I am writing from Jasper, IN. I am deeply concerned about the proposed coal-to-diesel refinery in Dale. This endeavor is an investment in the past, not the future. A 512-acre refinery will permanently destroy the irreplaceable beauty of SW Indiana. Sooner rather than later, this facility will be outdated, a disgusting, run-down reminder of how "we used to do things." However, it will continue to taint the landscape and disrupt our resources for lifetimes.

I have spent numerous summers performing outdoors at Holiday World and Lincoln Amphitheatre in Spencer County. I chose not to pursue a theatre career in an urban area in large part because of my desire to stay in picturesque SW Indiana. To potentially raise a family here. To fulfill the longing in my soul to see rolling hills and pure sunsets. A coal-to-diesel facility offers nothing of value to the vast majority of this area's citizens and future generations.

Please, please do not push people away from this area. Please do not make it so unattractive and undesirable that no one wants to move here. Please do not throw away this opportunity to make the best decision for the future.

**IDEM Response to Ms. Molly Rupert Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Mr. Dean Henke and Mrs. Mary Beth Henke Comments and IDEM Responses</b>
--

On December 4, 2018, Mr. Dean Henke and Mrs. Mary Beth Henke, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Dean Henke and Mrs. Mary Beth Henke Comment 1:**

My husband and I live on the edge of Dubois and Warrick County. The Spencer County line is very close to us, also. We feel it would be detrimental to our area to have the refinery. It may provide construction jobs temporarily but the lasting effects of the plant operation make it a poor investment for us. A medical doctor told me we live in the Ohio Valley which is known as "the armpit of America". Take a lead in making our area better.

**IDEM Response to Mr. Dean Henke and Mrs. Mary Beth Henke Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Bethany Hopf Comments and IDEM Responses</b>
---

On December 4, 2018, Ms. Bethany Hopf, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Bethany Hopf Comment:**

I join my voice with the 1,400-plus citizens of Southwestern Indiana who have signed petitions opposing Riverview Energy's coal to-diesel plant proposed for Dale IN.

In addition to the many TONS of pollutants this plant will release into our atmosphere, (nitrogen oxide, carbon monoxide, sulfur dioxide, particulate matter, carbon dioxide and hazardous air particles, benzene, n-Hexane, toluene and xylenes - all known carcinogens), Riverview Energy's coal-to-diesel plant will also pollute our water source.

Riverview Energy plans to pump 1.8 million gallons of water each day from an aquifer of the Ohio River. The company plans to pump the water via a 20-mile pipe from the aquifer to the plant, and then send the supposedly treated water back to the aquifer to be dumped, via another 20-mile pipe. Riverview Energy hasn't disclosed how it plans to remove the contaminants from the wastewater, or how they would dispose of the contaminants. And if the water was supposedly treated, why don't they just continue to use the same water via a closed loop? Why return it to the

aquifer, just to pull another 1.8 million gallons out the next day? It is my belief that the water will be highly contaminated. As such, Riverview Energy doesn't want to re-use it. They prefer to send the contaminated water downstream, to adversely affect citizens downstream.

These water pollutants should also be under review by the Indiana Department of Environmental Management.

It has also not been disclosed who is to pay for the water supply and return pipes. I understand that Riverview Energy is not offering to pay for them. It appears this will be paid for by Indiana taxpayers.

In 2016, Indiana released more toxic chemicals than 44 other states. INDIANA CAN DO BETTER! Spencer County was ranked 23rd out of 3,142 US counties in total toxins released. SPENCER COUNTY CAN DO BETTER!

The citizens of Spencer County and the surrounding areas are relying on IDEM to protect us from the proposed super-polluting coal-to-diesel refinery. Please deny the permit.

#### **IDEM Response to Ms. Bethany Hopf Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

#### **Ms. Gloria Rahman Comments and IDEM Responses**

On December 4, 2018, Ms. Gloria Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Gloria Rahman Comment:**

I am writing today to express my opposition to the proposed Riverview Energy Coal-to-Diesel plant proposed for Dale, Indiana. The reasons for my opposition are many, not the least of which is the many, many tons of hazardous pollutants that will be emitted by the plant.

In your preliminary draft permit you stated that the effects of these tons of hazardous pollutants will not have a significant impact on air quality or overall health. I understand that your judgment was based on monitors elsewhere in Indiana, far-removed from the Dale/Spencer County proposed plant location. The only monitor in Spencer County is a PM2.5 monitor at the David Turnham Elementary School in Dale. There are no monitors in the area to measure carbon dioxide, carbon monoxide, hydrogen sulfide or the other deadly substances that will be released by this plant. I also understand that some of the monitors used in your evaluation are based in northern Indiana, about as far away as you can get from Spencer County.

I have attached a copy of an article published in Counter Punch by Santa Claus, Indiana (Spencer County) resident Paul Kovacs. You can find the original article at <https://www.counterpunch.org/2018/11/22/coal-to-diesel-economic-development-or-not/> (See attachment).

Mr. Kovacs holds a Ph.D. in Physical Chemistry and has taught courses at Bellarmine University. He has studied the Riverview Energy air permit application in depth and has made some very compelling arguments against this plant. Please read the article.

I wholeheartedly agree with Mr. Kovacs, and with my neighbors, family and friends, that this plant is not needed, not necessary and will, most definitely, have a significant impact on the air quality and overall health of the residents in the region.

Please deny the Riverview Energy air permit.

Attachment:

NOVEMBER 22, 2018

## **Coal-to-Diesel: Economic Development or Not?**

by PAUL KOVACS

In a welcome move for the future of our community, the Indiana Department of Environmental Management is about to hold a public hearing on December 5, 2018 at Heritage Hill High school in order to receive input from the public on a controversial economic development project proposed by Riverview Energy. The proposal is on the construction and operation of a massive coal-to-diesel conversion plant in Dale, Indiana.

A state analysis has concluded that the proposed coal-to-diesel plant in southern Indiana will not significantly affect air quality or residents' health. State environmental officials have said that the facility wouldn't significantly contribute to pollution and poses very little cancer risk. The department found that the plant would emit a total of 30 tons per year of various hazardous air pollutants. According to the company's air permit application, the plant would have annual emissions rates of about 2.2 million tons of carbon dioxide, 225 tons of carbon monoxide and 120 tons of sulfur dioxide. (<https://www.wthr.com/article/state-indiana-coal-diesel-project-wont-harm-air-quality>) "This means if an individual was exposed to these hazardous air pollutants continuously for 70 years, the risk of getting cancer from this exposure would be 4.6 in 10 million," the state's analysis stated.

According to the Greg Merle, CEO of Riverview energy: "The point of this project is not to build one plant," he said, "it's to create a new industry in our country." Creating new industries that resulted in extremely negative environmental consequences is not unprecedented in American industrial history.

Thomas Midgley, Jr. (May 18, 1889 - November 2, 1944) was an American mechanical engineer and chemist. Midgley was a key figure in a team of chemists, led by Charles F. Kettering, who developed the tetraethyl lead (TEL) additive to gasolines as well as some of the first chlorofluorocarbons (CFCs), two of the most talked about chemical pollutants in human history. Many environmentalists consider him to be "the human who has done the most damage to the environment". After all, this was a man known as much for his showmanship as for his achievements in chemistry. Midgley demonstrated the nontoxic and nonflammable properties of Freon by inhaling the gas and softly exhaling it to extinguish a burning candle. He also demonstrated the apparent safety of TEL by pouring TEL over his hands, then placing a bottle of the chemical under his nose and inhaling its vapor for sixty seconds, declaring that he could do this every day without succumbing to any problems whatsoever. This was done after a new plant

was plagued by severe cases of lead poisoning, hallucinations, insanity, and then five deaths in quick succession. As a good salesman, Midgely himself was careful to avoid mentioning to the press that he required nearly a year to recover from the lead poisoning brought on by his demonstration.

TEL levels in automotive fuel were reduced in the 1970s under the U.S. Clean Air Act in two overlapping programs: to protect catalytic converters, which mandated unleaded gasoline for those vehicles; and to protect public health, which mandated lead reductions in annual phases (the "lead phasedown"). It is important to note that protecting public health was only second in importance to avoiding catalyst poisoning and serving certain short-term financial interests.

In decision making that requires the consideration of potentially negative environmental impacts, Midgley's story may serve as a cautionary tale. Especially in the light of the growing significance of applying the Precautionary Principle to making far-reaching public policy decisions. The precautionary principle, proposed as a new guideline in environmental decision making, has four central components ("*The Precautionary Principle in Environmental Science*", <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1240435/pdf/ehp0109-000871.pdf>):

- 1) taking preventive action in the face of uncertainty;
- 2) shifting the burden of proof to the proponents of an activity;
- 3) exploring a wide range of alternatives to possibly harmful actions;
- 4) and increasing public participation in decision making.

As a group of concerned citizens has been voicing their opposition to a \$2.5 billion direct coal-hydrogenation plant proposed for Dale, it is informative to analyze how the precautionary principle is applied in Indiana to the issuance of permits.

#### **Taking preventive action in the face of uncertainty**

The State of Indiana does not monitor air quality in the Dale area and does not correlate it with local health statistics. Consequently, additional levels of pollutants may not be adequately entered into computer models assessing related risks, particularly risks of unknown health consequences. Computer models require a fixed set of already known parameters, part of which are parameter of convenience satisfying mathematical needs. Real ecosystems, in contrast<sup>1</sup> are open, self-modifying systems, which constantly produce novelty and new parameters and which cannot be severed from their environment. Although calibration may adapt models to data sets of the past, it does not assure predictive capacity or validity. Consequently, the State's conclusion that " the risk of getting cancer from this exposure would be 4.6 in 10 million" may not be even remotely accurate.

It is of particular concern that not all prior experience seems to be taken into consideration by the State's risk assessment. An article in Environmental Health Perspectives back in 1976 already pointed out:

At the present time, no commercial scale liquefaction or gasification plants exist in the United States. However, a number of major installations are far advanced into the planning stage. Estimates of total populations who might be associated with these plants, including workers, dependents, and service personnel, vary from 5000 to 16,000. The potential health implications of coal processing plants to these people, and to those who might be affected by water and/or air transport over greater distances, need to be considered at the very outset of planning. Some large-scale liquefaction and gasification facilities exist elsewhere in the world. However, environmental measurements around such plants, if they exist at all, are not readily available. It is also likely that any coal conversion plants constructed in the U.S. will be considerably different than those already in existence. Consequently<sup>1</sup> analysis of the pollution potential of coal processing currently depends on the evaluation of data collected from pilot plant processes and bench scale reactors. Although this type of consideration is the only one presently available, it is well to point out that many pollution problems will become evident only after a facility has operated continuously for a period of weeks or months." ("*Coal*

*hydrogenation and environmental health*", <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1475092/>)

This article also emphasized that "One study of workers in a hydrogenation process has revealed an incidence of skin cancer 16-37 times that expected in the chemical industry. In addition, a number of high boiling point liquid products were identified as being carcinogenic, and air concentrations of benzo[a]pyrene up to 18,000 µg/1000 m<sup>3</sup> were reported. Health statistics on occupational groups in other coal conversion industries have shown significantly higher lung cancer rates, relative to groups without such occupational exposures." These findings do not seem to be in support of the conclusions the State of Indiana's analysis for the proposed Dale plant stated.

The lack of other plants of this kind in the US is another warning sign. Other targeted sites probably have taken preventive actions in the face of uncertainty, and decided on not moving forward with such "developments".

### **Shifting the burden of proof to the proponents of an activity**

Proponents of the proposed Dale plant place the burden of proof of negative consequences on the oppositions, who - in their views - represent anti-community interests. All the decision-makers, company officials, economic development and environmental management officials, as well as worker union representatives and members are, by default, interested in the approval of the project, based on creative marketing tactics that depicts any opposition as biased and anti-business. In other words, they are claiming immediate economic measures such as investment, job creation, and construction as counterparts of future environmental damages and harmful health effects. Any formal model that converts the precautionary principle into economic terms would help clarify the concept of precaution and decision-making. It would frame a decision problem concerning the prevention and management of risks. It would make an economic analysis of the impact of risks on individual and collective welfare (<https://duboiscountyherald.com/b/residents-seek-more-info-on-coal-to-diesel-plant>) as well as resolve the conflicts of interest with the purely economic and technical issues-driven proponents of the proposed plant listed below:

### **Economic Development personnel**

Tom Utter, the executive director of the Lincolnland Economic Development Corporation, said the Indiana Economic Development Corporation first contacted him and said Riverview Energy was looking for a site. He's been recruiting the project ever since. "I want to bring something new to the community," Utter said. "I got the opportunity to recruit it. I've recruited it heavily and I'm still recruiting it heavily. I'm recruiting Riverview Energy very strongly, very aggressively." He said it's his role with LEDC to "bring companies, industries, into the community. ... We search and search in a competitive world to find new ways to bring revenues into the community."

In terms of economic development, he looks for "large projects to bring significant, innovative technologies that will revive some of the jobs that have been lost, and create new jobs." "The fact is that what we look at is improvements in technology," Utter said. "Technologies now produce fewer environmental negatives than older technologies. We do want to keep bringing new investment, jobs, but we are looking at processes like this one that would indeed produce fewer environmental negatives than the older technologies. And we'll continue to do that to raise the bar in the community."

### **Questionable aspects of the above approach:**

- + New technology does not automatically mean better technology;
- + Fewer environmental negatives do not offer a solution to an existing problem, but become part of them; State environmental officials

The "innovative" technology proposed for the plant is mimicking the process that took Mother Nature millions of years and special conditions to accomplish. That process took place in a closed environment, underground, and did not release known toxic substances into the atmosphere at an accelerated rate. The proposed hydrogenation process would produce such compounds at an alarmingly high rate every day. On the other hand, the health of the workers and residents living nearby will not show a sudden decline, and any correlation between certain health problems and environmental factors may take decades to recognize, just as in the cases of asbestos, cigarette smoking, TEL, and CFCs. Computer models with limited understanding of potential issues involved may suggest that "exposure to these hazardous air pollutants continuously for 70 years, the risk of getting cancer from this exposure would be 4.6 in 10 million." Even if the numbers were true for cancer risk, they only declare that the loss of few human lives due to additional air pollution is acceptable.

### **Coal Industry Representatives**

+ Coal-related jobs are quickly disappearing in the Midwest as coal-fired power plants are shut down at record speeds, said Bruce Stevens, the president of the Indiana Coal Council. "We've lost 4 million tons per year of Indiana coal from retired power plants," Stevens said. "This [coal-to-diesel] plant will replace about half of that. We're very hopeful this plant becomes a reality because it will be very helpful to communities in which miners have lost work."

+ It's not just miners who are losing work as the coal industry declines. Local construction workers who've made a career of building and maintaining coal facilities are also suffering. "We need this for our families, for our futures and for our retirement packages," said Timothy Brunfield, a dispatcher for Boilermakers Local 374, a union that represents skilled construction workers. "This is not just a new plant, it's a new industry."

### **Exploring a wide range of alternatives to possibly harmful actions**

It is interesting to see that extending the life of a dying industry is defined as the birth of a new one, considering no other alternatives. According to an article in Financial Times ("Coal is dead: long live the sun"; <https://www.ft.com/content/702822b6-46f0-11e7-8d27-59b4dd6296b8>), the transition to renewables is possible if policymakers plan ahead

For more than 100 years, coal has driven economic growth, powering the Industrial Revolution and helping much of the world develop. But its best days have passed. Pretty much anywhere you look in the world, coal is no longer the best option for energy or for jobs. In fact, it's become a risky bet.

From an economic development point of view, however, there might be a promising answer to the question: the only thing we have is coal, and lots of it. What can we do? Certainly not what we've been doing - burning it, or turning it into other combustible products.

Challenging times call for challenging our old way of thinking.

Coal is a fantastic natural resource that offer a variety of useful, environmentally positive and economically pursuable developmental opportunities. One of them is the industrial-scale production of activated carbon.

"The activated carbon market was valued at USD 3,124.73 million in 2017 and is expected to expand significantly with an estimated CAGR of 6.24%, mainly due to the growing water treatment industry during the forecast period, 2018-2023. Activated carbon removes the impurities from water primarily through surface adsorption. It is primarily used for purification of gases and liquids in food & beverage processing, industrial pollution control, and environmental recovery."

"The United States holds the largest market and accounted for 80.18% in activated carbon market in North America. Growing end user industries, like pharmaceutical, oil & gas is expected to drive the market during the forecasted period. The gradual increase in the

number of drilling rigs in the United States is expected to gradually increase the consumption of activated carbon during the extraction process. In addition, the advances in the technology are opening up scope for increasing exploration in the deep-water fields of the Gulf of Mexico. This is expected to open up new opportunities for the usage of activated carbon in oil & gas field."

### **Increasing public participation in decision making**

In addition to the significant efforts made by the Spencer County Citizens for Quality of Life and the NOC2D Coalition in opposition to the proposed coal-to-diesel plant on Dale, the December 5 Idem hearing will provide an excellent opportunity for concerned citizens for letting their voice heard in the decision-making process.

In conclusion, real economic development efforts in finding contemporary use for Indiana's coal resources may benefit from concentrating on truly innovative projects that could also mitigate the negative environmental effects of the past 100 years of industrial pollution and careless use of natural resources. The health and well-being of future generations would also greatly benefit from a proactive yet restorative economic development policy that balances immediate interests with future ones.

**Paul Kovacs**, a native of Hungary earned his Ph.D. degree in Physical Chemistry from Eotvos University, Budapest. Having spent a year doing post-doctoral research at the Tokyo Institute of Technology and Tokyo University, Dr. Kovacs moved to the US and joined the R&D department of Smith and Nephew Orthopedics in Memphis, TN. Recent(y, he taught "Environmental Topics in Chemistry" and "Science and Society Today" courses at Bellarmine University in Louisville, KY. Currently he lives in Santa Claus IN and provides technical consulting.

### **IDEM Response to Ms. Gloria Rahman Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Mr. Edwin Rahman Comments and IDEM Responses</b>
---

On December 4, 2018, Mr. Edwin Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. Edwin Rahman Comment:**

Please deny the air permit application submitted by Riverview Energy for the coal-to-diesel plant proposed for Dale IN.

We do not need another source of pollution that will contribute to the ozone in this area. IDEM and EPA have issued multiple Ozone Alert Days just this year.

Per your website <https://www.in.gov/idem/airquality/2691.htm>, during those OADs we are instructed to:

- Carpool, walk, bike, or use public transportation when possible  
*Sir, we are in a rural area. It is not practical to walk or bike for miles to get where we need to go. And public transportation is non-existent*
- Refuel vehicles after dusk.
- Avoid excess idling and drive-through windows.
- Consolidate trips and avoid fast-starts.
- Postpone using gasoline-powered garden equipment or mowing the lawn until late evening, when temperatures are cooler.
- Work from home to reduce vehicle emissions.  
*Sir, with the types of industries and employers in our area, that is not a viable option for nearly all of us.*
- Use energy-efficient lighting and appliances recommended by the Energy Star Program.
- Turn off appliances and lights when not in use to reduce emissions from energy productions.
- Adjust your thermostat by turning it up in the summer and down in the winter to reduce emissions from energy production.
- Recycle to reduce emissions related to producing paper, plastic, glass bottles, aluminum cans, and cardboard.
- Use "low VOC" or "zero VOC" paint and cleaning products.  
*Sir, by denying the proposed plan you will prevent TONS of VOCs from being released into our atmosphere.*
- Consider burning gas logs instead of wood to reduce smoke.
- Avoid burning clean wood waste such as leaves and brush. If possible, recycle yard waste by shredding or chipping it at home or use a registered collection site. Never burn trash.

While these actions will contribute a little bit to reducing ozone levels, they will be completely negated by the construction and operation of this new super-polluter. If this plant is built and operating, IDEM and the EPA will be issuing many, many more Ozone Alert Days. It may even reach the point that we will have OADs nearly every day. Is that what you want for the state of Indiana? I know that those of us living in Southwestern Indiana certainly don't want it.

Please deny Riverview Energy's air permit application. Please do everything in your power to protect the beauty of Southern Indiana, and to protect the health of the citizens who live here.

## Mary and Michael Schriefer Comments and IDEM Responses

On December 4, 2018, Mary and Michael Schriefer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mary and Michael Schriefer Comment:**

We are writing in opposition to the proposed Coal to Diesel Plant in Dale, Indiana. We oppose it for several reasons. It has the potential to ruin the rural landscape in Spencer County. Farmers in our area plant crops to feed farm animals and local residents. We have local farmers that are producing organic foods so potential for pollution to our air, land and water is a concern for them as well as those of us who raise gardens at home. This type of industrial complex will also be an eyesore for the landscape. Every year we read about losing more and more acres of land to development and the shrinking of rural areas.

We read in the Evansville Courier and Press, November 2, 2018 an Associated Press article saying there is an Indiana Grown state program that devotes itself to finding new markets for Indiana-grown foods aimed to expand Hoosiers school districts' access to local foods. How can that succeed if rural land is taken for this type of project and our existing farm land is polluted?

USA Today reported wildernesses are rapidly disappearing. Spencer County is home to the Lincoln State Park and the Lincoln National Park. We believe the pollution from this plant will eventually destroy these two important parks which area residents used for recreation.

We know that IDEM has no ozone monitors in Dubois, Pike, Crawford or Spencer counties, and there is only one monitor for particulates in Dale. For an office that does not monitor our air quality and has no health experts on staff, how can you in good conscience allow this type of industry in Southern Indiana? IDEM issued one of many Air Quality Action Days on Wednesday, Sept 18, 2018 for our area and "advised" citizens to help reduce ozone by 1) walking, biking, carpooling or using public transportation (not possible in rural areas), 2) avoid using drive-throughs, 3) avoid refueling vehicles, 4) turning off engines when idling for more than 30 seconds, and 5) conserving energy by turning off lights or setting air conditioning to 75 degrees or above. Good advice, but why do WE have to do all these things when your department is not monitoring pollutants and demanding clean energy be the priority everywhere?

Also, why are we expected to welcome this C2D plant while northern Indiana (NIPSCO) is speeding up plans to retire coal-fired plants?

For these and more reasons we ask that you not allow the Coal-to-Diesel Plant for permit number T147-39554-00065 to be built in Dale, Indiana.

### **IDEM Response to Mary and Michael Schriefer Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 13 - Ozone Alert Days
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

### Mr. Aaron Hopf Comments and IDEM Responses

On December 4, 2018, Mr. Aaron Hopf, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Aaron Hopf Comment:

On 10/31/18 the Dubois County Herald reported that IDEM determined, in a draft permit, that the Riverview Energy coal-to- diesel plant proposed for Dale IN will not have "significant impact on air quality and overall health in the region".

The article went on to report "According to the Riverview Energy's draft air permit, the proposed facility would emit hazardous air pollutants (HAPs) in excess of the Environmental Protection Agency's significant impact levels. According to a Courier and Press story, those are nitrogen dioxide, sulfur dioxide and fine particulate matter". In Appendix A, Table 2, of your permit, it is stated that the plant will allow 26 tons per year of Hazardous Air Pollutants into our area's atmosphere - including benzene, n- Hexane, toluene and xylenes, all known carcinogens.

If the facility will emit hazardous air pollutants in excess of the EPA's "significant impact levels", how can IDEM state that the emissions will NOT have a significant impact? The IDEM statement defies logic, and makes no sense.

In addition, the article reported "No adverse impacts on the surrounding area are expected, the draft air permit states". With the many, many TONS of pollutants that will be spewed by the plant, there most definitely WILL be adverse impacts on the surrounding area.

And, the plant is utilizing asbestos, which is mentioned 14 times in the October 15 draft permit. Asbestos, which was once considered "safe" has been determined to be highly dangerous and requires haz-mat specialists to remove it from existing buildings and other installations. What is being done to protect the workers and the public from this asbestos? What is being done to protect the workers and the public when the asbestos is damaged and exposed?

Section C.11(d) in your draft permit states that whenever a continuous emission monitoring system is down for more than 24 hours, the Permittee "shall follow good air pollution control practices". Its daily operation will pump many, many TONS of pollutants into our atmosphere. Its daily operation, even if everything operates according to the proposed plan, would be as far removed from "good air pollution control practices" as can be.

If this plant is so great, why is it proposed for an area so far removed from the homes, families and businesses of the owners of Riverview Energy? They don't want it in their backyard to adversely affect their health and region either. They selected an area of Indiana that is already known as the "Sacrifice Zone" due to the number of super-polluters already in the area. Would you want this plant within 5 miles of your home? Within 1 mile of your children's elementary school? Within 1 mile of your parents' nursing home?

Please deny the Riverview Energy air permit. Do what's right for the Hoosiers you are supposed to be protecting.

#### IDEM Response to Mr. Aaron Hopf Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues,

- Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
  - IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

With regard to so much of the comment as concerns asbestos-containing materials, IDEM, OAQ notes that the word "asbestos" appears thirteen times in Condition C.7 - Asbestos Abatement Projects, including once in the condition title. The condition title also appears in the table of contents. IDEM, OAQ considers the remainder of the commenter's paragraph to be the same as that portion of Mr. Paul Hess Comment 1 that concerns asbestos-containing material. See IDEM Response to Mr. Paul Hess Comment 1.

No changes to the draft permit were made as a result of this statement.

### **Ms. Joan Heeke Comments and IDEM Responses**

On December 4, 2018, Ms. Joan Heeke, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Joan Heeke Comment:**

On IDEM's website (<https://www.in.gov/idem/>) the very harmful effects of Pollutants are listed, specifically Ozone and PM2.5 (particulate matter that is 2.5 micrometers wide or smaller - or one-thirtieth the diameter of a human hair).

Ozone is formed from a reaction between volatile organic compounds (VOCs) and nitrogen oxides (NOx). The proposed Riverview Energy Coal-to-Diesel plant will emit 175 TONS of VOCs and 184 TONS of nitrogen oxides. And over half of the Volatile Organic Compound (VOC) emissions from this plant are expected to come from "Fugitive Emissions" (uncontrolled leaks). Those leaks during operation of the plant are apparently expected to happen. Those "leaks" will only escalate with every passing year as equipment ages and fails. And "leaks" will occur during the start-up phase, as well, when things aren't working just quite how they are supposed to.

From your website: "Because PM2.5 is extremely small, the particles can deposit deep in lungs and are difficult to exhale'.... Being exposed to PM2.5 may cause coughing and difficulty in breathing. Exposure over several days may increase the chance of these symptoms. Health risks are greater for individuals with heart or lung diseases such as coronary artery disease, congestive heart failure, asthma, chronic obstructive pulmonary disease (COPD) and diabetes." The air permit application states the plant will emit 139 tons of particulate matter.

Your website goes on to describe Sensitive Groups as people with lung disease, older adults and children who are more vulnerable to ozone, and people with heart and lung disease, and older adults and children who are more vulnerable to PM2.5.

Spencer County currently has no monitor to measure ozone. There are monitors in surrounding counties that show ozone problems already exist.

With all of that being said, how can you possibly make a draft statement that the proposed plant would have "no significant impact on the air quality and overall health in the region". Especially since the plant will be located within one mile of an elementary school and a nursing home - exactly the people who are most sensitive to the effects of ozone and PM2.5. The plant will absolutely have a significant impact on our air quality and on our health.

Because of the nearness to the elementary school and the nursing home, (the most sensitive groups), the air quality standards should be much more stringent for this plant. Please stand up for the health of the children, the elderly, and the ordinary citizens of the Southwestern Indiana

area whose health will be adversely affected by this awful plant. Please deny air permit application T147-39554-00065.

**IDEM Response to Ms. Joan Heeke Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Ms. Molly Stenftenagel Comments and IDEM Responses</b>
---

On December 4, 2018, Ms. Molly Stenftenagel, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Molly Stenftenagel Comment:**

Please deny the air permit application T147-39554-00065 submitted by Riverview Energy for the coal-to-diesel plant proposed for Dale IN.

Proponents of this plant claim:

- JOBS -The plant proposal claims to create 225 to 255 new jobs. We already have such low unemployment that existing companies cannot find workers to fill the available positions.
- CONSTRUCTION JOBS FOR LOCAL CITIZENS - Union boilermakers and construction workers have always traveled across the country to work on large construction projects. That will be the same case here. The union workers will travel here to work on the construction of the plant, then they will move on to other jobs elsewhere. They will not choose to locate here and will not do anything to improve our local economy.
- POPULATION INCREASES -The workers who will run this plant will not move to and live in Spencer County. They will live as far away from the plant as possible and commute to avoid the stench and pollution. The AEP power plant and AK Steel have proven that NO ONE wants to live anywhere near these super-polluters. Rockport is the city nearest both of these plants. The population of Rockport has decreased by several hundred residents since those two plants were constructed. If you look at both of those plants, you will see there-are no housing developments nearby, no cities, no development. No one wants to be anywhere near them. The same will happen to Dale. Citizens will move away and no new residents will replace them.
- CORPORATE TAXES TO BE USED FOR INFRASTRUCTURE IMPROVEMENTS -The Linconland Economic Development Corp no doubt promised so many tax abatements that there won't be any worthwhile tax money for many years. By that time, the plant will have closed its doors and the company will have gone bankrupt because the technology is not feasible and not sustainable. The local government and residents will be left to deal with a toxic waste dump. The last large super-polluter brought to Spencer County by LEDC (AK Steel) has failed to pay the taxes that they were responsible for. It has already cost Spencer County several hundred thousand dollars in legal fees to try to collect the taxes due.

- IMPROVED ROADS - Since the tax money will be non-existent, there will be no road improvements. The many, many trucks that will be necessary to haul heavy loads to and from the plant will destroy the roads, so the county's roads will be much worse off.
- THE PLANT WILL BE CLOSELY MONITORED BY IDEM AND EPA -This also is non-existent There are no monitors in Spencer County to measure the toxic emissions that will be spewed by this plant There is only one monitor at David Turnham Elementary School in Dale to monitor PM2.5. NONE of the other deadly chemical emissions will be monitored by IDEM or EPA
- NEW TECHNOLOGY -The technology to be provided by Kellogg Brown & Root (KBR), under licensure to Riverview Energy, is nearly 100 years old. There are no plants like this anywhere in the US for a reason -this technology is not economically feasible. And KBR has already demonstrated a complete disregard for human life. Because of KBR's deceit and corruption, civilians and US military personnel have died and/or are suffering devastating illnesses. See the article at <https://www.houstonpress.com/news/blood-money-6592441> for the horrifying details.

We do not want this Riverview Energy plant. Please deny the air permit application. You have no way to monitor the awful pollutants, nor to fine this company that will no doubt change hands many times before finally going bankrupt. And even if you would be able to collect any fines, what good will that do to the area residents who will suffer the consequences of the many, many tons of pollutants produced by this plant?

Please deny the Riverview Energy air permit T147-39554-00065.

#### **IDEM Response to Ms. Molly Stenftenagel Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Ms. Andrea Hoelscher Comments and IDEM Responses</b>
---

On December 4, 2018, Ms. Andrea Hoelscher, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Andrea Hoelscher Comment:**

I am writing to express my passionate opposition to the building of a coal-to-diesel refinery in Dale, Indiana (permit number T147-39554-00065).

I live not far from Dale, and I am very much concerned about the consequences of this new plant for the health of my family. The residents of southwestern Indiana already have to cope with large amounts of pollution from coal-fired power plants, a vast aluminum processing plant, and other major sources. The proposed coal-to-diesel plant would compound our problems in a major way. Furthermore, the massive scale of the proposed plant would detract from the region's natural beauty, and the nasty sulfur smell it would emit would be a constant irritant. Who would want to visit this area, let alone relocate here, if the smell of rotten eggs were always in the air?

In addition to the added pollution, the ugliness of the plant, and the terrible smell, I am very worried about how this plant would contribute to global warming. According to current estimates, the plant would generate 2.2 million tons of carbon dioxide a year, which would only make our climate crisis worse. Our generation needs to make sound decisions that will help ensure that our children and grandchildren will inherit a world in which they can thrive.

Thank you for taking the time to read my concerns. Please do the right thing: Take a stand against this awful refinery!

**IDEM Response to Ms. Andrea Hoelscher Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Diane E. Hoppenjans Comments and IDEM Responses</b>
--

On December 4, 2018, Ms. Diane E. Hoppenjans, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Diane E. Hoppenjans Comment:**

Dear IDEM Commission Members, earlier this year, I had written to Senator Mark Messmer about my concern of the experimental Riverview coal-to-diesel plant in Dale, Indiana. As you know the plant could emit 184 tons of nitrogen oxide, 255 tons of carbon monoxide, 120 tons of sulfur dioxide, 139 tons of particulate matter, 2.2 million tons of carbon dioxide, and 32 tons of hazardous air particles in our air every year. This in Spencer County, a county that ranked 23rd out of 3,142 in total toxins released.

Six of the seven pollutants tracked by IDEM are not monitored in Spencer County. In 2016, Indiana released more toxic chemicals than 44 other states!!!! No wonder Riverview is looking to locate here.

Year ago, the Pride of Place Committee of Ferdinand, IN (just downwind from Dale) was presented with an award from The Southern Indiana Rural Development Project, Inc. for bettering our community. We continue doing everything in our power to improve the lives of our fellow Hoosiers. Are you?

No need to throw "JOBS" at us as a reason for approving this proposed plant! The unemployment rates in Spencer and Dubois Counties show we are not this desperate for jobs. Health is a much greater concern: heart attacks, strokes, asthmas, COPD, early death, reproductive and developmental harm.

As Senator Messmer stated, "The legislature does not have oversight authority of the agencies under the executive branch, but the GOVERNOR does." Capitalization was added by me here, to

emphasize that we understand who has our lives in HIS hands! And we understand, he will be making his decision based on your recommendation. So, you have our lives in YOUR hands, as well! Can you live with yourselves if you recommend further pollution of the air we breathe daily? Shouldn't you be working to improve our standards? Why are you not tracking pollutants in Spencer County at this time? How many more deaths do you want on your hands?

Please IDEM Commission Members, please consider the impact this will have on us! Show us that you ARE doing everything in your power to improve the lives of your fellow Hoosiers!

#### **IDEM Response to Ms. Diane E. Hoppenjans Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Mr. John Pund Comments and IDEM Responses**

On December 4, 2018, Mr. John Pund, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. John Pund Comment:**

Please deny Riverview Energy's air permit application T147-39554-00065. Re: the coal-to-diesel plant proposed for Dale IN.

Because of the deadly pollution and sulfur smell that will be produced by this plant, the property values of those of us within a 10-mile radius of the plant (and a potentially larger area), will suffer from reduced property values.

If I would choose to sell my home, who would want to buy it and be assaulted by the smell of rotten eggs nearly every day? Who would want to move to an area that will have Ozone Alert Days issued by IDEM and the EPA most days in the summer? And during those Ozone Alert Days we are advised to take measures to reduce carbon emissions, while at the same time, Riverview Energy will be allowed to emit many, many TONS of carbon emissions on a daily basis. Where is the sense in that?

I and my neighbors, family and friends take pride in our homes. We maintain them and improve them in order to preserve and increase the property values. It is not right that a big conglomerate from hundreds of miles away could be allowed to move in, pollute our environment and destroy our property values. I can't imagine that the good folks of Greenwich, Connecticut, who live near the home of Riverview Energy president Greg Merle, would allow this terrible plant to be built in their neighborhood, and within one mile of their schools.

Please deny the Riverview Energy air permit.

**IDEM Response to Mr. John Pund Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 13 - Ozone Alert Days

No changes to the draft permit were made as a result of this statement.

<b>Mr. Josh Stenftenagel Comments and IDEM Responses</b>
--

On December 4, 2018, Mr. Josh Stenftenagel, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Josh Stenftenagel Comment:**

I oppose the Riverview Energy plant proposed for Dale IN, Permit# T147-39554-00065. Please deny the air permit application.

I read about your preliminary draft that found there would be "no significant impact" on the air quality and overall health in our region. It is my understanding that some of the monitors used in making your mistaken decision are located in far-northern Indiana! How can that possibly carry any weight on the air permit for a plant that will pollute our Southwestern Indiana region? Indiana is a very long state from north to south. And Indiana reaches all the way to the Ohio River, lest those in Indianapolis have forgotten.

It is my understanding that there is only one monitor in Spencer County to measure any sort of pollution. That monitor is at David Turnham Elementary School in Dale and monitors only PM2.5 particulate matter. And I seriously doubt that IDEM pays any attention to that monitor. The proposed coal-to-diesel plant will emit many, many tons of hazardous and deadly chemicals into our environment, polluting our air, our soil, our water, our vegetation. None of those toxins will be monitored by IDEM or the EPA.

The children who attend David Turnham Elementary School will be within one mile of this super-polluter. They will be exposed to the deadly toxins every day from the age of 4 through the age of 12. Would you choose to have your children exposed to the same?

It has been proven over and over in this country that the most awful polluters are located in areas with lower income levels and lower education levels, while the people profiting from those plants are safely ensconced in areas with clean air. Spencer County already has more than its share of super-polluters. Yet Spencer County is an area with lower income levels, so that apparently makes it a target for even more highly-polluting industries.

We have borne more than our share of polluting industries. We do not deserve to be saddled with another one.

Please DENY the Riverview Energy air permit application.

### **IDEM Response to Mr. Josh Stenftenagel Comment:**

The ambient air monitor (Air Quality System #181470009) located at the David Turnham School in Dale, Indiana (Spencer County) takes a 3-day intermittent PM<sub>2.5</sub> concentration measurement (noncontinuous 24-hour data sample). Therefore, IDEM, OAQ records the 24-hour PM<sub>2.5</sub> concentration once every three (3) days.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Mr. Rick Heeke Comments and IDEM Responses</b>
---

On December 4, 2018, Mr. Rick Heeke, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. Rick Heeke Comment:**

I read the news release that IDEM issued a draft permit and stated that the Riverview Energy coal-to-diesel plant proposed within the city limits of Dale IN would have "no significant impact" on the air quality or overall health in our region.

With no air-quality monitors in the Dale area, what are you basing your "no significant impact" judgment on? You really have no measurement of the pollution already in our area from the well-documented "super-polluters", American Electric Power (AEP) and AK Steel, that are located nearest to this newly-proposed super-polluting coal-to-diesel plant.

The US Environmental Protection Agency ranked Spencer County 23rd for toxic emissions among all 3,142 counties in the country in its Toxic Release Inventory. We really don't want to add another super-polluter and climb up a few more notches closer to the number one position. That is not a designation we aspire to.

Your preliminary finding also determined that the plant would not adversely impact visibility, soil quality, wildlife and vegetation in the area. How can you possibly come to that determination? This plant will emit many, many TONS of additional contaminants. Those TONS of contaminants WILL settle into the soil, it WILL affect vegetation, and because of the contaminated soil and vegetation, it WILL affect wildlife, and it WILL settle into the bloodstreams of humans, and once in the bloodstream, it WILL affect every organ in the body.

According to your draft finding, an additional 4.6 people will develop cancer when exposed to this plant's emissions. How many hundreds more will be affected by the many other diseases and ailments caused by this plant's outpouring of TONS and TONS of pollutants? Studies by the journal of the American Medical Association and the American Heart Association state that exposure to particulate matter PM<sub>2.5</sub> causes cardiovascular disease, heart attack, stroke, and

lung cancer. The EPA and World Health Organization link air pollution to heart attacks, strokes, asthma, COPD, early death, reproductive and developmental harm (birth defects).

We already know that KBR, the "brains" behind the proposed Riverview Energy plant, exposed National Guard soldiers to deadly chemicals, causing very serious illnesses and DEATHS! (See <https://www.houstonpress.com/news/blood-money-6592441>).

I am sure that IDEM and EPA also considered the effects of those chemicals "insignificant". Now put yourself in the place of the soldiers and their families who suffered the consequences of those "insignificant" chemicals. And put yourselves in the place of the citizens of Southwestern Indiana who will bear the effects of this deadly plant for generations to come.

Please deny the air permit application submitted by Riverview Energy. Please help protect the health and the lives of the Hoosiers who live in this area.

#### **IDEM Response to Mr. Rick Heeke Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Mr. Matt Krynski Comments and IDEM Responses**

On December 5, 2018, Mr. Matt Krynski of Valparaiso, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Mr. Krynski repeated some of the same comments in an email on December 7, 2018.

#### **Mr. Matt Krynski Comment 1:**

I'm dumbfounded to have recently learned that the Indiana Department of Environmental Management is applying for a permit to construct a new coal plant in Spencer County, Indiana. In an era when all disciplines of science point to man's extraction, use, and disposal of fossil fuels as being the primary cause of climate change and global warming, the notion of building a brand new coal plant astounds me. I'm shocked. I'm embarrassed.

The complete disregard for the future health of our planet and the current health of the citizens of Spencer County is reckless and inhumane, and I simply cannot wrap my head around why anyone would find this proposal to be a sound and responsible decision.

I disapprove of the permit being granted and will actively campaign against this. I'm still dumbfounded by the notion that we're entertaining a new coal plant considering the scientific devastating impact of fossil fuel emissions to human health and the climate. How is this even a thing???

**IDEM Response to Mr. Matt Krynski Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mrs. Nancy Winternheimer Comments and IDEM Responses</b>
---

On December 5, 2018, Mrs. Nancy Winternheimer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mrs. Nancy Winternheimer Comment 1:**

With Southern Indiana already leading the nation in pollution, it is unthinking, thoughtless and uncaring to consider placing this coal-to-diesel plant here.

**IDEM Response to Mrs. Nancy Winternheimer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Mr. Mark Hallett Comments and IDEM Responses</b>
---

On December 5, 2018, Mr. Mark Hallett, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Mark Hallett Comment 1:**

Our civilization faces the most serious crisis in its history. It is difficult to overstate the threat of climate change. But because it is such a slow moving emergency, we have trouble grasping the urgency this catastrophe requires.

**IDEM Response to Mr. Mark Hallett Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### **Ms. Pamela Schatz Comments and IDEM Responses**

On December 5, 2018, Ms. Pamela Schatz of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Pamela Schatz Comment 1:**

I am against the construction of coal to diesel plant in Spencer County. 1. Air quality concerns, 2. Water waste, why don't they reuse the water?, 3. The "high paid professionals" will prefer not to live close to the plant due to health concerns and preferring more cosmopolitan amenities, 4. The construction jobs will be short term. For all of these reasons, I, as a resident of Spencer County, am against this plant for health reasons that I feel have not been fully explored and a perceived financial benefit that will not materialize. Our county already has a very high pollution rate, please show you are putting people's health first.

#### **IDEM Response to Ms. Pamela Schatz Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mrs. Carol Hugenberg Comments and IDEM Responses**

On December 5, 2018, Ms. Carol Hugenberg of Dubois County, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Carol Hugenberg Comment 1:**

Please stop this plant from coming and polluting and destroying southern Indiana. Of course it is making false claims about itself. I think I have read it actually had no true statistics, as they were not known. Obviously it is a polluter and needs to find another situation. Or perhaps do something at a tiny scale and measure the pollution. This type of pollution would condemn southern Indiana and ruin its tourist industry and beautiful natural setting. Please stand up to the false claims professed by this company and protect the citizens of southern Indiana.

#### **IDEM Response to Ms. Carol Hugenberg Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Mr. Dennis Waninger and Mrs. Carol Waninger Comments and IDEM Responses**

On December 5, 2018, Mr. Dennis Waninger and Mrs. Carol Waninger, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

##### **Mr. Dennis Waninger and Mrs. Carol Waninger Comment 1:**

We are voicing our opinion about the new Coal to Diesel plant that they want to build at Dale, Indiana. We definitely do not want them to build it. Our air in and around here would really be bad. Thanks for listening.

##### **IDEM Response to Mr. Dennis Waninger and Mrs. Carol Waninger Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Ms. Amanda Rodenberg Comments and IDEM Responses**

On December 5, 2018, Ms. Amanda Rodenberg of Evansville, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

##### **Ms. Amanda Rodenberg Comment 1:**

Consider the consequences of putting more pollution in our air here in southern Indiana. The people of Southern Indiana do not need to bear the brunt of the need to burn coal to make diesel. We as a community are trying to save our children and future generations from the power plants that already exist, this is back pedaling when technology is so advanced. Say no to allowing this Coal-to Diesel plant to ruin the farmers, families and businesses in the area that have worked hard for what they have.

##### **IDEM Response to Ms. Amanda Rodenberg Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Mr. Glen Steltenpohl Comments and IDEM Responses

On December 5, 2018, Mr. Glen Steltenpohl, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Glen Steltenpohl Comment 1:

I really do not understand why Indiana would allow an industry the causes such a level of pollution that I only saw in developing countries (third world). Why the State would open itself up to law suits due to the pollution put into the air, ground, water, and the food that is produced here. I figured after 28 years with the Army I had seen the last of such pollution, but I guess not. I grew-up in Indiana and the Ohio River Valley and as bad as it is, it has gotten better but I guess not.

#### IDEM Response to Mr. Glen Steltenpohl Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Mr. Nolan Brinkman Comments and IDEM Responses

On December 5, 2018, Mr. Nolan Brinkman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Nolan Brinkman Comment 1:

My name is Nolan Brinkman. I was born and raised in Spencer County. I attended Purdue University. I am proud to be from the State of Indiana. Though I no longer live in Indiana, I have many family and friends there and I visit several times a year. As I write this in December, I am reminded that there truly is no place like home for the holidays.

However, if the proposed Coal to Diesel plant in Dale, my hometown, is approved, home will no longer be recognizable to me. I will not fill this letter with the horrifying statistics about all the pollution this plant will cause. You are well aware of these facts. It seems to me that the only benefit of this plant is an economic benefit, but this supposed economic benefit will not last.

Coal and the fossil fuel industry is on the decline as the demand for renewable energy sources increases. The presence of this plant will scare away Spencer County's many tourists. And for what? A few hundred jobs that will not last and to make a bunch of strangers, who have never set foot in Spencer County, who will never meet its residents, who will never know its beauty, who will never know its true potential, much richer.

This plant will have long term negative effects on Spencer County's economy. I am young, I have not yet made plans to settle down or start a family, but if this plant is built, any inclination I had to return to Spencer County will be gone. Why would I want to live in the polluted wasteland that was once my hometown?

I am not the only person who feels this way. A majority of Americans know that CLIMATE CHANGE IS AN UNDENIABLE FACT. An overwhelming majority of millennials like myself know that CLIMATE CHANGE IS AN UNDENIABLE FACT. Young people from Spencer County will leave if this plant is built. They will go off to college and find jobs elsewhere as Spencer County's

economy crumbles and the only thing left in town is a hideous, unhealthy, unethical, super polluting Coal to Diesel plant.

I strongly oppose the construction of this plant and hope IDEM will do its job to protect the environment for all Hoosiers.

#### **IDEM Response to Mr. Nolan Brinkman Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Lonnie Valentine Comments and IDEM Responses**

On December 5, 2018, Lonnie Valentine of Richmond, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Lonnie Valentine Comment 1:**

As a resident of Indiana for 30 years, I am aware of the decline in Hoosier health, much of this related to environmental degradation. The people of southwestern Indiana are speaking up for their health and safety as they have done before. That area has four of the top coal plant polluters in the US. The Riverview coal-to-diesel plant will further degrade the health of people living there and contribute to climate change. Please do not issue a permit for this destructive plant.

According to the Indy Star article yesterday, this new plant will add "millions of tons of climate change-inducing greenhouse gases and dozens of tons of cancer-causing chemicals into the air each year, according to a draft permit for the facility." Specifically, this plant will produce 2.2 million tons of carbon dioxide, more 100 tons of particulate matter, and more than 60 tons of hazardous air pollutants.

For the Indiana environmental agency to say that this plant's emissions would have "no significant impact" is false. The impact just on those living there will be significant for them and this plant will contribute to the continued alteration of our climate for the worse. As Randy Vaal, a retired chemical engineer who worked in the oil and gas industry for many years who was quoted in the article said: "For the state to claim that this will have no significant impact is, in my opinion, simply false." Please urge that no permit is given for the Riverview plant.

#### **IDEM Response to Lonnie Valentine Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

### **Ms. Liz Robb Comments and IDEM Responses**

On December 5, 2018, Ms. Liz Robb of Unionville, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Liz Robb Comment 1:**

Please record my **opposition** to the proposed Riverview coal to diesel plant in Dale. There is absolutely no reason to be spending our resources on extracting more fossil fuels and adding carbon load to the atmosphere. Let's turn all available new infrastructure and investment onto developing renewable resources for all of our energy needs.

#### **IDEM Response to Ms. Liz Robb Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

### **Mr. Bill Bales Comments and IDEM Responses**

On December 5, 2018, Mr. Bill Bales of Carmel, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Bill Bales Comment 1:**

I am writing to urge the IDEM to reject the application of Riverview Energy Corporation for a permit to build a coal to diesel conversion plant in southern Indiana. I believe that this project is not worth the potential costs to health, the environment, and the taxpayers of Indiana. It is past time for citizens and their government representatives to recognize the extreme danger posed by global warming and climate change. We should not be starting projects that add to the pollution of our planet.

#### **IDEM Response to Mr. Bill Bales Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. Mark Bryant Comments and IDEM Responses**

On December 5, 2018, Mr. Mark Bryant submitted written comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Mark Bryant Comment 1:**

My name is Mark Bryant and I am a member of Valleywatch Inc. based in Evansville, Indiana which is an all volunteer and non-profit organization. Our organization's mission is to protect the public health and environment of the lower Ohio Valley. We are here today to comment on the newly issued draft permit (T147-39554-00065) for a coal to diesel toxic fountain that Riverview Energy has proposed to build within the town of Dale, Indiana.

A steady 10 mile per hour ENE wind and three hours is all that separates the Valleywatch Office from any airborne pollution that is generated within the Dale, Indiana general area. If the pollution from this proposed Riverview Energy facility stopped at the Spencer County boundary, most of us might feel that there was no need to voice concern for something that does not directly affect their health and well-being.

The mischaracterization of "no significant impact" that IDEM reached as a basis for issuing this permit, with regard to the toxic pollution releases by this facility, is at the very least dangerous. We can say, with scientific certainty, that the continued operation of this facility will condemn hundreds if not thousands of the local population to prolonged disease and early deaths.

Thank you for allowing me to voice my concern about this proposed facility.

#### **IDEM Response to Mr. Mark Bryant Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

### Mr. Mark W. Gogel Comments and IDEM Responses

On December 6, 2018, Mr. Mark W. Gogel of Dale, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Mark W. Gogel Comment 1:

I am a lifelong resident of Dale, IN living 1/2 mile from proposed location. I attended the hearing last night at Heritage Hills High School. I urge you to deny the air permit for the proposed plant. It makes no sense to me that you and IDEM would even consider this plant in its proposed location. There is such a high concentration of polluting factories and power plants in the immediate vicinity already in place. You as our state agency that is in place to "protect" our air and water should not allow another polluter of this magnitude to be built. It truly is "your job" to protect the health and welfare of tax paying citizens.

I am also concerned that you would use data gleaned from a monitor all the way in northern Indiana. We as lifelong residents deserve better protection from you and accurate information to even consider this site. Why have there been no extra monitors placed in the vicinity to see where are air quality really stands? I am also concerned about the water issues, rail traffic, truck traffic. There are so many unknowns and it seems to us, as the people that are going to have to live the rest of our lives here, we should get better treatment.

I also, having lived here my whole life, will not accept the argument of such an increase in other businesses and economic boom. I have been here through the building of the AEP Plant, AK Steel etc.. If you remember, we were told the same grandiose stories of all the growth coming. I am still waiting for this. My property taxes have not gone down, we have more pollution, and if you check population data going back to the late 70's, county population has actually dropped.

Thank you for taking the time to read this. Please protect what we have in my area. I truly love Indiana and don't want to be forced to move away from the place I have called home for 58 years.

#### IDEM Response to Mr. Mark W. Gogel Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring

No changes to the draft permit were made as a result of this statement.

### **Mr. Harold Barth Comments and IDEM Responses**

On December 6, 2018, Mr. Harold D. Barth of Jasper, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Harold D. Barth Comment 1:**

Being a concerned member of this world we live in, I am appalled at the way we, as inhabitants of this planet are destroying the environment by pollutants endangering humans, animals, and plants. We should be working together to create a more livable surrounding for the future inhabitants on the place we call earth. I attended the C2D forum at Heritage Hills auditorium in Spencer Co. to hear the pros and cons of the proposed coal to diesel plant near Dale, IN. To my knowledge, there were more negative concerns than positive ones for the construction of said plant. Needed jobs were the main concern for those in favor of the plant construction. Environmental pollution, noise, human health concerns, and plant and animal devastation were just a few of the reasons for negating the project. Since unemployment in the area is at such a low rate, this seems to cancel out the primary reason for constructing such a facility in the first place.

I am a retired electrical contractor, working in the construction industry for almost 45 yrs. I have lived in Dubois Co. (adjacent to Spencer) most of my life and have yet to see high unemployment in this area, working in Dubois, Spencer and surrounding counties. There are many opportunities for work in the agricultural, construction, commercial and industrial industries. There is no need to construct a plant in the vicinity just for the employment of workers and not see the detrimental results that will bring harm to plants, animals and humans in the surrounding area. Think about your grandchildren. What can we do to secure their future so they may live in an environment that is healthy, clean and life sustaining? In conclusion, may I say this. Don't be selfish and think about how pursuing this venture may benefit all those involved monetarily. Think about how not to pursue this and benefit those now and in the future-physically, mentally, and spiritually. Please do not help those who choose to destroy the environment that we still keep dear to us.

#### **IDEM Response to Mr. Harold D. Barth Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Rena Bever Comments and IDEM Responses**

On December 6, 2018, Ms. Rena Bever, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Rena Bever Comment 1:**

I urge IDEM to take more time before pursuing the proposed coal-to-diesel plant! It will significantly impact the local air quality not only around the local vicinity, but for miles around. Southwestern Indiana already has more bad air quality than most any place in the entire U.S.!

Please grow a conscience and think about your environment and the future environment of your children and grandchildren.

**IDEM Response to Ms. Rena Bever Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Suzanne Krampe Comments and IDEM Responses</b>
---

On December 6, 2018, Ms. Suzanne Krampe, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Suzanne Krampe Comment:**

In late October IDEM released a draft air permit and stated "Riverview Energy's coal-to-diesel plant proposed for Dale will not have a significant impact on air quality and overall health in the region." I don't know what that assessment is based on. According to the Riverview Energy permit application, the plant will release 184 TONS of nitrogen oxide, 255 TONS of carbon monoxide, 120 TONS of sulfur dioxide, 139 TONS of particulate matter, 2.2 MILLION TONS of carbon dioxide and 32 TONS of hazardous air particles every year. The carbon dioxide alone, combined with the output from the Rockport power plant, will be over 900 tons of CO2 per Spencer County resident, or more than 50 times the average consumption per US resident.

The plant will also produce significant amounts of deadly Hydrogen Sulfide gas under high temperature and pressure. The EPA has classified Hydrogen Sulfide as an "Extremely Hazardous Substance"1. Those toxic releases are NOT "insignificant" and will most definitely have a SIGNIFICANT Impact on air quality and overall health. Maybe in IDEM's eyes, the Southwestern Indiana region is already so polluted that another super-polluter wouldn't hurt those citizens in the "Sacrifice Zone". It's clear that IDEM and the government of Indiana are both more interested in attracting outside business and promoting the coal industry than in protecting the health and well-being of Hoosier citizens.

The most heinous aspect of this awful facility is that it will be within 1 mile of David Turnham Elementary School and a nursing home. The young and the elderly are those most at risk from air-borne pollutants. Students at the elementary school will be exposed to these additional pollutants every day from age 4 to age 12 (pre-K to 6th grade). These are very important years in the development of children's bodies. Not only the lungs will be affected. When these microscopic particles get into the blood stream, they will affect every organ in the body. Just the fact that this plant will be within one mile of these institutions, and inside the Dale town limits, should result in even stricter requirements than if the plant was going to be located in an unpopulated area.

In addition to the pollutants that Riverview Energy has named in their air permit application, I am sure there are many more deadly chemicals that will be used, and released into the surrounding environment, that Riverview Energy, and more specifically Kellogg Brown and Root (KBR) have not disclosed. KBR is the company that controls the coal-to-diesel technology that Riverview Energy (just a front for other behind-the-scenes players) will utilize in the proposed plant. KBR has proven themselves to be deceitful, willfully negligent and despicable in their disregard for human life.

See the attached text from an article in the Houston Press regarding the actions of KBR and their treachery against our troops and against their own employees. We cannot trust them to protect our citizens, nor to even accept liability for the devastation they will cause.

My entire family lives, works and BREATHEs in Southern Indiana. It is the most beautiful area in the country and we wouldn't choose to live anywhere else. We do not want this plant, nor any others like it, to move in and pollute our area further. Our home is within 5 miles due East of the proposed plant's location. We will be directly affected by the smell, the air pollution, the water pollution, the soil pollution, and the just-plain-ugliness of this proposed plant. We would have to live with that smell, pollution and ugliness every day of our lives.

All of the towns and citizens downwind of this proposed plant will suffer economically. Ferdinand IN is directly downwind of the proposed plant's location. Ferdinand, along with the rest of this region, has been working very hard, and successfully, to grow its tourism appeal. In addition to particulate matter air pollution, this plant will emit sulfur. (They claim they won't, but they will.) What tourists will want to come to spend time in an area that smells like rotten eggs?

The proposed coal-to-diesel plant is a monstrosity that should not be allowed to destroy our beautiful Southwest Indiana. Nor should it be allowed to destroy our health and welfare, and destroy the value of our homes and businesses.

No matter how "safe" the company claims to be, things always go wrong. Accidents happen. Deaths occur. Evacuations are ordered.

I am pleading with you to deny the air permit application submitted by Riverview Energy, in order to protect the environment in our beautiful Southern Indiana, and the lives and health of the wonderful Hoosiers who live here.

## **Blood Money**

Houston Press  
Craig Malisow / February 15, 2012 / 4:00am  
Basra, Iraq: July, 2003

Larry Roberta, a specialist in the Oregon National Guard, sat on a stack of sacks brimming with one of the most carcinogenic chemicals known to man and chomped on his chicken patty.

Unsuccessful in his mission to swap his rations with any of the British soldiers, who were stocked with heavenly corned beef hash and chocolate pudding, he braved the mystery meat's gooey coating while keeping an eye on the contractors' trailer a few yards away. While the Kellogg Brown & Root guys ate inside the trailer, Roberta could've taken lunch in one of the vehicles, but he figured vehicles were prime targets for any insurgents or Saddam loyalists who might be scouring the area. Better to suffer the hundred-plus-degree heat.

To Roberta's knowledge, the chicken patty, with its gooey coating, was the only toxic substance he was currently in contact with. The sand around the sacks was mixed with a dark-orange, crystalline powder, but it didn't faze him — the entire water-injection facility he was guarding was filthy with chemical residue.

The facility, Qarmat Ali, was a sprawling, approximately 50-acre plant where chemically treated water was pumped deep underground to maintain balance in the reservoirs while the oil was extracted. The plant had already felt the pains from years of U.N. sanctions before looters descended like human twisters in early spring and ran away with whatever wasn't bolted down,

and much of what was, knocking out electricity and leaving some buildings as mere husks. One building was littered with human feces; exposed machinery was coated with sludge and sand and colored powders.

A gust of wind kicked up the orange-tinted sand around the bags, and some blew into Roberta's left eye and mouth, and onto his slimy chicken patty. It burned. He ran a few yards, then grabbed his canteen and tried to wash down the stubborn sand clinging to the back of his throat, but doing so only made him retch.

After collecting himself, he walked back to where he'd been sitting and partially lifted one of the bags. SODIUM DICH was all he could see, and all he could think of was when he used to swim in the ocean as a kid, how his parents warned him not to swallow any of the saltwater, and to shut his eyes tight if he wanted to dive below the surface. Must be some weird sort of salt, Roberta thought. Not a huge deal.

But as the month progressed, he had trouble breathing; he had trouble sleeping for all the coughing, and it hurt to eat and swallow.

Roberta had been sitting on sacks of sodium dichromate, a compound containing hexavalent chromium, an especially hazardous material that most people might have first become aware of from the film Erin Brockovich. Banned for more than a decade in the United States, sodium dichromate had been used at Qarmat Ali as an anticorrosive, and questions surrounding its presence there are the basis of two federal lawsuits filed against Houston-based KBR on behalf of more than 200 military personnel from four U.S. states and England.

According to the lawsuits, filed in Oregon and Houston, KBR health and safety workers knew about the sodium dichromate in April or May of 2003, but did not notify the U.S. Army Corps of Engineers until mid-August, allowing the troops to be exposed to the potentially deadly chemical for months. During that time, according to the lawsuits, KBR personnel deceived the troops by first concealing the chemical's presence, then downplaying its danger. They told soldiers that their bloody noses and breathing problems were due to sand, or too many protein drinks, or pre-existing conditions.

The soldiers' lawyers say that two National Guardsmen who served at Qarmat Ali have died as a direct result of sodium dichromate exposure. But KBR maintains that the Army's own medical evidence proves that no troops suffered dangerous levels of the chemical.

Lead KBR attorney Geoff Harrison told the Houston Press that the mere presence of sodium dichromate at Qarmat Ali does not automatically mean everyone there was overexposed.

"Whether a chemical actually or even likely causes any adverse health effect — no matter how minor — depends on your level, duration and dosage of exposure," he says. "It is meaningless to say, 'There was an exposure,' without analyzing the level, duration and dosage of each individual's exposure. And that work has not been done by the plaintiffs and their hired medical expert at all."

The litigation has produced memos and e-mails showing an alarming lack of communication among and between Army and KBR personnel, especially involving so-called safety officers on both sides who, for a \$7 billion contract, appeared to take a remarkably lax approach to potential health hazards and the concerns of their own men.

However, even if KBR is found liable, an indemnity clause in the company's contract means that it won't have to cover legal costs. There's a reason both KBR and the Army wanted a last-minute addition to the contract to remain classified for as long as possible: It indemnifies KBR for any soldier's on-site injury or death — even if due to the company's willful misconduct.

---

Picture a grain of table salt floating in 1,000 liters of air. Now split that single grain into eighths, and get rid of seven. That remaining eighth is the Occupational Safety and Health Administration's acceptable level for hexavalent chromium exposure for an eight-hour period.

In August 2001, the United Nations, which had enforced sanctions on Iraq and oversaw the attendant Food-for-Oil program, implemented its Phase X. As a part of that phase, Iraq's South Oil Company, which ran Qarmat Ali, put in an order for 4,020 tons of "water treatment chemicals," which included sodium dichromate.

Located in southern Iraq, approximately 70 miles southeast of the confluence of the Tigris and Euphrates — the supposed Garden of Eden — Qarmat Ali was the region's biggest water-injection facility, pumping treated water into the Rumailah reservoir. Built by the Soviets, Qarmat Ali went online in 1982, was crippled during the UN sanctions of the 1990s and was already considered antiquated by the time the U.S. declared war in 2003.

Looting all but leveled the place, and the U.S. wanted to get Qarmat Ali operational as quickly as possible, so it could assist in beating the production goal of three million barrels a day the United States had set for the entire country.

This awesome responsibility fell to TF RIO, Task Force Restore Iraqi Oil, a coalition of military and civilian personnel. Step one was for the U.S. Army Corps of Engineers to award a \$7 billion sole-source contract to KBR, with about \$2.5 billion designated for Qarmat Ali. (At the time, KBR was owned by Halliburton; it separated in 2007 and, according to its Web site, employs 35,000 globally. Because the soldiers' Texas lawsuit mostly concerns Indiana National Guard troops, it was originally filed in Indiana, but dismissed on jurisdictional grounds. The soldiers' lawyers then argued successfully to have it filed in Houston — KBR's headquarters, and, according to the lawsuit, the actual nerve center of the Restore Iraqi Oil project).

The contract was generous beyond the base price: It included a performance bonus if KBR got Qarmat Ali operational before the deadline. But even after the contract was signed, KBR wasn't satisfied: Its contract specialist called the Corps of Engineers back to the table and said the company would not proceed unless the standard-issue indemnity language was modified to protect KBR from having to cover the costs of any litigation arising from injuries or deaths due to the company's willful misconduct. If anything happened, the government would have to cover the cost.

Despite the fact that the U.S. government had so much confidence in KBR's global expertise that it didn't even put the contract out for bid, and despite the fact that Iraq's Ministry of Oil depended on sodium dichromate so much that it ordered it by the ton, it is KBR's de facto position that its people had no reason to even consider the fact that the chemical might be present at Qarmat Ali.

This oversight is understandable once one examines one of the highly technical skills required to nab a multibillion-dollar sole-source government contract to restore an entire nation's oil industry: assumption.

To wit: Here's one of KBR's health, safety and environment managers, Johnny Morney, in a deposition, explaining the thought process upon entering the largest water-injection facility in southern Iraq: "The facility at Qarmat Ali is a water-treatment facility. So...in the States, you know, there's no real use of any hazardous chemicals used there. So we went in assuming that this was just a water-treatment plant."

Though KBR contractors were, of course, not military, they were in a war zone, and the area around Qarmat Ali was not immune to enemy fire, IEDs and unexploded mines. They needed military protection, which came in the form of National Guard units from Oregon, Indiana, South Carolina and West Virginia, as well as British troops. At night, the contractors slept in a Kuwait Crowne Plaza hotel, where a KBR manager had to issue a memo scolding them for bringing "ladies of the evening" back to their rooms.

---

Meanwhile, Indiana National Guard Lt. Col. Jim Gentry and his men stayed at Camp Wolf at the Kuwait City airport at night. Every evening, they stomped the orange- and yellow-stained sand off their boots and shook it from the crevices in their uniforms. Gentry figured the stuff covered half of Qarmat Ali, but no one wore personal protective equipment and no one said it was anything significant, so he didn't really think about it. When he and his men started getting nosebleeds, chest pains and rashes, KBR supervisors said it was the dry desert air, or maybe his men were just allergic to sand.

Gentry, 46 at the time, had signed up with the National Guard in 1981. He had wanted to serve his country — and the extra \$89 a month helped support a growing family. He was proud of his service in the Guard, especially the help he was able to provide the Iraqi people. Sure, he and his men found caches of weapons and IEDs, but they also dug wells for schools and delivered nearly two tons of school supplies donated by the good people of Indiana, and that's what he was most proud of. He had a soft spot for kids — he had five of his own, and he taught at a junior high, where he also coached basketball and football. He'd once owned a restaurant, and he worked many years as a mechanic, but it was the work with kids he most loved.

By late July 2003, Gentry would later say in a deposition, contractors murmured about how the yellow and orange sand was really contaminated with a cancer-causing agent, and Gentry's men got worried. Gentry went to his immediate commander, and then in August he wrote the general of the 220th MP Brigade. The general, as far as Gentry knew, forwarded the letter up the chain. He hated that his men came to him, and he could tell them nothing.

Russ Powell, a medic with the West Virginia National Guard, had the same frustrations. He could do a quick patch-up, but he wasn't a doctor. Could it just be the flu?

"They kind of look up to you," Powell told the Press, "...and it was just frustrating for me, 'cause one person would get it, then the other person would have it, then all of them have it — including myself. And I'm sitting here [thinking], 'What the hell's wrong with us?'"

Ed Blacke, KBR's health, safety and environment coordinator, had an idea what was wrong, and he was already pissing off his superiors when he told them he had discovered sodium dichromate on site. From his very first visit, he'd been worried about the stained soil and sand. He first got to Qarmat Ali July 10, and when he asked his colleagues who'd already been there about the stuff, he was told it was a non-issue. But the more time he spent at Qarmat Ali, the more complaints he heard from contractors and soldiers alike of bloody noses, spitting up of blood, rashes, sinus and eye irritation. He decided to take his interpreter along on an in-depth assessment, and, he'd later testify, he was told by some of KBR's subcontractors that sodium dichromate had been used at the plant for years.

When Blacke raised this issue with his supervisors, he later testified, he was told to stop agitating the men. He was told to shut the hell up. When he didn't, he was put on a plane back to Houston.

Even prior to Blacke's pernicious muckraking, a U.S. Army Corps of Engineer safety officer, Michael Remington, had also talked sodium dichromate with KBR.

According to Remington's later deposition, a KBR health, safety and environment manager named Chuck Adams invited him to lunch back at the Crowne Plaza and asked that Remington not put too much information down in writing. Adams was happy to talk about any issues, but there just wasn't a need to document every little thing.

Sodium dichromate may have been a sensitive issue to KBR's safety officers because, by mid-July when the men really cranked up the complaints, the safety officers had known about its presence on site for more than a month.

A June 1 KBR "Project Trip Report" noted the use of sodium dichromate; three weeks later, safety officer Jake Duhon would note in a "Daily HSE Log" that he had had a discussion with employees of Iraq's South Oil Company, who confirmed that sodium dichromate was on site.

"Should be able to use this information for PPE [personal protective equipment] requirements..." Duhon wrote.

Three days after this epiphany about protective gear, according to a KBR e-mail, an environmental engineer explained that another engineer "has asked Houston about using chromate in water treatment. As we are not following any EPA regulation in Iraq facility and this water is used only for water injection, we should not change the chemicals used now in the facilities."

The soldiers never got protective equipment, but in late August, they noticed something new: All of a sudden, KBR employees were wearing Tyvek suits with respirators.

It threw the soldiers for a loop. Why, after months of working at Qarmat Ali, did the contractors suddenly need PPE?

Gentry explained in an affidavit five years later that he asked someone to take a photograph of him, in battle rattle, standing on the orange sand between two contractors in their Tyveks. The contractors had been reluctant.

"Nobody is going to know who you are with your respirator on," he assured them.

On September 8, operations at Qarmat Ali were suspended.

---

Memorandum for Record: Department of Veterans Affairs, Indianapolis VA Regional Office, January 8, 2010:

James C. Gentry, VA File Number 315 66 6760.

Service connection for the cause of death is granted.

The cause of death is recorded as: lung cancer. The veteran was service connected for combined obstructive and restrictive ventilatory defect to include right maxillary sinus adenocarcinoma with metastatic lung cancer at a 100 percent evaluation.

Service connection for the cause of the veteran's death is granted since evidence shows that it was related to military service.

Indiana Joint Forces Headquarters, National Guard, Memorandum for HQ:

In line of duty for exposure to sodium dichromate between June-September 2003.

By authority of the Secretary of the Army.

To the layman, these findings from the Indiana National Guard and the Department of Veterans Affairs might seem like clear-cut statements that Lt. Col. Gentry's lung cancer was caused by his exposure to sodium dichromate.

Harrison, the KBR attorney, of course disagrees. And going straight to the source wasn't much help: A spokesman for the Indiana National Guard told the Press that its "line of duty" memorandum is not an official statement that the Guard believes Gentry's death was related to the exposure.

Furthermore, both the Indianapolis regional office of the Department of Veterans Affairs, where Gentry was treated for cancer, and the department's national office, which relied on the regional office's medical evaluations, would neither confirm nor deny that sodium dichromate caused Gentry's cancer. A spokesman for the national office explained that, in many cases, once the determination is made that an injury or disability occurred during active duty (or within a year after retirement), it is considered "service-connected." There is not necessarily an investigation into the specific cause.

Because the documents do not officially state that Gentry died as a result of sodium dichromate exposure, KBR's President of Infrastructure was able to exclude Gentry's death from a 2010 op-ed piece he wrote for the Portland Oregonian denying that KBR acted improperly in the handling of Qarmat Ali.

"As the old saying goes, everyone is entitled to their own opinion, but not their own facts," Williams wrote. "...Testing by the Army center showed that no troops were harmed and that they were unlikely to develop future injury from any limited exposure they received while in Iraq."

Williams was referring to the U.S. Army Center for Health Promotion & Preventive Medicine, which concluded in May 2010 "that long-term health effects related to cancer...were very unlikely from the exposure as understood."

It was probably for another reason, then, that Gentry was diagnosed with lung cancer in late 2007, which then spread from his lung to behind his eye and on up to his brain, while at the same time eating away at his bones to the point that, by February 2008, 60 percent of the bones in his hip and femur were like rotted wood. Surgeons implanted a rod, something his widow Luann says was "extremely painful for a man of his stature and size and pride."

By that time, the couple pretty much lived at the VA, driving two hours from their country home near Williams to Indianapolis. They fell in love with the home when they passed it on one of their motorcycle rides — one of the last Gentry would be able to take — in 2007. It was too expensive at the time, but, just their luck, the price soon dropped, and in November 2007 they bought it.

In a deposition Gentry gave on October 5, 2009, he said, "This is our peaceful little place in the world where we're going to spend the rest of our lives in peace."

Fifty days later, he died.

A death like Gentry's may have been what the Department of Defense's Office of Inspector General warned about in a September 2011 report blasting both Army officials and KBR managers for "not effectively" addressing "environmental hazards" prior to working at Qarmat Ali.

Just who exactly was supposed to address what hazards has been a point of conflict between the Army Corps and KBR, with much of the contention hinging on the meaning of the word "benign" as it appears in the multibillion-dollar Restore Iraqi Oil contract. According to KBR, the Army was supposed to conduct a site assessment and clear Qarmat Ali of any hazards, rendering it "benign," before operations began. Therefore, any sodium dichromate still on the ground was the Army's fault. But did "benign" mean the Army was supposed to clear any military-related, as opposed to environmental, hazards? Because the architects of the contract did not see fit to include a glossary, we may never know.

The DoD Inspector General's report called the Qarmat Ali contract "impractical" and stated that the Army changed the scope of the contract midstream, and "as a result, Service members and DoD civilians were unintentionally exposed to toxic chemicals and the U.S. Government was made vulnerable to potential health care liabilities for individuals exposed to contamination."

The report also concluded that KBR did not "fully comply" with — and the Corps of Engineers did not enforce — U.S. Occupational Safety and Health Administration standards. As a result, "nearly 1,000 U.S. Army soldiers and U.S. Army civilian employees were exposed to sodium dichromate

in the five months it took from the initial site visit until the military Command required personal protective equipment."

Hardly, according to John Resta, scientific adviser to the U.S. Army Center for Health Promotion. He told a Senate committee on Veterans Affairs in 2009 that soldiers at Qarmat Ali participated in a series of town hall-style meetings on the subject and "were provided fact sheets about the potential exposures." (The latter repository of knowledge smacked of junior-high health class, with one fact sheet titled — Scout's honor — "Chromium and You.")

Prior to the town hall meetings, according to later testimony, KBR managers had their own meeting to discuss concerns about sodium dichromate. Ed Blacke told a Senate committee in 2008 that he was escorted from the meeting after a disagreement with another KBR health and safety officer.

According to Blacke, the managers "told the workers at that time that sodium dichromate was at worst a mild irritant, that the plant had been thoroughly checked out and was safe, and they were to get back to work...I was kind of shocked that fellow safety and medical officers were telling outrageous and blatant lies to the workers."

When he questioned the findings, Blacke testified, a KBR manager named Garcia whispered something in his ear that "I cannot repeat in mixed company, but he did indicate some very severe references to my genealogy and my mother and asked me to get outside now or he would ask one of the security people from the Army to remove me forcibly. I did advise Mr. Garcia that it would not be beneficial to his personal health if he attempted to do that."

By the time of the first town hall meeting in September 2003, KBR managers already knew they had a problem on their hands. On July 28, an engineering project manager had e-mailed colleagues that "sodium dichromate is unsafe. Short term exposure can affect people and harm their body. Therefore please advise every body working at the Qarmat Ali water plant to stay away from the chemical feed tanks containing sodium dichromate" [sic].

According to an August 12 Project Trip Report, two KBR safety officers took soil samples at Qarmat Ali, noting that "sodium dichromate is a very toxic chemical and has been shown to have caused cancer in humans" and that "casual exposure has been shown to cause lung damage, liver damage, tooth decay, digestive disorders, and cancer."

The safety officers inspected the mixing room, which "was used to collect spills," and a "chemical sewer and open drainage ditch," and noted that "the conveyor platform, the floor around the mixing tanks, and the sump in the mixing room are stained dark orange and contain piles of dark orange crystalline material (most likely pure sodium dichromate)."

Workers for the South Oil Company ate their lunch on the floor in these areas. One worker, whose job it was to shovel sludge from the mixing-room sump, showed the safety officers the ulcers on his stomach and chest.

Minutes from a KBR meeting from the same week indicate that a project manager "reported that the problem seems worse than initially considered" and that "almost 60% of the people now exhibit the symptoms."

They talked remediation: "a decontamination station where people can wash and change clothes"; covering all working surfaces with gravel; and giving paper masks and goggles to "Halliburton hands."

Nothing about masks and goggles for the troops.

Gentry addressed this delay in one of his depositions: "I understand and accept there's danger with my line of service...What's very difficult for me to accept is if I'm working for KBR and they have knowledge of hazardous chemicals on the ground that can cause cancer and not share that

knowledge, then that is putting my men at risk that is unnecessary. I'm very upset over that...I feel like they should be ashamed that they did that."

By mid-August, soil sample results confirmed sodium dichromate contamination, and KBR formally notified the U.S. Army Corps of Engineers and requested that remediation immediately begin.

In October, the Army's Center for Health Promotion conducted physical exams of the 129 Indiana National Guard troops who were still in Iraq and provided medical history questionnaires to 103 Oregon and South Carolina Guardsmen who were no longer in the country. (The Center also took air and soil samples, which the plaintiffs' lawyers have criticized as being unreliable, since they were taken post-remediation, and also because the air samples weren't taken during high winds, when the sodium dichromate would have been more likely to be inhaled or ingested.)

Resta (the Center's scientific adviser) told the Senate Committee on Veterans Affairs in 2009 that "less than 30 percent of the people examined reported symptoms, and the symptoms that were reported were symptoms that could have a variety of causes...All of the people tested had normal blood levels; more than half of the chromium blood tests were actually below the detection limit of the test."

But the plaintiffs' expert, Herman Gibb, an epidemiologist and authority on hexavalent chromium, told the same Senate committee that the months-long delay in medical testing resulted in unreliable data.

For the Senate, Gibb put it like this: "An analogy is like giving a breathalyzer test to a person three days after they were pulled over for erratic driving."

---

Although the soldiers may have so far captured the public's sympathy, the courts are, of course, not the same, and the plaintiffs' case is hardly a slam dunk.

Much of this is because the Army's Center for Health Promotion & Preventive Medicine's evaluation of some of the Qarmat Ali soldiers turned up "no significant potential for long-term adverse health effects," and a subsequent Defense Health Board review of the Center's work stated that it "met or exceeded the standard of practice for occupational medicine in regard to the exposure assessment and medical evaluation."

Lead KBR attorney Harrison puts it like this: "This is not a 'The defense experts say one thing and the plaintiff experts say another' — this is not that case. This is a case where, in the real time, in 2003, the U.S. Army sent in its own medical team, who was, of course, interested in protecting the soldiers, to find out whether there was any medical issue to be concerned about at all."

Harrison also points out that, while the troops may have been in the same area as sodium dichromate, that doesn't automatically mean they were overexposed — and the medical evidence proves it.

However, the Center only tested a portion of the roughly 600 soldiers who rotated through Qarmat Ali; physical evaluations were done on the 129 Indiana National Guardsmen on site at the time of the testing. The Oregon, West Virginia and South Carolina Guardsmen no longer serving at the site were given questionnaires.

The Department of Defense's Office of Inspector General called this paucity of testing "a lost opportunity for obtaining more complete knowledge of the possible medical impact of pre-encapsulation exposure."

Moreover, many other Guardsmen were not even aware that they had been exposed to sodium dichromate until 2008, when Congressional hearings began.

And because the U.S. Army and KBR are vehemently backing the Center's findings, it appears they are casually dismissing the soldiers' complaints as misinformed whining at best, and opportunistic malingering at worst.

Both entities would have to brush aside the Congressional testimony of soldiers like Infantry Company Commander Russell Kimberling, who alleged that "We were told by KBR that the sodium dichromate was a mild irritant, and that one would have to literally bathe in it for any toxicity to occur."

Likewise, both the Army and KBR would have to brush aside the weird dichotomy between the "fact sheets" the Center was distributing to the Qarmat Ali soldiers and KBR's simultaneous meetings.

The Center's first fact sheet, dated September 19, 2003, stated the Army was "developing a robust risk communication program to keep everyone informed" about sodium dichromate exposure.

Two weeks later, KBR, Army Corps, and South Oil Company personnel held a meeting in which KBR safety officer Chuck Adams noted that "the company will be liable" if personnel are exposed, and suggested that blood testing should be done for "people shoveling the dust into bags" because "if exposed too long may cause death." (This meeting was more than a month after the KBR meeting where a safety officer noted that nearly 60 percent of the people exhibited symptoms).

Also at this meeting, a gentleman from the South Oil Company noted that his people needed "updated literature," as they were "using a book that is 25 years old."

There is also the question of what constitutes an "official" notice to the Army Corps of Engineers by KBR that sodium dichromate was on site. Although KBR notified the Corps in writing on August 12, 2003, of potential sodium dichromate exposure, a Corps safety officer wrote of sodium dichromate's presence in a June 25 log.

Houston-based plaintiffs' lawyer Mike Doyle finds the one-of-our-dudes-told-one-of-their-dudes defense ridiculous: "So whatever KBR says or did, as long as they pointed out one portion to one guy in one division of the Army, they can lie to everybody on an ongoing basis," is how he describes it.

Doyle refers to the willful misconduct clause in KBR's contract, which the Army had refused to turn over to a Congressional panel for years, as a vital clue that the company foresaw potentially fatal hazards but was more concerned with its bottom line than with the lives of even its own employees. (KBR's attorney, Harrison, says the fact that KBR asked for full indemnification was never classified and was revealed to Doyle as early as 2006.)

After the indemnification clause finally came to light, Oregon legislators authored a bill intending to stamp out what they considered questionable business practices. The National Defense Authorization Act requires the Secretary of Defense to notify Congressional defense committees of all future indemnifications in government contracts.

Co-author Senator Ron Wyden issued a statement promising that "From now on, contractors doing business with the Department of Defense are not going to get a free pass to be reckless and irresponsible with the lives and health of American soldiers."

Of course, Larry Roberta believes the Act came too late for those who worked at Qarmat Ali.

By December 2003, Roberta was experiencing extreme acid reflux disorder. In January 2004, he says, Army physicians recommended a Nissen fundoplication wrap: Surgeons made five incisions in his abdomen, entered laparoscopically and wrapped the top part of his stomach to form a one-way valve between his esophagus and the rest of the stomach.

Roberta says he had to grind up his food for a month, but that was a minor inconvenience when compared to the pain he says often hits out of the blue. The Nissen wrap leaves a person unable to vomit when he feels he has to. Roberta describes it as like someone punching your stomach from the inside.

"If I breathe too heavy, my lungs hurt," he told the Press. Unable to work since September 2004, a big day for Roberta is walking to the mailbox. He has a cane for these treks, but these days, he relies more on his 75-pound English bulldog, Gino. When he feels dizzy or faint, Roberta says, he can lean on Gino. Roberta named his brown and white companion after his first National Guard platoon sergeant.

Like Gentry, Roberta says he expected certain things with his service: You can get injured or killed by the enemy or through friendly fire. That's part of the deal.

"But I don't expect to be incapacitated by a contractor that's out there making millions of dollars," he says.

Gentry's widow, Luann, of course feels the same way.

"These were citizen soldiers, they were National Guardsmen," she says. "They were hung out to dry serving their country."

#### **IDEM Response to Ms. Suzanne Krampe Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

### Mr. Wayne Rahman Comments and IDEM Responses

On December 6, 2018, Mr. Wayne Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Wayne Rahman Comment:

As a farmer in Spencer County, living within 5 miles of the proposed Riverview Energy coal to diesel plant, I respectfully request that you deny air permit T147-39554-00065. I am concerned about the tons of carbon dioxide that will be released by this plant, which will increase the ozone problems already experienced in this area.

IDEM and the EPA issued many Ozone Alert Days for our area this past summer. When those alerts are issued, we are requested to do everything we can to limit carbon dioxide emissions -not idling our vehicles, not using drive-through windows, not mowing our lawns till after 7 PM, not fueling our vehicles till after dusk. And at the same time, IDEM is considering approving the air permit application for an industry that will pump 2.2 million tons of carbon dioxide into our atmosphere every year! Where is the sense in that?

Studies have shown that the warmer temperatures that will result from increased ozone levels will harm crops, reducing yields, cutting into my livelihood. The pollution that will be deposited onto vegetation and into the water that will be ingested by my livestock, will affect the health and fertility of the animals, also cutting into my livelihood. Wildlife will be harmed as well.

The pervasive odor of rotten eggs from the sulfur released by the plant will affect all of us.

We don't want this plant. It will absolutely affect the air quality and overall health of the people and animals in Southern Indiana.

Please deny air permit application T147-19554-00065.

#### IDEM Response to Mr. Wayne Rahman Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 13 - Ozone Alert Days

No changes to the draft permit were made as a result of this statement.

### Ms. Julie Rahman Comments and IDEM Responses

On December 6, 2018, Ms. Julie Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Julie Rahman Comment:

I am a resident of Spencer County in Southern Indiana, living within 5 miles of the proposed Riverview Energy plant planned for Dale IN. I am very concerned about the millions of tons of deadly chemicals and hazardous materials that will be emitted into our environment by this plant.

In late October IDEM issued a draft permit stating that there would be "no significant impact" on the air quality and overall health in the region. As I understand it, IDEM's data was distorted because IDEM used measurements from monitors in South Bend, Indiana. It appears that IDEM was bending to pressure from Governor Holcomb (who is pro-coal) and from the Indiana Economic Development Corp (which is also heavily funded by the coal industry), at the expense of the health of the citizens of Southern Indiana whom IDEM is expected to protect.

Southern Indiana is surrounded by 4 of the worst super-polluters in the country. Spencer County was ranked 23rd for toxic emissions among all 3,142 counties in the nation in the U.S. EPA's Toxic Release Inventory. Indiana was ranked 6th worst offender out of all 50 states in the release of toxic chemicals in 2016.

Southern Indiana has borne more than their share of super-polluters. We do not need another one in Spencer County or anywhere else in the entire region.

Please deny air permit application T147-39554-00065.

#### IDEM Response to Ms. Julie Rahman Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

### Darryl and Pat Irvin Comments and IDEM Responses

On December 6, 2018, Darryl and Pat Irvin, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Darryl and Pat Irvin Comment:

My letter is in reference to Permit # T147-39554-00065, concerning the Coal to Diesel plant being proposed to locate in Dale, Indiana.

Please, please, please do not allow this monster to locate in Dale. We live due east of Dale and we do not need more pollution from Spencer County, which is already overly polluted.

We live near the Ohio River and enjoy boating and swimming in it. The coal to diesel plant will definitely affect the water quality, which in my opinion, is finally clearing up.

Again, I beg you and your office to NOT ALLOW more pollution and devastation to the small rural town of Dale, Indiana.

Thank you for your time and attention. I pray you make a wise decision for the sake of all lives involved.

#### **IDEM Response to Darryl and Pat Irvin Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Stephen and Nancy Schroer Comments and IDEM Responses**

On December 6, 2018, Stephen and Nancy Schroer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Stephen and Nancy Schroer Comment:**

We are writing to you to state our opposition to Riverview Energy's proposed Coal to Diesel Fuel Refinery that is to be built INSIDE the city limits of Dale Indiana in Spencer County. We live in Dale and this refinery will be located less than a mile from our elementary school, nursing homes and many residences, including ours.

Riverview Energy's coal to diesel fuel refinery will be a major source of air, water, light, smell and noise pollution, not to mention the ugliness of the refinery itself. This refinery will produce an extremely hazardous substance, Hydrogen Sulfide gas, and will be a major source of fine particulate matter, as well as a number of hazardous air pollutants, including benzene.

According to the EPA, Spencer County Indiana is ranked 23rd worst out of all 3,142 counties in our nation for toxic air pollution. This plant will emit over two million tons of carbon dioxide per year. We do not need or want any more pollution added to what the Rockport Power Plant (AEP) is already producing in our county. Spencer County is a toxic hotspot and adding more pollution is not the answer.

The citizens of Dale were not given any voice as to the location of this proposed monstrosity refinery and we are asking for your help in seeing that this refinery is not built in our beautiful, peaceful farming community, Dale Indiana. We truly feel, as citizens of Dale, Spencer County, and Indiana that we deserve clean air to breathe and clean water to drink. Our health matters. WE DESERVE BETTER!!!

Please protect us, the citizens of Indiana. We ask that you please consider in your decision, the human beings that will be adversely affected.

**IDEM Response to Stephen and Nancy Schroer Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

<b>Mr. Steve Rahman Comments and IDEM Responses</b>
---

On December 6, 2018, Mr. Steve Rahman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Steve Rahman Comment:**

My family and I want to speak out against the Riverview Energy coal-to-diesel processing plant proposed for over 500 acres within the town of Dale IN. There is no other such facility in the Western hemisphere, and for good reason. It is not needed, it is not economically feasible or viable. When this plant, if built, eventually fails because it is not practical or sustainable, and the company inevitably goes bankrupt, the good citizens of Indiana, Spencer County, Dale and neighboring areas will have the immense burden of cleaning up the hazardous waste dump created by Riverview Energy. We will never again have the serene, beautiful, open cropland. The land will be useless.

The proposed process to convert coal into diesel fuel is an idea that only has economic promise in situations where crude oil is very expensive or not readily available. That is not the case in the present-day economy. Crude oil is plentiful and affordable. It is much more economical to produce diesel fuel directly from crude oil. Direct crude-to-diesel production will also release fewer toxic pollutants into our atmosphere.

Riverview Energy plans to pulverize 100 rail cars of coal every day (5,000 tons of coal per hour). They have no plans to capture carbon dioxide or other greenhouse gases on the site.

According to the permit, Bag Filters will be used to control the release of fine coal dust from coal handling operations. Section D.1.10 states that a bag failure will be indicated by a significant drop in the baghouse's pressure reading with abnormal visual emissions. In other words, when they see plumes of coal dust escaping into the air, they will realize that the bag filter has failed. In the meantime, coal dust will be pumping directly into the atmosphere and the surrounding environment for a significant amount of time. Section D.1.10(b) states this direct pollution can continue until "the completion of the processing of the material in the emission unit".

We all know that IDEM routinely grants permits to industries that are harmful, EPA regulations notwithstanding. In all good conscience, please deny Riverview Energy's air permit application.

**IDEM Response to Mr. Steve Rahman Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With regard to the paragraph about baghouse failures, please see IDEM Response to EPA Permit Comment 17.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Ron Balbach Comments and IDEM Responses</b>
--

On December 6, 2018, Mr. Ron Balbach, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Ron Balbach Comment:**

I also support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice. I did attend the meeting at Heritage Hills High School on December 5, 2018 but still wish to share my concerns about the proposed Riverview Project.

I am a small farm land owner within three quarters of a mile of the proposed Riverview Project.

Will or has the IDEM considered what effects the 184 tons of nitrogen oxide, 255 tons of carbon monoxide, 120 tons of sulfur dioxide, 139 tons of particulate matter, 2.2 million tons of carbon dioxide and 32 tons of hazardous air particles released every year by the proposed Riverview Energy Project have:

- on the Bald Eagles (our protected national bird) that are frequently seen and possibly have nests in the Dale Lake area.
- on the endangered Indiana Brown Bats. These bats live in the nearby forested area that is being clear cut. This forest habitat is part of what the Town of Dale annexed. Has the Department of Natural Resources (DNR) been notified about the Indiana Brown Bat and Bald Eagle concerns in this Riverview Energy proposed area?
- on the vineyards along with the produce, soybean, corn, wheat and hay crops that our farmers produce every year in Spencer and Dubois County. What farmer will be able to sell contaminated products because of Riverview's emitted pollution as stated in their permit application?
- on the nearby animals of hog farms, cattle farms, poultry farms, turkey farms, goat farms and organic farms. Is it possible these chemicals that will be released every year, according to Riverview Energy's proposal, might affect the strong agriculture economy that presently exists in the nearby areas of North Spencer County and Dubois County? Will the health of animals be affected to the extent of causing serious health concerns in our human food chain?

There are too many unanswered questions concerning Riverview's proposal that must be addressed prior to permitting because of the affect this project will have on the environment, our agricultural economy and the people of Spencer and surrounding counties. It is and should be the responsibility of government agencies such as IDEM to protect the people and the environment from industries that have the ability to do harm with pollution to people, animals, plants and areas of natural habitat. I have read on the IDEM Letter head, "We Protect Hoosiers and Our Environment." Is this really true and to what extent? Based on the data stated at the public hearing by informed, educated people there is much room for improvement for IDEM?

The State of Indiana should and must monitor air quality in the Dale area and surrounding counties in order to gather enough data several years in advance prior to permitting such a controversial industry that is found only in China and Russia. And only after much local data is collected over an extended time period can statements made by IDEM in local newspapers be verified as to whether or not there are or will be "significant impacts" on air quality, the environment and the human population in the area of North Spencer.

Because of the concerns of citizens in the Dale area and surrounding counties, I strongly urge you not to grant a permit to Riverview Energy Corp. until further pollution data has been collected that will verify there will be no harmful effects to the people and environment in the Southwestern Indiana area.

**IDEM Response to Mr. Ron Balbach Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Ms. Mary Balbach Comments and IDEM Responses</b>
---

On December 6, 2018, Ms. Mary Balbach, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Mary Balbach Comment:**

No changes to the draft permit were made as a result of this statement.

### **Ms. Angela Rahman Comments and IDEM Responses**

On December 7, 2018, Ms. Angela Rahman of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Angela Rahman Comment 1:**

Please let your records show that I stand with the Southwestern Indiana Citizens for the Quality of Life. I oppose the building of the coal to diesel plant in Dale, IN.

I am a resident of Spencer County, Indiana, and live less than ten minutes away from the proposed site. I am concerned about adding a single particle of pollution to the already pollution saturated county, even though you state that the emissions would be within "legal" limits.

Negative effects on the health and well-being of residents in the area is a huge concern. We should not be putting people at risk for illnesses which will undoubtedly occur because of the pollution stemming from the plant. Human beings should not have to suffer loss of their quality of life just for the sake of greed coming from someone who doesn't even live in the area.

Please do NOT allow this plant to be built here in our county, nor anywhere else in the world, for that matter. No human being deserves to suffer the effects of this plant, and neither does our planet. Thank you for allowing me to voice my concern.

#### **IDEM Response to Ms. Angela Rahman Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Becky Gonzalez Comments and IDEM Responses**

On December 7, 2018, Ms. Becky Gonzalez, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Becky Gonzalez Comment 1:**

My name is Becky and I have been a resident of Indiana my whole life. In the last few years I learned about the sacrifice zone down in Southern Indiana. It breaks my heart when I think about it. I live in Fort Wayne and my power travels 322 miles from Rockport. From one of the FOUR SUPPER POLLUTERS already in operation in the area.

This past summer myself and other concerned Hoosiers took a trip to Southern Indiana to meet the people who live in the wake of all the pollution. One of our stops took us to Dale where we sat in on a meeting of local residents who did NOT want to see this coal-to-diesel plant pop up in their back yard. ONE MILE from the school their children and grandchildren attend. I listened to a medical professional speak about what the pollution will mean for the community and what illness they could expect to see and which ones will get worse.

And then we have IDEM. An agency who is supposed to protect the environment but instead seems to protect the interests of the fossil fuel industry and other industries who compromise the environment for profit.

So I am asking you to break the tide. Do not give Riverview Energy a permit that allows this coal-to-diesel plant in Dale. Do not put my friends, the wonderful people of Dale I had the privilege of getting to know, in danger by allowing this monstrosity to move in to their back yards. Say NO to the coal-to-diesel plant in Dale.

#### **IDEM Response to Ms. Becky Gonzalez Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Darrell Boggess Comments and IDEM Responses</b>
--

On December 7, 2018, Mr. Darrell Boggess, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Darrell Boggess Comment 1:**

I am writing in opposition to the proposed coal-to-diesel operation in southern Indiana. Low quality of the air and water in the Ohio River valley is well known to residents of the tri-state area near Evansville. My family has been in the coal business for more than a century. Most of the men have died prematurely with lung disease and related illnesses. Coal, gas and oil are inherently dangerous to human health. Millions of people living in other parts of the state do not appreciate the personal sacrifice made by residents of coal producing areas. Decades ago, I moved to Muncie in search of cleaner air and water that will allow me to have a longer life with better health. An industrial scale experimental prototype releasing toxic materials in our state should not be allowed to proceed.

#### **IDEM Response to Mr. Darrell Boggess Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

## Mr. Aaron Hohl Comments and IDEM Responses

On December 7, 2018, Mr. Aaron Hohl, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### Mr. Aaron Hohl Comment 1:

My name is Aaron Hohl and I am emailing you with my concerns regarding the proposed 512 acre coal to diesel (C2D) refinery near Dale, IN. I am not emailing you from some distant location in the United States after being asked to do so by someone living closely to the proposed location. I am not a politician or businessman with an agenda or my own special interests in mind. I am not a lawyer or scientist with hundred page documents to support each of my points and positions. I am simply a fifth generation family farmer and land owner that makes his livelihood off of 300 acres directly north/northeast of this proposed C2D plant. I am just one more Hohl in a long line of Hohls that have farmed and survived on the aforementioned ground since my ancestor Mike Hohl Sr. bought it in 1851. My lineage has survived numerous depressions and economic disasters, civil and world wars, livestock and grain market crashes, droughts and natural disasters, and a long list of other challenges and hardships that have tested the fortitude of our land and the people who have survived on it.

Rather than type twenty pages pointing out scientific statistics and highlighting the potential environmental effects of such an untested, unstudied, and uncertain facility, I will simply point out what is at stake in a more personal manner. There are already many people doing a fine job presenting potential disastrous impacts of this facility using a more scientific, financial, and mathematical approach. IDEM reports and calculations meant to ease our minds might as well be thrown in the trash as there isn't another plant like this anywhere in the United States for them to have studied and examined to come up with such concrete conclusions. As someone who lives directly downwind (considering our most common weather patterns and their habitual direction of travel), I ask you to consider the question, "what if?"

What if this plant actually produces more pollutants than anticipated? Are unforeseen results unheard of in facilities/experiments being conducted for the first time? Those pollutants then enter the atmosphere upwind from our farm and my own children, nieces, and nephews grow up breathing in air that was supposed to be harmless. You won't be able to rewind time and reverse your decision to go ahead with this project. There won't be a "whoops, I take that decision back." Instead, breathing problems arise in otherwise healthy children, headaches become more common, and other health problems that were previously nonexistent become a regularity.

What if the pollution (anticipated levels or more) begin to affect our ground quality? Pollutants will no doubt enter our groundwater and soil and have an impact on the productivity of the livestock and crop fields our families depend on. In a society that is increasingly worried about the food their families ingest, shouldn't we be taking as many steps as possible to prevent pollution of the beef and grain raised on our family farm before it is distributed to American tables nationwide? How do we know a rare form of cancer won't one day be traced back to our area and pinpointed to have originated from the pollution of an originally assumed harmless facility? For example, there was a point in time when the U.S. Government considered asbestos to be a wonderful material due to its flame retardant properties and durability. The U.S. Government used it in everything from roofs to pipe insulation and floor tile on military bases around the world. I now work for a company, aside from farming with my brother, that was built on abating asbestos from Government facilities. We are paid by Government money, taxpayer money. It is no secret that significant funding goes into simply making asbestos go away. Shouldn't we try to avoid another asbestos-like scenario by observing such a facility/process AWAY from healthy populations and family farms before we come to a conclusion that, "it's probably harmless."

Finally, what if family farms such as our own can no longer thrive in proximity to this plant? Whether it be due to the health of our families, the condition of our soil/water, or other negative impacts resulting from this new C2D plant, what if traditions, lineages, and futures are cut short due to probabilities and ideas? What if gut feelings and promises fail and unintended outcomes

prevail? Is the American farmer who is surviving on the fruits of 170 years of hard work, sweat, blood, and tears of those that came before him worth risking for a couple temporary construction jobs and possibly antiquated coal consumption?

There are many families in southern Dubois County and northern Spencer County like my own. I ask that you and those responsible for the approval and potential construction of this C2D plant to consider what is at stake with a decision surrounded by so much uncertainty. This facility may not impact your family negatively and may even affect your career positively, but consider the common Hoosier men and women who have made this area so great, generation after generation. Don't have a hand in ending what so many have worked so hard to build.

**IDEM Response to Mr. Aaron Hohl Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With regard to the commenter's question about producing more pollutants than anticipated, the proposed permit includes limitations on the potential to emit of the source, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD). The permit also contains testing, monitoring, record keeping, and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis. The summary of uncontrolled emissions that appears in Appendix A to the TSD has the purpose of showing that the source is

subject to Part 70 and PSD and which pollutants may be subject to PSD BACT requirements. The uncontrolled emissions do not represent the actual emissions that will occur based on compliance with the permit requirements such as emission limitations and standards and pollution controls devices/measures. If the source determines that the uncontrolled potential to emit of the plant will increase in such a manner that would require a source/permit modification, then the source will be required to obtain prior construction/operation approval prior to making any changes to the plant that would increase the uncontrolled potential to emit.

The proposed permit contains all health-based and technology-based standards established by the U.S. EPA and the Indiana Environmental Rules Board, which will limit the amount of emissions from the facility to the very lowest level allowed by law. In addition, IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

IDEM, OAQ, Compliance and Enforcement Branch observes stack tests, reviews stack test results and reports, conducts inspections, reviews compliance determination and monitoring records and reports, and takes enforcement actions when a permit violation (noncompliance) is discovered. If noncompliance with any air permit condition is detected, IDEM, OAQ has a wide range of enforcement options including warnings, civil penalties, criminal charges and, in extreme cases, an injunction to cease operations at the facility.

IDEM, OAQ and U.S. EPA inspections are unannounced. IDEM, OAQ normally inspects major sources on an annual basis. IDEM, OAQ will make more frequent inspections on a case-by-case basis based on the compliance history of the source and any public complaints received. During an inspection, the IDEM, OAQ inspector will perform a records review, and inspect the facility operations, to determine if the source is in compliance with all air permit terms and conditions. Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions.

IDEM, OAQ encourages residents to contact an IDEM, OAQ compliance inspector if they witness or have evidence of any compliance related concerns with this operation. An IDEM OAQ compliance inspector will investigate complaints, perform any necessary observations or inspections of the source, determine if a violation of a permit term or condition has occurred, take appropriate action when a violation is observed, and initiate any necessary actions to bring to source back into compliance with applicable permit conditions and state and federal rules and regulations. The current compliance inspector for each county in Indiana can be found at the following website: <http://www.in.gov/idem/airquality/2418.htm>. The current IDEM OAQ compliance inspector for Spencer County is Daniel Roos, who may be contacted by telephone at (812) 380-2309 or toll free (888) 672-8323 an ask for Daniel Roos or by e-mail at [droos@idem.IN.gov](mailto:droos@idem.IN.gov).

If the commenter or citizens have complaints and issues with the source with respect to compliance with its air permit, complaints can be submitted to IDEM three (3) different ways:

1. Online at: <https://www.in.gov/idem/5274.htm>;
2. Through the Complaint Coordinator at (800) 451-6027 ext. 24464; or
3. By printing, completing, and mailing a paper-based Complaint Submission Form (Available under Agency Forms at: <http://www.in.gov/idem/5157.htm>)

No changes to the draft permit were made as a result of this statement.

### Mr. Larry K. Kleeman Comments and IDEM Responses

On December 7, 2018, Mr. Larry K. Kleeman of Tell City, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Larry K. Kleeman Comment 1:

I attended the December 5<sup>th</sup> Public Hearing held at Heritage Hills High School regarding the Air Quality Issues and the proposed Operating Permit for Riverview Energy. I heard **47** concerned citizens voice their concerns and opposition to the proposed plant. They provided facts and personal stories about the harmful effects and health hazards to the air quality of not only Spencer County but Dubois and Perry Counties as well if this plant is approved. Their testimonies were compelling and I respectfully ask that IDEM deny this operating permit.

I am a lifetime resident of Southern Indiana currently living in Tell City. Our family consists of my wife, 5 adult children, 4 in-laws, 10 grandchildren and 2 great grandchildren. Although I currently live in Perry County, my great great grandfather was one of the founding families in New Boston. He and a number of my relatives are buried in the Church Cemetery in New Boston. Additionally I work during the summer season, outside, at Holiday World-Splashin Safari, and I have a sister and grandson who work also at Holiday World. I have relatives who live in Dale and Santa Claus. In summary the air quality in Southern Indiana affects my family directly.

It is my understanding air monitors do not exist in most of the counties in our immediate area. I do not understand how a plant that will affect the air quality with hazardous chemicals can be issued a permit without proper monitoring. During the December 5<sup>th</sup> Public Hearing I heard 7 people speak in favor of the proposed plant. I believe all of their comments related to jobs not the air quality. I urge you to deny this permit. Thank you for conducting the Hearing and for your consideration.

#### IDEM Response to Mr. Larry K. Kleeman Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

### Ms. Amanda Schnell Comments and IDEM Responses

On December 7, 2018, Ms. Amanda Schnell, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Amanda Schnell Comment 1:

Please do not approve the permit for the Riverview Energy Coal - Diesel Plant Permit! I have 3 young children that I plan on raising in Dubois/Spencer County and I do not want any of the harmful pollutants from this plant to effect them in any way. If you have children, I am sure you understand there is nothing you would not do for them! I have seen some of the issues that other areas have had when these types of facilities come into their area. Even if there is the SMALLEST of chance that it could effect my child, I would NEVER approve of this. At some point, we have to stop thinking about money. We need to look and see that this is the wrong thing to do for our community...no matter the money. It is disappointing that you would even think

about approving this and honestly makes me sick to my stomach that people think this is OK.  
Let's not let greed take over...

**IDEM Response to Ms. Amanda Schnell Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Jan Evrard Comments and IDEM Responses</b>
---

On December 7, 2018, Ms. Jan Evrard of Fort Wayne, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Jan Evrard Comment 1:**

I hope by now that you realize many folks are against the approval of the Riverview Energy facility that you seem to think is a good idea to approve. What might surprise you is that it is not only the folks living in the area who are resisting, but those of us further away in Fort Wayne.

Just a few reasons why this is a bad idea:

- Toxins that will harm our environment & health of residents: 60 tons per year
- Toxins that will add to climate change just when we are given reasons that we MUST make changes NOW
- Plants similar in China & Russia, less elsewhere. Riverview Energy in our area where monitoring is less
- When the rest of the world is leaning toward renewable energy that is cleaner & less expensive - why?
- If the purpose of IDEM is to protect Hoosiers and the environment, do you really think approving this plant is protecting anything? I think not.

**IDEM Response to Ms. Jan Evrard Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

### **Ms. Bethany Hopf Comments and IDEM Responses**

On December 7, 2018, Ms. Bethany Hopf of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit. Ms. Hopf submitted additional comments in a letter received December 7, 2018.

#### **Ms. Bethany Hopf Comment 1:**

I attended the IDEM public hearing for the proposed Riverview Energy coal to diesel facility in Dale. I signed up to speak at the meeting, however, I had to leave before my turn came.

I would still like to express my thoughts to you regarding the project. I understand that, by law, IDEM has to issue a permit if the applicant meets the requirements set forth by the state and that personal opinion on whether or not residents want the project is not sufficient to deny the permit. If personal opinion did matter though, I urge you to deny the permit.

Indiana consistently ranks among the worst polluted states likely due to state set higher than average allowable pollutant emission limits. This is probably a large part of the reason Riverview Energy has tried to locate this plant in Indiana, both now in Spencer County and unsuccessfully several years ago in Vermillion County. Therefore, I would like to know how the allowable limits for pollutants are established for the State of Indiana. I would also like to know how residents may petition to get the limits lowered. How does Indiana determine if an applicant adheres to the requirements of the permit after a project is constructed? I've researched and read that there is no enforcement branch to monitor and penalize companies if compliance is not met, is that true?

In the not-so-distant past, lead pipes and lead paint were thought to be safe and asbestos was the perfect material for many construction and insulation materials. But research has proven the extreme dangers associated with those materials and now they are no longer used, treated carefully when encountered and disposed of safely so as not to harm anyone further. It is time for Indiana to wake up to the data proving that allowable limits of millions, thousands or even hundreds of tons of pollutants released every year is extremely reckless, dangerous and short sighted.

Although there is an abundance of coal in this area, there is also an abundance of sunshine as well. Recently a field of solar panels was constructed near Dale also. The panels don't emit particulates, CO<sub>2</sub>, SO<sub>2</sub>, CO, etc. We need to look up for the future and should not, literally and figuratively, keep our faces in the dirt. Indiana needs to change the air pollution regulations to protect the possibility of harnessing solar power moving forward. If we continue to pollute as currently allowed by the state, smog will reduce the ability to capture solar power and therefore limit future cleaner energy development.

Please let us know who we can contact to get allowable pollution limits lowered and to require monitoring, enforcement and severe penalties for non-compliance. We can, and should, do much better to protect our environment and the health of ourselves, our children and all future generations.

Every day I pray for the safety, happiness and health of my children. I can guarantee that not all parties will be happy with the outcome of this permit, but if the permit is denied, I can also guarantee we will all be safer and healthier.

#### **IDEM Response to Ms. Bethany Hopf Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With regard to the commenter's question about compliance, the permit contains all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis. These provisions are seen most clearly in the emissions unit operation conditions sections (D- sections), but are also included in Section C (Source Operation Conditions) and the NSPS and NESHAP sections (E- sections). IDEM, OAQ also has a Compliance and Enforcement Branch that observes stack tests, reviews stack test results and reports, conducts inspections, reviews compliance determination and monitoring records and reports, and takes enforcement actions when a permit violation (noncompliance) is discovered. If noncompliance with any air permit condition is detected, IDEM, OAQ has a wide range of enforcement options including warnings, civil penalties, criminal charges and, in extreme cases, an injunction to cease operations at the facility.

IDEM, OAQ and U.S. EPA inspections are unannounced. IDEM, OAQ normally inspects major sources on an annual basis. IDEM, OAQ will make more frequent inspections on a case-by-case basis based on the compliance history of the source and any public complaints received. During an inspection, the IDEM, OAQ inspector will perform a records review, and inspect the facility operations, to determine if the source is in compliance with all air permit terms and conditions. Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions.

IDEM, OAQ encourages residents to contact an IDEM, OAQ compliance inspector if they witness or have evidence of any compliance related concerns with this operation. An IDEM OAQ compliance inspector will investigate complaints, perform any necessary observations or inspections of the source, determine if a violation of a permit term or condition has occurred, take appropriate action when a violation is observed, and initiate any necessary actions to bring to source back into compliance with applicable permit conditions and state and federal rules and regulations. The current compliance inspector for each county in Indiana can be found at the following website: <http://www.in.gov/idem/airquality/2418.htm>. The current IDEM OAQ compliance inspector for Spencer County is Daniel Roos, who may be contacted by telephone at (812) 380-2309 or toll free (888) 672-8323 an ask for Daniel Roos or by e-mail at [droos@idem.IN.gov](mailto:droos@idem.IN.gov).

If the commenter or citizens have complaints and issues with the source with respect to compliance with its air permit, complaints can be submitted to IDEM three (3) different ways:

1. Online at: <https://www.in.gov/idem/5274.htm>;
2. Through the Complaint Coordinator at (800) 451-6027 ext. 24464; or
3. By printing, completing, and mailing a paper-based Complaint Submission Form (Available under Agency Forms at: <http://www.in.gov/idem/5157.htm>)

With regard to the commenter's question about how the allowable limits for pollutants are established for the State of Indiana, the emission limitations contained in the proposed permit are based on state and federal air pollution rules and regulations. For example, the proposed permit includes limitations on the potential to emit of the source, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD). The permit also contains all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as

a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

IDEM, OAQ relies on the scientific expertise of U.S. EPA which has developed the National Ambient Air Quality Standards (NAAQS) to protect public health and the environment. The Clean Air Act requires that U.S. EPA conduct periodic review of the most current scientific information to determine if air quality standards are adequate to protect human health and general welfare. This review includes an integrated science assessment which is a comprehensive review of science judgments and risk and exposure assessments. An independent committee, the Clean Air Scientific Advisory Committee (CASAC), reviews all health information and makes recommendations to U.S. EPA on whether current health standards are protective of public health and welfare or should be revised. After any health standard recommendations have been approved and finalized through rulemaking, IDEM is required to follow the new standards. Additional information on the CASAC can be found at the following website: <https://yosemite.epa.gov/sab/sabpeople.nsf/webcommittees/CASAC>.

IDEM has no authority to create any permit limits or measures in excess of what is legally required for a regulated source. The Indiana air permitting requirements that are applicable to this source are part of our state implementation plan (SIP) that is approved by the U.S. Environmental Protection Agency (EPA). Environmental laws are enacted by the Indiana legislature. The legislature has also given rulemaking authority to the Indiana Environmental Rules Board. More information about the rulemaking process is available at <http://www.in.gov/idem/4087.htm> on IDEM's Website. Information for getting involved with EPA's regulations can be found at the following website: <https://www.epa.gov/laws-regulations/get-involved-epa-regulations>.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Jeanne Melchior Comments and IDEM Responses</b>
--

On December 7, 2018, Ms. Jeanne Melchior of Jasper, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Jeanne Melchior Comment 1:**

I wish to submit several questions and comments about the permit for the above named entity. The report completed by IDEM needs much background information and should come up with results that would be understandable to a general reader. I am a retired professor of written communication and critical thinking skills, have expert reading skills, and I found the report to be a jumble of meaningless gobbledygook and obfuscation. We are not a free people if we need specialists to decipher the legal documents we encounter.

How did you determine that the significant releases of toxic chemicals would have "no significant impact" on this small rural town of Dale (population about 1,600 people) and its near vicinity? This small town is surrounded by farms and wooded areas, as well as other even smaller towns, and several well maintained tourist attractions. It doesn't take much to recognize that any facility of this magnitude would indeed, have significant impacts of many kinds.

Given the prevalence of human generated toxic materials already in our air, also being widely present in water, soil, plants, humans, and animals where it creates serious threats to human health and the health of entire ecosystems, both logic and common sense dictate that we need to begin to reduce the total number of emissions of all toxic chemicals into the air.

And it isn't enough to simply mandate that each separate facility is not exceeding an arbitrary legal limit. We must look at totals for an area to avoid exacerbating the numerous problems which already exist. Clearly Spencer County (population approximately 20,000) which already has high levels of pollution for a county of that size, needs to look at any expansion of toxic releases in that light, and allow only those endeavors which have a very low toxic footprint. Many excellent

scientists from the NoC2D movement, Earthjustice, etc. have provided the staggering numbers of serious impacts to our health and well-being in other comments, so I won't repeat them. I do have the following comments and questions about IDEM's finding of "no significant impact."

What would be the daily as well as the long term impacts of these chemicals on the people living near the proposed plant? Being down wind of several super-polluters in the area, plus being in the vicinity of several companies with emissions of their own, how would the total number of emissions of various chemicals further impact the air quality of the immediate area? Since Indiana has so many impaired bodies of water, and since it is widely known that many chemical pollutants that are airborne also make their way to the water and the soil, how would the accumulated totals affect the air, water quality, and soil of Spencer County? How would these pollutant affect agriculture and wildlife, not to mention human health, both today and projected into the future life of the project?

How would the extra traffic flow, the trucks, the railcars, etc. impact the air quality? The emissions produced by these extraneous factors should be included in the totals produced by the plant itself, as well as the impacts of this traffic along the routes travelled by these vehicles. How would these toxic chemicals impact farmers in the area? What impacts could this have on food quality and food security? How could the influx of 200 workers and their families impact air and water quality? It would definitely impact quality of life for current residents as well as their health and well-being. It's important to remember that this facility would be inside the city limits of a small town, and the property values, the health of the individuals who live there, need to be considered as well. The neighboring area is comprised of small farms and agricultural lands which would suffer the impacts, as would the Lincoln Parks nearby, and Holiday World just down the road.

In a Changing Climate, this plant and the CO<sub>2</sub> it would produce, are guaranteed to harm the environment worldwide. According to NASA "During ice ages, CO<sub>2</sub> levels were around 200 parts per million (ppm), and during the warmer interglacial periods, they hovered around 280 ppm (see fluctuations in the graph). In 2013, CO<sub>2</sub> levels [surpassed 400 ppm](#) for the first time in recorded history. This [recent relentless rise](#) in CO<sub>2</sub> shows a remarkably constant relationship with fossil-fuel burning, and can be well accounted for based on the simple premise that about 60 percent of fossil-fuel emissions stay in the air." Because of the many scientific warnings about runaway climate change, and the need to decrease its presence significantly CO<sub>2</sub> releases, which are now over 400 ppm, also need to be quantified. Since we live in an age when it is urgent to lower the CO<sub>2</sub>, it's hard to imagine that any new releases can be justified. In addition, the carbon load of the use of product over time should be factored in, as well as the likelihood that this is not carbon neutral, and in fact, that digging the coal, hauling it, and carrying out the process before hauling it away to be burned, will also create more CO<sub>2</sub> in an already overloaded atmosphere. As air quality specialists, you should recognize that we must stop burning fossil fuels as quickly as possible.

How would the additional toxic chemical load play out over time? Forty years ago, Spencer County did not have a high pollution rate from industry, but since the addition of I&M power plant and other industries, it is responsible for the emission of toxic chemicals making Spencer County one of the most polluted places in the country. In addition, Indiana is one of the most polluted states in the country, with a preponderance of super polluters up wind of Spencer County. These impacts are all substantial, and to protect the health of the residents of the region, it is the duty of IDEM to do more than list what a company says it will emit. IDEM's role is insure that these pollutants do not harm the public today as well as over the life of the project. Looking ahead a few years, what changes could happen? Would Riverview Energy be likely to leave a brownfield wasteland for someone to clean up? What would be the risk of spills, either on the property, or in transit? What plans would be made to control spills or other disasters? How would workers and next door neighbors be protected?

My personal observation of Spencer County over the past 70 years shows that significant changes do happen—often within the span of half a lifetime, or even less. My understanding of history and geography also bear out the fact that brownfields, superfund sites, polluted places of all kinds started out as small lovely places, but grew rapidly over time to become places not fit for

human habitation. No one wants to live near such places, nor do they want to live close enough to watch an area get trashed beyond belief. Even the processes of mining lay waste to huge swathes of land, both in Indiana and elsewhere, and threaten the lives of those who live nearby.

When I was a child, Spencer County, though far from pristine, was a bucolic paradise compared to now. My uncle had land there and farmed the portion that wasn't wooded wildlife habitat. I have fond memories of time spent there, as do my grown children walking in the woods, studying plants, exploring the swamps. When the Forest was classified, the forester found several rare species, and that portion had special classification. Santa Claus Land was a charming little podunk park "dedicated to the children of the world...." Later it was expanded and was recognized as the first theme park (since replaced by huge glitzy Holiday World and Splashing Safari)--a giant expansion of infrastructure, with a network of streets and shops. There was no I-64 interstate, the area was dotted with small farms and many small woodlands, and Rockport was a sleepy little town on the Ohio River. Though some secondary roads were blacktop, many were unpaved gravel. The Lincoln Memorial was built around the time I was born--an open stone structure that was then ungated, its carved panels created by a friend of my parents. Spencer County was a good place then, a prosperous place in a genuine sense, and I remember it fondly though the place I knew in my childhood and adolescence has vanished with few traces remaining.

In my adult lifetime, the winds of change have not been good to the area. In the mid-late 1970's quite a few people lost their life savings to unsuccessfully oppose the Indiana Michigan Power Plant in Rockport. Spin-off industries came. New highways were built, US 231 was widened, the small town of Dale was bypassed, despite many objections from around the area. The county is now considered by the EPA to be the 23rd in the nation of the most toxic chemical releases into the environment. Are the people of Spencer County better off for all this? Are their lives better or happier or healthier? Is this "progress"?

When I recently walked the woods at Lincoln Boyhood where I worked for a couple of summers back in my salad days, catching a whiff or two of the past on a fleeting autumn breeze, I considered that all polluted places everywhere were once pristine, and I became viscerally aware of the speed at which those changes occur. In the blink of an eye, but before my time, old growth forests became cut over and degraded, used, sold, burned off. Another blink of an eye, and those cut over forests became farms and homesteads. And now, within my lifetime, this.

How much could be restored if no further damage is done is only a guess. Is it even possible to reclaim lost innocence, if a place can be said to possess it? A few decades perhaps to reclaim farmland, centuries to restore a semblance of old growth woods, millennia for complete restoration of wilderness. The cleanup of brownfields and superfund sites is even more difficult—and very expensive. Climate change is near a point of no return, and cleaning up the toxic air and water, the chemical laden soils, has likely reached a point beyond human capacity, submitting the coming generations to a greatly diminished future. Is this what we want to leave the as our legacy?

In a world that seems to have gone mad, caught up in a delirium of mindless consumption and greed, succumbing to what seems to be increasingly meaningless scrambling to see how much of the remaining coal and gas reserves can be manufactured and used to create tacky tacky that will wind up in garbage dumps, as the by-products of their manufacture lead us closer to collapse. Do we embrace this as inevitable rather than focusing on the true meaning of a good life? I have to wonder if we first don't have to reclaim those more ephemeral qualities, our recognition that health, and happiness don't depend on those things, that we are connected to everything else, and dependent on the natural world before we have the will to just say no to the poisoned fruit at hand.

Information and facts about these air quality problems is widespread and readily available. IDEM needs to listen, and then act. They must do their jobs and stand up for the people of Indiana who have much to lose by projects like this. I urge IDEM to protect Rural Southern Indiana—and the entire state—by denying this permit, therefore taking it off the table. Perhaps this would give

those who desire growth a chance to move on to a more reasonable kind of growth, and least do so in ways that wouldn't be so damaging to the quality of life for so many, in ways that wouldn't leave a fatal footprint behind, and that would steal another part of our souls in the process.

**IDEM Response to Ms. Jeanne Melchior Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

Permit content and the requirement for a technical support document setting forth the legal and factual basis for a draft Part 70 permit are specified in Federal (40 CFR 70.7(a)(5)) and State regulations (326 IAC 2-7-8). IDEM, OAQ tries very hard to make the requirements of the permit very clear to sources, regulatory agencies, and the general public.

The purpose of the draft PSD/New Source Construction and Part 70 Operating Permit is to document all applicable state and federal rules and regulations related to air pollution (e.g., emission limitations and standards) and all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

IDEM, OAQ performed an Air Quality Analysis in order to predict the air pollution concentrations, travel distances, and resulting impact of Riverview's worst case scenario air pollution emissions on the surrounding area. IDEM, OAQ concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

Based on state and federal regulations for Part 70 permits, air pollution emissions from additional traffic (i.e., fuel combustion in mobile sources such as cars, trucks, railcars) or from additional workers and their families that would be associated with this proposed plant are not included in determining the potential to emit of a stationary source. The impact of air pollution emissions from additional mobile source emissions or from additional workers and their families associated with this proposed plant to ambient air pollution levels in southwest Indiana will be monitored as part of IDEM, OAQ's ambient air monitoring. Information about Indiana's air monitoring system and monitoring results is available at <http://www.in.gov/idem/airquality/2346.htm>.

Questions about possible redevelopment of the site if Riverview Energy ceases operations are outside the scope of the draft PSD/New Source Construction and Part 70 Operating Permit. For

information about brownfields and links to the Indiana Finance Authority program, please see <https://www.in.gov/idem/cleanups/2353.htm>.

Questions about spills on or off the property are outside the scope of the draft PSD/New Source Construction and Part 70 Operating Permit. For information about IDEM Emergency Response programs, please see <https://www.in.gov/idem/cleanups/2352.htm>.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Bennet B. Brabson Comments and IDEM Responses</b>
--

On December 7, 2018, Mr. Bennet B. Brabson, Emeritus Professor of Physics & Climate Scientist at Indiana University in Bloomington, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

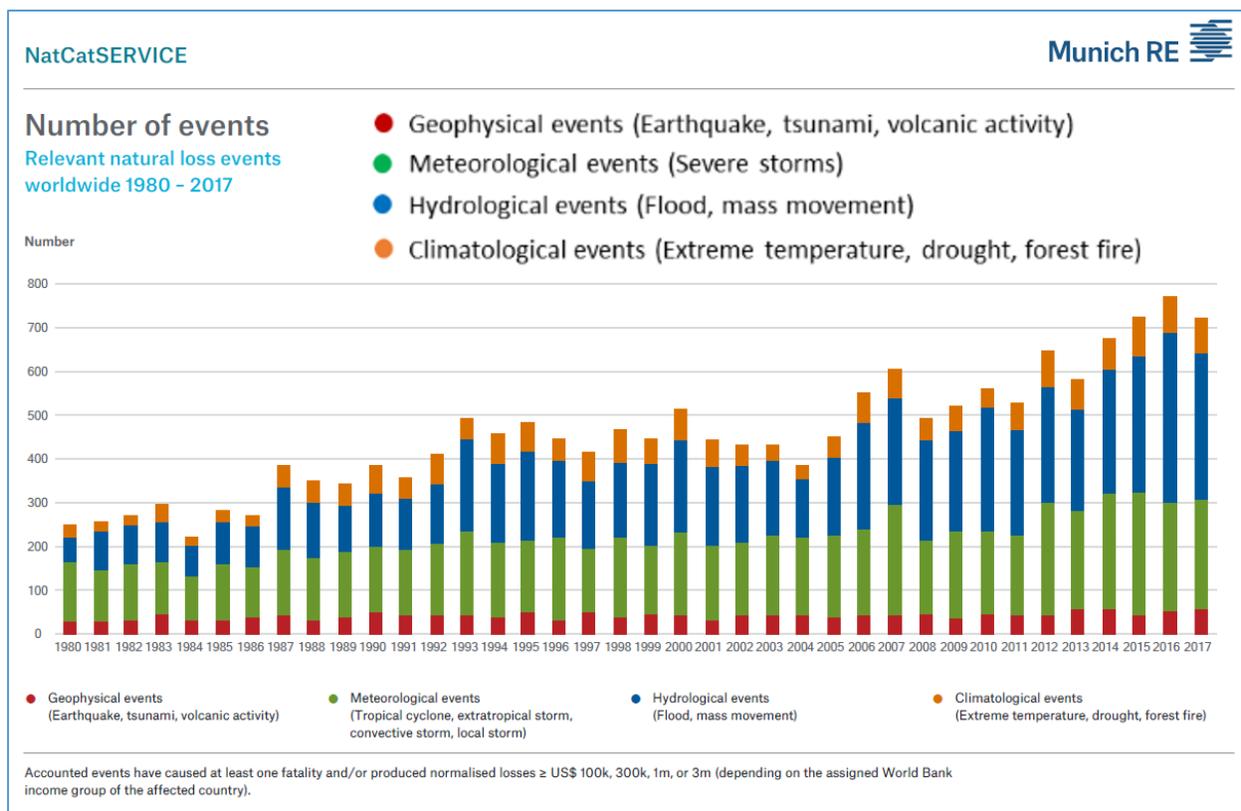

**Mr. Bennet B. Brabson Comment 1:**

I am a climate scientist and Emeritus Professor of Physics here at Indiana University in Bloomington. My research focusses on the connection between projected extreme temperatures here in the Midwest and loss of soil moisture. Not surprisingly, as our average temperature increases here in Indiana, soil moisture decreases and extreme temperatures rise. Unfortunately, this rise in temperature is a direct result of our human production of carbon dioxide (CO<sub>2</sub>). I wish it were otherwise.

There are a number of important ideas to keep in mind as you consider the proposed Riverview Energy direct conversion Coal-to-Diesel plant in Dale, Indiana. It is certainly true that Indiana has a very large coal resource and as little as twenty years ago, the US was importing the majority of its crude oil. Damage from climate change was not yet evident. Under those circumstances, coal to liquid (CTL) was seen as economic.

Several trends now mitigate strongly against CTL. First, shale oil fracking has changed the equation for transportation fuels. Oil fracking sites are waiting unused for the next rise in the price of oil. Diesel from coal is not price competitive. Second, transportation from electricity is replacing a good portion of the diesel market at the same moment that renewable electric energy sources - wind, solar, geothermal - are growing. Third, financial damage from climate change is now very much in evidence.

There are a number of specific costs of this rise in temperature here in the Midwest, not the least of which is a decrease in corn and soybean production as temperatures rise. Quoting from Prof. Steve Vigdor here at Indiana University, "the changes to Earth's climate are upsetting the delicate environmental balance that has long supported the diversity of life and the agricultural fertility of our planet. Serious consequences of these changes are already occurring. For example, the frequency of severe storms, floods, droughts and fires has tripled worldwide since 1980, as revealed by actuarial statistics (see figure below) compiled by the reinsurance company Munich RE. Without serious reductions to worldwide greenhouse gas emissions, the environmental, ecological and economic consequences will grow much more severe over the coming decades, as documented in the 2018 *IPCC Special Report on the Impacts of Global Warming of 1.5°C*. The recently released Volume II of the *Fourth National Climate Assessment* indicates that the U.S. will not be spared its share of these severe costs. The health and welfare of U.S. citizens are jeopardized."

In summary, climate costs for us here in Indiana are a non-starter for Coal-to-Diesel. So, is there a way to eliminate the climate costs of Coal-to-Diesel? In principal, yes - it is called Carbon Capture and Sequestration (CCS). However, the Coal-to-diesel plant in Dale is not considering CCS. There is good reason for that. CCS requires the compression of CO2 gas, immediately reducing the total efficiency of the process requiring as much as 1/3 of the energy of the diesel you produce. Coal-to-Diesel with Carbon Capture and Sequestration (CCL) is also not attractive.

Finally, and most importantly, the future of a coal-to-diesel plant in Dale is fraught with another major uncertainty. In the Federal House of Representatives a bipartisan bill H.R. 7173 (The Energy Innovation and Carbon Dividend Act of 2018) is being considered. It is a “fee and dividend” bill that starts with a \$40/ton of CO2. That the proposed coal-to-diesel plant at Dale is estimated to produce 2.2-2.8 million tons of CO2 per year, subtracts roughly \$100,000,000 a year from its bottom line. While it is true that this bill may not pass in the short term, it is likely, as climate damage becomes more and more annoying that such legislation will take place. I strongly suggest that we in Indiana avoid the high likelihood of a failed Dale coal-to-diesel plant.

**IDEM Response to Mr. Bennet B. Brabson Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Ms. Tina Knott Comments and IDEM Responses</b>
---

On December 7, 2018, Ms. Tina Knott, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Tina Knott Comment 1:**

My name is Tina Knott. I was born and raised in Huntingburg, Indiana and moved to Evansville, Indiana when I was 18 years old. I will be 44 years old in less than 2 weeks. I've been chronically ill for the last 8 years. It took me 6 years to find a doctor that could tell me why. I was diagnosed with CIRS, Chronic Inflammation Response Syndrome. I would be very surprised if you've heard of this illness. It's not an illness that western medicine recognizes or treats, yet. It's a relatively new illness, an environmental illness.

There is a small group of alternative medical practitioners that are trying to figure out the hows and whys of CIRS. One theory is that 25% of the population has the genotype that makes our bodies' predisposition to be unable to detox biotoxins, mold, VOCs, pollution, etc., from our bodies. Being exposed to these toxins isn't healthy for anyone but for people like me, it can be catastrophic. I was a relatively healthy person until 2010; my tipping point was the new home we purchased that year. It had hidden water leaks and hidden toxic mold. Within months, I became ill. We remediated our home in 2016 but I was still unable to live there. I've become hypersensitive to everything in my environment, mold, chemicals, pollution, etc. We sold the house, and got rid of almost everything we own. We've lost thousands of dollars trying to find housing that I don't react to. Thankfully we have family with a relatively mold free house that I can tolerate. We've been living there for 2 years. I've spent thousands and thousands of dollars trying to regain my health. I've taken medications, supplements, and done many alternative therapies. I've had some improvements but my healing has stalled.

Earlier this year, we went on vacation to Panama City Beach. I went, not knowing how I'd feel or react to the environment. I prepared myself to not feel well, assuming there would be mold everywhere in Florida. The assumption was right, but much to my surprise, my reactions were almost nonexistent. I will never forget the moment I opened the car door and got my first breath of clean ocean air. It was absolutely amazing! I couldn't stop taking deep breaths. Within 24 hours, symptoms that have all but destroyed my life for the last 8 years had improved. By the end of our vacation, I almost felt like my old healthy self. It was wonderful and I never wanted to leave but leave we did. My symptoms came back like a flip of a switch, right outside of Hanson, Kentucky. Not only did they come back, they came back more intense than ever.

I didn't understand what had happened, why I felt so good there. I came home and did hours and hours of research. I came upon a group of people who believe that in order to heal from CIRS, you must not only avoid mold, which is what I'd been focusing on, but you must also live in an environment with relatively clean outdoor air. I began to research this area that I've lived in my entire life, the results are terrifying. I've seen the smoke from the Rockport power plant and the smoke coming from Alcoa but I'd never given it much thought. Those things are just part of home. I'd never given much thought to why being healthy is not the norm around here. Cancer, thyroid issues, autoimmune disease, allergies, asthma, chronic fatigue, fibromyalgia, depression, heart disease, everyone seems to have something. Why do we have so many hospitals and doctor offices here? I began to question and search. When I found information on super polluters, the pieces of the puzzle fit together. We live in a valley, surround by the country's most concentrated cluster of super polluters, if that's not enough, we have industrial factories that add to the pollution, topped off with countless farms using harmful pesticides. How could I have lived here my entire life without realizing what a toxic petri dish we live in? It's just not something I gave any thought to. I took my health for granted. I'd give anything to know then what I know now. I've spent the last 8 years of my life struggling to survive and now I am faced with the realization that the only chance I have to heal is to leave this area, leave my home of 44 years, my family, and my friends, to search for cleaner air.

As I mentioned earlier, CIRS isn't a well-known illness. You might be questioning the legitimacy of it. I'm not offended, if I weren't living this nightmare, I'm not sure I'd believe it myself, but I promise you that this illness is very real. This may be the first time you've heard of CIRS but I guarantee, it won't be the last. People with CIRS are the canaries of our world. Our area, our state, our country, our Earth cannot handle much more. Pollution is slowly killing our Earth and every living creature on it. We need to create solutions to lessen our toxic foot print not increase it. Please do not move forward with the coal to diesel plant in Dale.

p.s. In case you are wondering what symptoms I live with because of CIRS, I am sharing the list:

Memory issues	Focus and concentration issues	Word recollection issues
Decreased learning of new knowledge	Issues with information organization and executive functioning	Math difficulties
Spaciness	Forgetfulness	Emotional Numbness
Depression	Anxiety	Mood swings
Suicidal ideation	Irritability	Anger episodes
Loss of self-confidence	Decreased sociability	Body aches
Muscle cramps	Chest Pain	Abdominal pain
Joint pain	Morning stiffness	Tingling
Burning	Chemical sensitivities	Sensitivities to medications
Reactions to gluten, dairy and other foods	Light sensitivity	Exercise intolerance
Poor tolerance of stress	Blurred vision	Burning eyes
Diarrhea	Constipation	Appetite swings
Heart palpitations	Rapid heartbeat (constant or erratic)	Dizziness
Temperature regulation issues	Abnormal body temperature (above normal or below normal)	Vertigo
Decreased coordination	Muscle weakness	Hair loss
Slow recovery from exercise	Rashes	weight gain
Edema or swelling	Decreased libido	Yeast infections
Hypothyroidism	Push-crash syndrome	Post-exertional relapse
Fatigue	Weakness	Generally feeling terrible
Never feeling rested		

**IDEM Response to Ms. Tina Knott Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Mr. Jim Bullis Comments and IDEM Responses**

On December 7, 2018, Mr. Jim Bullis of Saint Meinrad, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Jim Bullis Comment 1:**

Please add my name to this list of residents whom would vote NOT on the Coal to Diesel plant in Dale, Indiana.

### **IDEM Response to Mr. Jim Bullis Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

<b>Ms. Mary V. Hess Comments and IDEM Responses</b>
---

On December 7, 2018, Ms. Mary V Hess of Dale, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Ms. Mary V. Hess Comment 1:**

I support Southwestern Indiana Citizens for Quality of Life and Earth Justice's comments.

Please accept my following comments.

First, I am concerned that there is no Certificate of Truthfulness to be found within the draft permit. If one is in the draft permit or has not been submitted to IDEM, will you obtain one and forward it to me?

I am writing about my concerns that the refinery Riverview Energy is proposing to build inside the town limits of Dale, IN will add to the continued demise of our health in this part of the state. The coal-to-liquids technology proposed by Riverview Energy and KBR is a highly pollutive technology. In a 2018 article in BusinessDay, Stephen Cornell, the president of the Sasol plant in South Africa stated "This is our last coal-to-diesel operation for the world". He then quotes "the carbon footprint is very large". Wade Napier, a diversified resource analyst at Avior Capital, says that a new CTL plant may struggle to get regulatory approval as they are "highly pollutive". This concerns me because there is no other industry like this in the United States. How can you possibly approve a permit that has no definitive modeling numbers and no model to look at? Is there no law in Indiana that protects the citizens from being used as experimental subjects?

When rewriting the permit for Riverview Energy and KBR, did you bother to get information from the refineries in Russia and China or are they not in operation? You will note I am referring to Riverview as a refinery because, in one of your emails to KBR, you told them that under federal regulation this plant is considered a petroleum refinery. I believe you further stated in the email that you would refer to it as a "hybrid". Really?

I would like to refer to the recent reports issued by the UN and our own United States Government. These reports warned us that we needed to cut back on carbon emissions by 2030. Instead of reducing our carbon footprint, with your draft permit, you are going to allow Riverview Energy and KBR to release over 2.2 million tons of carbon dioxide per year into our air. This will not only be catastrophic to our area, it will be contributing to a world problem. I know that you will probably state that the EPA has been told to ease the carbon emissions on coal-fired plants (which this refinery is not). But that will not make the true science go away. The CO<sub>2</sub> released by this refinery combined with the output from the AEP Power Plant in Rockport, IN (21.9 miles from Dale), will be 900 tons of CO<sub>2</sub> per Spencer County resident, or more than 50 times the average consumption per U S resident. Does this sound like no significant impact?

In the beginning of your permit you state the Source Location Status as Attainment. Then at the end of your permit in the TSD section, you state that all the pollutants except for one are Unclassifiable, meaning there is insufficient air quality data. How can you designate a county as Attainment when there is clearly insufficient data and why would you go to South Bend (282 miles away) to get some of your modeling numbers. Is this not inaccurate? If this refinery is built, will

there be more than one monitor (on top of David Turnham Elementary School in Dale) in Spencer County? I realize you base your monitor placement on population, but seriously, AEP (a super polluter) approximately 22 miles away and Spencer County cannot have more monitors?

I have also noticed in at least 13 places in the draft you state: "These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit." This is a very specific document. Why aren't specific numbers incorporated into the permit rather than a reference to a document that may not include clear requirements? If you don't know the final refinery design (this is where a model would help), how do you know what the manufacturer's operating guidelines will be? Can you please address this?

Since an OEM has been written for dealing with asbestos containing materials, I assume they will be used. Weathering and daily use will deteriorate the materials allowing for fiber release downwind. If this is the case, are there any listed procedures for monitoring the placement of asbestos containing materials?

We are a rural farming community with our major crops being corn and soy beans. I attach this report on the effects of ozone on our crops. [Ozone effects on plants : USDA ARS](#). This refinery will increase the ozone in our area and this will affect the crop yield for our local farmers. Should the livelihood of local farmers be put in jeopardy by a project that is clearly not necessary for anyone but a few who will profit from it?

If this isn't enough to be concerned about, please take into consideration our Lincoln Parks, the Hoosier National Forest, Ferdinand Monastery, and one of the largest amusement parks in the country. Holiday World brings in tens of thousands of tourist to our area annually. This monstrosity will be at the gateway of Northern Spencer County. What a way to welcome people to our county!! And I can see Holiday World losing customers just for the smell of sulfur that will hang in the air on damp days. We have a beautiful rural landscape here and this is one of the reasons people live here. Why are you even considering ruining the beautiful rolling hills of Southern Indiana?

I ask you to reject this air quality permit for Riverview Energy. Thank you for your consideration.

#### **IDEM Response to Ms. Mary V. Hess Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring
- IDEM Response to General Statement 13 - Ozone Alert Days

With regard to the commenter's question about a certificate of truthfulness, the Air Permit Application Cover Sheet form submitted by Riverview Energy Corporation was certified (signed) by the responsible official (Gregory Merle, President of Riverview Energy Corporation) that the information contained within the air permit application packet was truthful, accurate, and complete. The air permit application was received on January 25, 2018, and can be found under document ID 80599966 on IDEM's Virtual File Cabinet (VFC) at the following website: <https://www.in.gov/idem/legal/2363.htm>.

With regard to the commenter's question about information from China and Russia, see IDEM Response to Valley Watch Comment 12.

So much of the commenter's paragraph as relates to characterizing the source as a petroleum refinery and the description as a "hybrid project" are discussed in IDEM Response to Earthjustice Comment 10 and IDEM Response to Valley Watch Comment 3, respectively. See IDEM Response to Earthjustice Comment 10 and IDEM Response to Valley Watch Comment 3.

With regard to the commenter's question about unclassifiable areas, 326 IAC 1-2-86 defines "unclassifiable (unclassified) areas" as "[a] geographical area which cannot be classified as attainment or nonattainment on the basis of available information, but for the purpose of establishing emission limitations in the applicable rule, an area comparable to an attainment area." (emphasis added)

With regard to the commenter's question about "recommended operating guidelines", IDEM notes that the phrase appears in the draft PSD/New Source Construction and Part 70 Operating Permit six times, in conditions requiring the use of good combustion practices. The commenter may have included times where the phrase appeared in the TSD also. In IDEM Response to EPA Permit Comment 5, IDEM describes reviewing the BACT requirements applicable to good combustion practices and resulting changes to the permit. As a result of those changes, the phrase "These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit." no longer appears in the permit.

IDEM, OAQ considers so much of this comment as relates to asbestos-containing materials to be the same as a part of Mr. Paul Hess Comment 1. See IDEM Response to Mr. Paul Hess Comment 1.

With regard to the commenter's question about ozone effects on crops, IDEM, OAQ notes that the chart "Effect of O<sub>3</sub> on Yield of Crops" in the web page the commenter references shows the effect on yield becoming apparent only at levels greater than approximately 20 ppb. As explained in the Air Quality Analysis (Appendix C to this ATSD) the secondary analysis for ozone indicates that the emissions are not expected to have an impact above the Significant Impact Level (SIL) of 1 ppb for the 8-hour Ozone NAAQS. No effect on crop yield can reasonably be expected from secondary ozone related to the source.

No changes to the draft permit were made as a result of this statement.

### Ms. Joan Fisher Comments and IDEM Responses

On December 7, 2018, Ms. Joan Fischer of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Joan Fischer Comment 1:

I am deeply concerned about the probability of this plant going forward. Having read the following article in the Evansville Courier, the amount of pollution the plant would expel into our environment scares me to death. Indeed, if the permit is approved, this pollution could eventually cause my death.

<https://www.courierpress.com/story/news/local/2018/06/15/riverview-dale-spencer-county-coal-diesel-pollution/699435002/>

As you can see via the following link, this area already has a history of poor air quality. We certainly don't need to expound the problem. <http://www.usa.com/spencer-county-in-air-quality.htm>

In fact, our entire state is in hazardous territory regarding the air we breathe. <http://www.usa.com/indiana-state-air-quality.htm>

When you follow this link, you find out just how polluted our area already is: <http://www.countyhealthrankings.org/app/indiana/2016/measure/factors/125/map>

In addition, the pollution this Coal-Diesel plant would emit would contribute heavily to global warming, which will effect not only us, but every generation after us, until life is no longer sustainable in the mid-west. I know there are those who deny that mankind is responsible for climate change, including POTUS -- but that doesn't change the facts and data shared by scientists in their most recent report.

Are jobs for a few -- and more dollars from a non-renewable source of energy really worth sacrificing the health of our children & grandchildren? Is it worth contributing to the destruction of our planet as we know it? I don't think so. Please deny this permit.

#### **IDEM Response to Ms. Joan Fischer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. and Mrs. Clarence Waninger Comments and IDEM Responses</b>
---

On December 7, 2018, Mr. and Mrs. Clarence Waninger of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. and Mrs. Clarence Waninger Comment 1:**

We are totally against the proposed coal to diesel plant being considered for Dale Indiana in Spencer County. We feel that we have too much pollution in the atmosphere already. We also don't want to be having that "rotten egg" smell when we go out our door. That has to be pretty awful. We live East of Dale, so we would be directly in the path when the wind comes from the west. Please reconsider the building of this plant at Dale. Thanks for listening.

### **IDEM Response to Mr. and Mrs. Clarence Waninger Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Mr. Dale Emowrey Comments and IDEM Responses</b>
---

On December 7, 2018, Mr. Daryl Emowrey, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. Daryl Emowrey Comment 1:**

I am writing in regards to the proposed Coal-to-Diesel Plant in Lincoln City. My name is Daryl Emowrey and I am a thirty-year old pastor who serves in northeast Indiana. I am writing out of general concern for this project. Consistently, we are investing in methods of energy production (using coal and diesel) that are harmful to the air we breathe and to the planet overall. I think the proposal produces an unwarranted increase in air pollution that causes both negative health effects to those in the vicinity, and contributes more to the ever-growing problem of climate change. I think there are alternatives we could invest in that would be healthier for our citizens and for our planet long-term, such as wind and solar energy.

As a person of faith, I believe God has called us to steward the earth and our resources in ways that promote the well-being of our neighbor: human, creature, and creation alike. The proposed measure, while satisfying our desire to consume energy, I believe is ultimately harmful to humans, creatures, and this earth that we all share. There are other avenues to meet our energy demands that I think should be explored and invested in, for the sake of living out of the love God has called us to show and to share in this world.

For all of these reasons, I urge you to reject the Coal-to-Diesel plant permit as it currently stands. Thank you for your service to our community.

### **IDEM Response to Mr. Daryl Emowrey Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Francis Strege Comments and IDEM Responses**

On December 7, 2018, Ms. Francis Strege, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Francis Strege Comment:**

Please do not build another coal fired power plant in Dale IN. Coal is from the past. It pollutes. Coal ash ponds contain carcinogenic neuro toxin chemicals that pollute the water and the environment.

This leads to poor health outcomes for Hoosiers.

Indiana needs to wean off of coal and mover towards a cleaner greener healthier future.

#### **IDEM Response to Ms. Francis Strege Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. William D. Schneider Comments and IDEM Responses**

On December 7, 2018, Mr. William D. Schneider, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. William D. Schneider Comment:**

I am writing today to strongly oppose the Riverview Energy coal-to-diesel plant proposed for Dale IN.

I believe that the citizens of Dale IN, Spencer County and the whole Southwestern Indiana region are being sold a bill of goods by Riverview Energy, Lincolnland Economic Development Corporation, Indiana Economic Development Corporation (which is heavily financed by the coal industry) and the Indiana Dept of Environmental Management.

In late October, IDEM released a draft air permit which stated there would be "no significant impact" on the air quality or overall health in the region. IDEM's determination was based on faulty data IDEM did not use the data from monitors anywhere close to the proposed plant's location. There are no monitors near Dale to correctly measure the current air quality in the region. And some of the monitors located several counties away do not function for extended periods of time.

IDEM purposely selected monitors elsewhere in the state to skew the results of the draft permit in favor of Riverview Energy, a coal marketer that is heavily backed by the deep pockets of the coal industry. Some of the monitors that IDEM used in their determination were located in South Bend, Indiana, 275 miles away on the northern border of the state. Those monitors cannot possibly accurately reflect the air quality in Dale, Indiana, on the southern border of the state.

I contend that IDEM must do due diligence by installing the appropriate monitors in the immediate area in Dale, ensure the accuracy of the data produced by those monitors, evaluate the data generated by those monitors for a period of no less than 3 years before even considering reviewing the Riverview Energy air permit.

My family, honest hard-working Hoosiers, deserves the protection of IDEM which claims "We Protect Hoosiers And Our Environment". The purpose of IDEM is not to enable greedy, out-of-state coal barons to harm our environment, to jeopardize the health of our families, neighbors and friends.

Please reject air permit application T147-39554-00065. Do not even consider the air permit application again until after you have installed, maintained, and ensured the accuracy of data from monitors in Dale, and correctly measured that data for a minimum of 3 years. The people of southern Indiana deserve no less from IDEM.

**IDEM Response to Mr. William D. Schneider Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Ms. Lisa E. Schneider Comments and IDEM Responses</b>
--

On December 7, 2018, Ms. Lisa E. Schneider, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Lisa E. Schneider Comment:**

I am writing today to strongly oppose the Riverview Energy coal-to-diesel plant proposed for Dale IN.

I believe that the citizens of Dale IN, Spencer County and the whole Southwestern Indiana region are being sold a bill of goods by Riverview Energy, Lincolnland Economic Development Corporation, Indiana Economic Development Corporation (which is heavily financed by the coal industry) and the Indiana Dept of Environmental Management.

In late October, IDEM released a draft air permit which stated there would be "no significant impact" on the air quality or overall health in the region. IDEM's determination was based on faulty data. IDEM did not use the data from monitors anywhere close to the proposed plant's location. There are no monitors near Dale to correctly measure the current air quality in the region. And some of the monitors located several counties away do not function for extended periods of time.

IDEM purposely selected monitors elsewhere in the state to skew the results of the draft permit in favor of Riverview Energy, a coal marketer that is heavily backed by the deep pockets of the coal industry. Some of the monitors that IDEM used in their determination were located in South Bend, Indiana, 275 miles away on the northern border of the state. Those monitors cannot possibly accurately reflect the air quality in Dale, Indiana, on the southern border of the state.

I contend that IDEM must do due diligence by installing the appropriate monitors in the immediate area in Dale, ensure the accuracy of the data produced by those monitors, evaluate the data generated by those monitors for a period of no less than 3 years before even considering reviewing the Riverview Energy air permit.

My family, honest hard-working Hoosiers, deserves the protection of IDEM which claims "We Protect Hoosiers And Our Environment". The purpose of IDEM is not to enable greedy, out-of-state coal barons to harm our environment, to jeopardize the health of our families, neighbors and friends.

Please reject air permit application T147-.39554-00065. Do not even consider the air permit application again until after you have installed, maintained, and ensured the accuracy of data from monitors in Dale, and correctly measured that data for minimum of 3 years. The people of southern Indiana deserve no less from IDEM:

Riverview Energy will not only mar the most beautiful landscape of southern Indiana, it will compromise the health of us who live here. If you wouldn't want it in your backyard, don't vote to permit it.

#### **IDEM Response to Ms. Lisa E. Schneider Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Ms. Angela Devore Comments and IDEM Responses**

On December 7, 2018, Ms. Angela Devore, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Angela Devore Comment:**

I am opposed to the Riverview Energy coal-to-diesel plant proposed for Dale IN. I have read the many articles the have been published regarding the pollution that will be released by this plant. I

have also read that IDEM released a preliminary report that this plant will not have a significant impact on the air quality and overall health in this region.

It appears that in making this absurd determination, IDEM did not even research the air quality in the Southwestern Indiana region. Some of the monitors used by IDEM were in the far-northern regions of Indiana, about as far away from Southwestern Indiana as you can get. And there are no monitors in Spencer County to measure the existing air quality.

My husband suffers from COPD. This plant will most definitely have a significant impact on his health, and on the health of all of our family, neighbors and friends.

Please deny the air permit application by Riverview Energy. Spencer County and the rest of the Southwestern Indiana region already has enough super-polluters fouling our air. We do not need to add any more.

#### **IDEM Response to Ms. Angela Devore Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Ms. Stacy Rasche Comments and IDEM Responses**

On December 7, 2018, Ms. Stacy Rasche, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Stacy Rasche Comment:**

As a mother of two children and one on the way, I oppose the Riverview Energy coal to diesel plant proposed for Dale IN.

My family lives within 5 miles of the proposed plant's location. I am very concerned about the air, water and soil pollution that will be produced by this plant, and which will affect all of the region downwind of the plant, including my home, the home of my parents, grandparents and extended family.

It is my understanding that the draft air permit released by IDEM which stated there would be "no significant impact" on the air quality or overall health in the region was based on flawed data; There are no monitors in Spencer County except for a PM<sub>2.5</sub> monitor located at David Turnham Elementary School in Dale. IDEM did not use the data from monitors anywhere close to the proposed plant's location. The monitors used by IDEM were specifically selected to show the results that were the most favorable to Riverview Energy, even using the data from a monitor located in South Bend IN. South Bend IN is nearly 275 miles from Dale IN. If you'll check an Indiana map, South Bend is on the very northern border of Indiana, while Dale is within 25 miles

of the very southern border of Indiana. The entire state of Indiana lies between the two locations. The monitors in South Bend can in no way reflect the air quality in Dale.

IDEM claims on your website's homepage "We Protect Hoosiers And Our Environment". IDEM must do what is right to protect the environment of the Hoosiers who live in the southern regions of Indiana, and not skew the data to suit the purposes of a greedy, out-of-state coal marketer who will harm our environment for generations to come.

We don't want this plant in Southern Indiana. It will most definitely have a significant impact on the air quality and overall health of the Hoosiers whom you are meant to protect. Please deny air permit application T147-39554-00065.

#### **IDEM Response to Ms. Stacy Rasche Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Ms. Jill VanHoosier Comments and IDEM Responses**

On December 7, 2018, Ms. Jill VanHoosier, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Jill VanHoosier Comment:**

Please deny the air permit application for Riverview Energy. Riverview Energy is a coal marketer incorporated in the state of Delaware that will sell off the coal-to-diesel plant as soon as all the coal-purchasing deals have been put in place. The nearly-100-year-old technology that will be used by this refinery is not economically feasible, not sustainable and just plain doesn't make any sense to any logical person.

Because it makes no economic sense and cannot be profitable, the plant will be sold again and again until finally it will go bankrupt, leaving the folks in Dale, Spencer County and the state of Indiana to try to deal with the toxic waste dump that will remain. Where will IDEM be in all of this? Will they accept any of the blame for the harm done to our region? Will they carry any of the economic burden of the cleanup? Or will they simply throw up their hands and say well, Riverview DID just barely meet the minimum requirements of the law at the time (even though IDEM used inaccurate data to arrive at the minimum requirements)?

Kellogg Brown & Root (KBR), the owners of the technology for the coal-to-diesel process proposed for this plant, already has such a terrible history of despicable disregard for the health and safety of their own employees, and the military personnel who were forced to protect them. Check out the article at <https://www.houstonpress.com/news/blood-money-6592441> for the details of the horrible injuries inflicted on those people by KBR's willful actions. How can honest,

hardworking Hoosiers possibly put any faith and trust in a company like that? KBR and Riverview Energy will do nothing to ensure no harm will come to folks in this area. They will bear no monetary burden when they inflict pain and suffering on our families.

The entities involved in bringing Riverview Energy to this area tout jobs, jobs, jobs. The jobs they are expecting are short-term construction jobs. Little do they realize that the long-lasting jobs that will be brought by this plant will actually be jobs in the healthcare industry and beyond - doctors, nurses, respiratory therapists, hospitals, funeral directors, casket builders.

Spencer County, Indiana is already ranked 23rd out of 3,142 counties in the country for worst air pollution. Indiana is already ranked 6th of all 50 states for worst air pollution. That tells me that IDEM, whose job is to protect the air quality in the state of Indiana, is not doing its job. It is placing more emphasis on allowing polluting industries to set up shop in this state, than on protecting the environment in Indiana.

I strongly oppose the Riverview Energy coal to diesel plant proposed for Dale, IN. Please reject Riverview Energy's air permit application. Do what IS right for the Hoosiers of Southwest Indiana.

#### **IDEM Response to Ms. Jill VanHoosier Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

#### **Ms. Nancy Graman Comments and IDEM Responses**

On December 7, 2018, Ms. Nancy Graman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Nancy Graman Comment:**

I know that IDEM is currently considering the air permit application for Riverview Energy, a Delaware-based coal marketer, that wants to construct a coal-to-diesel refinery on the northern edge of Dale IN in Spencer County. I read that IDEM has released a preliminary report stating that there would be "no significant impact on the air quality or overall health" of the residents in this region.

How can IDEM make a general public statement like that when IDEM has not adequately measured the air quality in our region? I understand that some of the data on which IDEM based their preliminary findings came from monitors in *South Bend IN!* South Bend IN is on the very

*NORTHERN* edge of Indiana. Dale IN is within 30 miles of the *SOUTHERN* edge of Indiana. The *ENTIRE* state of *INDIANA* lies between the two cities. According to Mapquest, the distance from Dale IN to South Bend IN is 274 miles. It would take 5-and-a-half hours to travel by car from Dale IN to South Bend IN.

We do not share the same air quality with northern Indiana. Southern Indiana is already heavily burdened with super-polluters including AK Steel and the AEP power plant in Rockport IN, as well as coal-fired power plants in nearby *SOUTHERN INDIANA* counties.

IDEM has listed, on their very own website (<https://www.in.gov/idem/>) the very harmful effects of pollutants, specifically Ozone and PM2.5 (particulate matter that is 2.5 micrometers wide or smaller - or one-thirtieth the diameter of a human hair). Ozone is formed from a reaction between volatile organic compounds (VOCs) and nitrogen oxides (NOx). The proposed Riverview Energy Coal-to-Diesel plant will emit *175 TONS of VOCs and 184 TONS of nitrogen oxides*. And over half of the Volatile Organic Compound (VOC) emissions from this plant are expected to come from "Fugitive Emissions" (uncontrolled leaks). Those-leaks during operation of the plant are apparently *expected* to happen. Those "leaks" will only escalate with every passing year as equipment ages and fails. And "leaks" will occur during the start-up phase as well, when things aren't working just quite how they are supposed to.

From your website: "Because PM2.5 is extremely small the particles can deposit deep in lungs and are difficult to exhale. Being exposed to PM2.5 may cause coughing and difficulty in breathing. Exposure over several days may increase the chance of these symptoms. Health risks are greater-for individuals with heart or lung diseases such as coronary artery disease, congestive heart failure, asthma, chronic obstructive pulmonary disease (COPD) and diabetes." The air permit application states the plant will emit 139 *tons* of particulate matter.

Your website goes on to describe Sensitive Groups as people with lung disease, older adults and children who are more vulnerable to ozone, and people with heart and lung disease, and older adults and children who are more vulnerable to PM2.5. *This plant will be located within ONE MILE of an elementary school and a nursing home!*

There will *MOST DEFINITELY* be a significant impact on the health of the residents here.

Spencer County currently has no monitor to measure ozone. There are monitors in surrounding counties that show ozone problems already exist. IDEM and the EPA have already issued Ozone Alert Days for Southern Indiana several times this past summer. You already know there is a definite problem with ozone here. Adding another super-polluter will definitely exacerbate the problem.

Please deny air permit application T147-39554-00065.

#### **IDEM Response to Ms. Nancy Graman Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring

- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring
- IDEM Response to General Statement 13 - Ozone Alert Days

No changes to the draft permit were made as a result of this statement.

### Mr. Gary Graman Comments and IDEM Responses

On December 7, 2018, Mr. Gary Graman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Gary Graman Comment:

I am writing today to express my opposition to the Riverview Energy coal-to-diesel plant proposed for Dale IN.

The technology for the process that Riverview Energy proposes to use to convert coal into liquid diesel fuel is nearly 100 years old. There is no other plant utilizing this technology anywhere in the western hemisphere, and for good reason. In a Dec 7, 2009 article in "Taxpayers For Common Sense" (<https://www.taxpayer.net/energy-natural-resources/coal-to-liquids-a-costly-gamble/>), the process was described as a "risky investment" and that "without constant, long-term taxpayer support, liquid coal projects are likely to be untenable" (unsustainable). I urge you to read the article which also quoted a GAO report that "cited regulatory and liability uncertainties surrounding CO2 leakage, which could lead to forest destruction, poisoned water supplies and other costly cleanups". This technology is not new, it is not "clean" and is definitely not economically liable. It was not viable in 2009, and it still is not viable in 2018.

Kellogg Brown & Root (KBR) is the company that's actually providing the coal-to-diesel technology to Riverview Energy. Riverview is simply a coal marketer who will quickly abandon their interest in the plant once the coal supply chain is established. Because the process is unsustainable and not economically viable, the ownership of this plant will change hands several times before it will finally go bankrupt, leaving this hulking, deadly monstrosity in the hands of the town of Dale, Spencer County and the State of Indiana to clean up (if even possible). It is a very costly "experiment" that is doomed to fail.

KBR has already demonstrated their despicable disregard for human life. Because of KBR's deceit and corruption, civilians and US military personnel were exposed to vile chemicals and have died and/or are suffering devastating illnesses. See the article at <https://www.houstonpress.com/news/blood-money-6592441> for the horrifying details.

Neither Riverview Energy nor Kellogg Brown & Root will be good, responsible corporate citizens in Southern Indiana. They will willfully pollute our area and will abandon this ill-advised plant, leaving the mess behind for the citizens of Indiana.

Please deny air permit application T147-39554-00065.

#### IDEM Response to Mr. Gary Graman Comment:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Autumn Devore Comments and IDEM Responses**

On December 7, 2018, Ms. Autumn Devore, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Autumn Devore Comment:**

I have been following the posts and newspaper articles regarding the proposed Riverview Energy coal-to-diesel plant. This plant will pump many, many tons of deadly chemicals into our atmosphere which will be inhaled by our residents, will settle into our soil and waterways, will be ingested by our wildlife and livestock, and will cause irreparable damage.

It's bad enough that these deadly toxins will affect the lives of the residents of Spencer County and the whole Southwestern Indiana region. There are also many hundreds of thousands of visitors who come to Spencer County every year to our campgrounds, state parks, Lincoln Boyhood National Memorial, Holiday World, and other sites. All of those people will be affected during their stays here. And the stench of the sulfur released by this plant, which will smell like rotten eggs, will drive those visitors away. Our tourism in Spencer County will suffer.

Please deny the Riverview Energy air permit application. We do not want this super-polluter in our area. We have more than enough super-polluters in Spencer County already.

Spencer County deserves better. Southwestern Indiana deserves better.

#### **IDEM Response to Ms. Autumn Devore Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. Larry Buechler Comments and IDEM Responses**

On December 7, 2018, Mr. Larry Buechler, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Larry Buechler Comment:**

Riverview Energy, a Delaware-based coal marketer, has proposed constructing a refinery in Dale IN that will pulverize coal and with a series of chemical treatments, produce liquid diesel fuel. By the very nature of this refinery, millions of tons of deadly pollutants and gases will be released into the environment in the Southern Indiana region and will have a significant detrimental effect on the air quality and overall health of the residents in the region.

A partner in this proposed plant, Kellogg Brown & Root (KBR), has the title to the process that Riverview Energy will utilize. This technology is nearly 100 years old and has never been used successfully anywhere in the western hemisphere. It was attempted in Hitler's Germany and in South Africa's Apartheid. In both of those instances, the endeavors failed because they were not economically feasible. KBR has already demonstrated that they cannot be trusted to protect people's health and welfare. See the article at <https://www.houstonpress.com/news/blood-money-6592441> for details on how KBR exposed their own employees, and the service personnel who were deployed to protect them, to deadly chemicals resulting in deaths and devastating illnesses.

My family and I live within 5 miles of this awful plant. We will be affected by the deadly pollutants that will be released by the plant, along with the horrible smell of rotten eggs from the sulfur that will be released. We cannot trust Riverview Energy, and we most definitely cannot trust KBR, to show any concern whatsoever for the health and safety of the residents in this area.

Please deny air permit application T147-39554-00065.

**IDEM Response to Mr. Larry Buechler Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jovian Devore Comments and IDEM Responses</b>
--

On December 7, 2018, Mr. Jovian Devore, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Jovian Devore Comment:**

Please deny the air permit application by Riverview Energy. The proposed coal-to-diesel plant will pump many, many tons of deadly toxins into our air which will then settle into our soil and water sources.

These deadly chemicals will affect the health of the residents in our region for many generations to come. Wildlife and livestock in our area will be harmed. Consumption of the affected fish, deer, birds, cattle, hogs, and other game and livestock will further poison the residents in our region.

When this plant fails, and it will fail because it's not economically sustainable, we will be left with a toxic waste dump which will poison our environment for many, many decades. The residents and local governments, and maybe even the state of Indiana, will be burdened with the cleanup.

Please deny the air permit application by Riverview Energy.

**IDEM Response to Mr. Jovian Devore Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Kim Buechler Comments and IDEM Responses</b>
---

On December 7, 2018, Ms. Kim Buechler, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Kim Buechler Comment:**

As a resident of Spencer County, I am asking you to please deny Riverview Energy's air permit application T147-39554-00065.

I am most concerned with the millions of tons of deadly chemicals that will be released by the plant, as listed in the air permit application. And those are the chemicals that will be released when the plant is operating normally. We all know that there will be malfunctions resulting in even more significant releases of deadly chemicals, blanketing our region. In fact, in the air permit application itself, it is stated that a failure of the bag filters that will be utilized to control the release of fine coal dust would be indicated "by a significant drop in the baghouse's pressure reading with abnormal visible emissions", in other words, a plume of black coal dust shooting into the air will be an expected indicator of the bag filter's failure. And the air permit also states that this pollution can continue until "the completion of the processing of the material in the emission unit".

We all know that malfunctions happen in many industrial plants, as evidenced by the many, many recalls of various products every day. A malfunction in this plant will have disastrous consequences: Emergency personnel in this area will be ill-equipped to handle an emergency situation at this plant resulting from fire, explosion, earthquake, tornado, operator error, equipment failure.

This plant will cover a 512-acre tract located at the edge of Dale IN. The plant site is more than 4 times the size of the rest of the town of Dale. It will be within one mile of an elementary school and nursing homes. Because of that fact alone, this refinery must be held to even more stringent standards than any plant that would be located in a remote, unpopulated area.

The stench of rotten eggs from this plant's release of sulfur will permeate the entire region. It will be a detriment to the tourism industry in Spencer, Dubois and surrounding counties. And it will be a huge detriment to the quality of life for the residents in the region.

This plant will most definitely have a significant impact on the air quality and overall health of residents in this region.

Please do your part to protect the lives and health of the Hoosiers who live in Southwestern Indiana. Please deny Riverview Energy's air permit application T147-39554-00065.

**IDEM Response to Ms. Kim Buechler Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Calvin Devore Comments and IDEM Responses</b>
--

On December 7, 2018, Mr. Calvin Devore, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Calvin Devore Comment:**

I am opposed to the Riverview Energy coal-to-diesel plant proposed for Dale IN. My family and I are residents of Spencer County and we are already surrounded by large industries and power plants that pollute our air, soil and water.

I suffer from COPD which is aggravated by the poor air quality in this area. If Riverview Energy's plant is allowed to be constructed and begin operation, my health will be significantly impacted. The health of my family, friends and neighbors will be significantly impacted.

IDEM and the EPA have issued many Ozone Alert Days for this area. During those OADs, the conditions of people with COPD, asthma and other respiratory illnesses are significantly worsened. Riverview Energy's emissions will contribute to additional Ozone Alert Days.

Do not allow this plant to pump additional tons of deadly toxins into our air, soil and water. Do not grant the Riverview Energy permit application.

**IDEM Response to Mr. Calvin Devore Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 13 - Ozone Alert Days

No changes to the draft permit were made as a result of this statement.

<b>Ms. Andrea Hamman Comments and IDEM Responses</b>
--

On December 7, 2018, Ms. Andrea Hamman, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Andrea Hamman Comment:**

Indiana is ready for renewables.

Southern Indiana is not a sacrifice we are willing to accept.

Listen to the voices of the people directly affected by the pollution caused by coal and diesel.

Coal is not new technology.

Renewables are the only way to save us. Less pollution, more jobs, permanent jobs.

Do what you are supposed to do and manage the environment.

**IDEM Response to Ms. Andrea Hamman Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr Larry Hess Comments and IDEM Responses</b>
--

On December 7, 2018, Mr Larry Hess, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr Larry Hess Comment:**

I am opposed to the proposed Riverview Energy's coal-to-diesel plant proposed for Dale, IN in Spencer County. The main reason I oppose the plant is that it will be highly pollutive to the air we breathe. Combining its polluted air with the polluted air which the citizens of northern Spencer County receive from the Indiana Michigan Power plant, the AK Steel plant, the Alcoa plant in Warrick County, and several plants located in Vanderburgh County, I feel that this plant will be more detrimental to our area than good. Being an area that thrives on tourism, the reputation for the environment is important.

In the July 16, 2018 issue of "Business Day," Stephen Cornell, the president and CEO of South African Synthetic Oil Liquids, known as Sasol, was interviewed. Sasol is an integrated energy and chemical company based in Sandton, South Africa. Part of Sasol's energy division uses a coal-to-liquification process. The original coal to liquid plant was established in 1955, the main reason being the oil embargo against apartheid South Africa. The technology makes use of the Fischer-Tropsch reaction, which was developed by German scientists under Nazi rule to produce petroleum products from coal during World War II. The same technology is planned to be used in the plant at Dale, IN.

In the article; Mr. Cornell stated that Sasol would not replace the plant in the future. He was quoted to say that "This was Sasol's last coal-to-liquids operation in the world." He went on to say that "The basic business case is challenged in terms of making a return on the investment." And that "the carbon footprint is extremely large."

Wade Napier, a diversified resources analyst at Avior Capital says that any new coal-to-liquid plant may struggle to get regulatory approval as they are highly pollutive.

It is ludicrous for IDEM to say that this coal to diesel plant would not have a significant impact on our air quality and overall health when we hear from Stephen Cornell, president and CEO of Sasol, who has had personal experience with a coal-to-liquification plant and says this type of plant causes an extremely large carbon footprint and his company would never operate another coal-to-liquification plant in the world. This should tell us how awful this plant would be. I beg you to not approve the proposal for Riverview Energy Corporation

**IDEM Response to Mr Larry Hess Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Mr. Ralph Lueken Comments and IDEM Responses</b>
---

On December 8, 2018, Mr. Ralph Lueken of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Ralph Lueken Comment 1:**

Please do not approve the permit for the coal to diesel plant proposed for Spencer County. There are so many things wrong with this proposal they are not possible to list. In addition to the increased air and water pollution that will affect millions of people; the economics of the plant do not make sense. If built; I expect the plant would be abandoned in less than 10 years and the state and county will be left with a massive contaminated site to clean up. Please do not approve this permit.

**IDEM Response to Mr. Ralph Lueken Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Janet Kennedy Comments and IDEM Responses**

On December 8, 2018, Ms. Janet Kennedy of Paoli, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Janet Kennedy Comment 1:**

I attended the hearing on Wednesday night about the Coal to Diesel Plant in Dale. I am strongly against it as someone who lives downwind of it in Orange County. The longer I listened to those who spoke, the more clear it became to me that you must deny this permit.

As you know, the IPCC announced this week that we have only 12 years to turn around our destruction (climate catastrophe) by reducing greenhouse gases. How would this plant help us achieve that goal? Can IDEM come up with permits for businesses that would help us avoid climate catastrophe?

I was very concerned about the effects on fetal and children's development and health brought up at the meeting. Why does IDEM not have any input from the state department of public health or any medical providers or environmental health experts when making these decisions? Environmental management should involve effects on human health as well as wild-life; wouldn't you agree? The last thing our economy needs is more autistic, special ed and asthmatic children.

Finally, as I have seen on a bumper sticker: There are no jobs on a dead planet. Your job is to protect the environment and, presumably, those of us who live in it. The concerns of those who want financial gain from hurting Spencer County or anywhere else in Indiana should not be included in your decision.

Thank you for your consideration. I hope nothing like this will come up again as it is the antithesis of the direction our state and our planet need to be going now.

#### **IDEM Response to Ms. Janet Kennedy Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

IDEM, OAQ relies on the scientific expertise of U.S. EPA which sets the National Ambient Air Quality Standards (NAAQS) to be protective of public health and the environment, establishes federal regulations to limit or reduce pollution such as Prevention of Significant Deterioration (PSD), New Source Performance Standards (NSPS), and the National Emission Standards for Hazardous Air Pollutants (NESHAP), and establishes air quality modeling, impact analysis, and risk assessment procedures and guidelines.

Regarding the 2017 special education enrollment for southwest Indiana schools, please see the IDEM Response to Mr. Rock Emmert Comment 1.

No changes to the draft permit were made as a result of this statement.

### **Ms. Sarah Garrison Comments and IDEM Responses**

On December 8, 2018, Ms. Sarah Garrison, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Sarah Garrison Comment:**

I cannot imagine how hard IDEM's job must be! I'm sure a lot of hard work goes into your decision making.

As a resident of Dale, IN and making our home in Spencer County, I ask that you consider all aspects of this proposed coal-to-diesel plant.

I cannot believe anyone would want this plant within their city limits and within 1 mile of our schools and nursing homes.

I wonder how this will affect our current water supply. Who will pay for all the pipe laying and what would happen if it became faulty?

Mr. Logan, would you want this in your backyard, within the city limits where you and your family reside?

I could go on and on. A lot is at stake here! Please consider the future generations in this town and help them live in a healthy community.

Please deny permit T147-39554-00065.

#### **IDEM Response to Ms. Sarah Garrison Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Adrienne Highhouse Comments and IDEM Responses**

On December 8, 2018, Ms. Adrienne Highhouse, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Adrienne Highhouse Comment:**

As a member of the public, I want to express my opposition to the coal-to-diesel plant proposed for Dale, Indiana (permit #T147-39554-00065). We live in an area with plenty of other sources of air and water pollution. We are already doing more than our share of sacrifice when it comes to exposure to air and water pollution.

I have been a hospice social worker in this area for 15 years. I work every day with people who are losing their fight with respiratory illness. These folks live a long time with poor quality of life and require extensive and expensive medical care. Air pollution also contributes to other kinds of

cancer and disease, of which I witness the end result. Many of these people worked hard all their lives only to be ill during the years they should be enjoying; others are younger and haven't even had a chance to finish working.

I believe it's our duty to consider the future of our quality of life, as well as our financial resources. We are smart; we can come up with better sources of livelihood for our community. Please feel free to contact me regarding this issue.

**IDEM Response to Ms. Adrienne Highhouse Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Gail Brown Comments and IDEM Responses</b>
---

On December 8, 2018, Ms. Gail Brown, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Gail Brown Comment:**

Regarding the coal to diesel plant in Dale, Indiana, it is my desire to communicate my horror of this proposal. Now that we are aware that the air we breathe must be clean in order to be healthy, it is shocking to hear that there is a plan to reduce air quality in Dale, Indiana (or in any part of the country).

People who have asthma (as my son), for example, simply can't get well under these circumstances. He has had to move to California in order to live a quality life where he is not sick all the time.

It is also important that our precious resource, WATER, will also be affected. What are you thinking?? We seem to be willing to pollute our water that we cannot live without!

It is beyond my ability to figure out how money is a reason for such a proposal!! What we destroy cannot be brought back and so many will suffer.

**IDEM Response to Ms. Gail Brown Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Roger Payne Comments and IDEM Responses</b>
--

On December 8, 2018, Mr. Roger Payne, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Roger Payne Comment:**

I received the Notice of Period for Public Comment for Review Energy Corporation in Spencer County (New Source Construction and Part 70 Operating Permit No. T147-39554-00065), and I wish to convey my opposition to the renewal of said permit.

My residence is located at 4130 E CR 2100 N, Dale, IN 47523, which means that the proposed facility would be in my backyard. I am concerned not only that construction of the proposed facility will lower my property value, but also that it will affect the air quality and my health.

According to Section H - Summary of Air Quality Analysis, the proposed Direct Coal Hydrogenation facility had emissions above the significant emission rates for NO<sub>x</sub>, VOCs, PM<sub>2.5</sub>, PM<sub>10</sub>, CO, SO<sub>2</sub>, and HAPs, which required a refined air quality impact analysis. Although the refined air quality impact analysis claims that the final resulting concentrations were under the NAAQS and PSD increments for all averaging times and pollutants, a closer look at the analysis shows that the data used to come to that conclusion may be skewed, making the conclusion flawed.

Table 4, for instance, shows that the monitor used to calculate NO<sub>2</sub> concentrations is located in South Bend, IN. South Bend is hundreds of miles away from Dale, on the other side of the State of Indiana. According to data available online, South Bend has much better air quality than Evansville, IN, which is where the closest NO<sub>x</sub> is located. Moreover, there are at least six NO<sub>x</sub> monitors in Indiana that are located closer to Dale than the South Bend monitor. Why did the air quality analysis use numbers from South Bend? I believe these numbers have skewed the results, making the numbers lower than they actually would be.

Even if the numbers used in the air quality analysis were not skewed, the increase in the concentration of pollutants still is concerning. Spencer County is already ranked 23rd out of 3,142 counties for most toxins released. We do not need more pollution in this area. Thousands of studies have shown how air pollution can harm people. With the proposed facility being so close to my house, I am concerned for my own health as well as the health of the community.

According to 326 IAC 2-1.1-5(5), "The commissioner should not issue preconstruction approval to any person for construction or modification of any source of emission unit if the commissioner determines that the terms and conditions of the preconstruction approval [...] are not protective of the public health." The terms of Permit Number T147-39554-00065 are not protective of the public health. The air quality impact analysis appears to be flawed, which means that the risks are not fully taken into account. Regardless of specific numbers, it is undeniable that the proposed facility would increase the concentration of pollutants, further worsening the air quality of an area that already has a high level of pollution. I respectfully request that you deny the renewal of Permit Number T147-39554-00065.

The location of the plant, to the south of my property, will isolate my property between Interstate 64, to the north, and the plant. The plant location is literally in my backyard. I raised my family here. My children played in the yard. We looked out across the fields and watched the crops grow and the seasons change. If this plant is built, we will no longer be able to do these things.

It is my opinion and belief that this plant will make my home and property basically worthless. I have worked hard to own and maintain my home and property. A lot of my life savings are invested in my home. If I were looking to purchase a home, I would not consider purchasing a

home next to this plant. Therefore, I do not believe I will be able to sell my home and property at fair market value. Also, the irony of this is that it is my understanding that the purchase price of the real estate this plant is to be built on will cause my property taxes to increase. Therefore, if this plant is built, I will be left with a home and property that is reduced in value, but taxed at a high rate. For these reasons also, I respectfully request that you deny the renewal of Permit Number T147-39554-00065.

**IDEM Response to Mr. Roger Payne Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

<b>Mr. Thomas Thake Comments and IDEM Responses</b>
---

On December 9, 2018, Mr. Thomas Thake of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Thomas Thake Comment 1:**

My question is regarding the dispersal rate for the 1.6 million tons of coal. I would like to know the distance and how much of the particulate matter and other toxic waste would fall within differing distances from the plant. As an example can it be expected that 20 percent would fall to the ground within the first mile and another 20 percent could be expected between 1-10 miles. To continue that thought, the next 20 percent between 100-1000 miles and 20 percent between 1000-10,000 miles and the remaining would be either suspended or fall in the remaining distance?

To help, I believe the US Department of Agriculture, Forest Service and the military has models or estimates it used when trying to determine the dispersal of particulate matter for such events such as prescribed fires and estimating effects caused by military explosions. I am hoping to understand what percentage of the particulate matter will fall based on the distance from the plant. Thanks you for your time and attention.

**IDEM Response to Mr. Thomas Thake Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 14 - Pollutant Travel Distance. Note that IDEM, OAQ considers the exaggerated distances cited by the commenter as only examples.

No changes to the draft permit were made as a result of this statement.

### **Alex Slabosky Comments and IDEM Responses**

On December 9, 2018, Alex Slabosky of Indianapolis, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Alex Slabosky Comment 1:**

This is to express my opposition to the proposed coal-to-diesel plant sponsored by Riverview Energy in Dale, Indiana. There are overwhelming environmental, health, and economic arguments against the proposed plant. One that has received comparatively little attention in the discussions about the plant and will have immense impact on the future economic growth of the state is the need to retain and attract highly skilled employees in Indiana.

In March Governor Holcomb said, "We have to have this ready, skilled-up workforce here at home, right in our backyard in addition to attracting talent from all over the world." He had previously described workforce development as the, "issue of the decade." In a column in the December 7, 2018 edition of the Indianapolis Business Journal, commenting on Amazon's HQ2 project decision, Nate Feltman writes, "Indiana has made great progress in terms of our competitiveness for business investment. Our focus now must be on retaining and attracting talent."

In a nation where highly educated individuals are in great demand everywhere, adding a coal-to-diesel plant in a state where pollution is already high will do nothing to retain and attract highly educated, environmentally concerned talent to Indiana. In all likelihood, the plant and the associated pollution will be a deterrent to retaining and attracting the talent that Governor Holcomb believes Indiana needs to grow its economy.

#### **IDEM Response to Alex Slabosky Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. Greg Silver Comments and IDEM Responses**

On December 9, 2018, Mr. Greg Silver of Indianapolis, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Greg Silver Comment 1:**

After examining the facts about employment in this proposal I now conclude it is far outweighed by the gross increase in amounts of CO2 to be generated as presented by objective facts submitted into the recent testimony. Look at the S Africa example- YOU do not want self-serving facts to be the accepted "truth" by IDEM-paid data by the petitioner or its paid experts. You must

be the objective evaluator, without political pressure as you were on Dunes Lakeshore to stop nuclear power at NIBSCO power plant. You were right then and you need to be right now.

The proposal is financially defective too because, while it may produce coal jobs, it does not objectively quantify the air pollution costs to public health and quality of life damage in real estate values and such for the region from those who have previously invested in their homes and businesses in the region. The gross emissions allowed provides the image of a state that cannot see the financial detriment to health and property and stays with coal as the primary energy source for the long term despite the US, UN and International Reports in the last 30 days objectively documenting the urgency to reduce right now the greenhouse gases from coal fired power plants here and abroad.

I hereby request those US Interagency, UN and EU Reports of the last 30 days to be placed in full into the file of this case by IDEM as expert testimony. The costs and risks are too high for our descendants. This proposal will be tied up in appeals and in courts for years and under the federal Clean Air Act in federal court for sure.

In conclusion, this is a lose lose for Indiana's future of clean tech jobs and economy and air pollution we have combated, to any disinterested regulator. It is not a good for Indiana where wind and solar and geothermal and natural gas are available. What rational financier would put up money knowing a change of administration can kill the project after 2020 election. The project should be tabled until other energy sources and efficiencies of use are proposed even if a plant is even needed. Sometimes IDEM has to say NO even to the politically powerful. There are many reasons to say NO to this one.

#### **IDEM Response to Mr. Greg Silver Comment 1:**

IDEM understands that the commenter has serious concerns about the global effects of greenhouse gas emissions. However, IDEM has followed all proper procedures to include all current Clean Air Act requirements for greenhouse gas emissions in the draft permit.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

IDEM, OAQ is not legally required to place this report in full into the file for this proposed permit as expert testimony. Indiana Code §13-15-5-1(c)(1), as well as 326 IAC 2-1.1-6, allow interested persons including members of the public to submit written comments concerning a permit application. In submitting public comments, it is incumbent upon the commenter to supply all of the information the person requests be included in the comment. This not only lessens the administrative burden placed on the agency, but also ensures that items are not made a part of the record by mistake. Further, nothing in the relevant statutes governing notice and comment in reviewing permit applications requires the agency to place referenced documents into the record.

No changes to the draft permit were made as a result of this statement.

### **Mr. Randy Hildenbrand and Mrs. Connie Hildenbrand Comments and IDEM Responses**

On December 9, 2018, Mr. Randy Hildenbrand and Mrs. Connie Hildenbrand of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Randy Hildenbrand and Mrs. Connie Hildenbrand Comment 1:**

I attended the mtg. Wednesday evening at Heritage Hills as well as several earlier mtgs. According to my count there were approximately forty speakers adamantly against this permit with about six in favor. The ones in favor were looking at the short term goals of construction jobs, and plant jobs once built. The few FOR this project will not be local citizens, but out of state and county construction workers. Please look at the effect this plant would have on thousands of citizens of Spencer and surrounding counties for years and years to come. You've already heard all the arguments about harming our health, so I'm not going to repeat all of them. I will however, tell you about my wife who suffers from fibromyalgia and has for years. We are convinced it's from the toxic air in this area. Since she's been diagnosed, we've found out there is a heavy concentration of this disease in this immediate area. Adding to the air pollution, in any amount, is only going to multiply this disease and many, many more. WE DON'T NEED THIS PLANT FOR ANY REASON !!!!!!!

Please don't give in to our commissioners and the Dale Town Council, who are only looking out for themselves, and not the majority of the citizens in this area. Be a hero and vote NO for this permit !!!! Let your conscious be your guide. The letter of the law is not always the only way to make decisions.

If anyone tells you these people would be good stewards for the county, let me tell you a story. I am president of the St. Meinrad Chamber of Commerce. Shortly after another super polluter in the county was built, we approached them for help with a fundraiser. They would not even talk to us!! Toyota, in Gibson County were more helpful. This company will be based on the east coast as I understand. They won't give a second thought about helping us out with local projects in this area! We just don't need these kinds of businesses in our county, or anywhere else in the entire US.

#### **IDEM Response to Mr. Randy Hildenbrand and Mrs. Connie Hildenbrand Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Mr. Chris Welp Comments and IDEM Responses

On December 9, 2018, Mr. Chris Welp of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Chris Welp Comment 1:

I am deeply concerned about the proposed Coal-to-Diesel plant permit being considered in the Dale, IN area. Southern Indiana is home to more than enough pollution that is ruining our quality of life. Even if the plant does not significantly increase pollution in the area, it DOES NOT mean we should sell out to big businesses and allow more. Letting one business with the prospect of a handful of jobs wreck the lives of thousands living in the region is a poor decision. The benefits of this project DO NOT outweigh the costs. Please DO NOT issue a permit for this project.

#### IDEM Response to Mr. Chris Welp Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Ms. Sally Welp Comments and IDEM Responses

On December 10, 2018, Ms. Sally Welp, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Sally Welp Comment 1:

As a member of an impacted community, I oppose this plan. Thank you for considering our health and well-being.

#### IDEM Response to Ms. Sally Welp Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### Mr. Richard P. Clark Comments and IDEM Responses

On December 10, 2018, Mr. Richard P. Clark of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Richard P. Clark Comment 1:

As I drive around our great state of Indiana, I am pleased to see the investment in Wind and Solar power such as the windmills North of Lafayette and the solar farms built by Vectren and other

forward thinking businesses and municipalities. This is our future. In addition many utility companies are converting to natural gas. So, why in the world do we want to regress and build a World War II era coal to diesel plant in our area? The numbers do not add up and the harm to our citizens is not conscionable. Something really stinks about the whole process in getting this project approved. First, IDEM assisted Riverview in preparing the permit which just happens to get under the allowable emissions in every category, second the Spencer County Development Director, the Dale Town Board, and the Spencer County Commissioners vote in favor of this development even though there is overwhelming opposition to this plant. Either there are future promises of compensation or up front compensation to these individuals in the works. I think an investigation by the FBI and scrutiny by the media such as 60 Minutes or Dateline is appropriate to check this corruption. Let's see how everyone backtracks when their motives are exposed. I also feel that Riverview is not forthcoming with information as I suspect they are expecting a substantial investment by the State in infrastructure similar to an earlier plant proposed in Vermillion County. As I watched the funeral today of President George H.W. Bush I was reminded that during his Administration the Clean Air Act was passed. This was the culmination of activism by my generation to clean up the results of acid rain that we experienced during the 70's and 80's. Why do we want to return to that part of our history? I worked for the State of Indiana for over 30 years and I understand that all State employees serve at the pleasure of the Governor - including IDEM. I also understand that Governor Holcomb has indicated that he is in favor of this project - if it is not harmful to the area citizens. That argument is indisputable that there will be irreparable harm to us. I ask you to do the right thing and decide against the permit application that you are reviewing. Keep Southwest Indiana safe for our children and grandchildren. We have at least three of the greatest research universities in the world located in our state. At least get their input before making any decision on the future of this plant. Thank you for your consideration.

**IDEM Response to Mr. Richard P. Clark Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

IDEM, OAQ wrote the draft PSD/New Source Construction and Part 70 Operating Permit. The source submitted an application and provided additional information as requested by the permit writer. The permit limits emissions to levels that modeling demonstrates as protective of human health and the environment. The proposed permit includes limitations on the potential to emit of the source, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD). The permit also contains testing, monitoring, record keeping, and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

IDEM, OAQ relies on the scientific expertise of U.S. EPA which sets the National Ambient Air Quality Standards (NAAQS) to be protective of public health and the environment, establishes federal regulations to limit or reduce pollution such as Prevention of Significant Deterioration (PSD), New Source Performance Standards (NSPS), and the National Emission Standards for Hazardous Air Pollutants (NESHAP), and establishes air quality modeling, impact analysis, and risk assessment procedures and guidelines.

No changes to the draft permit were made as a result of this statement.

### **Ms. Amy Brehmer Comments and IDEM Responses**

On December 10, 2018, Ms. Amy Brehmer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Amy Brehmer Comment 1:**

I am a member of the Sierra Club in Fort Wayne; but more importantly, I am a mom. Why is this important? Because I can relate to the other moms in southwestern, IN who are worried about their children having asthma, developmental delays, and other illnesses caused by excessive amounts of carbon in the air! I am aware of the Rockport Plant, a super polluter in Evansville, and also know there are at least 4 other coal plants within a 30 mile radius of one another! Now? A coal diesel plant? Please don't do anymore damage to our environment. The plants, the animals...the people. Do what is right, say NO to the plant in Dale, IN!

#### **IDEM Response to Ms. Amy Brehmer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Linda K. Cooper Comments and IDEM Responses**

On December 10, 2018, Ms. Linda K. Cooper of New Albany, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Linda K. Cooper Comment 1:**

As a resident of the state of Indiana, I am extremely concerned with the proposed diesel to coal plant in Dale, Indiana. I long for the day when Indiana might become a leader for innovative technologies that will not threaten our air, water and quality of life. Please vote NO to the permit for this project!!

#### **IDEM Response to Ms. Linda K. Cooper Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Ms. Amanda Pulley Comments and IDEM Responses

On December 10, 2018, Ms. Amanda Pulley of Dale, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Amanda Pulley Comment 1:

I am sending you this message to express my concerns about the proposed coal-to-diesel gasification plant in Dale, Indiana. I have been a resident of Spencer County most of my life and a resident of Dale since 2007. I live here with my husband and three children. I have heard many concerns brought up about the proposed plant and have tried to read and understand the permit myself. It is obviously a very confusing read if you are not familiar with the processes described. I would like to explain the reasons for my concerns and ask you a few questions that I hope you can answer for me.

My father was a union construction worker (Labor Local 561) for more than 30 years. He was also a farmer his entire life. In 1993, he was diagnosed with a rare blood disorder called thrombocytosis. This blood disorder caused an excessive production of blood platelets. Thrombocytosis slowly wore out my father's body. He was forced to retire early because he could no longer do physical labor. He had to slow down with farming and eventually stopped doing it altogether. To survive, he had to see multiple specialists, including a cardiologist, nephrologist, and oncologist. He had to take several medications that were expensive and sometimes caused nasty side effects. He essentially was not the same man he used to be.

Around 2009, my family started noticing a more significant slow-down with my father. He fell asleep in his chair very easily. He had no appetite. He could not carry heavy items without being easily fatigued. We thought it was a natural progression of the thrombocytosis, but it was not. He was finally diagnosed with multiple myeloma in June 2011. By the time it was discovered, the cancer was in its latest stages. He was given a life expectancy of 2 years. He only lived 16 months.

My father suffered through chemotherapy, multiple heart surgeries, and multiple trips to the hospital. He was in ICU several times. He became incoherent and did not know who we were. The very worst of it was his kidney failure and the multiple types of dialysis we tried to keep him alive and comfortable. He suffered greatly during those 16 months.

I was eventually made his legal guardian and had to make decisions about his health. At the age of 32, I stopped all of his medical care and signed him into a hospice center. I knew he was going to die, and I literally sent him to his death bed. Even though I knew it was the right thing to do, I live with the guilt of what I did every single day. No daughter should have to experience that tragedy with her father.

I am sharing all of this personal information with you because of my father's oncologists. Neither oncologist could prove what caused my father's thrombocytosis or his cancer. Both of their professional opinions, however, was that his cancer was caused by prolonged exposure to environmental toxins-through farming, but also through his work in construction.

One of the toxins my father was exposed to was benzene. According to the American Cancer Society, benzene is "carcinogenic to humans, based on sufficient evidence that benzene causes acute myeloid leukemia.... benzene exposure has been linked with acute lymphocytic leukemia chronic lymphocytic leukemia, **multiple myeloma**, and non-Hodgkin lymphoma." Benzene is one of the many toxins that is going to be released in the air by this coal-to-diesel gasification plant. The permit for the plant states that fact.

My three children attend school at David Turnham Elementary School, which is about a mile away from where this plant will be located. Students at David Turnham are outside quite a bit with recess. It is considered a "Healthy Choices" school, and the children spend a lot of time at their outdoor lab and fitness trail. Our home in Dale is located about two miles away from the proposed

plant. As a family, we are outside almost every day. My mother has had to live in a nursing home on three different occasions, which is located less than a mile from the proposed plant. Residents there go outside almost every day.

I believe my father's oncologists when they said his illnesses were caused by environmental toxins. I fear that prolonged exposure to the toxins released by that plant will eventually cause cancer in one of my other family members. I am most afraid that it will cause cancer in one of my children. I do not want to make life-ending decisions for my children like I had to for my father.

What are all of the toxins that are proposed to be released by the coal-to-diesel gasification plant? How many of these toxins are linked to cancer? How can Mr. Merle know the amounts of toxins this plant will release when this plant does not exist anywhere else in the United States? Did he build the plant in Russia or China?

If this plant comes to Dale, my family will leave Dale. We don't want to leave Spencer County because most of our extended family lives here. We are not eliminating that possibility, however. My husband and I are most concerned about our children's health, and we will not live in a community that values jobs and money over children and their lives. Please consider all of the people who have been plagued with cancer in this community. There is a reason why southwestern Indiana is known as the cancer belt and the sacrifice zone. Please do not encourage any industry to settle in Spencer County that will increase cancer risk among our residents. No job is worth a person's life.

#### **IDEM Response to Ms. Amanda Pulley Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

With regard to the commenter's question about toxins, IDEM, OAQ must consider that the question is specific to the Hazardous Air Pollutants (HAP) regulated under Section 112 of the Clean Air Act. As noted elsewhere in this ATSD (e.g., IDEM Response to Ms. Mary V. Hess Comment 1) the methodologies for determining the potential to emit of each component of the coal conversion process are well established.

IDEM, OAQ used generally-available information to determine the HAP potential to emit where the sources for criteria pollutant emission factors do not also include HAP emission factors. For example, HAP potential to emit for coal handling processes was established by the particulate potential to emit and data from the Indiana Geological Survey on the average metal HAP content of Indiana coal. As another example, because references describe the liquid products of direct liquefaction coal-to-liquids plants as similar to high-aromatic-content crude oil, the HAP profile of typical petroleum diesel is applied to determine the HAP potential to emit of storage tank, loading rack, and process fugitive emissions. Appendix A to this ATSD include the HAP potential to emit calculations for each process block and a source-wide HAP emission summary tab.

Appendix A does not separately identify HAP on a basis of carcinogenicity, but that information is widely available in public sources such as the National Institutes of Health and National Institute for Occupational Safety and Health. Section G of the Air Quality Analysis (see Appendix C to this

ATSD) includes a cancer risk analysis for carcinogenic HAP that may be present at the source and a non-cancer health effects risk analysis for all HAP. The U.S. EPA established the methodology and application guidelines for HAP modeling based on very conservative risk assessments.

No changes to the draft permit were made as a result of this statement.

### **Mr. Bruce Dodds Comments and IDEM Responses**

On December 10, 2018, Mr. Bruce Dodds of Richmond, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Bruce Dodds Comment 1:**

I am concerned about the new coal power plant proposed for Spenser IN. Since southern Indiana is already home to several super polluter facilities, it does not make sense to open the door to even higher air pollution levels in the area. Pollution numbers associated with this plant predict annual amounts of 2.2 million tons of carbon dioxide, which contribute to global warming. More than 100 tons of particulate matter, which cause smog and contribute to respiratory issues. And more than 60 tons of hazardous air pollutants which the EPA defines as those known to cause cancer and other serious health problems. According to an EPA database, Spencer County ranks in the top 1% of all US counties for the toxic substances it releases into the air. Please put a stop to adding additional pollution to Indiana air.

#### **IDEM Response to Mr. Bruce Dodds Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Alice D. Lindauer Comments and IDEM Responses**

On December 10, 2018, Ms. Alice D. Lindauer of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Alice D. Lindauer Comment 1:**

I am a resident of Spencer County and live about 7 miles or so from Dale. I am very opposed to this plant!!! So many people in this area have health problems already. It isn't fair to throw more pollution in the air around here. This will only make things worse for us. I already have two **rare** medical problems to deal with. (Polymyalgia Rheumatica and Giant Cell Arteritis)

Please reject this crazy idea and put that plant in Alaska or some deserted area where humans will not be affected. Citizens here have everything to lose and nothing to gain. PLEASE !!! I beg you to stop this before it is too late.

### **IDEM Response to Ms. Alice D. Lindauer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. David P. Lindauer Comments and IDEM Responses</b>
--

On December 10, 2018, Mr. David P. Lindauer of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. David P. Lindauer Comment 1:**

Please stop this plant from coming to Dale, Indiana. We already have too much pollution in this area and many of our friends and acquaintances have medical problems. Why can't you locate this polluting plant in an isolated area? Why risk human lives by putting this plant on the edge of a town? The United States and Indiana used to care about its people. I am so disappointed that local people have no "say" in this matter. This is not right!! The majority of people living in towns near Dale are not in favor of this plant either. Just because many of them are elderly and don't have email or won't write letters should not be taken as a "don't care" attitude. Some have the opinion that Indiana would not do this to us. I also would like to believe that my state officials would protect us and keep us from harm. But I am worried now.....  
Please, please stop this monster from coming here. How can we convince you that it is not good for our health?

### **IDEM Response to Mr. David P. Lindauer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Lorin McVey Comments and IDEM Responses</b>
--

On December 10, 2018, Lorin McVey of Georgetown, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Lorin McVey Comment 1:**

I am writing in regards to the Coal to Diesel plant that is being proposed to Dale, Indiana. I am against this plant being built for numerous reasons. First, I grew up around Dale. It has a special place in my heart. I believe the environmental impact will be negative on the people that live there. I do not see a positive health impact for the community, the animals that live there including wildlife. I also believe that all of us in the tristate area and Southern Indiana will be impacted by its pollutants. There has been much correlating data showing the negative impacts on health in connection to these large plants. There is data showing an increased risk of birth defects, cancer, and lung issues. I myself, am 32 years old and a skin cancer survivor. I had no previous melanoma risks in my family making my oncologists believe there was a possible environmental

factor. I can't say for sure negative pollutants in the area caused my cancer but it does make me wonder. Our area is already at a high pollutant level, this plant would only increase it.

I also have concerns about the long term usage of the plant. Looking at previous coal to diesel plants that have been built in the world, they've all been abandoned after a few decades. I am a supporter of economic growth but I believe we need to embrace new clean energy methods. Coal is not the future.

In addition, Santa Claus and Dale have a large tourism base. I don't believe this plant will have an attractive or pleasant impact on tourism in the area. It will most likely an unpleasant smell similar to rotten eggs. The plant is massive and not something pretty to look at in the landscape. Those do play a role to tourism and the desire for people to visit again.

I have spoke and listened to many residents in southern Indiana that are against this plant. I hope you will consider us and say no to Coal to Diesel. Thank you for your time reading and considering this. My family and I appreciate all the work you do.

#### **IDEM Response to Lorin McVey Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Genetta Fancher Comments and IDEM Responses**

On December 10, 2018, Genetta Fancher of Taswell, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Genetta Fancher Comment 1:**

This proposed project - Permit # T147-39554-00065 is absolutely irresponsible & unacceptable. We live approx 60 miles from Dale & have for almost 20 years. I am a retired Health Care Provider & have 1st hand experiences with the increased incidences of cancer, preterm birth, asthma, COPD, shortened life expectancies, dementia etc etc. In this age of global warming the releasing of MORE greenhouse gases & toxic air & water pollutants is ludicrous!

Just imagine all this money & resources used to develop more sustainable types of energy like solar & wind. Or making more efficient vehicles that don't use gas that the average person could AFFORD to purchase. Now THOSE jobs would benefit us all instead of just big corporations like Riverview Energy that only care about money & nothing about people's lives & the future of MOTHER EARTH!

PLEASE DO NOT VOTE FOR THIS!

### **IDEM Response to Genetta Fancher Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Betty Michel Comments and IDEM Responses</b>
---

On December 10, 2018, Ms. Betty Michel of Grandview, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Ms. Betty Michel Comment 1:**

After attending the air permit hearing for the Coal to Diesel plant planned for Dale, IN, I had several questions. How did Riverview Energy arrive at the projected emissions. Could they be much higher? Do they prove how they arrive at these figures since there are no plants in the United States converting coal to diesel. How is IDEM going to measure and confirm what and how much is actually being emitted? Does IDEM plan to add air monitors in the area or is this process self-reporting? Has IDEM lowered the acceptable levels of any pollutants in the past 20 years.

This entire process is a scam for a few business people to get rich on government (taxpayer's) subsidies. It is not about jobs - one researcher noted there are about 150 good job openings in the immediate area.

The IDEM gentleman who stated there would be no significant impact to the Dale area has zero evidence to back it up. It would have a huge negative effect driving people away from the area. I support the 47 speakers who opposed this plant.

### **IDEM Response to Ms. Betty Michel Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis.

- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

With regard to the commenter's question about measuring actual emissions, the proposed permit requires either stack testing or continuous emissions monitoring for most of the point source emissions at the source. The IDEM, OAQ Compliance and Enforcement Branch will review all stack test protocols and results. The draft PSD/New Source Construction and Part 70 Operating Permit includes record keeping requirements for monitoring information and reporting requirements for continuous emission monitoring systems. If the source determines that the uncontrolled potential to emit of the plant will increase in such a manner that would require a source/permit modification, then the source will be required to obtain prior construction/operation approval prior to making any changes to the plant that would increase the uncontrolled potential to emit.

With regard to the commenter's question about acceptable levels, the federal Clean Air Act requires the U.S. EPA to set National Ambient Air Quality Standards (NAAQS) for six criteria pollutants - particulate (PM<sub>10</sub> and PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), ozone (O<sub>3</sub>), nitrogen dioxide (NO<sub>2</sub>), carbon monoxide (CO), and lead. These standards are set at levels that protect human health, including the health of sensitive persons, such as asthmatics, children and the elderly. The Clean Air Act requires that U.S. EPA conduct periodic review of the most current scientific information to determine if air quality standards are adequate to protect human health and general welfare. This review includes an integrated science assessment which is a comprehensive review of science judgments and risk and exposure assessments. An independent committee, the Clean Air Scientific Advisory Committee (CASAC), reviews all health information and makes recommendations to U.S. EPA on whether current health standards are protective of public health and welfare or should be revised. After any health standard recommendations have been approved and finalized through rulemaking, IDEM is required to follow the new standards. Additional information on the CASAC can be found at the following website: <https://yosemite.epa.gov/sab/sabpeople.nsf/webcommittees/CASAC>.

In 2013, for example, EPA lowered the NAAQS for sulfur dioxide (SO<sub>2</sub>). As a result of the lowered SO<sub>2</sub> NAAQS, townships in several Indiana counties were nonattainment of the revised SO<sub>2</sub> NAAQS and IDEM amended the State Implementation Plan to bring those areas back into attainment. In many cases, getting back into attainment required closing coal-fired electric generating units or converting coal burning units to natural gas.

Since the passage of the Clean Air Act Amendments in 1990, U.S. EPA has promulgated about 140 different National Emission Standards for Hazardous Air Pollutants (NESHAP) to limit, control, or reduce hazardous air pollutants (HAP) emissions from for various types of facilities. As the name suggests, NESHAPs intend to reduce emissions of hazardous air pollutants, usually by requiring what is known as Maximum Achievable Control Technology that is defined by the level of control of the best performing existing sources.

No changes to the draft permit were made as a result of this statement.

### **Ms. Candice Cook Comments and IDEM Responses**

On December 10, 2018, Ms. Candice Cook of Huntingburg, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Candice Cook Comment 1:**

As a resident of Dubois County, I strongly oppose granting a permit for the proposed Riverview Energy Coal to Diesel plant. I expect IDEM to operate for the benefit and the health of the citizens of our state. Since Indiana is already 44th in air quality, with our area being the worst of the worst, it is beyond understanding why IDEM would consider approving this permit which clearly benefits only the corporation from Connecticut and clearly harms the citizens of our state with mega-tons of carcinogenic pollutants. The lack of monitors in strategic places makes the issue of compliance

void. There is no compliance where there is no information/data assessing air quality in the actual area of the proposed plant.

In the interest of the health of my family and neighbors, I ask that you deny the T147-39554-00065/Riverview Energy Coal-to-Diesel plant permit.

#### **IDEM Response to Ms. Candice Cook Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Mr. Edward Cook Comments and IDEM Responses</b>
--

On December 10, 2018, Mr. Edward Cook of Huntingburg, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Edward Cook Comment 1:**

1. Suggestion: If the plant is built, IDEM needs to add Ambient Air PM2.5 Monitoring in the prevailing downwind population centers of Ferdinand and Huntingburg if it is going to fulfill its mandate of managing the environment while protecting the public. This needs to be a condition of approving the permit.

2. The proposed plant is far too close to a population center, no matter how relatively small that population may be. If this proximity is allowed by law then our laws are woefully inadequate. While the town of Dale may have the legal right to re-zone their town, they do not have the right to re-zone the air downwind from them.

3. Generally I am against the permit for the proposed plant because it would be too much of an environmental risk for little reward. The plant would be a monstrosity in the local community for decades even while coal mining is on the decline amid the inevitable transition to renewable sun-sourced energy. The people of Spencer County and the surrounding area do not wish to be sacrificed to a dirty energy process in the waning days of the coal wars.

#### **IDEM Response to Mr. Edward Cook Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

**Mr. Edward Cook Comment 2:**

IDEM's permit process states that "If a permit applicant demonstrates that it will be able to comply with all federal and state laws regarding air pollution control, IDEM is required by law to issue the air permit."

This is a flawed concept. You can't demonstrate some future act. IDEM is merely requiring applicants to read IDEM'S permit requirements and agree to try to attain them. What a low bar to leap over. And if by some small chance the applicant fails to attain the air quality standards in the future, they can merely declare bankruptcy and walk away while leaving taxpayers to foot the bill and pay with their lives. Corporate America runs roughshod over the ordinary people once again and Indiana greases the skids. Deny this flawed permit.

**IDEM Response to Mr. Edward Cook Comment 2:**

The responsible official designated for a source that is applying for an air permit is required to certify the truth, accuracy, and completeness of all information contained in an air permit application on the Air Permit Application Cover Sheet form, otherwise the application would be deemed incomplete. Based on the information provided by the applicant in an air permit application, IDEM, OAQ determines the potential to emit and all applicable state and federal requirements for of all emission units at the source.

This proposed permit includes all applicable state and federal rules and regulations related to air pollution, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD), applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

If the information provided by the applicant in an air permit application indicates that that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

No changes to the draft permit were made as a result of this statement.

<b>Robyn Cornwell Comments and IDEM Responses</b>
---

On December 10, 2018, Robyn Cornwell of Bloomington, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Robyn Cornwell Comment 1:**

Please use intelligent decision-making in refusing to go forward with this life threatening plan to allow a coal plant to be added in Indiana. It is a totally irresponsible way to move forward. Do NOT allow this to happen!!!

**IDEM Response to Robyn Cornwell Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. Michael Baran Comments and IDEM Responses**

On December 10, 2018, Mr. Michael Baran, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Michael Baran Comment 1:**

The Permit #T147-39554-00065 is unacceptable! I live in the area and this will crush the meager economy the county has. It will also create the worst pollution possible. Leave fossil fuel in the ground dead and buried where it belongs.

#### **IDEM Response to Mr. Michael Baran Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Mr. David Lasuertmer Comments and IDEM Responses**

On December 10, 2018, Mr. David Lasuertmer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. David Lasuertmer Comment 1:**

I would like to express my strong resistance to the permitting of the Riverview Energy Coal-Diesel Plant being considered near Dale, IN.

I'm extremely concerned about the effects of carbon emissions on our communities and our children. I strongly prefer any new energy production facilities to be based on renewable energy and not fossil fuels.

#### **IDEM Response to Mr. David Lasuertmer Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### Mr. Doug Winchell Comments and IDEM Responses

On December 10, 2018, Mr. Doug Winchell, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Doug Winchell Comment 1:

I have hunted this ground thru the years. If it was going to become a solar park I would say darn but in the name of progress. But to add to global warming. With the great president we have now easing pollution standards and the USA life expectancy going down how stupid are we to want your pollution plant in the USA.

#### IDEM Response to Mr. Doug Winchell Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this comment.

### Mr. Chuck Botsko and Mrs. Janet Botsko Comments and IDEM Responses

On December 10, 2018, Mr. Chuck Botsko and Mrs. Janet Botsko of Gentryville, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Chuck Botsko and Mrs. Janet Botsko Comment 1:

If this refinery were being planned in the city of Indianapolis, or in one of your neighborhoods, would you have worked so closely with KBR and Riverview to craft a permit that just met the letter of the law? Would the draft permit look any different than it does now? If so, how can we trust IDEM to protect our environment with permits like this? For many years coal to liquid projects have been proposed in many locations in the country. Various departments in the government have done studies on CTL. There was even a project considered for a location at the Crane Naval base. Sponsored and supported by the government. It never happened.

Where is the data coming from? The couple of projects that are in the world using this technology aren't using coal as their feed stock. Who is coming up with this data? Not a single Coal to Diesel experimental project anywhere in the U.S... .....**we do not want this experiment in our area.** This proposed project has caused a divide in the town of Dale and surrounding area. Even within families. Some people are afraid to speak out against it because of reprisals from those in favor of it. The Dale Zoning Board annexed the 500+ acres by a vote of 4 to 3 against. The Spencer County Commissioners passed a resolution stating their support for the Draft Air Permit by a vote of 2-1. The resolution was suggested by the commissioner who was a member of the local economic development corp. Written by the commissioner's lawyer who is also the chairman of the economic development board.

In the process proposed by KBR, a catalyst for fine/course additive is identified as "red mud". **Red mud comes from the Bauxite Processing** and according to the EPA "Red muds are **caustic**, and the United States **does not** currently approve **any** secondary use of the waste. The **radioactivity** content is only one of several concerns that pose a risk to the environment, as red muds also have a high salinity and pH. In some red muds samples, the EPA has identified **elevated arsenic and chromium concentrations**; in some cases, arsenic levels were as high as 16,000 parts per billion (ppb), and chromium, 374,000 ppb. In the United States, wastes are usually disposed in large impoundments that are lined with clay or synthetic liners." Why would

they be allowed to use a compound that “is not approved for any secondary use”? Being “cost effective” is not an acceptable answer.

No Significant Impact is a misleading statement when these amounts will still be released; 2.2 million tons of **carbon dioxide** which contribute to the earth’s warming. More than 100 tons of **particulate matter**, which cause smog and contribute to respiratory issues. More than 60 tons of **hazardous air pollutants**, which the U.S Environmental Protection Agency defines as those known to cause cancer and other serious conditions. All within a mile of the local elementary school and 2 nursing homes.

We support the suggestion that the issuance of the permit be delayed until working monitors be placed in the surrounding local area to gather actual data on the quality of the air. We have a booming tourism industry, attracting over one million visitors to our county and surrounding area. After industrializing the southern entry point of Spencer County with **A+K Steel** and the **I&M power plant**, our economic development leader, this is **NOT** the type of welcome we want visitors to see. Who is going to accept the blame if existing tourism related businesses start losing visitors? This refinery depends on running 24 hours a day, 365 days a year. That means lights all around the facility would be on all night, every night, noise from the operation, rail and trucks coming and going at all times of the day and night. This type of facility requires 1.8 million gallons of water per day. And needs a waste water pipeline to discharge water into the Ohio River. The location is 20+ miles from the aquifer and the river. What kinds of promises has the state, county and LEDC officials made to Riverview Energy and their backers about getting this done for them?

The promoters of this facility worked for 6 years to place this project in Vermillion Co. They had 1500 acres optioned out of over 7,000 that the Newport Chemical Depot Reuse Authority had to develop. When that didn’t work out they reduced the size of the project to 2.5 Billion dollars and 225 jobs and then “found” the Dale location of 500 acres. Mr. Roland Otte and Mr. Greg Merle are just the promoters of this project. If it does ever get built, they won’t be involved with its actual operation. They will be looking for someone else to purchase it so they can get their money out of it, quickly. They will use the issuance of a permit as a major “talking point” when trying to get financing from whatever domestic and foreign investors they have been in contact. We are not in favor of this project at this location. If the government wants this experiment in Indiana, tell Riverview Energy to take it back to Vermillion County and for them to work with the Reuse Authority.

Finally, we support the comments submitted by the Earth Justice Representatives, those from Valley Watch, and those of the Southwestern Indiana Citizens for Quality of Life.

#### **IDEM Response to Mr. Chuck Botsko and Mrs. Janet Botsko Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

With regard to the commenters' question about location, if the source had been proposed in another location with similar NAAQS county attainment status, the permit would not be substantially different. Determinations about what level of control is BACT or the applicability of most State and Federal regulations would be unchanged. Locations in Lake County or certain other counties would have involved different rules for fugitive particulate matter. Sites in Lake, Porter, Clark, or Floyd County may have introduced additional requirements for VOC. Locations in townships that are in nonattainment for any NAAQS criteria pollutant would have introduced emission offset requirements for that pollutant.

With respect to development of the draft PSD/New Source Construction and Part 70 Operating Permit, the permit was drafted by IDEM, OAQ based on information provided by the source in the application, additional information as requested by the permit writer, and additional information from research of other available resources. The source was also responsible for the air quality monitoring, subject to IDEM review and using background monitoring and meteorological data that IDEM offers to all applicants.

With regard to the commenters' question about data sources, additional information may be found in IDEM Response to Valley Watch Comment 12. See IDEM Response to Valley Watch Comment 12.

With regard to the commenters' question about the "red mud" additive, IDEM is not able to review the source of the information referenced as "according to the EPA" because no references were provided. Wikipedia lists a number of applications for red mud from bauxite processing, including cement and other building materials. The statement that EPA has not approved any secondary use may be accurate, but should probably be taken in the context of metallurgical industries, where "secondary" refers to the recovery of a metal from scrap materials or dross. For the VCC process, red mud offers advantages as a source of iron to catalyze the hydrogenation reaction such as the availability in or ease of processing into fine and coarse particle sizes. While it may not be germane to consideration of characteristics of the additive material in the draft PSD/New Source Construction and Part 70 Operating Permit, IDEM observes that the methods of delivery, storage, and transport of the material suggest that red mud is in the form of a low-alkalinity rinsed and dried filter cake, not a water-containing sludge. Downstream of the VCC process, the residue of solid additives and tarry hydrocarbons will be pelletized, cooled and sold as a product, markets for which are outside the scope of this ATSD.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Hugh Farrell Comments and IDEM Responses</b>
---

On December 10, 2018, Mr. Hugh Farrell, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Mr. Hugh Farrell Comment 1:**

I'm writing to express my concern regarding the Dale plant. I am a resident of southern Indiana who struggles with chronic asthma, and the figures released so far about the plant suggest that it will decrease air quality, hurting my ability to breathe and that of those like me. I am also deeply concerned by the huge CO2 output of the plant and its effect on climate change, which will worsen my life and those of children growing up now across Indiana.

**IDEM Response to Mr. Hugh Farrell Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Katie Mehling Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Katie Mehling of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Katie Mehling Comment 1:**

I am writing to voice my concern over the proposed coal to diesel plant for Dale, Indiana (permit #T147-39554-00065). I sincerely hope that this does NOT pass. There are so many reasons, (and tons of research against) for it not to move forward, as stated at the public meeting held at Heritage Hills HS last Wednesday. And NO real data/research that supports it. Please do NOT move this forward!!

**IDEM Response to Ms. Katie Mehling Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Erin Beach Comments and IDEM Responses</b>
---

On December 10, 2018, Ms. Erin Beach, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Erin Beach Comment 1:**

I am very opposed to the proposed coal to diesel plant that might end up in Dale. As the parent of asthmatic children, and a firm believer in the negative affects of climate change, I do not want this coal to diesel plant in Indiana. I know many, many people are talking about this. I know that many, many people are disappointed in the way IDEM has managed this situation. People are watching you, hoping you'll make the right decision for the citizens of Indiana - by denying this permit. Please do not let this proposed plant be put in our beautiful state.

**IDEM Response to Ms. Erin Beach Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Kathy Foerster Comments and IDEM Responses</b>
---

On December 10, 2018, Ms. Kathy Foerster of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Kathy Foerster Comment 1:**

Please do not allow this plant into the southern Indiana area. Our families are dealing with health issues and plead 'no' to this!!

**IDEM Response to Ms. Kathy Foerster Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Darcy Wadsworth Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Darcy Wadsworth of Huntingburg, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Darcy Wadsworth Comment 1:**

Please do not issue a permit for Riverview Energy Corporation to come to Spencer County or anywhere in Indiana to add to our impaired air quality. I went to the Spencer County school meeting last week and was duly impressed with how much more air pollutants will be added to our air. We don't need/want any more. Actually less would be better - thank you.

**IDEM Response to Ms. Darcy Wadsworth Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### **Dolores and Gary Comments and IDEM Responses**

On December 10, 2018, Dolores and Gary Hasenour of Celestine, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Dolores and Gary Hasenour Comment 1:**

I am writing to voice my extreme concern over the proposed coal to diesel plant for Dale, Indiana (permit # T147-39554-00065). I sincerely hope that this does NOT PASS. There are so many reasons and tons of research against it, for it not to move forward! Everyone is looking at the money that will flow in from this project, but no one is considering the ramifications. The medical expenses and funeral expenses that will come from all the pollution. We have suffered enough in southern Indiana from outside companies making big money at our expense. Please do NOT move this forward!!!

#### **IDEM Response to Dolores and Gary Hasenour Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### **Mr. Barton Heath Comments and IDEM Responses**

On December 10, 2018, Mr. Barton Heath of Newburgh, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Barton Heath Comment 1:**

I disagree with building this plant in Dale Indiana or for that matter any other place. The process that this plant will use is based on a Nobel prize-winning process has only been used five times since its invention in 1931, making this purely experimental. If this lauded process had been profitable it would have been in use long ago. At a time when our environment is by all expert measure in such danger from pollution it's hard to see this as a worthwhile venture with the nearby residents bearing the cost of the hazards it could bring about.

Additionally have many questions about the water discharge into the Ohio River by the River View Refinery project in Dale, Indiana. Has the Ohio River Valley Water Sanitation Commission been given data on the effluent that will be dumped into the Ohio River? What process elements could be present in the discharge water? What will the volume of discharge water measure? What will the temperature of the discharge water be? Are any of the or ORSANCO commissioners involved in a non-governmental capacity with the design, implementation, consultation or construction of this project? Who will monitor the river downstream for potential pollution compliance from this plant?

**IDEM Response to Mr. Barton Heath Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

With respect to the issued raised about potential water usage and water discharge/pollution to the Ohio River, these issues are outside the scope of this air pollution permit. This proposed air permit only contains applicable state and federal rules and regulations related air pollution. IDEM OAQ is not aware whether the Ohio River Valley Water Sanitation Commission or any ORSANCO commissioners have been notified any the potential water usage, discharge, and pollution related to this proposed project.

No changes to the draft permit were made as a result of this comment.

<b>Indiana Forest Alliance and Ms. Anne Laker Comments and IDEM Responses</b>
---

On December 10, 2018, Ms. Anne Laker on behalf of the Indiana Forest Alliance of Indianapolis, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Indiana Forest Alliance and Ms. Anne Laker Comment 1:**

Southern Indiana is already one of the most polluted places in the nation. That alone is an excellent reason to deny Riverview's permit for the coal to diesel plant. If built, this plant WILL further degrade the poor air, water and soil quality of this beleaguered location. It's a grave injustice to subject the health of the people of this region to more pollution. No amount of job creation is worth it.

**IDEM Response to Indiana Forest Alliance and Ms. Anne Laker Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### Ms. Renee Ananda Arnold Comments and IDEM Responses

On December 10, 2018, Ms. Renee Ananda Arnold, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Ms. Renee Ananda Arnold Comment 1:

I spoke up about my concerns about the Coal to Diesel plant in Dale on December 5th. I was pleading with you and your colleagues to **please deny** the permit for this proposed plant. As our leaders, we count on you to serve us by protecting us. Please listen to the hearts of everyone here tonight who have and will share the dangers and risks to the health of our environment and individuals from what is released from this plant. Please preserve our environment that we love so much. Please protect us and help us protect our families that we love so deeply. Please hear my heart and the heart of this community and refuse to allow this plant to be built.

Over 90% of those who spoke on December 5th spoke up as being against the proposed plant. Many were sharing critical facts about the dangers to the health of individuals and our environment if this plant is allowed. I want to amplify all those concerns by speaking to you from my heart to your heart tonight...I'm a Daddy's girl and I lost my Daddy last year to Acute Myeloid Leukemia after exposure to benzene. My heart is broken...I miss my Dad so much.

You may think this is personal to me and it is... and it should be to you too because this proposed plant will release the toxic carcinogen benzene and many more toxins and pollutants placing you and your loved ones at a risk of disease and loss of life as me and my family have experienced losing my Dad. I can't get my Dad back or couldn't save him from leukemia because we weren't aware that his exposure was making him sick until it was too late. In this case, with this Coal to Diesel plant, we are aware of the dangers of carcinogens and pollutants which will cause disease and death and we can save you and your loved ones by stopping this proposed plant from being built.

I want you to think of the person or person(s) you love the most...I want to know what financial gain is worth the personal loss of their life for you? You are aware that if you support this you would be putting your loved ones at risk. Is there any amount of financial gain that is worth more than those you love? What is your price? What is worth more to you than preserving and protecting those you love? Think about it...feel it...you still have time to save them.

I can't get my Daddy back but you can save the ones you love...My Dad was diagnosed with Acute Myeloid Leukemia on December 18<sup>th</sup> and we lost him on January 13<sup>th</sup>. He passed away that quickly. My Dad was a successful businessman and his career was important to him, but when my Dad was in his last days he didn't care about that anymore...all he cared about was who he loved and how he loved.

Ultimately that is all that will matter to you...so choose what is lasting and eternal...love...not a job or the economy that you will leave behind when you leave this life. As someone who has experienced the personal loss of my Daddy, I encourage you to choose for what will matter eternally...choose love.

Please don't sacrifice us and our loved ones health and well being. Please take the action you would choose to protect your own loved ones and yourself. We are all God's children and this is God's creation. Please honor God. Please protect us. As our leaders, we count on you to serve us by protecting us. Please listen to the hearts of everyone here tonight who have and will share the dangers and risks to the health of our environment and individuals from what is released from this plant. Please preserve our environment that we love so much. Please protect us and help us protect our families that we love so deeply. Please hear my heart and the heart of this community and refuse to allow this plant to be built.

### **IDEM Response to Ms. Renee Ananda Arnold Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Amy Benningfield Comments and IDEM Responses</b>
---

On December 10, 2018, Ms. Amy Benningfield of Perry County, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Ms. Amy Benningfield Comment 1:**

I am a citizen and constituent in Perry County 47551. I am writing to implore the immediate removal/denial of the proposal for the Coal to Diesel Plant in Dale, IN. This plant will bring Cancer, Leukemia, Birth Defects, Autism, Asthma and other devastating health issues to all of the citizens of this area. We can only guess how bad because no testing has been done on this kind of technology. We do know what coal fired plants do to human health. This would be exponentially worse - poisoning air, water and soil not to mention quality of life with a constant rotten egg smell.

A Coal to Diesel Plant proposed with devastating pollution to our area - already one of the worst in the nation for air quality and all of the health issues that is already tormenting us. A Coal to Diesel Plant proposed in our area when all of the authorities on our climate & environment are desperately warning us that we have 10 years to stop fossil fuel emissions before irrevocable cataclysmic weather patterns create massive death, destruction and economic trauma. A Coal to Diesel Plant proposed when Coal & Fossil Fuel use is being phased out and divested from in countries like Ireland and others, companies, universities and state & local governments. It will be obsolete and southern Indiana will be left without job training for the future and its citizens suffering from its toxic pollution or dead.

AP: A report by U.S. Energy Information Administration projects 2018 will see lowest U.S. coal consumption since 1979, second-greatest number on record of coal-fired power plants shutting down.

Coal Ash pollution leaching into fresh groundwater supplies for humans & livestock.

The fourth National Climate Assessment, commissioned by Congress and compiled by over 300 scientists from 13 federal agencies, warns that rising temperatures and more extreme weather patterns will have a devastating impact on the environment in the Midwest. Yields could drop by 5 to 25 percent for corn and more than 25 percent in the southern half of the Midwest for soybeans, said the [latest National Climate Assessment](#), which is released every four years and required by law. Farmers will likely be paying more to control increased disease, pests and soil erosion - levels not seen since the 1980s, when drought and flooding were detrimental to crop yields. Bloomberg New Energy Finance, which predicts that wind and solar will be cheaper than coal and gas generators by 2027, and electric vehicles could make up 25 percent of the global car fleet by 2040. The peak year for coal, gas, and oil looks to be 2025, and then it's all downhill from there. For big oil guys, at least. "You can't fight the future," [says lead researcher, Seb Henbest](#). "The economics are increasingly locked in. Released on Monday, Bloomberg's [New Energy Outlook](#) report has found that US\$11.4 trillion will be invested in new energy sources over the next 25 years, and two thirds of that will go towards renewables, particularly wind and solar. Any new coal plants will mostly be cropping up in India and other emerging markets in Asia. Coal and gas will begin their terminal decline in less than a decade.

Be a hero and ensure your re-election from a new generation of workers by investing in our future. Let's entice and fund Solar & Wind Turbine manufacturing. Train computer coders and technological services. There is no real data on the health effects of this plant so you have no way to confidently and with conscience, assure us and our children that our health will not be gravely affected. There are no accurate or reliable air monitors in our area. Our lives are in your hands. Please ask God for the highest and best good that you can do.

**IDEM Response to Ms. Amy Benningfield Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Ms. Shirley Stern Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Shirley Stern, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Shirley Stern Comment 1:**

I wish to let you know that I am against that C2D Plant being built in Spencer County. People in this area are already exposed to so many things causing cancer, breathing problems, and other health issues. Thank you for listening to the pleas of those of us who live here in and around Spencer County.

**IDEM Response to Ms. Shirley Stern Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Marilyn and Paul L. Harpenau Comments and IDEM Responses</b>
---

On December 10, 2018, Marilyn and Paul L Harpenau of Louisville, Kentucky, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Marilyn and Paul L Harpenau Comment 1:**

We are property owners in Spencer County IN, and are extremely concerned about the possible damage to the environment and land in the area. We are especially concerned about the harmful effects to humans and all life in the area. Please don't let those companies and individuals put greed and money ahead of doing the moral and ethical right thing. Thank you.

### **IDEM Response to Marilyn and Paul L Harpenau Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### **Mr. David J. Vonderheide Comments and IDEM Responses**

On December 10, 2018, Mr. David J Vonderheide of Severance, Colorado, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Mr. David J Vonderheide Comment 1:**

As a land owner in Spencer County, I own property within 10 miles of the proposed plant. I STRONGLY OPPOSE building this plant due to the environmental impact and the air quality that will be affected in this area.

### **IDEM Response to Mr. David J Vonderheide Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

### **Ms. Yvonne J Vonderheide Comments and IDEM Responses**

On December 10, 2018, Ms. Yvonne J Vonderheide of Severance, Colorado, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

### **Ms. Yvonne J Vonderheide Comment 1:**

As a land owner in Spencer County, I own property within 10 miles of the proposed plant. I STRONGLY OPPOSE building this plant due to the environmental impact and the air quality that will be affected in this area.

**IDEM Response to Ms. Yvonne J Vonderheide Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Deborah Flake Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Deborah Flake submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Deborah Flake Comment 1:**

I am writing this email in opposition to the coal to diesel plant proposed for southern Indiana (Dale). We have too many of these superpolluters already in our area. The prosperity of our people can only come if we are healthy and with the emissions already surrounding us we DO NOT want more adverse pollution for ourselves and families living here. Thankful for your time.

**IDEM Response to Ms. Deborah Flake Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

<b>Ms. Tara Foll Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Tara Foll of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Tara Foll Comment 1:**

As a 15 year resident of Ferdinand after growing up in Fulda and Santa Claus in northern Spencer County, I adamantly oppose the proposed coal-to-diesel plant in Dale. Regardless of whether Riverview Energy claims they will stay within current IDEM pollution guidelines, Southwestern Indiana does NOT need more pollution dumped on our beautiful towns.

I personally know of four 40 year old women in the past three years diagnosed with breast cancer - all from northern Spencer and southern Dubois counties. In each of these cases, no breast cancer gene or history of breast cancer were identified. These are just a few of the endless cases of cancer in my family, friends, neighbors, and coworkers. While there are many causes of cancer, pollution is undoubtedly a factor.

Indiana needs to start taking back our state from super-polluters and begin focusing on a cleaner future. Denying Riverview Energy's permit for the proposed coal-to-diesel plant should be the first step.

#### **IDEM Response to Ms. Tara Foll Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

#### **Mr. Michael A Flake Comments and IDEM Responses**

On December 10, 2018, Mr. Michael A Flake submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Michael A Flake Comment 1:**

I am writing this email in opposition to the coal to diesel plant proposed for southern Indiana (Dale). We have too many of these superpolluters already in our area. The prosperity of our people can only come if we are healthy and with the emissions already surrounding us we DO NOT want more adverse pollution for ourselves and families living here. Thankful for your time.

#### **IDEM Response to Mr. Michael A Flake Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this comment.

#### **Mr. Rock Emmert Comments and IDEM Responses**

On December 10, 2018, Mr. Rock Emmert of Ferdinand, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Rock Emmert Comment 1:**

Thank you for this opportunity. I have grave concerns for my family and friends and everyone who lives in the region where Greg Merle and Riverview Energy plan to change our quality of life for generations to come. Based on my observations now and over many years, I am concerned that I am not being represented by IDEM, that IDEM is merely a "rubber stamp" for polluting companies, even though thousands of other area concerned citizens and I pay taxes that fund this state agency.

My comments are structured in two parts--a list of my questions and my comments made at the Dec. 5 hearing in Heritage Hills High School auditorium, with my one question in the hearing comments highlighted near the end of the essay.

I fully support the comments filed by Southwestern Indiana Citizens for Quality of Life, Valley Watch, Sierra Club, Citizens Action Coalition, and Earthjustice.

## **PART ONE--QUESTIONS**

### **HEALTH CONCERNS**

1. Specifically who in IDEM is qualified to determine the effects of toxic emissions upon human tissue, especially the tissue of growing fetuses, small children, and senior citizens? What are the names of these medical authorities, and please include the curriculum vitae for each doctor. If IDEM employs no medical authorities to serve as watchdogs to protect public health (as stated in IDEM's mission), why not? Who determines this absence?
2. Can IDEM communicate with ISDH and vice versa regarding linking air and water pollution and public health? Explain in detail the grievance process in Indiana for citizens who sincerely believe that pollution is the cause of their sick children, cancer clusters, autism, asthma, etc.
3. What agency in Indiana exists to study why we have such high special education rates, infant mortality, etc.?
4. What specific studies regarding the area's existing special education rates, in many cases over twice the national average of 13%, have you conducted to determine the effect of adding additional toxic emissions into the air that expectant mothers' will breathe?
5. What specific studies regarding the area's existing high infant mortality rates, in some cases over twice the national average, have you conducted to determine the effect of adding additional toxic emissions into the air that expectant mothers' will breathe?
6. Thirty-four year veteran chemical engineer Randy Vaal is familiar with complex processes in the oil and gas industry, having worked in the energy field in Texas for many years. Mr. Vaal states that the refinery absolutely will emit the toxic stench of rotten eggs or sulfur. I do not see this addressed in the draft. Specifically what does IDEM predict regarding this concern? What statement will you stand by? Exactly what existing model currently in operation in the US was used to address this concern for area residents and attractions? What models have been used to state that the emission of rotten egg smell will have "no significant impact" on the region's health and quality of life? Based on your modeling, how will Dale's reputation for the source of stench compare to Terre Haute and Hawesville's reputations?
7. Thermal inversions are a very common weather phenomenon in southwestern Indiana. Frequently I see a huge, dark cloud of emissions (not the steam) emitted directly by furniture companies' smoke stacks in Jasper downward into the downtown residential area where it lingers. Frequently I see the brown plume from Petersburg's massive IPL plant migrate down to the earth and linger there. Whole neighborhoods and huge portions of our area are often stuck in the middle of these clouds. Pregnant mothers, infant, toddlers, and the elderly especially are severely vulnerable during these inversions where they are clearly forced to breathe poisonous air. The outcomes in terms of public health are sobering. Disabilities, disease, and death clearly can and does happen during these episodes. Exactly how did IDEM account for these common thermal inversions in its modeling? Who served as the subjects? What scientific medical models/studies did you use to determine that these inversion episodes will cause no harm to public health? APA? ALA? etc.

### **INDIANA'S ROLE IN BLINDLY CONTRIBUTING TO GLOBAL CRISIS / INDIANA'S RECKLESS POLICY, HARMING OUR CHILDREN AND FUTURE GENERATIONS**

8. We are all well aware of the recent dire warnings from the Intergovernmental Panel on Climate Change (IPCC), the hundreds of scientists within 13 US government agencies (released recently by the White House), Indiana institutions of higher learning, including Purdue University, and many more agencies--that climate change is real and humans' greenhouse gas emissions are the cause, and to avoid catastrophic results, we must immediately reduce our greenhouse gas emissions. Given that this refinery would release 2.2 million tons of the greenhouse gas CO2 and

other gases into our world's atmosphere, how can you justify to Indiana's taxpayers, whom you are commissioned to protect, stating that this refinery would have "no significant impact"?

### **ECONOMY, TOURISM, POPULATION GROWTH**

9. A local study by neighboring businessman Blake Voges, using online sources and figures shared by human resource officials within area companies, shows that Riverview will emit up to 10,000 tons of air pollution per employee per year. Masterbrand is 6.6 tons per employee, Toyota is 1.4 tons, and Waupaca is 670 tons. To what extent does IDEM take this incredible ratio into account when issuing permits to pollute? Please explain how IDEM and the state of Indiana can justify an out-of-state company emitting such exorbitant amounts of pollution per employee. Is there any amount per employee that IDEM would not approve?

10. Since the AEP power plant in Rockport was built in the 1980s, according to census records, the Rockport population has decreased, even though citizens were promised an economic boon by company officials and local and state politicians. How will Riverview Energy's refinery affect local real estate values, specifically towns like Dale, St. Henry, Ferdinand, and Mariah Hill? Exactly what models and methodology have you used to determine this effect? Were the effects of AEP and AK Steel on their residential real estate values in and near Rockport included in your methodology? These companies' effect on the surrounding population would provide valuable baseline data, which I do not see in the draft permit.

11. Steckler Grassfed is an organic farm located about one mile downwind from Riverview Energy's proposed site. For health reasons, many local and regional customers rely on this farm for our dairy and meat products, the only farm of its kind in the region. Steckler's products (cheeses, eggs, etc.) are sold throughout the region. The demand for locally grown, grass fed, chemical-free food is growing. Have you consulted with owner Jerry Steckler to discuss the effect this refinery will have on his farm's existence and sustainability? Have you discussed grant programs that might fund the relocation of his farm, which will likely be out of compliance to be organic if the refinery is built? (It would take several years for conventionally farmed land to be free of chemicals and certifiable organic.) What models and methodology have you used to determine how soon the fallout from the refinery will force him to move because his farm is no longer compliant? Will you be taking soil samples before the plant is built to ensure accurate baseline data is on record if/when his livestock and products start to suffer after the plant is built? Environmental toxins lower milk production and hurt the health of both the cows, sheep, and microorganisms in the soil that support organic farming.

12. According to company online sources, "Thermwood Corporation, located in southern Indiana and established in 1969, offers both three & five axis CNC machining centers ideally suited for the production, fabrication and trimming of wood, plastics, non-ferrous metals, composites and other advanced materials. Thermwood also offers a Large Scale Additive Manufacturing system for 3D printing of reinforced thermoplastic composite material suitable for producing industrial tooling, masters, patterns, molds, plugs and fixtures for a variety of industries including aerospace, automotive, foundry and boating. Thermwood is a US company with distributors worldwide and provides extensive and complete support, installation, training, and ongoing service." The Thermwood CEO stated last week at the hearing, via his safety engineer, that the company, which has been in operation for 40 years and employs 100, will relocate if the refinery gets built because of the current shortage of workers and the likelihood of toxic fallout that would affect their company, given their very close proximity to the proposed site. What models and methodology has IDEM used to determine the overall gains vs losses in area economic development? Have IDEM officials communicated with Thermwood officials about the proposed refinery location? Has IDEM reached out to Thermwood and/or other longstanding local companies to discuss economic impacts upon them?

13. Nearby amusement park Holiday World, Lincoln State Park, Lincoln Amphitheatre, Lincoln Boyhood National Memorial, the Sisters of St. Benedict in Ferdinand, St. Meinrad Archabbey, historic Fourth Street in Huntingburg, Parklands in Jasper, Hoosier National Forest, Ferdinand State Forest, the historic Astra Theatre in Jasper, Sultan's Run Golf Course, area wineries, etc.,

are all tourism and cultural amenities that bring in millions, perhaps tens of millions of dollars in revenue annually. They employ thousands of employees and add significantly to our area's tax base. What model(s) has IDEM used to measure the short and long-term economic effect Riverview's refinery will have upon these area attractions? Is there a refinery built so close to amenities like these. Where is it and what have been its economic effects? Has IDEM reached out to any of these attractions to build a healthy relationship, given the large scale of the new neighbor that Riverview would be?

14. I am a co-coordinator of the Ferdinand Folk Festival, a free, music, art, environment, and wellness festival held annually in September in our beautiful 18th Street Park. Each year--we're entering our tenth year--the festival attracts between five and eight thousand people, and tourism officials have stated that the event brings in about one million in revenue for area businesses each year. Similarly our annual Christkindmarkt in November attracts even higher numbers. Thousands also come out for the annual Rosenvolk German Medieval Festival in October, also located in Ferdinand. What promises can you make that Riverview refinery's toxic smell of rotten eggs will have no effect on our growing tourism revenue? What models have you used?

15. What studies or models has IDEM used to determine the financial costs of Riverview's refinery in terms of families' healthcare and funeral costs if the fallout harms innocent bystanders in the region? What recourse will citizens have if/when they are suffering the consequences of living near the refinery?

#### **TRANSPARENCY AND TRUST IN IDEM**

16. Under IDEM's watch, Indiana consistently ranks 44th to 50th in the nation in toxic emissions and nearly as low in health quality. Indiana is stuck at the bottom; it has been there for many years. Improving our ranking does not seem to be a priority at all. Given Indiana's standing in the nation, what confidence can we place in IDEM officials' honesty and/or competence when officials state that this massive refinery will have "no significant impact"?

17. Why doesn't IDEM install many more air quality monitors in our extremely polluted area? For Spencer County, ranked 23rd out of 3,142 counties in air pollution, not to have a series of state-of-the-art monitors for mercury and the many other toxins emitted from our superpolluters screams apathy from IDEM. We are not expendable. Our lives and especially our most vulnerable children and senior citizens' lives matter. Population numbers are absolutely irrelevant; quantity of toxins is all that matters, and IDEM is failing us miserably. How can any new source of pollution be carte blanche approved when you do not even have anywhere close to accurate baseline data to rely on?

18. Why was the air monitor near AK Steel removed?

19. Has IDEM ever not approved a new source of pollution? Please give examples, dates, locations.

20. Are IDEM employees' employment positions in jeopardy if they deny this permit? Please explain.

21. What is IDEM's whistleblower policy if an employee suspects, detects and/or reports alleged corruption that can harm public health? What is IDEM's grievance culture and policy? Is it in writing? If so, please share it. If an employee suspects or tries to investigate or report anomalies, will he or she potentially be fired?

22. A regional state representative shared with me earlier this year, "The Indiana government is not going to investigate what they don't want you to know." Given our bottom dwelling pollution and health records, please name any studies initiated by IDEM or the ISDH that have in any way investigated the effect of pollution on public health. If IDEM has not conducted studies, given our bottom ranking and related health effects, why not?

23. If there are suddenly spikes in childhood cancers, learning disabilities, infant mortality, asthma, etc., near Riverview's refinery if built, what recourse, including legal, will citizens have to correct the situation and stop the stream of toxins? Please give examples where IDEM has helped grieving families if/when their well-known pro-industry permitting process causes harm. What role has IDEM played in Franklin, Indiana's health crisis? What is IDEM doing today to provide transparency, honesty, answers, comfort, and relief to the grieving families in Franklin?

24. What cleanup strategy does IDEM have in place if/when the site gets built and the soil and water in the neighborhood is contaminated? Who will foot the bill? What if Riverview goes bankrupt?

25. IDEM released an interestingly timed, seemingly random press release on or around October 29--on the eve of citizens' third (very well-attended) educational forum and the week after citizens installed a billboard on I-64--that made the sweeping claim that the refinery would have "no significant impact" on public health. <https://www.ijb.com/articles/71190-state-25b-coal-to-diesel-project-wont-harm-air-quality>. However, nowhere in IDEM's data are any medical authorities cited to back up the claim. Blanket statements are made with apparently no citations, no transparent methodology, questionable models used from the other end of the state, and no medical authorities qualified to evaluate the effects of specific toxins on human tissue. Why was this press release issued when it was, before the Dec. 5 hearing? Secondly, please provide references and the scientific methodology used to arrive at the conclusions in the press release. If IDEM's conclusions are based upon sound science and fact, IDEM officials should be transparent and forthcoming in response to these questions. Basic requirement of COMP 101 requires a detailed and accurate list of citations. The public deserves as much from our tax-funded agencies.

26. What effort is IDEM taking to address human-caused climate change? What shift is happening within the halls of IDEM? What green initiatives are coming soon? What conservation, energy-efficiency, and jobs retraining programs are being initiated by IDEM? In other words, how is our tax-payer-funded agency making a positive difference to respond to the grave warnings that we must reduce our fossil fuel consumption immediately? How is IDEM being a responsive and responsibly agency? For example, Ball State University's campus several years ago changed to a huge geothermal system to cut the school's emissions, reduce its carbon footprint, and to save money and lives in the long run. What year is IDEM's goal for Indiana not to be dependent on fossil fuels?

27. In repeated studies, Indiana's regulations are shown to be among the worst in the nation. It is my understanding that there are few toxic dam (such as coal ash ponds) safety requirements, including no requirement that dams be designed by a professional engineer, no requirement that they be inspected, no reporting requirements, no requirement for inundation maps or emergency plans, and no bond requirements. Similarly, it is my understanding that Indiana law fails to protect drinking water and surface water from the leaching of toxic chemicals, and that Indiana regulations do not require groundwater monitoring or composite liners at all ponds and landfills, nor do the regulations prohibit dumping directly into the water table. I am aware of what the mothers and citizens are dealing with in Franklin, and their view of IDEM. AK Steel, located just a few miles south of Riverview's proposed site, under IDEM's watch or stated another way, with IDEM's approval, is the number one polluter of the entire Ohio River, and the Ohio River has been the most polluted body of water in the US for the past seven years. Given this reputation, how can citizens trust that IDEM is living up to its mission to protect the environment and to protect public health?

28. Does Greg Merle's website for Riverview Energy [www.riverviewenergy.com](http://www.riverviewenergy.com) concern IDEM officials? Given the massive scale and newness of this technology, does the extremely sparse information about the science, methodology, investors, etc., on Mr. Merle's website give IDEM officials pause? Does the website's shortness and simplicity raise any red flags that Mr. Merle might not be able to pull off a high-tech, never-before-built-in-the-western-hemisphere coal-to-diesel refinery? It's disconcerting that citizens should trust a person (and permitting agency) to a state-of-the-art facility when the company president cannot even afford to build a state-of-the-

art website. Our website [www.noc2d.com](http://www.noc2d.com), created entirely by volunteers at little cost, by comparison is more professional and more in depth.

**PART TWO--COMMENTS AND QUESTION SHARED at PUBLIC HEARING on DEC 5, 2018**

**IDEM'S RESPONSIBILITY TO PROTECT OUR CHILDREN FROM POLLUTION, REDUCE SPECIAL ED AND ILLNESS RATES: URGENT AND IMMEDIATE NEED FOR ROOT-CAUSE-ANALYSES, NEED FOR MORATORIUM ON NEW POLLUTION**

What we don't know can harm us. As an educator, I see an issue that gets little to no attention in Indiana, related to one we all care about--the well being of our kids. While many factors can contribute to learning disabilities, exposure to pollution during pregnancy and early childhood is one of them. Expectant moms and their toddlers can't escape the air they breathe.

Under your watch, Indiana consistently gets a failing grade--44th to 50th in air quality--an embarrassing 10% or lower. To maintain that your bottom-ranking pollution levels--which you intentionally do not even monitor here--and now want to increase--will have "no significant effect" on our unborn children and toddlers is illogical, dangerous, and reckless--and you are funded by us, the taxpayers.

We're not talking about a mild allergy or discomfort. We're talking about, for example, a common weather pattern here called thermal inversion, that traps emissions close to the ground. We're talking about a harmful dose of benzene, methanol, hexane, formaldehyde, or nickel (all approved to be released in this permit) into an unsuspecting home in Mariah Hill at week 14 of a pregnancy. We're talking about a resulting pervasive disability a child and his or her parents did not ask for and do not deserve, that follows one for life, as the child learns to cope. The long-term costs of just a few lower IQ points has staggering effects on families, one's quality of life, and our state's economy. The research is extensive.

**UNACCEPTABLE SPECIAL EDUCATION RATES**

According to the US government, the percentage of special ed students in our nation's schools is 13%.

The Indiana Department of Education released the following special ed numbers from these neighboring schools just last year:

North Spencer, Chrisney Elementary 24%  
Nancy Hanks 21

South Spencer, Rockport-Ohio 24

Warrick County schools, Elberfeld 21  
Lynnville 25

Loge 23  
Warrick County Preschool 97  
Tennyson 30  
Boonville High School 26

Boonville Middle 23

Chandler 23

Mount Vernon High School 22

Jr High 21

West Elementary 30  
Farmersville 30  
North Posey, Elementary 25  
East Gibson, Wood Memorial Jr High 24  
Oakland City Elementary 33  
North Gibson schools, 28, 29, 22, 26  
(Princeton Intermediate 28  
Middle 29  
High School 22  
Primary 26)  
South Gibson, Fort Branch 21  
Owensville 26  
Pike County Winslow 24  
Petersburg 22  
Northeast Dubois, Celestine 21  
Dubois Middle 20  
Elementary 22  
Southwest Dubois, Holland 20  
Jasper, Fifth Street 25  
Washington, Lena Dunn Elementary 28

and I could go on.

Again, the national average is 13%.

***Why in the world would we even consider taking a risk with more pollution with numbers like these in this area? Please answer this question.***

To quote Shakespeare in Hamlet, "Something is rotten in the state of Denmark." Well, there's something rotten in the state of Indiana. We owe our children answers--an intense, scientific, root cause analysis initiated by our elected officials to determine why so many children here, are born, through no fault of their own, with an immediate and lifelong disadvantage.

Deny this permit. If Governor Holcomb meant what he said down the road at Santa's Lodge back on June 7, when he said we won't do anything to harm public health, deny this permit, and work with a new generation of thinkers and innovators to move our state forward--in education, job training, healthier work environments, cleaner, sustainable energy, and conservation.

### **IDEM Response to Mr. Rock Emmert Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

IDEM, OAQ relies on the scientific expertise of U.S. EPA which sets the National Ambient Air Quality Standards (NAAQS) to be protective of public health and the environment, establishes federal regulations to limit or reduce pollution such as Prevention of Significant Deterioration (PSD), New Source Performance Standards (NSPS), and the National Emission Standards for Hazardous Air Pollutants (NESHAP), and establishes air quality modeling, impact analysis, and risk assessment procedures and guidelines.

#### Regarding Health and Pollution Monitoring, Data, and Additional Information

IDEM OAQ has not conducted any specific studies regarding the existing rates of infant mortality rates, asthma-related health effects, cancer incidence, or cancer mortality (death) in southern Indiana or the effect of addition pollution from this proposed plant would have on these rates. IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety). For a detailed explanation of the methodology used in the Air Quality Analysis see Appendix C to this ATSD and IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis.

The proposed permit requires either stack testing or continuous emissions monitoring (with associated record keeping and reporting requirements) for most of the point source emissions at the source. The IDEM, OAQ Compliance and Enforcement Branch will observe all stack tests and review all stack test protocols and results. Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions.

In addition, the impact of air pollution emissions from this proposed plant to ambient air pollution levels in southwest Indiana will be monitored as part of IDEM, OAQ's ambient air monitoring in southwest Indiana. Information about Indiana's air monitoring system and monitoring results is available at <http://www.in.gov/idem/airquality/2346.htm>.

Other than the stack testing and compliance monitoring required by the proposed permit and IDEM, OAQ's ambient air monitoring within southwest Indiana, IDEM OAQ is not planning any additional air, soil, or water sampling in local areas near this proposed plant.

The Indiana State Department of Health (ISDH), in conjunction with partners from across the state, gathers epidemiological data from local health department assessments, local hospital and clinic assessments, and other sources, and from key informant interview data to assess the health of Indiana's residents. ISDH collects data and information on births, deaths (including cancer and infant mortality), marriages, maternal and child health (including cancer and asthma), inpatient hospital discharges/hospitalizations, outpatient hospital discharges, emergency department visits, and other public health matters. This data is used by legislators and health professionals to make critical decisions affecting the health and well-being of the citizens of Indiana. ISDH data and reports can be found at the following website: <https://www.in.gov/isdh/18888.htm>.

Data collected from the US Department of Health and Human Services, Centers for Disease Control and Prevention (CDC) and the Indiana State Department of Health (ISDH) do not indicate that the rates of infant mortality, asthma-related health effects, cancer incidence, or cancer mortality (death) are profoundly higher in all counties in southwest Indiana as compared to the Indiana (state-wide) rates (see IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source). Regarding infant mortality in Indiana and southwest Indiana, please see the IDEM Response to Dr. Norma Kreilein Comment 1.

If citizens believe that pollution is the causing sickness, cancer clusters, autism, asthma, infant mortality, leaning disabilities, or other illness, please contact the Indiana State Department of Health:

Indiana State Department of Health  
2 North Meridian Street  
Indianapolis, IN 46204  
(317) 233-1325  
Toll Free: 1-800-382-9480

ISDH provides additional information on cancer clusters at the following website:  
(<https://www.in.gov/isdh/26882.htm>):

Instructions for reporting a suspected cancer cluster in Indiana can be found at the following website: [https://www.in.gov/isdh/files/How%20to%20Report%20a%20Suspected%20Cancer%20Cluster\\_102616.pdf](https://www.in.gov/isdh/files/How%20to%20Report%20a%20Suspected%20Cancer%20Cluster_102616.pdf)

#### Regarding Special Education Rates

IDEM OAQ has not conducted any specific studies for the existing special education rates in southern Indiana or the effect of addition pollution from this proposed plant would have on special education rates in southern Indiana. IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

The Indiana Department of Education (IDOE) maintains special education enrollment data for all schools in Indiana.

The 2017 special education enrollment data provided by the commenter does not represent the complete data set for all schools in the southwest Indiana school corporation areas cited (North Spencer, South Spencer, Warrick County, Mount Vernon, North Posey, East Gibson, North Gibson, South Gibson, Pike County, Northeast Dubois, Southwest Dubois, Jasper, Washington). Members of the public who would like to access complete data with respect to southwest Indiana school corporations can go to the following link:

<https://www.doe.in.gov/sites/default/files/accountability/school-enrollment-ell-special-education-2006-19.xlsx>

#### Regarding Infant Mortality

Regarding infant mortality in Indiana and southwest Indiana, please see the IDEM Response to Dr. Norma Kreilein Comment 1.

The CDC and ISDH data provided in IDEM Response to Dr. Norma Kreilein Comment 1 do not support the commenter's claim that the infant mortality rate in southwest Indiana is "twice the national average".

#### Regarding Thermal Inversions

Air temperature inversions frequently occur in southern Indiana and mixing heights and stable atmospheric conditions are accounted for in the National Weather Service (NWS) surface and upper air meteorological data used in the modeling. The meteorological data were preprocessed into an AERMOD ready format by the Office of Air Quality (OAQ) using U.S. EPA's AERMET Version 16216, meteorological preprocessor for AERMOD. AERMET uses upper air data and surface data to capture these boundary layer features which are included in the air dispersion model runs that replicate actual meteorological conditions, such as inversions, and predict concentrations from modeled sources.

#### Regarding Amount of Pollution Per Employee

IDEM OAQ does not consider or evaluate the amount of air pollution per employee that a company will emit. For this proposed plant, IDEM OAQ evaluated the potential to emit (PTE) of air pollution and performed an air quality analysis.

#### Regarding Economic Impact of Proposed Plant Local Area

IDEM OAQ does not evaluate or have any models to determine whether (or not) a proposed facility will have an economic impact on the quality of life, real estate values, farming operations, relocation of businesses or families, economic development, area attractions, tourism, families' healthcare and funeral costs. IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

In addition, IDEM OAQ has not contacted any local businesses or attractions to discuss whether (or not) this proposed facility will have an economic impact on their operations.

#### Regarding Site Investigations in Franklin, Indiana

For additional information regarding site investigations (water, soil, and air) in Franklin, Indiana, please see the following website: <https://www.in.gov/idem/cleanups/2417.htm>.

#### Regarding Former Ozone Monitor Near AK Steel

As explained in the Addendum to the Technical Support Document (ATSD) for Part 70 Operation Permit No. T147-11043-00041 (<https://permits.air.idem.in.gov/11043f.pdf>) for AK Steel Corporation, the ambient ozone monitor that was previous located near AK Steel was removed for the following reason:

AK Steel's original Construction Permit (141-6713-00041) contained appropriate monitoring requirements. At the time of issuance, IDEM required that AK Steel operate the required ozone monitor for three complete seasons to determine compliance with the NAAQS (National Ambient Air Quality Standards). The

ozone monitor was located approximately 22 miles northeast of the plant (assuming southwest prevailing winds) thus allowing for peak ozone formation from the source. Because of AK Steel's close proximity to the Spencer-Perry county line, 22 miles northeast put the monitor in Perry County. The monitor operated for part of 1998 and the entire ozone seasons of 1999, 2000, and 2001. This met the requirement to operate the ozone monitor for three complete ozone seasons. Because of this, the monitoring requirements were met and the monitoring requirement was discontinued as a result. . . .

Currently, IDEM operates two ozone monitors in Vanderburgh County, three in Warrick County, and one in Perry County. Spencer County data for the years 2000 and 2002 is from a PM-2.5 monitoring site located in Dale, and the data used for the attainment demonstration was from the years 2001 and 2003 of which the annual average of 14.4ug/M3 was calculated.

Because of the information above, it is not necessary to employ additional monitors in southwestern Indiana, or add new monitoring requirements in this Part 70 operating permit.

#### Regarding Greenhouse Gas Emissions and Climate Change

IDEM, OAQ has limited authority to regulate greenhouse gas (GHG) emissions. The permit includes the PSD Best Available Control Technology (BACT) requirements that limit GHG (CO<sub>2</sub>e) emissions in conditions D.3.1(f)(4), D.4.1(m), D.5.1(g), D.7.1(g), D.9.1(d), and D.10.1(h). The PSD BACT analysis for GHG emissions is included in Appendix B of this Addendum to the Technical Support Document (ATSD). For additional information, see IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change.

IDEM OAQ has no authority to create any permit limits or measures in excess of what is legally required by federal and state rules and regulations, such as requirements to use "green" technologies, to use renewable sources of energy such as wind and solar, to implement energy conservation or efficiency measures, or to implement waste minimization, reuse, recycling, or pollution prevention measures. The Indiana air permitting requirements that are applicable to this source are part of our state implementation plan (SIP) that is approved by the U.S. Environmental Protection Agency (EPA). Environmental laws are enacted by the Indiana legislature. The legislature has also given rulemaking authority to the Indiana Environmental Rules Board. More information about the rulemaking process is available at <http://www.in.gov/idem/4087.htm> on IDEM's Website.

#### Regarding IDEM Environmental Programs

The information provided below summarizes many of environmental programs and activities that IDEM manages or participates in that may directly or indirectly help to improve the environment in Indiana.

IDEM promotes pollution prevention activities in businesses and communities throughout the state by offering voluntary recognition programs and technical assistance. Pollution prevention and other environmental stewardship activities, such as recycling and waste management activities, help ensure that Indiana's environment and economy are sustainable for future generations. IDEM's Office of Program Support (OPS) manages the following programs:

- CLEAN Community Challenge
- Environmental Stewardship Program (ESP)
- Governor's Awards for Environmental Excellence
- Household Hazardous Waste Management
- Indiana E-Cycle and Recycling Market Development Program

- Partners for Pollution Prevention (including Quarterly Meetings and an Annual Pollution Prevention Conference)
- Toxics Release Inventory
- Unwanted Medicine Collections

Additional information on these programs is available at the following website: <https://www.in.gov/idem/prevention/>

In addition, IDEM's Compliance and Technical Assistance Program (CTAP) was established to help Indiana businesses achieve compliance with environmental regulations and help businesses to identify opportunities for energy conservation/efficiency and waste minimization, reuse, recycling, and pollution prevention. IDEM's CTAP provides a free training entitled "Environmental Education for Regulated Entities (E101)" to assist environmental managers in understanding current state and federal environmental regulations, determine how they are applied to Indiana businesses, and demonstrate how to implement practices that assist environmental sustainability efforts, including pollution prevention. Information on this training is available at the following website: <https://www.in.gov/idem/ctap/2471.htm>.

Finally, IDEM also manages or participates in several environmental programs/activities, including but not limited to, the following:

- Year-round participation in various environmental conferences and meetings
- Year-round participation in public meetings on various environmental issues
- Year-Round Environmental Presentations for School and Organizations (<https://www.in.gov/idem/iee/2340.htm>)
- Earth Day Booths and School Classroom Presentations (<https://www.in.gov/idem/iee/2418.htm>)
- IDEM education and information booth at the Indiana State Fair
- Hoosier Riverwatch (<http://www.hoosieriverwatch.com/>)
- Pollution Prevention Week ([https://www.in.gov/idem/ppp/files/featured\\_2018\\_proclamation.pdf](https://www.in.gov/idem/ppp/files/featured_2018_proclamation.pdf))
- Indiana Clean Yard Program (<https://www.in.gov/idem/landquality/2470.htm>)
- Northwest Indiana Partners for Clean Air (PCA) (<https://www.in.gov/idem/airquality/2587.htm>)

#### Denial of a Permit Application

If information provided by an applicant in an air permit application, including any additional information request by IDEM OAQ during review and processing of the application, is sufficient to determine a source's potential to emit (PTE) air pollution and applicable state and federal rules, regulations, and requirements, and the application information indicates that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

Pursuant to Indiana Administrative Code (IAC) 326 IAC 2-1.1-8(j) and 326 IAC 2-1.1-8(k), IDEM OAQ may deny a permit application if it is determined to be incomplete because an applicant fails to submit requested information to IDEM OAQ within the timeframes specified 326 IAC 2-1.1-8(j), an applicant fails to submit applicable permit application fees within the timeframes specified 326 IAC 2-1.1-8(j), or if the application contains provisions that are not consistent with applicable rules or laws.

In response to the commenter's question, IDEM OAQ employees' employment positions are not in jeopardy if a permit is denied pursuant to the provisions of 326 IAC 2-1.1-8(j) and/or 326 IAC 2-1.1-8(k).

Below are example permit applications that were denied by IDEM OAQ:

- Application 029-38375-00005 (<https://permits.air.idem.in.gov/38375f.pdf>) was denied on August 25, 2017, because the application was determined to be incomplete and the applicant failed to submit requested information to IDEM OAQ within the timeframes specified 326 IAC 2-1.1-8(j).
- Application 081-33655-00057 (<http://permits.air.idem.in.gov/33655f.pdf>) was denied on March 21, 2014, because the application was determined to be incomplete (response for additional information was not adequate) and applicant had applied for wrong permit level.
- Application 085-29737-00122 (<https://permits.air.idem.in.gov/29737f.pdf>) was denied on September 17, 2012, because the application was determined to be incomplete (response for additional information was not adequate) and the applicant failed to submit requested information to IDEM OAQ within the timeframes specified 326 IAC 2-1.1-8(j).

#### Regarding State of Indiana Whistleblower Laws

State of Indiana laws related to whistleblowers are codified under Indiana Code IC 4-15-10 (State Employees' Bill of Rights). Specific sections of this law that are applicable to whistleblowers include, IC 4-15-10-1, IC 4-15-10-4, IC 4-15-10-5, and IC 4-15-10-6:

##### **IC 4-15-10-1 Definitions**

Sec. 1. As used in this chapter:

"Agency" means any state administration, agency, authority, board, bureau, commission, committee, council, department, division, institution, office, service, or other similar body of state government created or established by law. However, the term does not include state colleges and universities.

"Appointing authority" means the individual or group of individuals who have the power by law or by lawfully delegated authority to make appointment to a position in an agency.

"Employee" means an employee of an agency except an elected official.

"Supervisor" means an individual who oversees the daily activity of an employee.

*As added by Acts 1981, P.L.36, SEC.2.*

\*\*\*\*\*

##### **IC 4-15-10-4 Protection of employees reporting violations of state or federal laws**

Sec. 4. (a) Any employee may report in writing the existence of:

- (1) a violation of a federal law or regulation;
  - (2) a violation of a state law or rule;
  - (3) a violation of an ordinance of a political subdivision (as defined in IC 36-1-2-13);
- or
- (4) the misuse of public resources;

to a supervisor or to the inspector general.

(b) For having made a report under subsection (a), the employee making the report may not:

- (1) be dismissed from employment;
- (2) have salary increases or employment related benefits withheld;
- (3) be transferred or reassigned;
- (4) be denied a promotion the employee otherwise would have received; or
- (5) be demoted.

(c) Notwithstanding subsections (a) and (b), an employee must make a reasonable attempt to ascertain the correctness of any information to be furnished and may be subject to disciplinary actions for knowingly furnishing false information, including suspension or dismissal, as determined by the employee's appointing authority, the appointing authority's designee, or the ethics commission. However, any state employee disciplined under this subsection is entitled to process an appeal of the disciplinary action under the procedure as set forth in IC 4-15-2.2-42.

(d) An employer who violates this section is subject to criminal prosecution under IC 35-44.2-1-1.

*As added by Acts 1981, P.L.36, SEC.2. Amended by P.L.17-1984, SEC.1; P.L.32-1987,*

*SEC.1; P.L.5-1988, SEC.25; P.L.9-1990, SEC.11; P.L.222-2005, SEC.21; P.L.6-2012, SEC.13; P.L.126-2012, SEC.12.*

**IC 4-15-10-5 Exercise of rights; penalties prohibited**

Sec. 5. No employee shall suffer a penalty or the threat of a penalty because the employee exercised the employee's rights under this chapter.

*As added by Acts 1981, P.L.36, SEC.2. Amended by P.L.215-2016, SEC.87.*

**IC 4-15-10-6 Limitation of rights and remedies prohibited**

Sec. 6. Nothing in this chapter shall disparage, impair, or limit any other right or legal remedy of an employee.

*As added by Acts 1981, P.L.36, SEC.2.*

Regarding State Employees' Appeals Commission (SEAC)

If an at-will, unclassified employee believes that s/he was dismissed, demoted, disciplined, or transferred in contravention of public policy, the employee can file a complaint to the State Employees' Appeals Commission (SEAC) pursuant to the complaint procedure is enacted at IC 4-15-2.2-42. The employee must prove that the reason for management's decision is: (1) that the employee was in a protected class, and unlawfully discriminated or retaliated against under federal or state law; (2) that the employee was exercising a federal or state statutory right (such as filing a worker's compensation claim, whistle-blowing, or filing a civil service complaint); or (3) fulfilling a federal or state statutory duty (such as reporting for jury duty) or refusing to violate a penal statute.

**IC 4-15-2.2-42 Complaint procedure**

Sec. 42. (a) An employee in the state civil service system may file a complaint concerning the application of a law, rule, or policy to the complainant. However, a gubernatorial appointee does not have standing to file a complaint under this section.

(b) A complaint filed under this section must identify the law, rule, or policy that was allegedly violated.

(c) An employee who files a complaint under this section must initiate the complaint procedure as soon as possible after the occurrence of the act or condition complained of, and not later than thirty (30) calendar days after the date the employee became aware, or by the exercise of reasonable diligence should have been aware, of the occurrence giving rise to the complaint. An employee who does not initiate the complaint procedure within the thirty (30) day period waives the right to file that complaint.

(d) A remedy granted under this section may not extend back more than thirty (30) calendar days before the complaint was initiated.

(e) The following complaint procedure is established:

Step I: The complainant shall reduce the complaint to writing and present the complaint to the appointing authority or the appointing authority's designated representative. The appointing authority or designee shall conduct any investigation considered necessary and issue a decision, in writing, not later than fifteen (15) calendar days after the date the appointing authority receives the complaint.

Step II: If the appointing authority or the appointing authority's designated representative does not find in favor of the complainant, the complainant may submit the complaint to the director not later than fifteen (15) calendar days after the date of the appointing authority's finding. The director or the director's designee shall review the complaint and issue a decision not later than thirty (30) calendar days after the date the complaint is submitted to the director.

Step III: If the employee is not satisfied with the director's decision, the employee may submit an appeal in writing to the commission not later than fifteen (15) calendar days after the date the employee receives notice of the action taken by the director or the director's designee. The commission shall determine whether all previous steps were completed properly and in a timely manner, and, subject to subsection (f), whether the employee and subject of the complaint meet the jurisdictional

- requirements. If a procedural or jurisdictional requirement is not met, the commission shall dismiss the appeal. If the procedural and jurisdictional requirements have been met, the commission shall conduct proceedings in accordance with IC 4-21.5-3.
- (f) An unclassified employee must establish that the commission has subject matter jurisdiction to hear the employee's wrongful discharge claim by establishing that a public policy exception to the employment at will doctrine was the reason for the employee's discharge. The former employee has the burden of proof on this issue.
  - (g) In a disciplinary case involving a classified employee, the commission shall defer to the appointing authority's choice as to the discipline imposed, if the appointing authority establishes that there was just cause for the imposition of the discipline. The appointing authority has the burden of proof on this issue.
  - (h) Decisions of the commission are subject to judicial review in accordance with IC 4-21.5-3.
  - (i) An employee who is suspended or terminated after a hearing held by the state ethics commission is not entitled to use the procedure set forth in this section. An employee who seeks further review of a suspension or termination imposed by the state ethics commission must seek judicial review of the state ethics commission's decision in accordance with IC 4-21.5-3.

*As added by P.L.229-2011, SEC.56.*

The State Employees' Appeals Commission (SEAC) is established by statute (IC 4-15-1.5) and its Commission Members are appointed by the Governor. SEAC impartially and fairly hears qualified state employees' appeals under the Civil Service System (IC 4-15-2.2). Employees in the state civil service, except those exempt or appointed by the governor, may file a complaint concerning the application of a law, rule, or policy to that employee. The complaint must identify the law, rule, or policy allegedly violated, the facts supporting the allegation, and the remedy the employee is requesting. More information on the SEAC is available at the following websites:

- <https://www.in.gov/seac/>
- <https://www.in.gov/seac/2328.htm>
- [https://www.in.gov/spd/files/SEAC\\_Policy\\_Statement.pdf](https://www.in.gov/spd/files/SEAC_Policy_Statement.pdf)

#### Regarding IDEM Compliance and Enforcement

IDEM, OAQ encourages residents to contact an IDEM, OAQ compliance inspector if they witness or have evidence of any compliance related concerns with this operation. An IDEM OAQ compliance inspector will investigate complaints, perform any necessary observations or inspections of the source, determine if a violation of a permit term or condition has occurred, take appropriate action when a violation is observed, and initiate any necessary actions to bring to source back into compliance with applicable permit conditions and state and federal rules and regulations. The current compliance inspector for each county in Indiana can be found at the following website: <http://www.in.gov/idem/airquality/2418.htm>. The current IDEM OAQ compliance inspector for Spencer County is Daniel Roos, who may be contacted by telephone at (812) 380-2309 or toll free (888) 672-8323 an ask for Daniel Roos or by e-mail at [droos@idem.IN.gov](mailto:droos@idem.IN.gov).

If the commenter or citizens have complaints and issues with the source with respect to compliance with its air permit, complaints can be submitted to IDEM three (3) different ways:

1. Online at: <https://www.in.gov/idem/5274.htm>;
2. Through the Complaint Coordinator at (800) 451-6027 ext. 24464; or
3. By printing, completing, and mailing a paper-based Complaint Submission Form (Available under Agency Forms at: <http://www.in.gov/idem/5157.htm>)

IDEM, OAQ and U.S. EPA inspections are unannounced. IDEM, OAQ normally inspects major sources on an annual basis. IDEM, OAQ will make more frequent inspections on a case-by-case basis based on the compliance history of the source and any public complaints received. During an inspection, the IDEM, OAQ inspector will perform a records review, and inspect the facility operations, to determine if the source is in compliance with all air permit terms and conditions.

Regular inspections, regular stack testing, along with compliance monitoring, record keeping and reporting, will allow IDEM, OAQ to determine if Riverview is in continuous compliance with all air permit terms and conditions. If noncompliance with any air permit condition is detected, IDEM, OAQ has a wide range of enforcement options including warnings, civil penalties, criminal charges and, in extreme cases, an injunction to cease operations at the facility.

#### Regarding IDEM Investigation and Cleanup Program

If there are accidental spills, leaks, or instances of improper disposal and handling of pollutants that results in contaminated land, water, and air at this proposed plant, the contamination must be assessed and either cleaned up or effectively managed to eliminate or prevent risk to human health or further degradation to the environment.

IDEM Office of Land Quality (OLQ) oversees investigation and cleanup actions at sites where contaminants have or may have been released. OLQ employs a variety of investigation and cleanup programs in partnership with other state agencies, municipalities, federal agencies, or responsible parties to investigate, assess, manage, and/or clean up contaminated properties

Additional information on IDEM OLQ's Investigation and Cleanup Programs can be found at the following website: <https://www.in.gov/idem/cleanups/2332.htm>.

#### Regarding Newspaper Article

Other than the public notice for the draft PSD/New Source Construction and Part 70 Operating Permit (<https://permits.air.idem.in.gov/39554d.pdf>) that was published in The Journal-Democrat, Spencer, Indiana on October 24, 2018, and the public hearing announcements posted to IDEM's website calendar (<https://calendar.in.gov/site/idem/>) for a public hearing on November 29, 2018 (subsequently rescheduled), and a rescheduled public hearing on December 5, 2018, no other "press releases" were released by IDEM.

News media articles and stories about the proposed plant, the draft permit, the public notice period, and the public hearing often cited information that was contained in the draft permit documents, the notice of public hearing, and notice of public comment, all of which were made available on IDEM's website at the following link: <https://permits.air.idem.in.gov/39554d.pdf>. IDEM had no control over the timing of these news media articles and stories.

During 2018 and 2019, IDEM has received several media inquiries about this proposed plant and the draft permit and IDEM has responded to those media inquiries.

#### Regarding Riverview Website

IDEM, OAQ does not have legal authority to deny an air permit based on whether a permit applicant has a company website or based on the amount of information a permit applicant includes on their company's website.

No changes to the draft permit were made as a result of this statement.

### **Ms. Jane A. Schipp Comments and IDEM Responses**

On December 10, 2018, Ms. Jane A. Schipp of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Jane A. Schipp Comment 1:**

I am writing regarding the above-referenced permit, awaiting approval with the Indiana Department of Environmental Management. I'm sure you are quite aware of the existing pollution problems in Southwest Indiana and now, in addition, this permit being considered on the proposed Riverview refinery in Dale. This refinery will add a huge amount of pollution and toxins

in our area. With Spencer County being the 23rd most polluted county in the nation, being named #1 certainly is not in our radar. I am asking you, as a fellow Hoosier and human-being, to support the residents of our area in opposing this plant.

I am a member of the Southwestern Indiana Citizens for Quality of Life (SWICQL). As a member of that group, we have canvassed the towns of Dale, Santa Claus, Mariah Hill, St. Meinrad, and Ferdinand, have held multiple forums, and convened informational stands at area festivals and fairs. What we encountered was an overwhelming support of our group and the stance against the construction of this refinery in our already over-polluted area of southwest Indiana. We have distributed over 500 lawn signs, received petition signatures in excess of 1400 people and received both state and national media attention alerting the public of this monstrosity. Going door-to-door has enabled us to take the pulse of the community. While we have encountered people who support the plant, in our best estimate, it is 10 to 1 **AGAINST** the construction of this refinery.

SWICQL is a group of local citizens from all walks of life. We are made up of engineers, housewives, doctors, retirees, accountants, etc. Though most of the proponents see us as a group of "Liberals", we actually are a very balanced group of Republicans and Democrats who leave politics aside, and instead, focus on the environmental problems of our area. Various members of our group have spent hundreds of hours combing over the permit, researching the effects of the various toxic releases on our health and the environment. We have not taken our position lightly. What we have found is that the very people elected to oversee the quality of life for their constituents have not taken the time to read the permit and/or consult with experts to understand the permit and the real effects of each toxic chemical being released. Most of our officials have barely read a page (if any) of this complicated permit. We are doing the job of IDEM, who is supposed to be protecting the citizens of Indiana from such a toxic, poisonous environment.

I am probably not the typical opponent of a coal plant. I worked in the coal industry for 25 years and only resigned my position as CFO two years ago. As everyone in the coal industry will agree, wages in the coal industry are good. I was making a 6-figure income which is not so easy to come by in Indiana. The reason for my resignation? Too much corruption in the coal industry. It gets worse all the time. I've seen entire vessels of coal just 'disappear'. I've sat at dinner with energy officials who laughed how the "Clean Coal" campaign was the best farce ever created and the best money they'd ever spent. I've seen tens of thousands of tons of bottom ash dumped into unlined pits, polluting the groundwater, and the toxic run-off pumped into the river in the dark of the night. I've seen bribes paid for mining permits and kickbacks given for contracts. I've seen vendors cheated out of millions of dollars, only to see hundreds of thousands of dollars pour out to political super-PACS (and then reap the benefits of those contributions in million-dollar grants). The greed and corruption in the coal industry runs rampant. And I'm quite sure political contributions are a huge part of why we have not seen any state officials come out against this plant. When the IEDC is sponsored by 5 coal-fired plants and a bank that loans to coal companies, you know you're fighting an uphill situation. And, for those that are so opposed to welfare, this is an industry that receives in excess of ONE BILLION DOLLARS annually in subsidies by the federal and state governments.

It is utterly outrageous to read IDEM's statement from late October when they stated this refinery 'will not have a significant impact on the environment and overall health in the region'. I guarantee you if you could be held personally liable for providing such a statement, this statement would NEVER have been issued. How can you make such a reckless statement when there are over 750 TONS of toxic chemicals and 2,200,000 TONS of greenhouse gases being released annually by this plant? That doesn't take into consideration the amount of noise, light, and water pollution that will be occurring, and all INSIDE the town of Dale. It also doesn't consider that we are already polluted beyond reason by the 7 Super-Polluters in our area. It is also outrageous that Spencer County, as the #23 most polluted county in the US, has ONE monitor (for PM), despite a multitude of requests made over the years to install them. Of course, you are aware of this and you are part of the problem. How would you feel if this were your children or elderly parents

inhaling these poisonous chemicals each and every day for the next 50+ years? We do not deserve such treatment.

I am therefore begging you to rise above the politics, rise above the money, rise above the corruption that is surrounding industry today and reject this application. You know, and we know, since no plant of this kind exists in the developed world, that most of the calculations in this permit are nothing more than supposition and/or monitors based hundreds of miles from Dale. The real result will be worse than you are modeling. We are asking you, before issuing this permit, to talk to the doctors in our area. The incident of asthma, premature birth, birth defects, learning-disabled, cancer, etc., in our children is just alarming. I personally have experienced such grief as my 12-year-old cousin died of liver cancer a couple years ago.

Imagine a 9 year-old, 80 pound child with a 9 pound tumor on his liver. This kid never complained, always smiling through his illness and horrendous chemo treatments he had to endure. Only to die. He was one of four children in his small county who suffered/died within a few years of each other, all of cancer. Coincidence? Not hardly. Do you really want another Franklin on your conscience?

***You can surely take a few hours of your time for some additional research before offloading a poisonous plant on us for the next 50+ years. This is all in a day's work for you - it is truly a life-changing event for us and one our children and grandchildren will have to live with for decades to come.***

The economic advantage of 200 additional jobs, creating perhaps \$20k in additional income per year per employee, CANNOT override the health of tens of thousands of people in southwestern Indiana (and the surrounding states) whose lives depend on clean air, clean water and untainted soils to grow food and feed our livestock.

***PLEASE STAND WITH US TO ENSURE THIS PERMIT IS NOT APPROVED.***

#### **IDEM Response to Ms. Jane A. Schipp Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

### Mr. John J. Stocker Comments and IDEM Responses

On December 10, 2018, Mr. John J. Stocker of Santa Claus, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. John J. Stocker Comment 1:

I am writing to oppose the issuance of the above-referenced permit application by Riverview Energy. IDEM has long denied Spencer County residents the opportunity to compile factual information on the quality of the air and water in this county. To base a permit on supposition and monitors hundreds of miles away is obviously an erroneous and fraudulent calculation. How can IDEM possibly issue this permit without a baseline idea of our air quality (not Evansville, not South Bend, not supposition, but Spencer County)? Before a permit can be issued from IDEM on the proposed Riverview refinery in Dale, proper monitors MUST be installed in Spencer County. This is a disgrace to our integrity, your integrity and to the human lives in our county.

At a time when an alarming number of international, national and state reports have been issued on climate change, how can IDEM just negligently ignore them? Where is the science that backs the belief that there is no climate change? Bluffing is an art - not a science. Why don't YOU take the lead and assemble a panel from both sides to discuss this issue? It would be quite interesting and informative and, I might add, would bring Indiana to the forefront of the debate on climate change. Indiana in the spotlight of a worldwide topic! Even though I believe in climate change, I'm quite sure it would be a learning experience for both sides of this debate.

You owe it to us as residents of this county to do your research and do it properly. The IDEM mission is to protect human health and the environment. When do you plan to start doing the job you were appointed to do for the residents of Spencer County?

The day that you reach into your heart and your conscience and put an end to the pandering to the money and greed in politics and the coal industry is the day the residents of Spencer County will finally be protected.

Please deny this permit until proper research and data has been compiled to properly perform the modeling for this refinery.

#### IDEM Response to Mr. John J. Stocker Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring

No changes to the draft permit were made as a result of this statement.

### Mr. Michael Berndt Comments and IDEM Responses

On December 10, 2018, Mr. Michael Berndt of Bloomington, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Michael Berndt Comment 1:

I am writing in opposition to the Riverview application for a coal to diesel processing plant. My own family's experience with this process is limited. My father served in the Battle of the Bulge in World War II. He did not talk about the war often. One thing I do remember is his stories about the buzz-bombs. These early missiles were powered by fuel processed from coal by the Nazis. Wikipedia states that over ninety percent of Nazi Germany's fuel was from this dirty source. Thinking about my father's part in the victory over the Axis powers, I wonder what possible expediency would warrant subjecting Hoosiers to the sulfur smell and particulate poisons of a major refinery, in an already high-pollution area? Why would Riverview's profits justify the economic harm such a plant would occasion on the tourist industry which annually brings thousands to Holiday World and the Lincoln Boyhood Home State Park? Since we are not, as a country, involved in a war that hinges on fossil-fuel shortages, I must conclude that the devastation Riverview's plant would have on the children and wildlife in the area is simply an economic decision. The health effects from this plant may continue to develop long after Riverview has reaped their profits and left the area. By that time, they will have won their economic war against the local economy and natural ecosystem integrity. The next generation of Southern Indiana will have lost. To consider an analogy from the tobacco industry, the dangers of this course of action are known. The permitting process can be viewed as the part where the cigarette is lit and put to the mouth. Of course in a fascist system, such as the Third Reich, regulatory agencies serve only to rubber-stamp the ambitions of the military-industrial complex. I hope you will consider the repercussions of this permit and tell Riverview to take their unnecessary, toxic project somewhere else.

#### IDEM Response to Mr. Michael Berndt Comment 1:

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### Mr. Jim Gregory Comments and IDEM Responses

On December 10, 2018, Mr. Jim Gregory of Birdseye, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### Mr. Jim Gregory Comment 1:

My name is Jim Gregory and I am from Dubois County, Indiana, right next to Spencer County, Indiana. I attended Hanover College graduating in 2010, I work for Humana Inc. in Louisville, KY in data science, and I am a proud Hoosier! I am writing to your agency to ask you to not approve the Air Quality permit for Riverview Energy Corporation in Spencer County, Indiana.

[Based on the EPA's Toxic Release Inventory](#), Indiana is ranked the third highest out of all fifty-six States and territories in toxic releases and Spencer County is ranked the twenty-third most polluted county in toxic releases in the entire country. Achieving these high scores is not something to be proud of and to approve this coal-to-diesel plant would undoubtedly raise air pollution for our region even higher. There is no scientifically plausible way to claim that a plant of this size (over 550 acres) and with an infrastructure that would cost over \$2.5BB would not push Spencer County, my community, even further up the EPA's Toxic Release Inventory.

Also according to the EPA, [Pike County and Davies County \(counties just north of Spencer County\), Sulfur Dioxide emissions are in "non-attainment" status from 2013-2018](#), which, as you probably know, means they are in violation with federal air standards for sulfur dioxide. In your permit, in Appendix A, I have observed the emissions released by this power plant before and after control measures are put into place. One item that stands out in particular is the instance of sulfur dioxide emission which does not reduce after control mechanisms are put in place, but actually is the only emission that increases from 208 tons to 225 tons per year. Which seems to indicate that there are no controls for this air pollutant which the nearby region is already in violation of federal standards. How is this region to reduce Sulfur Dioxide emissions to such an extent which would bring this region back into "attainment" status if emissions in this area do not reduce overtime? Your permit would allow for emissions of SO<sub>2</sub> to increase by hundreds of tons. Furthermore, most importantly, the effects that SO<sub>2</sub> have on children's developing respiratory system and those most vulnerably in our communities would lead to more burdensome healthcare costs within our government and do our community irreversible harm as disease rates increase further.

As a U.S. Army veteran and a proud American who has served our country, I am also in total understanding of how important it is that we continue to prosper economically in order to compete globally. I am not against industry developments in general. In my opinion, this power plant that proposes to boil coal infused with various compounds until it will result in the production of diesel fuel and sulfur by-product is in the opposite direction that our country should be headed. Further supporting burning pre-historic dinosaur remains that were once trapped under the earth's surface isn't going to be a viable future option in the face of a rapidly changing global economy that is becoming ever more efficiency driven and automated. The future freight of this country will not be running on diesel, [America's Department of Defense is aware of this reality](#) and has been becoming increasingly less dependent on fossil fuels as they are a significant threat to security on the battlefield (I was a petroleum supply officer).

However, I know that your agency is not in the role to determine what is and is not economically viable, so I ask you to consider your role in protecting the health and safety of Indiana residents. There are numerous reports already regarding the high rate of diseases in and around Spencer County, Indiana. By allowing the permit of this power plant to move forward, you will contribute to the premature deaths of residents living in this area. I would speculate that the 225 jobs that some in the community would celebrate would be eventually foreshadowed by the many more hundreds of premature deaths caused by the addition of thousands of tons of extra air pollutants and other hazardous matter released into the surrounding atmosphere.

If allowed to move forward, I am ready and willing to support every effort both in my free time and in financial contribution to support the organizations that will challenge this facility's development in the nearby community. I really hope that it does not come to this and that IDEM will do what is in the best interests for our community's health and wellbeing and set precedent for a more balanced standard of industry emissions which will move Indiana and her people into the future of industry which will generate prosperity for our community while not robbing us of clean air to breathe.

### **IDEM Response to Mr. Jim Gregory Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

With regard to the commenter's question about the effect of emissions from the source on nonattainment areas 40-50 km Northwest of Dale, IDEM's modeling analysis shows the 1-hour SO<sub>2</sub> impacts from Riverview show a significant concentration gradient from the maximum modeled impact, which occurs just west of the proposed facility location. The modeled concentrations decrease from this location and modeled impacts from Riverview at Daviess County (Veale Township) and Pike County (Washington Township) are not expected to be significant in and around the 1-hour SO<sub>2</sub> nonattainment area. It should be noted that monitoring values at Pike and Daviess County SO<sub>2</sub> monitors have decreased dramatically over the past several years and are now attaining the 1-hour SO<sub>2</sub> standard.

With regard to the commenter's question about controlled and uncontrolled sulfur dioxide emissions, IDEM, OAQ considers this to be the same as one of the points in Earthjustice Comment 2. Please see IDEM Response to Earthjustice Comment 2, particularly the second bullet point below the paragraph that begins, "The magnitude of uncontrolled ...".

No changes to the draft permit were made as a result of this statement.

### **Dr. Norma Kreilein Comments and IDEM Responses**

On December 10, 2018, Dr. Norma Kreilein of Jasper, Indiana, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Dr. Norma Kreilein Comment 1:**

I fully support the comments filed by Southwestern Indiana Citizens for Quality of Life, Valley Watch, Sierra Club, Citizens Action Coalition, and Earthjustice.

There is a lack of scientific integrity in IDEM permitting and surveillance, as well as a deliberate disconnect between air/water/environmental pollution and the effect it has on children and their development.

Although I am a physician, I should not have to explain the science of how children are harmed. However, one study showed that only 6 hours of moderate metropolitan air pollution produced brain changes in mice consistent with autism and early schizophrenia (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4154204/>). Autism clusters with pollution, not vaccines (<https://journals.plos.org/ploscompbiol/article?id=10.1371/journal.pcbi.1003518>). California researchers demonstrated a 25% drop in prematurity after coal fired power plants were closed, and the effect was the most pronounced within a couple miles of the plant (<https://academic.oup.com/aje/article/187/8/1586/4996680>).

Your department refused to meet with me for many months, then did nothing even though you know that you don't have health experts, and you know that the Health department cannot even

talk about pollution. Instead, in places like Franklin, you average the hot spot out so that you don't have to call it a cluster. Loopholes are consistently used in Indiana to hide the effects that pollutants are having on our children.

California 4.2 and New York 4.5, New Jersey 4.1 Massachusetts 3.9, have been able to lower their infant mortality to just over half of Indiana's which has been stuck at 7.5. Those states have an opiate crisis and large urban areas, but have had aggressive environmental initiatives ([https://www.cdc.gov/nchs/pressroom/sosmap/infant\\_mortality\\_rates/infant\\_mortality.htm](https://www.cdc.gov/nchs/pressroom/sosmap/infant_mortality_rates/infant_mortality.htm)). Indiana refuses to even consider pollution in its infant mortality work, despite the fact that Indiana ranks basically rock bottom among 50 states on air and water quality. Pollutants profoundly affect placentas, as well as the brain development of the child attached to that placenta.

My first paper on Indiana's corrupt environmental and the deliberate disconnect between pollution and infant mortality was published by the Catholic Medical Association in 2014 (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4434791/>). My second paper was published by the Section on Bioethics of the American Academy of Pediatrics in 2015. My third paper on Flaws in Indiana Air Quality Science, YOUR SCIENCE, was approved by the Scientific Committee, then exhibited and published by the 2016 International Congress of Pediatrics (<http://www.ipa2016.com/cfm/index.cfm?AF=Download&AA=202,1955&AD=DIFile>).

I was notified this past week that my article on the lack of scientific integrity of Indiana Government regarding this plant and the governor's statement that health would not be jeopardized, was accepted for presentation at the 2019 International Congress of Pediatrics in Panama City, Panama.

It is unconscionable that IDEM maintains such an adversarial relationship to medical providers and remains cozy and assistant to industry which flagrantly pollute our young. I would like to see the responses to Rock Emmert's questions as well as the following:

I would like a response to the following questions and fallacies in IDEM policy and procedure:

1. This company cannot demonstrate compliance with existing regulations without meaningful monitoring in place by the state to actually assess exposure. Current modeling did not fully utilize regional monitors. In order to comply, the full exposure to children of regional air pollution must be integrated to monitored health benchmarks, otherwise individuals are not protected and IDEM is failing its mission. Please comment on how IDEM will integrate health measures and increase monitoring to assure compliance.
2. Please explain how production of hazardous air pollutants has no impact on the health of the public.
3. Please explain how IDEM assisting with permit application while having no health experts constitutes protecting the public.
4. Flawed science is not science. Governor Holcomb stated that health would not be jeopardized and the release of HAZARDOUS air pollutants without OBJECTIVE monitoring and health surveillance constitutes harm to children. The exposure and ultimate harm of children and elderly in the immediate vicinity of this plant is not mitigated by the modeling scenarios presented.
5. Why does your agency actively assist polluting industries and fail to address, in a meaningful way, the concerns of scientists and medical professionals? Please provide actual statements from health professionals as well as citations to back up the statement made by IDEM that this plant will not significantly impact health.

Franklin, IN, is sadly a typical example of serious consequences of longstanding pollutant exposure and manipulation of data. The current concentration of coal-fired power plants constitutes another serious harm to the health of thousands of children.

Speaking as a scientist who has actually succeeded in publishing several times on the myriad flaws in IDEM and ISDH science, I find this plant appalling, as well as the measures already taken to ensure its construction over the health of children. All children are vulnerable to the effects of pollution, and it is a mathematical certainty that children in the region are already disproportionately burdened. This situation needs to be remedied by acknowledging the toxicity of pollution in a meaningful way.

### **IDEM Response to Dr. Norma Kreilein Comment 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

### Regarding Site Investigations in Franklin, Indiana

For additional information regarding site investigations (water, soil, and air) in Franklin, Indiana, please see the following website: <https://www.in.gov/idem/cleanups/2417.htm>.

The Indiana State Department of Health (ISDH) gathers data about cancer in Indiana by way of the Indiana State Cancer Registry in order to conduct epidemiologic surveys of cancer and to apply appropriate preventive and control measures. Information on the Indiana State Cancer Registry can be accessed from the following website: <https://www.in.gov/isdh/24968.htm>. Information on cancer clusters can be found at the following website: <https://www.in.gov/isdh/26882.htm>

### Regarding Infant Mortality

The infant mortality data cited by the commenter, which can be found at [https://www.cdc.gov/nchs/pressroom/sosmap/infant\\_mortality\\_rates/infant\\_mortality.htm](https://www.cdc.gov/nchs/pressroom/sosmap/infant_mortality_rates/infant_mortality.htm) (U.S. Department Of Health & Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics), indicates that in 2017 there were 24 states that had an infant mortality rate higher (greater than 6.1 per 1,000 live births) than the U.S. average rate (5.8 per 1,000 live births): Alabama, Arkansas, Delaware, Florida, Georgia, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Michigan, Mississippi, Missouri, North Carolina, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, West Virginia, and Wisconsin. The state-wide Indiana 2017 average infant mortality rate was 7.3 per 1,000 live births.

Infant mortality data for southwest Indiana is provided in the 2017 Indiana Infant Mortality and Birth Outcomes Fact Sheet for Southwestern Hospital Region (Indiana State Department of Health, Division of Maternal and Child Health) at the following website: <https://www.in.gov/isdh/files/Southwestern%20Region%20IMR%20Fact%20Sheet%202017.pdf>. Based on this fact sheet, the 2017 average infant mortality rate in southwest Indiana (6.2 per 1,000 live births) was slightly higher than the U.S. average rate (5.8 per 1,000 live births), but was lower than the state-wide Indiana average rate (7.3 per 1,000 live births).

It is unlikely that air pollution is the cause for the infant mortality rates in southwestern Indiana. Emission rates have been decreasing significantly over time and the infant mortality rates have not.

The Labor of Love, a campaign to reduce infant death in Indiana produced by the Indiana State Department of Health in cooperation with other organizations, has the following information (<https://www.in.gov/laboroflove/713.htm>) regarding infant mortality, its common causes, and preventive measures:

**What is infant mortality?**

When a baby dies after taking their first breath, but before he or she reaches their first birthday.

**What causes babies to die within the first year, and how can I prevent it?**

The three primary causes of infant mortality are perinatal complications, birth defects and SUIDs.

To help prevent these, follow the tips below:

*Prenatal Care*

Prenatal care begins long before you plan to become pregnant. Having a healthy baby takes advanced planning. Schedule regular prenatal appointments, maintain a healthy weight, take folic acid and avoid tobacco, alcohol and drugs.

*Safe Sleep*

Everyone—caregivers, family members, dads and moms—should practice the ABCs of safe sleep. Babies need to sleep alone, on their back and in a crib.

*Breastfeeding*

Breastfeeding provides vital nutrients for babies and helps moms lose weight. It's best to provide a healthy and positive breastfeeding environment for both mom and baby.

*Stop Smoking*

Smoking or using any drugs can cause the placenta to restrict or separate causing harm to the baby. Secondhand smoke is also dangerous to a baby's health.

*Early Elective Delivery*

Babies aren't fully developed until least 39 weeks of pregnancy. Babies born even a few weeks early have the possibility of experiencing serious medical complications.

*Level of Hospital Care*

Talk to your health care provider to make sure that the delivery facility you choose has the proper equipment to deliver your baby.

Methodologies, Permit Requirements, and Health Impact

The calculation methodology used to determine the potential to emit of this proposed facility and the modeling methodology used to perform the air quality analyses are sufficiently conservative for purposes of determining permitting level, applicability of state and federal rules, and the impact of the proposed facility on human health and the environment.

The purpose of the draft PSD/New Source Construction and Part 70 Operating Permit is to document all applicable state and federal rules and regulations related to air pollution (e.g., emission limitations and standards) and all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to

assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

IDEM, OAQ relies on the scientific expertise of U.S. EPA which sets the National Ambient Air Quality Standards (NAAQS) to be protective of public health and the environment, establishes federal regulations to limit or reduce pollution such as Prevention of Significant Deterioration (PSD), New Source Performance Standards (NSPS), and the National Emission Standards for Hazardous Air Pollutants (NESHAP), and establishes air quality modeling, impact analysis, and risk assessment procedures and guidelines.

IDEM, OAQ performed an Air Quality Analysis in order to predict the air pollution concentrations, travel distances, and resulting impact of Riverview's worst case scenario air pollution emissions on the surrounding area. IDEM, OAQ concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety). Riverview's modeled results using AERMOD were compared to the primary and secondary NAAQS standards and concentrations were found to be at a level that will be protective of public health and the environment in the surrounding area. In addition, the annual modeled concentrations for each of the hazardous air pollutants (HAPs) was compared to their respective cancer unit risk factor (URF) and non-cancer chronic reference concentration (RfC) value and the cumulative risk from HAPs was found to be below the cancer and non-cancerous risk thresholds. The cumulative cancer risk estimate from all HAPs was well below the U.S. EPA excess cancer risk threshold of one in ten thousand (1.0E-04) and the cumulative non-cancer health effects were below a Hazard Index (HI) of 1.

The impact of air pollution emissions from this proposed plant to ambient air pollution levels in southwest Indiana will be monitored as part of IDEM, OAQ's ambient air monitoring. Information about Indiana's air monitoring system and monitoring results is available at <http://www.in.gov/idem/airquality/2346.htm>.

The Indiana State Department of Health (ISDH), in conjunction with partners from across the state, gathers epidemiological data from local health department assessments, local hospital and clinic assessments, and other sources, and from key informant interview data to assess the health of Indiana's residents. ISDH collects data and information on births, deaths (including cancer and infant mortality), marriages, maternal and child health (including cancer and asthma), inpatient hospital discharges/hospitalizations, outpatient hospital discharges, emergency department visits, and other public health matters. This data is used by legislators and health professionals to make critical decisions affecting the health and well-being of the citizens of Indiana. ISDH data and reports can be found at the following website: <https://www.in.gov/isdh/18888.htm>.

No changes to the draft permit were made as a result of this statement.

#### **Mr. James R. Farmer Comments and IDEM Responses**

On December 10, 2018, Mr. James R Farmer, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. James R. Farmer Comment:**

I write to voice my immediate concern for the proposed coal-to-diesel plant in Dale, IN. My reasoning is fourfold. First, much scientific research has reported on the serious and critical negative effects living near coal plants cause, particularly on children and the elderly. This is not new information. Second, health effects will not only be felt by those living near the plant, but by other Hoosiers in the airshed, and those beyond. I moved my family out of WV for many reasons, but #1 was because of air pollution coming from the coal plants. Third, the process of digging and burning coal has numerous negative consequences on the environment - consequences that in turn impact human health and our ability to recreate and harvest food (i.e. fish) from rivers and lakes. The Indiana Dept. of Health has strict recommendations on fish consumption - with these

limitations largely brought on by the use of coal for energy and its negative impacts on the environment. Fourth, with the unmistakable and clear scientific consensus on climate change - adding another coal plant to the landscape is irresponsible and an injustice to humanity. I would much rather my children inherit a larger deficit than a planet unfit to live on. Purdue's Climate Change Research Center has damning evidence that we will be impacted by climate change. Adding another coal plant will only contribute to an antiquated economy that continues to haunt us and more greenhouse gas emissions.

I write this letter as a father of young children that will be faced with a world changing faster than anything our civilization has ever witnessed. Please be part of the solution. While this plant may meet all current regulations - it doesn't make it right. Slavery was still wrong even before it was abolished. Women's right to vote, or lack thereof, was a travesty before suffrage was successful. We need brave leaders to spot injustice on moral grounds and make the just decision.

I would be happy to discuss the matter with you.

Please contact me if you have any questions.

#### **IDEM Response to Mr. James R. Farmer Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

#### **Mr. Jerry Stewart Comments and IDEM Responses**

On December 10, 2018, Mr. Jerry Stewart, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Mr. Jerry Stewart Comment:**

I am writing today to express my opposition to the Riverview Energy coal to diesel plant that is under consideration for Dale IN.

I oppose this plant for so many reasons:

- The effects on the health of residents in the area from the many tons of hazardous chemicals that will be released by this plant.
- The pollution that will settle into our water, our soil, our bloodstreams.
- The effects of these hazardous pollutants on the area wildlife and livestock.
- This plant is not economically feasible or sustainable. It is doomed to fail and the residents in our area will be left with a toxic waste dump.
- Kellogg Brown & Root (KBR) is the main company behind this venture. KBR has already proven a blatant disregard for human life.
- Riverview Energy is just a front for a coal marketer. Once they get this plant up and running so they can market the coal, the plant will change hands again and again until it

will finally go bankrupt. None of the companies will be responsible for the environmental damages or the damages to our health.  
Please deny the Riverview Energy air permit.

**IDEM Response to Mr. Jerry Stewart Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Carol Stewart Comments and IDEM Responses</b>
--

On December 10, 2018, Ms. Carol Stewart, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

**Ms. Carol Stewart Comment:**

My family and I are opposed to the coal to diesel refinery that Riverview Energy is planning to build on the northern edge of Dale IN.

According to the air permit application, Riverview Energy is planning to release many, many tons of deadly chemicals into our atmosphere. This deadly pollution will be added to the air pollution already covering our region from AK Steel, the AEP power plant in Rockport, and the other coal-fired plants in neighboring counties.

I read that IDEM released a preliminary report that there would not be a significant impact on the air quality and the overall health in our region. It is my understanding that IDEM based this finding on air quality monitors that are in South Bend IN. That is on the extreme opposite end of the state! How can IDEM possibly base such an important decision on such skewed information?

Please do the right thing for the Hoosiers who reside in the Southwestern Indiana region. Please deny the Riverview Energy air permit.

**IDEM Response to Ms. Carol Stewart Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

### **Ms. Lisa Gogel Comments and IDEM Responses**

On December 10, 2018, Ms. Lisa Gogel, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Lisa Gogel Comment:**

I am a resident of Spencer County in southwestern Indiana. I respectfully request that you deny air permit application T147-39554-00065 submitted by Riverview Energy Corp.

My husband and I are the parents of a young son with another child on the way. We and our entire family live within 5 miles of the proposed plant. Because young children are the most susceptible to the hazardous pollutants that will be released by this plant, I am very concerned about the effects this plant will have on the health of my children, and all of my family.

I read that IDEM released a draft permit stating there would be "no significant impact" on the air quality and overall health in our region. Since there are no air-quality monitors in the Dale area, what are you basing your "no significant impact" judgment on? As I understand it, some of the measurements in your ill-advised judgment came from monitors in South Bend IN, along the northernmost border of Indiana. South Bend is about as far away as you can possibly get from Dale and still be in Indiana.

Southern Indiana is already surrounded by 4 of the worst super-polluters in the nation. The U.S. EPA ranked Spencer County 23rd for toxic emissions among all 3,142 counties in the country in its Toxic Release Inventory. In 2016, Indiana released more toxic chemicals than 44 other states. We absolutely do not need or want another super-polluter in Spencer County, or anywhere else in Southern Indiana.

This plant will emit many, many tons of additional contaminants into our atmosphere, which will most definitely settle into the soil and will affect vegetation which, in turn, will affect wildlife and the humans who ingest it.

Please take action to protect the health and well-being of the citizens of Southern Indiana, the folks you are supposed to protect.

Please deny air permit application T147-39554-00065.

#### **IDEM Response to Ms. Lisa Gogel Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.
