On December 10, 2018, Ms. Angela Pulley, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Angela Pulley Comment:**

I am asking you from the bottom of my heart that you please do not approve the permit for the Coal to Diesel plant that is proposed in Dale, IN. I am a 59 year old resident of Spencer County and have been USPS Postal employee for 24 years. My customers have become an extended family for me. I have watched sadly as many of them have become ill over the past 24 years sacrificing their health because they live in Spencer County, commonly referred to as the "the sacrifice zone". Everyone that lives in Spencer County wonders if they will be the next victim to sacrifice their health because they have opted to live here. This is not a good way to live our lives, always living in fear. We should not have to live our lives wondering if each and every one of us will be the next "sacrifice".

My husband and I have a 23 year old daughter, a graduate of Heritage Hills High School in Spencer County, who is currently studying to be an Occupational Therapist in the Master's Program at USI in Evansville, Indiana. She will graduate in August of 2019. If this plant does get built, we are going to encourage her very heavily to move away from this area. Why would we want to sacrifice our one and only beloved daughter just so some millionaire can get richer? I believe this plant will drive many others away from this area as well.

I will end my letter with a quote: "The truth is that you always know the right thing to do. The hard part is doing it." I beg you to do the right thing...

#### **IDEM Response to Ms. Angela Pulley Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

### **Ms. Shirley Ricklefs Comments and IDEM Responses**

On December 10, 2018, Ms. Shirley Ricklefs, submitted comments to IDEM, OAQ on the draft PSD/New Source Construction and Part 70 Operating Permit.

#### **Ms. Shirley Ricklefs Comment:**

I support the Southwestern IN Citizens for Quality of Life and Earth Justices comments. Please accept mine.

My name is Shirley and I attended the public forum in Dale Wednesday. I shook your hand at the end and your all seem like good people. I don't have much to add as I feel like a lot of good people said it to you.

However, I will ask one question at the end of my letter.

First, I am writing in my own hand instead of a computer (printing so hopefully you can read some of it!) to show you the effects of chemo on my body. I used to be pretty good. I have many other side effects but we will just mention this one. I took my turn with the breast cancer in 2011. In July was surgery followed by 16 chemos, 33 radiations, a year off work (thankfully it was over a year sick leave, but I kept my job!) I've been on chemo pills for 10 years. Two checkups every year. My checkup was November 27 and my doctor says for the first time "you are not out of the woods yet!) This has hit me like a ton of bricks. Cancer like to come back in this area. As I live along with others with cancer. We live in the "Zone", "the SACRIFICE ZONE" I believe we are called.

I'm trying my best to eat right and exercise. I can control these, but I can't control the pollutants that will come out of this plant. Will you help me?

Would you want to move yourself, your family and children, grandchildren, next to this plant? Would you be able to eat the food from a garden and drink the water? I don't want anyone to get sick or die and I'm sure you wouldn't want that for your family, or anyone, would you help me?

The plant reminds me of what hell looks like when I see a picture of it. Won't you help keep this out of southern Indiana?

No amount of money is worth the lives of our families and good people.

Please help me once. Please say no to this plant.

#### **IDEM Response to Ms. Shirley Ricklefs Comment:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Additional Changes</b>
---------------------------

IDEM, OAQ has decided to make additional revisions to the permit as described below, with deleted language as ~~strikeouts~~ and new language **bolded**.

- (a) IDEM, OAQ received a revised modeling spreadsheet from the source on October 23, 2018. In reviewing that submission, IDEM found that modeling for benzene had not included building downwash. Correcting the benzene modeling to include downwash, resulted in a slightly higher modeled impact, increasing the annual concentration from 0.0737 to 0.0966 ug/m<sup>3</sup>. Therefore, cumulative cancer risk results changed from 5.91e-07 to 1.29E-05, which is below the U.S. EPA cancer risk threshold level of 1.0E-04, which would require action or investigation.. The Hazard

Index (HI) for the cumulative non-cancerous health effects increased from 0.0404 to 0.155, still below the Hazard Index (HI) risk threshold of 1.0.

See Appendix C to this ATSD for the revised modeling analysis in its entirety.

- (b) IDEM, OAQ notes that a typographical error in the source address found in the Technical Support Document was repeated in Appendix B of the TSD, the public notice, and notices published in the newspapers. The street address in the draft permit and calculations (Appendix A of the TSD) were correct. The correct address of the source is:

~~4702~~ **4704** E 2000 N, Dale, IN 47523

See Appendix B to this ATSD for the revised BACT analysis in its entirety.

- (c) IDEM, OAQ has updated the construction approval date throughout the permit, as follows:

approved in ~~2018~~**2019** for construction

- (d) IDEM, OAQ has updated the model language for the regional office of the U.S. EPA in Chicago throughout the permit, as follows:

United States Environmental Protection Agency, Region ~~5~~

- (e) IDEM, OAQ has inserted a word unintentionally left out of descriptive information for the LP flare throughout the permit, as follows:

... controlling emissions **from** Block 7000 ...

- (f) IDEM, OAQ has inserted descriptive information regarding 40 CFR 63, Subpart ZZZZ unintentionally left out of the emissions unit description box in Section E.16, as follows:  
...

- (h) Utilities operations, identified as Block 6000, consisting of:

(3) ...

- (4) One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2019 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), using no add-on controls and exhausting to stack EU-6008.

...

**Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency fire pump EU-6008 is an affected source.**

...

- (g) IDEM, OAQ has inserted explanatory text that was unintentionally not included in the BACT analysis for flares. See Appendix B to this ATSD for the revised BACT analysis in its entirety.
- (h) IDEM, OAQ has deleted a duplicate entry from the Step 4 table for cooling towers in the BACT Analysis appendix. See Appendix B to this ATSD for the revised BACT analysis in its entirety.

- (i) IDEM. OAQ has made certain changes to sulfur recovery process unit descriptions.

Unit descriptions for Sulfur Recovery Units A and B were corrected in the Section D.4 emissions unit description box as follows:

... One (1) ~~Sulfur Recovery Unit A~~ **sulfur recovery unit**, identified as ~~EU-3004~~ **Sulfur Recovery Unit A**, approved ...

... One (1) ~~Sulfur Recovery Unit B~~ **sulfur recovery unit**, identified as ~~EU-3002~~ **Sulfur Recovery Unit B**, approved...

IDEM, OAQ updated the descriptions of Sulfur Recovery Units A and B in emissions unit description boxes for Sections D.4, E.2, E.3, E.6, E.13, and E.15 where the most recent revision to the text had unintentionally not been copied, as follows:

... construction, ~~discharging~~ **with** emergency and pressure relief streams **vented** to ...

IDEM, OAQ has clarified various sulfur recovery process unit capacities and expressed those capacities in units of long tons per day (LTD) corresponding to the way thresholds are expressed in 40 CFR 60, Subpart Ja throughout the permit as follows:

- (e) Sulfur recovery operations, identified as Block 3000, **with a maximum design capacity of 218 long tons per day (LTD) and a bottlenecked capacity of 156 LTD**, consisting of:
- (1) ...
- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2019 for construction, **with a maximum design capacity of 109 LTD**, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (i) ...
- (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year **109 LTD (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity)**, discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
- (vi) ...
- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2019 for construction, **with a maximum design capacity of 109 LTD**, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (i) ...
- (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year **109 LTD (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity)**, discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
- (vi) ...

- (j) IDEM. OAQ has corrected typographical and formatting errors in the calculations spreadsheet, including:
- Moving a page break so all of the Potential to Emit After Issuance summary table headings appear on the same page.
  - Correcting a typographical error in the publisher name of the source cited in note 1, section 3, of the Block 1000 Coal Handling Operations with Baghouse tab.
  - Correcting incorrect links in after-controls PM, PM<sub>10</sub>, and PM<sub>2.5</sub> PTE formulas, not referenced elsewhere in the calculations, in section 3 of the Block 1500 Additive Handling Emissions tab.

See Appendix A to this ATSD for the revised calculations in their entirety.

<b>IDEM Contact</b>
---------------------

- (a) If you have any questions regarding this permit, please contact Doug Logan, Indiana Department Environmental Management, Office of Air Quality, Permits Branch, 100 North Senate Avenue, MC 61-53 IGCN 1003, Indianapolis, Indiana 46204-2251, or by telephone at (317) 234-5328 or (800) 451-6027, and ask for Doug Logan or (317) 234-5328.
- (b) A copy of the findings is available on the Internet at: <http://www.in.gov/ai/appfiles/idem-caats/>
- (c) For additional information about air permits and how the public and interested parties can participate, refer to the IDEM Air Permits page on the Internet at: <http://www.in.gov/idem/airquality/2356.htm>; and the Citizens' Guide to IDEM on the Internet at: <http://www.in.gov/idem/6900.htm>.

EU7002	Hydrogen Reformer 2	0.2730	838.60	0.0011

**Methodology**

Maximum Sulfur Content (gr/scf) = Model SO<sub>2</sub> Emissions (lb/hr) x 32 lb (S/lb-mole) / 64 lb (SO<sub>2</sub>/lb-mole)  
x 7,000 (gr/lb) / 1,000,000 (scf/MMCF) x HHV (MMBtu/MMCF)  
/ Heat Input Capacity (MMBtu/hr)

**Notes:**

- Bottom dump truck unloading (batch drop), any location, Table 11.9-4, AP-42, 5th ed, 7/98
- Conveyor transfer point (controlled), SCC 3-05-020-06, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Tertiary crushing (controlled), SCC 3-05-020-03, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Fines crushing (controlled), SCC 3-05-020-21, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Fluidized bed dryer, SCC 3-05-010-01, Table 11.10-1, AP-42, 5th ed, 11/95
- Control efficiency for partial enclosure conservatively taken as 75%, based on guidance from *Fugitive Emissions from Integrated Iron and Steel Plants*, EPA 600/2-78-050, March 1978 and Permit to Install 96-12A, Michigan Department of Environmental Quality, December 9, 2014

**Methodology**

Uncontrolled Potential to Emit (lb/hr) = Coal Throughput (tons/hr) x Emission Factor (lb/ton)

PTE (tons/yr) = PTE (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton)

<b>Total</b>							<b>29503.25</b>	<b>4377.35</b>	<b>1319.81</b>

**Notes:**

- Bottom dump truck unloading (batch drop), any location, Table 11.9-4, AP-42, 5th ed, 7/98
- Conveyor transfer point (controlled), SCC 3-05-020-06, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Tertiary crushing (controlled), SCC 3-05-020-03, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Fines crushing (controlled), SCC 3-05-020-21, Table 11.19.2-2, AP-42 5th ed, 8/04, control a moisture content of 3%
- Fluidized bed dryer, SCC 3-05-010-01, Table 11.10-1, AP-42, 5th ed, 11/95
- Control efficiency for partial enclosure conservatively taken as 75%, based on guidance from *Fugitive Emissions from Integrated Iron and Steel Plants*, EPA 600/2-78-050, March 1978 and Permit to Install 96-12A, Michigan Department of Environmental Quality, December 9, 2014
- Bottlenecked PTE of stacker conveyors and reclaimers is represented in conveyors 2 and 2A and reclaimer 1
- Bottlenecked PTE of all conveyors into reclaim transfer is represented in conveyor 4

**Methodology**

Bottlenecked Potential to Emit Before Controls (tons/yr) = Coal Throughput (tons/yr) x Emission Factor (lb/ton) / 2,000 (lb/ton)

**Appendix A: Emissions Calculations  
Coal Handling Operations with Baghouse**

Heat Input Capacity MMBtu/hr	HHV mmBtu mmscf	Potential Throughput MMCF/yr
55.8	1009	484.4

**1. Uncontrolled Potential to Emit**

	Pollutant						
	PM <sup>1</sup>	PM <sub>10</sub> <sup>1</sup>	direct PM <sub>2.5</sub> <sup>1</sup>	SO <sub>2</sub>	NOx	VOC	CO
Emission Factor in lb/MMCF (AP-42)	1.9	7.6	7.6	-	-	5.5	-
Emission Factor in lb/MMCF <sup>2</sup>	-	-	-	1.797	-	-	-
Emission Factor in lb/MMBtu <sup>3</sup> (Mfr)	-	-	-	-	0.04	-	0.036
Potential Emission in tons/yr	0.46	1.84	1.84	0.44	9.78	1.33	8.80

- Notes:*
1. PM emission factor is filterable PM only. PM10 emission factor is filterable and condensable PM10 combined. PM2.5 emission factor is filterable and condensable PM2.5 combined.
  2. Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.
  3. Emission factors provided by the burner manufacturer, subject to testing.

**Methodology**

MMBtu = 1,000,000 Btu  
 MMCF = 1,000,000 Cubic Feet of Gas  
 Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
 Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					Total - Organics
	Benzene	Dichlorobenzene	Formaldehyde	n-Hexane	Toluene	
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	
Potential Emission in tons/yr	5.09E-04	2.91E-04	1.82E-02	0.44	8.24E-04	<b>0.46</b>

	HAPs - Metals					Total - Metals
	Lead	Cadmium	Chromium	Manganese	Nickel	
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	
Potential Emission in tons/yr	1.21E-04	2.66E-04	3.39E-04	9.20E-05	5.09E-04	<b>1.33E-03</b>

Methodology is the same as above.  
 The five highest organic and metal HAPs emission factors are provided above.  
 Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO2	CH4	N2O
Emission Factor in lb/MMcf	120,000	2.3	0.64
Potential Emission in tons/yr	29,067	0.56	0.16
Summed Potential Emissions in tons/yr	29,068		
CO2e Total in tons/yr	29,127		

**Methodology**

The N2O Emission Factor for uncontrolled is 2.2. The N2O Emission Factor for low Nox burner is 0.64.  
 Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
 Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
 CO2e (tons/yr) = CO2 Potential Emission ton/yr x CO2 GWP (1) + CH4 Potential Emission ton/yr x CH4 GWP (25) + N2O Potential Emission ton/yr x N2O GWP (298).

**2. Potential to Emit After Issuance**

	Pollutant							
	PM	PM <sub>10</sub>	direct PM <sub>2.5</sub>	SO <sub>2</sub>	NOx	VOC	CO	CO <sub>2e</sub>
Emission Limit <sup>1</sup> in lb/MMBtu	0.0019	0.0075	0.0075	-	0.030	0.0054	0.0365	-
Maximum Emission Limit <sup>2</sup> in gr S/scf	-	-	-	0.0062	-	-	-	-
Annual Emission Limit <sup>3</sup> in gr S/scf	-	-	-	0.005	-	-	-	-
Compliance determination coefficient (ton CO2e/MMCF)	60.12							
PTE After Issuance in lb/hr	0.11	0.42	0.42	0.10	1.67	0.30	2.04	-
PTE After Issuance in tons/yr	0.46	1.83	1.83	0.35	7.33	1.32	8.92	29,127

- Notes:*
1. BACT specifications
  2. Maximum
  3. Twelve (12) month average

**Methodology**

Compliance determination coefficient (ton CO2e/MMCF) = CO<sub>2e</sub> Total (tons/yr) / Potential Throughput (MMCF/yr)  
 PTE After Issuance (lb/hr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Maximum Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO<sub>2</sub>/lb-mole) / 32 (lb S/lb-mole) SO<sub>2</sub>  
 PTE After Issuance (lb/hr) = Emission Limit (lb/MMBtu) x Heat Input Capacity (MMBtu/hr) all others  
 PTE After Issuance (tons/yr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Annual Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO<sub>2</sub>/lb-mole) / 32 (lb S/lb-mole) x 8,760 (hr/yr) / 2,000 (lb/ton) SO<sub>2</sub>  
 PTE After Issuance (tons/yr) = PTE After Issuance (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton) all others

**Appendix A: Emissions Calculations**  
**Additive Handling Emissions**

**Company Name:** Riverview Energy Corporation  
**Source Address:** 4704 E 2000 N, Dale, IN 47523

**Date:** 4/15/2019

**1. Silo Loading**

**A. Unrestricted Potential to Emit**

Description	Unit ID	Control Device ID	Silo Throughput <sup>1</sup> (tons/hr)	Uncontrolled					
				Emission Factor <sup>2</sup>		Potential to Emit			
				PM (lb/ton)	PM10 = PM2.5 (lb/ton)	PM (lb/hr)	PM10 = PM2.5 (lb/hr)	PM (tons/yr)	PM10 = PM2.5 (tons/yr)
Coarse additive silo	T33	EU-1501	20.00	0.73	0.46	14.60	9.20	63.95	40.30
Fine additive silo	T34	EU-1502	20.00	0.73	0.46	14.60	9.20	63.95	40.30
Sodium sulfide silo	T35	EU-1503	10.00	0.73	0.46	7.30	4.60	31.97	20.15

**Methodology**

Potential to Emit (lb/hr) = Silo Throughput (tons/hr) x Emission Factor (lb/ton)  
Potential to Emit (tons/yr) = Potential to Emit (lb/hr) x 8,760 (hrs/yr) / 2,000 (lb/ton)

**B. Bottlenecked Potential to Emit**

Description	Unit ID	Control Device ID	Bottlenecked Additive Throughput <sup>3</sup> (tons/yr)	Uncontrolled			
				Emission Factor <sup>2</sup>		Potential to Emit	
				PM (lb/ton)	PM10 = PM2.5 (lb/ton)	PM (tons/yr)	PM10 = PM2.5 (tons/yr)
Coarse additive silo	T33	EU-1501	28776.60	0.73	0.46	10.50	6.62
Fine additive silo	T34	EU-1502	28776.60	0.73	0.46	10.50	6.62
Sodium sulfide silo	T35	EU-1503	674.52	0.73	0.46	0.25	0.16
<b>Total</b>						<b>21.25</b>	<b>13.39</b>

Notes to section 1A & B:

1. Silo Throughput is the rate of unloading delivery trucks or railcars.
2. Emission factors from AP-42, Chapter 11.12 Concrete Batching, Table 11.12-2 (updated June 2006) SCC 3-05-011-07 (cement unloading to elevated storage silo) Emission factor unit is pounds per ton of material loaded. PM2.5 assumed equal to PM10 because AP-42 does not have emission factors for PM2.5.
3. Bottlenecked throughput based on bottlenecked production capacity.

**Methodology**

Bottlenecked Throughput (tons/yr) = Bottlenecked mixer capacity (tons/hr) x 8,760 hr/yr x weight fraction of cement in mix  
Potential to Emit (tons/yr) = Bottlenecked Throughput (tons/yr) x Emission Factor (lb/ton) / 2,000 (lb/ton)

**C. Hazardous Air Pollutants**

Description	Unit ID	Control Device ID	HAP Content		Unrestricted PTE (tons/yr)			
			Manganese compounds (as Mn) (Wt %)	Phosphorus pentoxide (as P) (Wt %)	PM	Manganese	Phosphorus	Combined HAP
Coarse additive silo	T33	EU-1501	0.11%	0.13%	63.95	0.07	0.08	0.15
Fine additive silo	T34	EU-1502	0.11%	0.13%	63.95	0.07	0.08	0.15
<b>Total</b>						<b>0.14</b>	<b>0.17</b>	<b>0.31</b>

Description	Bottlenecked PTE (tons/yr)			
	PM	Manganese	Phosphorus	Combined HAP
Coarse additive silo	10.50	1.16E-02	1.37E-02	2.52E-02

<b>Total</b>		<b>2.31E-02</b>	<b>2.73E-02</b>	<b>5.04E-02</b>

**Methodology**

Unrestricted HAP PTE (tons/yr) = Unrestricted PM PTE (tons/yr, Section 1A) x HAP Content (Wt %)/100  
Bottlenecked HAP PTE (tons/yr) = Bottlenecked PM PTE (tons/yr, Section 1B) x HAP Content (Wt %)/100

**2. Size Reduction**

**A. Particulate**

Description	Unit ID	Control Device ID	Process Throughput (tons/hr)	Uncontrolled								
				Emission Factor <sup>1</sup>			Potential to Emit					
				PM (lb/ton)	PM10 (lb/ton)	PM2.5 (lb/ton)	PM (lb/hr)	PM10 (lb/hr)	PM2.5 (lb/hr)	PM (tons/yr)	PM10 (tons/yr)	PM2.5 (tons/yr)
Fine additive production system		EU-1504	3.28	12	12	12	39.42	39.42	39.42	172.65	172.65	172.65
<b>Total</b>										<b>172.65</b>	<b>172.65</b>	<b>172.65</b>

Description	Unit ID	Control Device ID	Process Throughput (tons/hr)	After Controls								
				Emission Factor <sup>2</sup>			Potential to Emit					
				PM (lb/ton)	PM10 (lb/ton)	PM2.5 (lb/ton)	PM (lb/hr)	PM10 (lb/hr)	PM2.5 (lb/hr)	PM (tons/yr)	PM10 (tons/yr)	PM2.5 (tons/yr)
Fine additive production system		EU-1504	3.28	0.12	0.12	0.12	0.39	0.39	0.39	1.73	1.73	1.73
<b>Total</b>										<b>1.73</b>	<b>1.73</b>	<b>1.73</b>

Notes:

1. Additive (coarse or fine) is red mud, a byproduct of aluminum production. Considered as a finely ground material held in larger particles by physical bonding.
1. Emission factor for natural clay crushing, screening, and storage (SCC 3-05-009-04), Table 11.9-2, AP-42, 5th ed., February 1972
2. Emission factor for comminution - raw material crushing and screening line with fabric filter (SCC 3-05-008-02), Table 11.7-1, AP-42, 5th ed., July 1996

**Methodology**

Uncontrolled PTE (lb/hr) = Process Throughput (tons/hr) x Uncontrolled Emission Factor (lb/ton)  
After Controls PTE (lb/hr) = Process Throughput (tons/hr) x After Controls Emission Factor (lb/ton)  
PTE (tons/yr) = PTE (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton)

**Appendix A: Emissions Calculations**

HAPs emission factors from AP-42, Chapter 1.4. **Total** EU-2002 0.43 ton/yr  
 The five highest organic and metal HAPs emission factors are provided above. EU-2003 7.37E-02 ton/yr

**Greenhouse Gases (GHGs)**

	EU-2002			EU-2003		
	CO2	CH4	N2O	CO2	CH4	N2O
Emission Factor in lb/MMcf	120,000	2.3	0.64	120,000	2.3	0.64
Potential Emission in tons/yr	27,504	0.53	0.15	4,688	0.1	0.0
Summed Potential Emissions in tons/yr	27,505			4,688		
CO2e Total in tons/yr	27,561			4,698		

**Methodology**

The N2O Emission Factor for uncontrolled is 2.2. The N2O Emission Factor for low Nox burner is 0.64.  
 Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
 Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
 CO2e (tons/yr) = CO2 Potential Emission ton/yr x CO2 GWP (1) + CH4 Potential Emission ton/yr x CH4 GWP (25) + N2O Potential Emission ton/yr x N2O GWP (298).

**Notes:**

1. BACT specifications
2. Maximum
3. Twelve (12) month average

**Methodology**

Compliance determination coefficient (ton CO2e/MMCF) = CO<sub>2</sub>e Total (tons/yr) / Potential Throughput (MMCF/yr)  
 PTE After Issuance (lb/hr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Maximum Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO<sub>2</sub>/lb-mole) / 32 (lb S/lb-mole) SO<sub>2</sub>  
 PTE After Issuance (lb/hr) = Emission Limit (lb/MMBtu) x Heat Input Capacity (MMBtu/hr) all others  
 PTE After Issuance (tons/yr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Annual Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO<sub>2</sub>/lb-mole) / 32 (lb S/lb-mole) x 8,760 (hr/yr) / 2,000 (lb/ton) SO<sub>2</sub>  
 PTE After Issuance (tons/yr) = PTE After Issuance (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton) all others

**Appendix A: Emission Calculations  
Tail Gas Treatment Units**

**Company Name:** Riverview Energy Corporation  
**Source Address:** 4704 E 2000 N, Dale, IN 47523  
**Part 70 Permit No.:** 147-39554-00065  
**Reviewer:** Doug Logan  
**Date:** 4/15/2019

**Process Specifications**

Coal usage: 258 tph at 8.00% moisture and 6.67% ash = 220.46 tph, moisture and ash free  
 sulfur content: 3.30% by weight (moisture and ash free)  
 from S. Lang, KBR, by email 3/29/2018, 11:39AM

Potential sulfur producti 220.46 tons coal/hr x 3.30% sulfur x 8760 hr/yr = 63,731 tons of sulfur/year

	Heat Input Capacity (MMBtu/hr)		Sulfur Production Rate (tons/yr)	
	Maximum	Bottlenecked	Maximum	Bottlenecked
TGTUA (EU-3001)	52.75	75.35	44,611	63,731
TGTUB (EU-3002)	52.75		44,611	

Exhaust flow rate (each 25,169 acfm @ 549.3 K = 989 °R *Bottlenecked case, each SRU handling a nominal 50% of VCC capacity*  
 35,956 acfm *Maximum for each SRU, 70% of VCC capacity*  
 (based on modeling parameters provided by the source, 70% of VCC capacity, including excess oxygen, nitrogen, and trace gases)

Site elevation (ASL): 148 m, thus nominal site atmospheric pressure = 0.983 atm  
 Interpolated from Table 3-214, *Perry's Chemical Engineers' Handbook, 6th ed.*

**Exhaust moisture correction:**

4.69 (lb mole H<sub>2</sub>O/min), each SRU, bottlenecked, 50% of VCC capacity

6.57 (lb mole H<sub>2</sub>O/min), SRU maximum, 70% of VCC capacity

determined by the source from design material balance, includes moisture from combustion of H<sub>2</sub>S and saturation of inlet streams after amine and caustic scrubbers

and the exhaust molar flow rate (dry) is:

*Bottlenecked condition, 50% of VCC capacity.*

25,169 (acfm) x 0.983 (atm) / [ 989 (°R) x 0.7302 (atm ft<sup>3</sup>/lb mole °R) ] - 4.69 (lb mole H<sub>2</sub>O/min) = 29.59 (lb mole/min)  
 correcting to 0% O<sub>2</sub> based on design oxygen content in the exhaust: 3.29% O<sub>2</sub> 28.62 (lb mole/min @ 0% O<sub>2</sub>)

*SRU (each) maximum, 70% of VCC capacity*

35,956 (acfm) x 0.983 (atm) / [ 989 (°R) x 0.7302 (atm ft<sup>3</sup>/lb mole °R) ] - 6.57 (lb mole H<sub>2</sub>O/min) = 42.40 (lb mole/min)  
 correcting to 0% O<sub>2</sub> based on design oxygen content in the exhaust: 3.29% O<sub>2</sub> 41.01 (lb mole/min @ 0% O<sub>2</sub>)

**Methodology**

Exhaust molar flow rate (lb-mole/min @ 0% O<sub>2</sub>) = Exhaust molar flow rate (lb-mole/min) x [1 - %O<sub>2</sub>/100]

**1. Uncontrolled Potential to Emit**

	Pollutant

**Notes:**

- PM emission factor is filterable PM only. PM10 emission factor is filterable and condensable PM10 combined. PM2.5 emission factor is filterable and condensable PM2.5 combined.
- Emission Factors for NOx: Uncontrolled = 100, Low NOx Burner = 50, Low NOx Burners/Flue gas recirculation = 32
- Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.

**Methodology**

All emission factors are based on normal firing.

MMBtu = 1,000,000 Btu

MMCF = 1,000,000 Cubic Feet of Gas

Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03

Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu

Unit SO<sub>2</sub> PTE (lb/hr) = Emission Limit (gr/dscf) x Heat Input Capacity (HHV) (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) / 7,000 (gr/lb) / 2,000 (lb/ton) x 64 lb SO<sub>2</sub>/lb mole / 32 lb S/lb mole SO<sub>2</sub>

Unit PTE (lb/hr) = Heat Input Capacity (HHV) (MMBtu/hr) x Emission Factor (lb/MMBtu) all others

PTE (tons/yr) = Potential Throughput (MMCF/yr) x Emission Limit (gr/scf) x 1,000,000 (scf/MMCF) / 7,000 (gr/lb) / 2,000 lb/ton x 64 lb SO<sub>2</sub>/lb mole / 32 lb S/lb mole SO<sub>2</sub>

PTE (tons/yr) = Total Heat Input Capacity (HHV) (MMBtu/hr) x Emission Limit (lb/MMBtu) x 8,760 (hr/yr) / 2,000 lb/ton all others

**Hazardous Air Pollutants (HAPs)**

	HAPs - Metals					Total - Metals
	Lead	Cadmium	Chromium	Manganese	Nickel	
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	
Potential Emission in tons/yr	1.86E-06	4.08E-06	5.19E-06	1.41E-06	7.79E-06	<b>2.03E-05</b>

Methodology is the same as above.

The five highest organic and metal HAPs emission factors are provided above.

Additional HAPs emission factors are available in AP-42, Chapter 1.4.

<b>Total HAPs</b>	<b>7.00E-03</b>
<b>Worst HAP</b>	<b>6.68E-03</b>

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Emission Factor in lb/MMcf	120,000	2.3	2.2
Potential Emission in tons/yr	SB Flare	445	0.01
	LP Flare	3,758	0.07
	HP Flare	3,758	0.07
Summed Potential Emissions in tons/yr		7,962	
CO <sub>2</sub> e Total in tons/yr	SB Flare	448	
	LP Flare	3,781	
	HP Flare	3,781	
	<b>Total</b>	<b>8,009</b>	

GHG compliance determination factor = 1079.36 (tons CO<sub>2</sub>e/MMCF fuel gas)

**Methodology**

The N<sub>2</sub>O Emission Factor for uncontrolled is 2.2. The N<sub>2</sub>O Emission Factor for low Nox burner is 0.64.

Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.

Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.

Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton

CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).

GHG compliance determination factor (tons CO<sub>2</sub>e/MMCF fuel gas) = CO<sub>2</sub>e Total (tons/yr) / Potential Throughput (MMCF/yr)

Notes:

- Vapor molecular weights calculated in "Product Vapor HAP" tab.
- Loading loss calculated in "Block 4000 Racks" tab.
- Product heat content provided by the source, 7/26/2018.

**Methodology**

VOC Input (lb/yr) = Loading Loss (lb/kgal) x Annual Throughput (kgal/yr)  
Heat Input (MMBtu/yr) = VOC Input (lb/yr) x Heat Content (MMBtu/lb)

A. Criteria Pollutants

	Pollutant						
	PM	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>	NO <sub>x</sub>	VOC	CO
Emission Factor <sup>1</sup> (lb/MMBtu)	- <sup>2</sup>	- <sup>2</sup>	- <sup>2</sup>	- <sup>3</sup>	0.068	- <sup>4</sup>	0.31
Potential to Emit (tons/yr)					0.20		0.90

Notes:

- Emission factor source, Tables 13.5-1 and 13.5-2, AP-42 (2/18) except as noted.
- Particulate matter (soot) emissions negligible for nonsmoking flare, ref. note d, AP-42 Table 13.5-1 (2/18).
- Sulfur content of hydrotreated products considered negligible.
- VOC emissions are accounted for in the loading rack PTE.

**Methodology**

Potential to Emit (tons/yr) = Emission Factor (lb/MMBtu) x Total Heat Input (MMBtu/yr) / 2,000 (lb/ton)

B. Hazardous Air Pollutants

HAP Emissions are accounted for in the loading rack PTE.

C. Greenhouse Gases (GHGs)

Given that alkanes have the nominal formula C<sub>n</sub>H<sub>2n+2</sub> and the atomic weights of C = 12 and H = 1, then the molecular weight is M = 12n + 2n + 2, and n = (M-2)/14

	VOC Input <sup>1</sup> (lb/yr)	Molecular Weight <sup>1</sup> , M (lb/lb mole)	VOC Input (lb mole/yr)	n (lb mole CO <sub>2</sub> / lb mole VOC)	Molar CO <sub>2</sub> Emissions (lb mole/yr)	Molar CO Emissions (lb mole/yr)	CO <sub>2</sub> Emissions (tons/yr)

**Notes:**

- BACT specifications
- PM<sub>2.5</sub> emission factor is filterable and condensable PM<sub>2.5</sub> combined.

**Methodology**

All emission factors are based on normal firing.  
MMBtu = 1,000,000 Btu  
MMCF = 1,000,000 Cubic Feet of Gas  
Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu  
SO<sub>2</sub> Emission Limit (lb/MMBtu) = Emission Limit (ppmv) / 1,000,000 / 359 (lb mole/ft<sup>3</sup>) x 1,000,000 (scf/MMCF) / HHV (MMBtu/MMCF) x 64 lb SO<sub>2</sub>/lb mole / 34 lb H<sub>2</sub>S/lb mole  
note: Volume fractions equal mole fraction, so ppmv/1,000,000=mole fraction, molar volume standard conditions (1 atm, 273.15 K), molar volume V = RT/P = 359 ft<sup>3</sup>/lb-mole from the  
PTE (tons/yr) = Potential Throughput (MMCF/yr) x HHV (MMBtu/MMCF) x Emission Limit (lb/MMBtu) x 8,760 (hr/yr) / 2,000 lb/ton

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					Total - Organics

						<b>Total HAPs 1.82E-03</b>
						<b>Worst HAP 1.73E-03</b>

Methodology is the same as above.  
The five highest organic and metal HAPs emission factors are provided above.  
Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Emission Factor in lb/MMcf	120,000	2.3	2.2
Potential Emission in tons/yr	116	2.22E-03	2.12E-03
Summed Potential Emissions in tons/yr	116		
CO <sub>2</sub> e Total in tons/yr	116		

GHG compliance determination factor = 60.36

**Methodology**

The N<sub>2</sub>O Emission Factor for uncontrolled is 2.2. The N<sub>2</sub>O Emission Factor for low Nox burner is 0.64.  
Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).  
GHG Compliance Determination Factor (tons CO<sub>2</sub>e/MMCF fuel gas) = CO<sub>2</sub>e Total (tons/yr) / Potential Throughput (MMCF/yr)

**3. Potential to Emit After Issuance**

	Pollutant							
	PM	PM <sub>10</sub>	direct PM <sub>2.5</sub>	SO <sub>2</sub>	NOx	VOC	CO	CO <sub>2</sub> e
Flare Steam (tons/yr)	-	-	-	-	0.20	-	0.90	442
Pilot Operations (tons/yr)	1.85E-03	7.20E-03	7.20E-03	8.19E-04	9.63E-02	5.25E-03	8.07E-02	116

**Appendix A: Emissions Calculations**  
**Loading Rack Flare (EU-4001)**

**Company Name:** Riverview Energy Corporation  
**Source Address:** 4704 E 2000 N, Dale, IN 47523  
**Part 70 Permit No.:** 147-39554-00065  
**Reviewer:** Doug Logan  
**Date:** 4/15/2019

Total	1.85E-03	7.20E-03	7.20E-03	8.19E-04	0.29	5.25E-03	0.98	559
Modeled emission rates (lb/hr)	4.22E-04	1.64E-03	1.64E-03	1.87E-04	6.69E-02	1.20E-03	2.23E-01	

**Methodology**

Modeled emission rates (lb/hr) = Total (tons/yr) / 8,760 (hr/yr) x 2,000 (lb/ton)

**Appendix A: Emissions Calculations  
Product Loading Rack**

**Company Name:** Riverview Energy Corporation  
**Source Address:** 4704 E 2000 N, Dale, IN 47523

**1. VOC**

Uncontrolled loading loss from AP-42 Chapter 5.2, Eqn. 1.

$$L_L = 12.46 \text{ (SPM / T)}$$

Where  $L_L$  = Loading Loss (lb/kgal)

S = a saturation factor, AP-42 Table 5.2-1 (dimensionless)

P = true vapor pressure of liquid loaded, (psia) (AP-42 Table 7.1-2 or other standard engineering sources)

M = vapor molecular weight (lb/lb mole) (AP-42 Table 7.1-2 or other standard engineering sources)

T = temperature of bulk liquid loaded, (°R)

Fuel Type <sup>1</sup>	Saturation Factor <sup>2</sup>	True Vapor Pressure <sup>3</sup> (psia)	Molecular Weight <sup>4</sup> (lb/lb-mole)	Temperature <sup>5</sup> (°R)	$L_L$ Loading Loss (lb/kgal)	Annual Throughput <sup>6</sup> (kgal/yr)	Uncontrolled VOC PTE (ton/yr)	Emission Control Efficiency (%)	Controlled VOC Emissions (ton/yr)	Emissions Limit (lb/kgal)
Naphtha loading	1.0	1.17	90.55	537.97	2.45	112,721	138.20	98%	2.76	0.049
Distillate loading	1.0	1.14E-02	192.39	537.97	0.051	220,277	5.61	98%	0.11	1.02E-03
<b>Total</b>							<b>143.8</b>		<b>2.88</b>	

**Notes:**

- The source has stated there are no emissions from sulfur loading or ammonia loading.
- Vapor balance service, submerged loading
- Vapor pressure determined using August Equation (Eqn 1-24, AP-42 Chapter 7) with coefficients for naphtha and diesel from "Product Vapor HAP" tab.
- Vapor molecular weights calculated in "Product Vapor HAP" tab.
- Temperature is maximum monthly average temperature from meteorological data in TANKS 4.0.9d for Evansville, Indiana
- Annual product throughput from "Block 4000 Tanks" tab.

**Methodology**

1 kgal = 1,000 gal

Vapor recovery collection efficiency is from AP-42 Chapter 5.2.

Uncontrolled VOC PTE (ton/yr) = Annual throughput (kgal/yr) x loading loss (lb/kgal) x 1 ton / 2000 lb

Controlled VOC PTE (ton/yr) = Uncontrolled VOC PTE (ton/yr) x [1 - (Control Eff x Collection Eff.)]

Emissions Limit (lb/kgal) =  $L_L$  (lb/kgal) x (1-Control Efficiency (%)/100)

**2. Hazardous Air Pollutants**

<b>Total</b>					<b>5.59</b>	<b>24.50</b>

Notes:  
 1. Each unit has the capacity to process 1/3 of the total hourly residue production, 51.49 tons.  
 2. Emission factor derived by the source from mass transfer model.

**Methodology**

VOC Emission factor provided by source.  
 VOC PTE (ton/yr) = Solidification Rate (ton/hr) x VOC Emission Factor (lb/ton) x 8760 hr/yr x 1 ton / 2000 lb  
 VCC residue is the bottoms product of VCC Vacuum Distillation Tower where vacuum gas oil (VGO) is extracted for recycle. This residue is solidified (into pastilles) and cooled along a conveyor.

**B. Pastille handling**

	Number of Transfers	Throughput per transfer (tons/hr)	Emission Factor (lb/ton)			Uncontrolled PTE					
			PM	PM <sub>10</sub>	PM <sub>2.5</sub>	(lb/hr)			(tons/yr)

<b>Total</b>									<b>2.48</b>	<b>0.91</b>	<b>0.91</b>

Notes:  
 1. Emission factor: conveyor transfer point, uncontrolled (SCC 3-05-020-06), Table 11.19.2-2, AP-42, 5th ed., August 2004  
 2. Residue cooling forms a glassy coat on material with some characteristics of bitumen.  
 3. Loading conveyor discharges to only one point at a time (EU-5009, EU-5010, or EU-5011). Transfer to loading hoppers EU-5005 and EU-5006 controlled by baghouse EU-5010  
 Transfer to loading hoppers EU-5007 and EU-5008 controlled by baghouse EU-5011.  
 4. Based on the bituminous (i.e., tarry) characteristics of the residue, IDEM considers that the emissions from loadout operations will be negligible. Use of control devices for silos and hoppers is considered mainly to retain the material in the vessel rather than as an emission control.

**Methodology**

Uncontrolled PTE (lb/hr) = Number of transfers x Throughput per transfer (tons/hr) x Emission Factor (lb/ton)  
 PTE (tons/yr) = PTE (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton)

**2. Bottlenecked Potential to Emit<sup>1</sup>**

**A. Pastillators**

**1. Uncontrolled Potential to Emit**

	Pollutant						
	PM <sup>1</sup>	PM <sub>10</sub> <sup>1</sup>	direct PM <sub>2.5</sub> <sup>1</sup>	SO <sub>2</sub>	NOx	VOC	CO
Emission Factor in lb/MMCF (AP-42)	1.9	7.6	7.6	-	-	5.5	-
Emission Factor in lb/MMCF <sup>2</sup>	-	-	-	1.797	-	-	-
Emission Factor in lb/MMBtu <sup>3</sup>	-	-	-	-	0.04	-	0.036
Potential Emission in tons/yr	0.56	2.26	2.26	0.53	12.00	1.64	10.80

**Notes:**

- PM emission factor is filterable PM only. PM<sub>10</sub> emission factor is filterable and condensable PM<sub>10</sub> combined.
- PM<sub>2.5</sub> emission factor is filterable and condensable PM<sub>2.5</sub> combined.
- Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.
- Emission factors provided by the burner manufacturer, subject to testing.

**Methodology**

Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
 MMBtu = 1,000,000 Btu  
 MMCF = 1,000,000 Cubic Feet of Gas  
 Emission (tons/yr) = Throughput (MMBtu/hr) x Emission Factor (lb/MMBtu) x 8760 hr/yr x 1 ton/2,000 lb

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					
	Benzene	Dichlorobenzene	Formaldehyde	n-Hexane	Toluene	Total - Organics
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	-
Potential Emission in tons/yr	6.24E-04	3.57E-04	2.23E-02	0.54	1.01E-03	0.56

	HAPs - Metals					
	Lead	Cadmium	Chromium	Manganese	Nickel	Total - Metals
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	-
Potential Emission in tons/yr	1.49E-04	3.27E-04	4.16E-04	1.13E-04	6.24E-04	1.63E-03
<b>Total HAPs</b>						<b>0.56</b>
<b>Worst HAP</b>						<b>0.54</b>

HAPs emission factors from AP-42, Chapter 1.4.  
 The five highest organic and metal HAPs emission factors are provided above.  
 Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Emission Factor in lb/MMcf	120,000	2.3	0.64
Potential Emission in tons/yr	35,682	0.68	0.19
Summed Potential Emissions in tons/yr	35,683		
CO <sub>2</sub> e Total in tons/yr	35,756		

**Methodology**

The N<sub>2</sub>O Emission Factor for uncontrolled is 2.2. The N<sub>2</sub>O Emission Factor for low Nox burner is 0.64.  
 Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
 Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
 CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).

**2. Potential to Emit After Issuance**

	Pollutant							
	PM	PM <sub>10</sub>	direct PM <sub>2.5</sub>	SO <sub>2</sub>	NOx	VOC	CO	CO <sub>2</sub> e

**2. Hazardous Air Pollutants**

HAP	Weight Percent <sup>1</sup> %	Potential to Emit	
		Uncontrolled (tons/yr)	After Issuance (tons/yr)
Benzene	1.50%	5.24	2.64
o-cresol	0.12%	0.42	0.21
m- & p-cresol	0.05%	0.17	8.81E-02
n-Hexane	4.00%	13.96	7.05
Phenol	0.05%	0.17	8.81E-02
Toluene	4.00%	13.96	7.05
Xylenes	5.00%	17.45	8.81
<b>Total</b>	<b>14.72%</b>	<b>51.38</b>	<b>25.94</b>

Notes:

- HAP weight percentages from licensor historical data, provided by the source

**3. Totals**

TOTAL FUGITIVES			
	Uncontrolled	After Issuance	
VOC	349.0	176.2	ton/yr
HAPs	51.4	25.9	ton/yr

**Methodology**

Emission Factor (lb/hr/source) = Emission Factor (kg/hr/source) x 2.205 (lb/kg)

VOC PTE (ton/yr) = Emission factor (lb/hr/source) x number of components (count) x 8,760 (hr/yr) / 2,000 (lb/ton)

HAP (ton/yr) = VOC PTE (ton/yr) x HAP wt%

**Appendix A: Emission Calculations  
Fugitive Dust Emissions - Paved Roads**

**Company Name:** Riverview Energy Corporation  
**Source Address:** 4704 E 2000 N, Dale, IN 47523

Notes:

1. Sulfur and residue will ship by rail. As a worst-case estimate, truck shipments totaling 5% of the annual production are included in road fugitives calculations.

Average Vehicle Weight Per Trip = 27.5 tons/trip  
 Average Miles Per Trip = 0.19 miles/trip

Unmitigated Emission Factor, Ef = [k \* (sL)<sup>0.91</sup> \* (W)<sup>1.02</sup>] (Equation 1 from AP-42 13.2.1)

	PM	PM10	PM2.5	
where k =	0.011	0.0022	0.00054	lb/VMT = particle size multiplier (AP-42 Table 13.2.1-1)
W =	27.5	27.5	27.5	tons = average vehicle weight (provided by source)
sL =	9.7	9.7	9.7	g/m <sup>2</sup> = silt loading (worst-case value for paved roads at iron and steel production facilities - Table 13.2.1-3)

Taking natural mitigation due to precipitation into consideration, Mitigated Emission Factor, Eext = E \* [1 - (p/4N)] (Equation 2 from AP-42 13.2.1)

Mitigated Emission Factor, Eext = Ef \* [1 - (p/4N)]  
 where p = 120 days of rain greater than or equal to 0.01 inches (see Fig. 13.2.1-2)  
 N = 365 days per year

	PM	PM10	PM2.5	
Unmitigated Emission Factor, Ef =	2.555	0.511	0.1255	lb/mile
Mitigated Emission Factor, Eext =	2.345	0.469	0.1151	lb/mile
Dust Control Efficiency =	90%	90%	90%	(pursuant to control measures outlined in fugitive dust control plan)

**Notes:**

- HAP fractions from licensor historical data, provided by the source
- Coefficients determined by regression of data in Tbl 3-8, Perry's Chemical Engineers' Handbook, 6th ed., except as noted.
- Vapor mole fraction in air at standard pressure.
- Vapor weight fraction as the fraction of total VOC.
- Product naphtha liquid molecular weight provided by the source from process modeling, 7/26/2018. Vapor pressure coefficients determined by regression of model values provided by the source, 7/27/2018.
- Molecular weight determined by solving iteratively for ΣxM = product naphtha value above. Fraction partial pressure taken as mixture vapor pressure minus the sum of HAP partial pressures.
- Worst-case (highest) vapor pressure (m-cresol)
- Diesel molecular weight provided by the source from process modeling, 7/26/2018. Vapor pressure coefficients determined by regression of data in AP-42, Table 7.1-2 for No 2 distillate fuel oil.
- Molecular weight determined by solving iteratively for ΣxM = product diesel value above. Fraction partial pressure taken as mixture vapor pressure minus the sum of HAP partial pressures.

**Methodology**

x = (m/M) / Σ (m/M)  
P<sup>sat</sup> = exp (A-B/T), T taken to be 517.7°R  
p = x P<sup>sat</sup>, derived from Raoult's Law  
y = p / Ptot (Dalton's Law, Ptot = 14.7 psia)  
v = (yM) / Σ (yM), expressed as weight fraction of VOC  
average vapor molecular weight = Σ(yM) / Σy

for a PSD/New Source Construction and Part 70 Operating Permit

**Source Description and Location**

<b>Source Name:</b>	<b>Riverview Energy Corporation</b>
<b>Source Location:</b>	<b>4702 E 2000 N, Dale, IN 47523</b>
<b>County:</b>	<b>Spencer</b>
<b>SIC Code:</b>	<b>2911 (Petroleum Refining), 2999 (Products of Petroleum and Coal, Not Elsewhere Classified)</b>
<b>Operation Permit No.:</b>	<b>T 147-39554-00065</b>
<b>Permit Reviewer:</b>	<b>Douglas Logan, P.E.</b>

**Background Information**

On January 25, 2018, the Office of Air Quality (OAQ) received an application from Riverview Energy Corporation related to the construction and operation of a new stationary direct coal hydrogenation plant.

This proposed plant will use a Veba Combi Cracker (VCC) process to produce premium distillate products, such as ultra-low sulfur diesel fuel. The VCC technology is a thermal hydrocracking/hydrogenation process for converting raw coal at very high conversion rates and liquid yields into directly marketable distillates. The feedstock is slurried with finely ground coal, additive and catalyst and then is injected into the high pressure section of the process. After adding makeup hydrogen, the feed stream is preheated by heat recovery from the reactor effluents and fired heater. This feed mixture is converted in a cascade of three slurry phase reactors.

The converted coal, the additive and catalyst are separated from the vaporized reaction products and the recycle gas in a hot separator. The hot separator bottom product is fed to a vacuum flasher for additional distillate recovery. The hydrotreating stage is a single reactor vessel with three beds for hydrotreating, followed by two beds for hydrocracking to maximize diesel production. After leaving the hydrotreating stage the effluent is cooled, condensed and separated from the non-condensable gas fraction and the liquids are processed in a fractionator to produce high quality naphtha, ultra-low sulfur diesel fuel and fractionator bottoms. The bottoms are recycled back to the hydrotreating stage and converted to diesel.

**Requirement for Best Available Control Technology (BACT)**

326 IAC 2-2 requires a best available control technology (BACT) review to be performed on the proposed new emission units because the potential to emit of at least one pollutant is greater than the PSD major thresholds. The potential to emit of PM, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, NO<sub>x</sub>, VOC, CO, H<sub>2</sub>SO<sub>4</sub>, and GHGs is greater than PSD thresholds for these pollutants, therefore a BACT evaluation for these pollutants will be conducted.

**Proposed New Emission Units**

326 IAC 2-2 (Prevention of Significant Deterioration) requires a BACT analysis for the following emission units:

- (a) Coal handling operations, identified as Block 1000, consisting of:

- (1) One (1) shelter-type railcar dump unloading facility, identified as EU-1000, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by a negative pressure enclosure and baghouse EU-1000, exhausting to stack EU-1000, consisting of:
  - (A) Two (2) enclosed receiving pits, identified as Receiving Pit 1 and Receiving Pit 2, discharging to Receiving Bin 1 and Receiving Bin 2, respectively.
  - (B) Two (2) enclosed receiving bins, identified as Receiving Bin 1 and Receiving Bin 2, discharging to Drag Flight Feeder 1 and Drag Flight Feeder 2, respectively, with water spray dust suppression systems.
  - (C) Two (2) enclosed drag flight feeders, identified as Drag Flight Feeder 1 and Drag Flight Feeder 2, discharging to the Unloading Conveyor, with water spray dust suppression systems.

Under the NSPS, 40 CFR 60, Subpart Y, EU-1000 is an affected facility.

- (2) One (1) enclosed rail unloading conveyor discharging to Transfer Station 1, identified as Unloading Conveyor, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, the Unloading Conveyor is an affected facility.

- (3) One (1) enclosed transfer station discharging to Conveyor 1, Conveyor 2, or Conveyor 9, identified as Transfer Station 1 (EU-1001), approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, Transfer Station 1 (EU-1001) is an affected facility.

- (4) One (1) enclosed feed conveyor discharging to Stacker 1 Boom Conveyor/Chute, identified as Conveyor 1, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 1 is an affected facility.

- (5) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #1A & #1B, identified as Stacker 1 Boom Conveyor/Chute, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 1 Conveyor/Chute is an affected facility.

- (6) Two (2) radial conical ring coal storage piles, approved in 2019 for construction, identified as Stockpile #1A and Stockpile #1B, with a maximum capacity of

93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #1A and #1B are affected facilities.

- (7) One (1) enclosed feed conveyor discharging to Stacker 2 Boom Conveyor/Chute, identified as Conveyor 2, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 2 is an affected facility.

- (8) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #2A & #2B, identified as Stacker 2 Boom Conveyor/Chute, approved in 2019 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 2 Boom Conveyor/Chute is an affected facility.

- (9) Two (2) radial conical ring coal storage piles, approved in 2019 for construction, identified as Stockpile #2A and Stockpile #2B, with a maximum capacity of 93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #2A and #2B are affected facilities.

- (10) One (1) reclaimer for Stockpiles #1A & #1B, discharging to Reclaim Conveyor 6, identified as Reclaimer 1, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 1 is an affected facility.

- (11) One (1) enclosed reclaimer conveyor, identified as Conveyor 6 discharging to the Reclaim Transfer Station, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 6 is an affected facility.

- (12) One (1) reclaimer for Stockpiles #2A & #2B, discharging to Reclaim Conveyor 7, identified as Reclaimer 2, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 2 is an affected facility.

- (13) One (1) enclosed reclaimer conveyor, identified as Conveyor 7 discharging to the Reclaim Transfer Station, approved in 2019 for construction, with a maximum

capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 7 is an affected facility.

- (14) One (1) enclosed transfer station conveyor, identified as Conveyor 9 discharging to the Reclaim Transfer Station, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 9 is an affected facility.

- (15) One (1) enclosed reclaim transfer station discharging to Reclaim Conveyor 8, identified as Reclaim Transfer Station (EU-1006), approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Reclaim Transfer Station is an affected facility.

- (16) One (1) enclosed conveyor, identified as Reclaim Conveyor 8 discharging to the Coal Mill and Pulverizer, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 8 is an affected facility.

- (b) Coal drying loop, collectively identified as EU-1008, with emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008, consisting of the following:

- (1) One (1) enclosed coal mill and pulverizer, identified as Coal Mill and Pulverizer, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Mill and Pulverizer is an affected facility.

- (2) One (1) enclosed coal dryer, identified as Coal Dryer, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer Baghouse, with particulate emissions controlled by the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer is an affected facility.

- (3) One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2019 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.

Under the NSPS, 40 CFR 60, Subpart Ja, the Coal Dryer Heater (EU-1007) is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Heater (EU-1007) is part of an affected thermal dryer.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, the Coal Dryer Heater (EU-1007) is an affected source.

- (4) One (1) process baghouse, identified as Coal Dryer Baghouse, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging fines to the Block 2000 Coal Hopper, exhausting particulate and filtered nitrogen to the condenser.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Baghouse is an affected facility.

- (5) One (1) water-cooled condenser, identified as Drying Loop Condenser, approved in 2019 for construction, with a nominal capacity of 40 MMBtu/hr, with particulate emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008.

Under the NSPS, 40 CFR 60, Subpart Y, the Drying Loop Condenser is part of an affected thermal dryer.

- (c) Additives handling operations, identified as Block 1500, consisting of:

- (1) Three (3) pneumatic (nitrogen) truck unloading systems discharging to storage silos, approved in 2019 for construction, as follows:
- (A) Coarse Additive Unloading, with a maximum capacity of 20.00 tons per hour.
  - (B) Fine Additive Unloading, with a maximum capacity of 20.00 tons per hour.
  - (C) Sodium Sulfide (Na<sub>2</sub>S) Unloading, with a maximum capacity of 10.00 tons per hour.
- (2) Three (3) nitrogen-blanketed storage silos, as follows:
- (A) One (1) coarse additive silo, identified as T34, approved in 2019 for construction, controlled by baghouse EU-1501, exhausting to stack EU-1501.
  - (B) One (1) fine additive silo, identified as T33, approved in 2019 for construction, controlled by baghouse EU-1502, exhausting to stack EU-1502.
  - (C) One (1) Na<sub>2</sub>S silo, identified as T35, approved in 2019 for construction, controlled by baghouse EU-1503, exhausting to stack EU-1503.
- (3) One (1) nitrogen-blanketed fine additive production system, identified as Fine Additive Production System, approved in 2019 for construction, with a maximum capacity of 3.28 tons per hour, controlled by baghouse EU-1504, exhausting to stack EU-1504, consisting of:
- (A) One (1) coarse additive silo rotary feeder solid weigh scale.
  - (B) One (1) coarse additive screw conveyor discharging to the Fine Additive Production System.

- (C) One (1) additive size reduction system, identified as Fine Additive Production System discharging to the T33 or the Block 2000 coarse additive transfer system.
- (d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
- (1) One (1) enclosed hopper receiving coal from Block 1000 Coal Dryer Baghouse and discharging to the Feed Prep Screw Conveyor, identified as Coal Hopper, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year.  
  
Under the NSPS, 40 CFR 60, Subpart Y, the Coal Hopper is an affected facility.
  - (2) One (1) enclosed screw conveyor, identified as Closed Screw Conveyor, approved in 2019 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Feed Premix Drum, identified as Closed Screw Conveyor, with particulate emissions controlled by the Coal Handling System Filter, exhausting to stack EU-2005.  
  
Under the NSPS, 40 CFR 60, Subpart Y, the Closed Screw Conveyor is an affected facility.
  - (3) One (1) nitrogen-blanketed coarse additive transfer system, identified as Coarse Additive Screw Conveyor, approved in 2019 for construction, with a maximum capacity of 2.20 tons per hour, receiving material from the Block 1500 coarse additive silo and discharging to the Feed Premix Drum, with particulate emissions controlled by the Coarse Additive System Filter, exhausting to stack EU-2006.
  - (4) One (1) nitrogen-blanketed fine additive transfer system, identified as Fine Additive Handling System, approved in 2019 for construction, with a maximum capacity of 3.28 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Fine Additive System Filter, exhausting to stack EU-2007, consisting of:
    - (A) One (1) fine additive silo rotary feeder solid weigh scale.
    - (B) One (1) fine additive screw conveyor discharging to the Block 2000 feed premix drum.
  - (5) One (1) nitrogen-blanketed Na<sub>2</sub>S slurry preparation system, identified as Na<sub>2</sub>S Slurry Preparation, approved in 2019 for construction, with a maximum capacity of 0.077 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Na<sub>2</sub>S Handling System Filter, exhausting to stack EU-2008, consisting of:
    - (A) One (1) Na<sub>2</sub>S silo rotary feeder solid weigh scale.
    - (B) One (1) Na<sub>2</sub>S screw conveyor discharging to the Na<sub>2</sub>S mixing drum.
    - (C) One (1) nitrogen-blanketed mixing drum for Na<sub>2</sub>S and Block 2000 vacuum tower VGO (vacuum gas oil) discharging to the feed premix drum.  
  
Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the mixing drum is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the mixing drum is an affected source.

- (6) One (1) feed premix drum, identified as Feed Premix Drum, approved in 2019 for construction, receiving coal, solid additives, and recycled vacuum gas oil (VGO) and discharging to the feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the feed premix drum is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed premix drum is part of an affected source.

- (7) One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2019 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.

Under the NSPS, 40 CFR 60, Subpart Ja, the feed heater EU-2001 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the feed heater EU-2001 is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed heater EU-2001 is part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, feed heater EU-2001 is an affected source.

- (8) One (1) natural gas and process fuel gas-fired indirect treat gas heater, identified as EU-2002, approved in 2019 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 52.8 MMBtu/hr (HHV), receiving hydrogen from Block 7000 and discharging to the 1st stage reactors, exhausting to stack EU-2002.

Under the NSPS, 40 CFR 60, Subpart Ja, the treat gas heater EU-2002 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, treat gas heater EU-2002 is an affected source.

- (9) One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2019 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the first stage reactor - liquid phase hydrocracking system is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the first stage reactor - liquid phase hydrocracking system is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the first stage reactor - liquid phase hydrocracking system is part of an affected source.

- (10) One (1) hot separator, identified as Hot Separator, approved in 2019 for construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the hot separator is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the hot separator is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the hot separator is part of an affected source.

- (11) One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2019 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003.

Under the NSPS, 40 CFR 60, Subpart Ja, the vacuum column feed heater EU-2003 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the vacuum column feed heater EU-2003 is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum column feed heater EU-2003 is part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, vacuum column feed heater EU-2003 is an affected source.

- (12) One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2019 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the vacuum distillation tower is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the vacuum distillation tower is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum distillation tower is part of an affected source.

- (13) One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2019 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the second stage reactor - gas phase hydrotreating system is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the second stage reactor - gas phase hydrotreating system is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the second stage reactor - gas phase hydrotreating system is part of an affected source.

- (14) One (1) cold separator, identified as Cold Separator, approved in 2019 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the cold separator is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the cold separator is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the cold separator is part of an affected source.

- (15) One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2019 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.

Under the NSPS, 40 CFR 60, Subpart Db, fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, the fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the fractionator heater is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator heater is part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, fractionator heater EU-2004 is an affected source.

- (16) One (1) fractionator tower, identified as Fractionator Tower, approved in 2019 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix

Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the fractionator tower is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the fractionator tower is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator tower is part of an affected source.

- (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:
- (A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2019 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine regeneration unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) two-stage low pressure absorber, approved in 2019 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine regeneration unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the HP Absorber and LP Absorber are part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the HP Absorber and LP Absorber is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the amine absorber system is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the HP Absorber and LP Absorber are part of an affected source.

- (18) Block 2000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.

Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.

- (e) Sulfur recovery operations, identified as Block 3000, consisting of:
- (1) Amine Regeneration Unit, consisting of:

- (A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2019 for construction, where rich amine from Block 2000 or the rich amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (B) One (1) stripper column, identified as Stripper, approved in 2019 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2019 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2019 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2019 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Amine Regeneration Unit is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the Amine Regeneration Unit is part of a sulfur recovery plant that is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the Amine Regeneration Unit is part of an affected source.

- (2) Sour Water Stripping System, consisting of:
  - (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2019 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2019 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Sour Water Stripping System is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the Sour Water Stripping System is part of a sulfur recovery plant that is part of an affected facility.

Under the NESHAP, 40 CFR 61, Subpart FF, provisions of the subpart are applicable to the Sour Water Stripping System.

Under the NESHAP, 40 CFR 63, Subpart CC, the Sour Water Stripping System is part of an affected source.

- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2019 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
    - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
    - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
    - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
    - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
    - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
    - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
    - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine regeneration unit.
    - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.

- (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605A Incinerator and A-605A Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit A is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with Sulfur Recovery Unit A is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit A is part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit A is an affected source.

- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2019 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine regeneration unit.

- (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
- (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605B Incinerator and A-605B Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit B is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with Sulfur Recovery Unit B is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit B is part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit B is an affected source.

- (4) Block 3000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.

Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.

- (f) Offsites operations, identified as Block 4000, consisting of:

- (1) Flares, as follows:

- (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2019 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
- (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2019 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions from Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.

- (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2019 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
- (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2019 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.

Under the NSPS, 40 CFR 60, Subpart Ja, the flares are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the flares is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the HP Flare, LP Flare, and SB Flare are control devices for emission points subject to this subpart.

- (2) Product storage tanks, approved in 2019 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T1	IFR	Naphtha product	4,629,879 (17,524)	-
T2	IFR	Naphtha product	4,629,879 (17,524)	-
T3	FR	Diesel product	4,525,796 (17,130)	-
T4	FR	Diesel product	4,525,796 (17,130)	-
T5	FR	Diesel product	4,525,796 (17,130)	-
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)	-
T7	FR	Molten sulfur	342,367 (1,296)	-
T8	FR	Molten sulfur	342,367 (1,296)	-
T9	HPV	Ammonia product	36,720 (17,524)	-
T10	FR	Residue surge tank 1	926,980 (17,524)	-
T11	FR	Residue surge tank 2	926,980 (3,509)	-
T12	FR	Residue feed tank	926,980 (3,509)	-
T13	FR	VGO tank 1	926,980 (3,509)	-
T14	FR	VGO tank 2	926,980 (3,509)	-

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T15	HPV	LPG storage	48,872 (185)	-
T16	FR	Slop tank	4,195,581 (15,880)	LP flare
T17	FR	Diesel fuel tank	23,775 (90)	-
T18	FR	Non-phenolic sour water storage tank 1	1,268,026 (4,799)	SB flare
T19	FR	Non-phenolic sour water storage tank 2	1,268,026 (4,799)	SB flare
T20	FR	Non-phenolic sour water storage tank 3	1,268,026 (4,799)	SB flare
T21	FR	Phenolic sour water storage tank	40,947 (155)	SB flare
T22	FR	Stripped non-phenolic sour water surge tank	1,268,026 (4,799)	-
T23	FR	Stripped phenolic sour water surge tank	13,737 (52)	-
T24	FR	Amine surge/deinventory tank	63,943 (242)	-
T25	FR	Fresh amine tank	63,943 (242)	-
T26	FR	Amine containment tank (sump)	793 (3)	-

1. FR - fixed roof, IFR - internal floating roof, HPV-horizontal pressure vessel
2. Tank vents to flares are part of sweep and pilot gas streams.

Under the NSPS, 40 CFR 60, Subpart Kb, T1, T2, and T6 are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with T1 - T6 and T10 - T15 is part of an affected facility.

Under the NSPS, 40 CFR 60, Subpart QQQ, T16 is part of an affected facility.

Under the NSPS, 40 CFR 61, Subpart FF, provisions of the subpart are applicable to T16 and T18 - T21.

Under the NESHAP, 40 CFR 63, Subpart CC, T1 - T6, T10 - T14, T16, and T18-T23 are part of an affected source.

Provisions of the NESHAP, 40 CFR 63, Subpart WW, apply to T3 - T6 and T10 - T14.

(3) Loading operations, as follows:

- (A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2019 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with the Product Loading Rack is part of an affected facility.

Under the NESHAP, 40 CFR 61, Subpart BB, the Product Loading Rack is an affected facility.

- (B) One (1) single-spot railcar loading rack for ammonia, identified as Ammonia Loading Rack, approved in 2019 for construction, with a bottlenecked capacity of 15,024,167 gallons per year, controlled by the Loading Flare.
  - (C) One (1) single-spot railcar loading rack for molten sulfur, identified as Sulfur Loading Rack, approved in 2019 for construction, with a bottlenecked capacity of 63,781 tons per year, controlled by the Sulfur Block Flare.
- (g) Residue solidification operations, identified as Block 5000, as follows:
- (1) Four (4) pastillators, identified as EU-5001A - EU5001D, approved in 2019 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5001.
  - (2) Four (4) pastillators, identified as EU-5002A - EU5002D, approved in 2019 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5002.
  - (3) Four (4) pastillators, identified as EU-5003A - EU5003D, approved in 2019 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5003.
  - (4) Four (4) pastillators, identified as EU-5004A - EU5004D, approved in 2019 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5004.
  - (5) Enclosed conveyors for residue pellets, with particulate emissions controlled by filters EU-5009, EU-5010, and EU-5011, as follows:
    - (A) One (1) enclosed conveyor, identified as Block 1 & 2 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5001A - EU5001D and EU-5002A - EU5002D.
    - (B) One (1) enclosed conveyor, identified as Block 3 & 4 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5003A - EU5003D and EU-5004A - EU5004D.
    - (C) One (1) enclosed loading conveyor, identified as Loading Conveyor, approved in 2019 for construction, with a maximum capacity of 51.49 tons per hour, receiving pastillators from Block 1 & 2 and Block 3 & 4 transfer conveyors, and discharging to the bulk container loading station, railcar residue silo, or swing residue silo.

- (6) One (1) residue bulk container loading station, identified as EU-5009, approved in 2019 for construction, with a maximum capacity of 8.00 tons per hour, using filter EU-5009 for particulate control and exhausting to stack EU-5009.
  - (7) One (1) railcar residue storage silo, identified as EU-5010, approved in 2019 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
  - (8) Two (2) residue loading hoppers, identified as EU-5005 and EU-5006, approved in 2019 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the railcar residue storage silo, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
  - (9) One (1) swing residue storage silo, identified as EU-5011, approved in 2019 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
  - (10) Two (2) residue loading hoppers, identified as EU-5007 and EU-5008, approved in 2019 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the swing residue storage silo, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
  - (11) Residue loadout operations using spouts and choke flow-practices, as follows:
    - (A) Two (2) railcar loadspots, approved in 2019 for construction.
    - (B) Two (2) swing loadspots, approved in 2019 for construction, accommodating either trucks or railcars.
- (h) Utilities operations, identified as Block 6000, consisting of:
- (1) One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2019 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.  
  
Under the NSPS, 40 CFR 60, Subpart Dc, boiler EU-6000 is an affected facility.  
  
Under the NSPS, 40 CFR 60, Subpart Ja, boiler EU-6000 is an affected facility.  
  
Under the NESHAP, 40 CFR 63, Subpart DDDDD, boiler EU-6000 is an affected source.
  - (2) One (1) three-cell crossflow mechanical draft cooling tower, identified as EU-6001, approved in 2019 for construction, with a maximum capacity of 32,000 gallons per hour, equipped with mist eliminators and exhausting to stacks EU-6001, EU-6002, and EU-6003.  
  
Under the NESHAP, 40 CFR 63, Subpart CC, the three-cell cooling tower is part of an affected source.
  - (3) One (1) diesel engine-driven emergency generator, identified as EU-6006, approved in 2019 for construction, with a maximum heat input capacity of 19.60 MMBtu/hr (2,800 hp) (average heating value), exhausting to stack EU-6006.

Under the NSPS, 40 CFR 60, Subpart IIII, provisions of the subpart are applicable to emergency generator EU-6006.

Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency generator EU-6006 is an affected source.

- (4) One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2019 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), exhausting to stack EU-6008.

Under the NSPS, 40 CFR 60, Subpart IIII, provisions of the subpart are applicable to emergency fire pump EU-6008.

Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency fire pump EU-6008 is an affected source.

- (i) Water supply and treatment operations, identified as Block 6500, consisting of:

- (1) One (1) pneumatic lime truck unloading system, identified as Lime Unloading, approved in 2019 for construction, with a maximum capacity of 20.00 tons per hour, discharging to silo EU-6501.
- (2) One (1) lime storage silo, identified as EU-6501, approved in 2019 for construction, with a maximum capacity of 20.00 tons per hour, with particulate emissions controlled by dust collector EU-6501 and exhausting to stack EU-6501.

- (j) Hydrogen unit operations, identified as Block 7000, as follows:

- (1) Hydrogen Plant 1, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:
- (A) One (1) boiler feed water treatment system including deaerator vent EU-7003, identified as Feed Water Treatment System 1, approved in 2019 for construction, exhausting to stack EU-7003.
- (B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2019 for construction, consisting of:
- (i) One (1) hydrogenation reactor.
- (ii) One (1) hydrogen sulfide adsorber.
- (C) One (1) reformer system, consisting of:
- (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2019 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.

Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7001, is an affected facility.

- (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2019 for construction.
- (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2019 for construction, discharging shift gas to the pressure swing adsorber.
- (E) One (1) pressure swing adsorber, identified as PSA 1, approved in 2019 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with Hydrogen Plant 1 is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 1 is part of an affected source.

- (2) Hydrogen Plant 2, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:
  - (A) One (1) boiler feed water treatment system including deaerator vent EU-7004, identified as Feed Water Treatment System 2, approved in 2019 for construction, exhausting to stack EU-7004.
  - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2019 for construction, consisting of:
    - (i) One (1) hydrogenation reactor.
    - (ii) One (1) hydrogen sulfide adsorber.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2019 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.  
  
Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7002, is an affected facility.
    - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2019 for construction.
  - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2019 for construction, discharging shift gas to the pressure swing adsorber.

- (E) One (1) pressure swing adsorber, identified as PSA 2, approved in 2019 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, the group of all the equipment (defined in § 60.591a) associated with Hydrogen Plant 2 is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 2 is part of an affected source.

- (3) Block 7000 petroleum refinery process unit heat exchangers that are in organic HAP service, as defined in 40 CFR 63, Subpart CC, and all water lines to and from these petroleum refinery process unit heat exchangers.

Under the NESHAP, 40 CFR 63, Subpart CC, petroleum refinery process unit heat exchangers that are in organic HAP service and related water lines are part of an affected source.

- (k) Wastewater treatment operations, identified as Block 8000, as follows:

- (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2019 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
- (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2019 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
- (3) One (1) wastewater junction box with, identified as MH1, approved in 2019 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.
- (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2019 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
- (5) One (1) biological wastewater treatment system, approved in 2019 for construction, with emissions exhausting to vent EU-8001.

Under the NSPS, 40 CFR 60, Subpart QQQ, the process drains, junction boxes, Oily Water Separator, Oily Amine Separator, associated sewer lines, and any secondary oil-water separator in the biological wastewater treatment system are an affected aggregate facility.

Under the NESHAP, 40 CFR 61, Subpart FF, provisions of the subpart are applicable to the Oily Water Separator, Oily Amine Separator, and any secondary oil-water separator in the biological wastewater treatment system.

Under the NESHAP, 40 CFR 63, Subpart CC, the wastewater streams and treatment operations associated with petroleum refining process units are part of a new affected source..

### Summary of the Best Available Control Technology (BACT) Process

IDEM, OAQ conducts BACT analyses in accordance with the "Top-Down" Best Available Control Technology Guidance Document outlined in the 1990 draft U.S. EPA New Source Review Workshop Manual, which outlines the steps for conducting a top-down BACT analysis. Those steps are listed below:

- (1) Identify all potentially available control options;
- (2) Eliminate technically infeasible control options;
- (3) Rank remaining control technologies;
- (4) Evaluate the most effective controls and document the results; and
- (5) Select BACT.

Also in accordance with the "Top-Down" Best Available Control Technology Guidance Document outlined in the 1990 draft U.S. EPA New Source Review Workshop Manual, BACT analyses take into account the energy, environmental, and economic impacts of the control options. Emission reductions may be determined through the application of available control techniques, process design, and/or operational limitations. Such reductions are necessary to demonstrate that the emissions remaining after application of BACT will not cause adverse environmental effects to public health and the environment. The Office of Air Quality (OAQ) makes BACT determinations by following the five steps identified above.

This BACT determination is based on the following information:

- (1) The EPA RACT/BACT/LAER (RBLCL) Clearinghouse;
- (2) EPA and State air quality permits;
- (3) Communications with control device equipment manufacturers;
- (4) Technical books and articles; and
- (5) Guidance documents from state and federal agencies.

### Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis Material Handling

#### Step 1: Identify Potential Control Technologies

Particulate matter (PM) is a complex mixture of small particles and liquid droplets. PM can be made up of a variety of components, including acids, organic chemicals, metals, and soil or dust particles. PM includes any size of filterable particulate. Filterable particulate is the particulate that is emitted directly as a solid or liquid at the stack.

Emissions of particulate matter (PM) are generally controlled with add-on control equipment designed to capture the emissions prior to the time they are exhausted to the atmosphere. In cases where the material being emitted is organic, particulate matter may be controlled through a combustion process. Generally, PM emissions are controlled through one of the following mechanisms:

- (1) Mechanical collectors (such as cyclones or multiclones).
- (2) Wet scrubbers.
- (3) Electrostatic precipitators (ESP).
- (4) Fabric filter dust collectors (baghouses).
- (5) Wet suppression

Fugitive PM emissions from paved roads are typically controlled through the use of work practices which include a site-specific Fugitive Dust Control Plan.

The choice of which technology is most appropriate for a specific application depends upon several factors, including particle size to be collected, particle loading, stack gas flow rate, stack gas physical

characteristics (e.g., temperature, moisture content, presence of reactive materials), and desired collection efficiency.

### ***Mechanical Collectors (such as Cyclones or Multiclones)***

Mechanical collectors use the inertia of the particles for collection. The particulate-laden gas stream enters the control device and is forced to move in a cyclonic manner, which causes the particles to move toward the outside of the vortex. Most of the large-diameter particles enter a hopper below the cyclonic tubes while the gas stream turns and exits the device.

Cyclones are typically used to remove relatively large particles from gas streams. Conventional single cyclones are estimated to control PM at 70-90%, PM<sub>10</sub> at 30-90%, and PM<sub>2.5</sub> at 0-40%. High efficiency single cyclones are designed to achieve higher control of smaller particles and multiclones may also achieve higher control of smaller particles. Collection efficiency generally increases with particle size and/or density, inlet duct velocity, cyclone body length, number of gas revolutions in the cyclone, ratio of cyclone body diameter to gas exit diameter, dust loading, and smoothness of the cyclone inner wall. Cyclone efficiency will decrease with increases in gas viscosity, body diameter, gas exit diameter, gas inlet duct area, and gas density.

Cyclones are often used for recovery and recycling of material or as precleaners for more expensive final control devices such as fabric filters or electrostatic precipitators. Cyclones are used for applications such as after spray drying operations in the food and chemical industries; after crushing/grinding/calcining operations in the mineral and chemical industries to collect salable or useful material; for first stage control of PM from sinter plants, roasters, kilns, and furnaces in the metallurgical industries; for catalyst recycling in the fluid-cracking process; and for precleaning fossil-fuel and wood-waste fired industrial and commercial fuel combustion units.

The typical gas flow rates for a single cyclone are 1,060 to 25,400 scfm. Flows that are higher use multiple cyclones in parallel. Inlet gas temperatures are only limited by the material of construction of the cyclone. Cyclones perform more efficiently with higher pollutant loadings, with loadings typically ranging from 1.0 to 100 gr/scf. Cyclones are unable to handle sticky or tacky materials.

### ***Wet Scrubbers***

A wet scrubber is an air pollution control device that removes PM from waste gas streams primarily through the impaction, diffusion, interception and/or absorption of the pollutant onto droplets of liquid. The liquid containing the pollutant is then collected for disposal. There are numerous types of wet scrubbers that remove PM, including venturi, impingement and sieve plate, spray towers, mechanically aided, condensation growth, packed beds, ejector, mobile bed, catenary grid, froth tower, oriented fiber pad, and wetted mist eliminators. Collection efficiencies for wet scrubbers vary with the particle size distribution of the waste gas stream. In general, collection efficiency decreases as the PM size decreases. Collection efficiencies also vary with scrubber type. Collection efficiencies range from greater than 99% for venturi scrubbers to 40-60% (or lower) for simple spray towers. Wet scrubbers are smaller and more compact than baghouses or ESPs. They have lower capital costs and comparable operation and maintenance (O&M) costs. Wet scrubbers are particularly useful in the removal of PM with the following characteristics:

- (1) Sticky and/or hygroscopic materials (materials that readily absorb water);
- (2) Combustible, corrosive and explosive materials;
- (3) Particles which are difficult to remove in their dry form;
- (4) PM in the presence of soluble gases; and
- (5) PM in waste gas streams with high moisture content.

Some applications of wet scrubbers include the following:

- Condensation scrubbers: for controlling fine PM-containing waste-gas streams.
- Fiber-bed scrubbers (wetted-fiber scrubbers or mist eliminators): for controlling aerosol emissions from chemical, plastics, asphalt, sulfuric acid, and surface coating industries; for controlling lubricant mist emission from rotating machinery and storage tanks; and for eliminating visible plume downstream of other control devices.
- Impingement-plate/tray-tower scrubbers: for the food and agriculture industry and at gray and iron foundries. These types of scrubbers may be used to control other pollutants such as SO<sub>2</sub>, VOC, and HAPs in other settings.
- Mechanically-aided scrubbers: for food processing paper, pharmaceuticals, chemicals, plastics, tobacco, fiberglass, ceramics, and fertilizer. Processes controlled include dryers, cookers, crushing and grinding operations, spraying, ventilation, and material handling.
- Orifice scrubbers: for food processing and packaging; pharmaceutical processing and packaging; manufacture of chemicals, rubber and plastics, ceramics, and fertilizer. Processes controlled include dryers, cookers, crushing and grinding operations, spraying, ventilation, and material handling.
- Packed-bed/packed-tower wet scrubbers: for the chemical, aluminum, coke and ferroalloy, food and agriculture, and chromium electroplating industries.
- Spray-chamber/spray-tower wet scrubbers: often used as part of a flue gas desulfurization systems, where they are used to control emissions from coal and oil combustion from electric utilities and industrial sources.
- Venturi scrubbers: for controlling PM emissions from utility, industrial, commercial, and institutional boilers fired with coal, oil, wood, and liquid waste; for sources in the chemical, mineral products, wood, pulp and paper, rock products, and asphalt manufacturing industries; for lead, aluminum, iron and steel, and gray iron production industries; for municipal solid waste incinerators. They are typically used where it is necessary to obtain high collection efficiencies for fine PM.

The primary disadvantage of wet scrubbers is that increased collection efficiency comes at the cost of increased pressure drop across the control system. Another disadvantage is that they generate waste in the form of a sludge which requires treatment and/or disposal. Lastly, downstream plume visibility problems can result unless the added moisture is removed from the gas stream.

### ***Electrostatic Precipitators***

An electrostatic precipitator (ESP) is a particle control device that uses electrical forces to move the particles out of the flowing gas stream and onto collector plates. The particles are given an electrical charge by forcing them to pass through a corona, a region in which gaseous ions flow. The electrical field that forces the charged particles to the walls comes from electrodes maintained at high voltage in the center of the flow lane.

Once the particles are collected on the plates, they must be removed from the plates without re-entraining them into the gas stream. This is usually accomplished by knocking them loose from the plates, allowing the collected layer of particles to slide down into a hopper from which they are evacuated. Some precipitators remove the particles by intermittent or continuous washing with water.

Dry-type ESPs are primarily used in the electric utility industry and may also be used by the textile industry, pulp and paper facilities, the metallurgical industry, cement and mineral industry, sulfuric acid manufacturing plants, as well as for coke ovens and hazardous waste incinerators. Dust characteristics are a limiting factor for dry-type ESPs. Sticky, moist, high resistivity, flammable, or explosive dusts and particles are not well-suited for dry-type ESPs. Wet ESPs are used in situations for which dry ESPs are

not suited, such as when the material to be collected is wet, sticky, flammable, explosive, or has a high resistivity. Wet ESPs are commonly used by the textile industry, pulp and paper facilities, the metallurgical industry, and sulfuric acid manufacturing plants. The limiting factor for wet ESPs is temperature; typically wet ESPs cannot handle operating temperatures exceeding 170°F.

ESP control efficiencies are very high and can range from 95% to 99.9% due to the strong electrical forces applied to small particles and can handle high temperatures (dry ESPs), pressures, and gas flow rates. The composition of the particulate matter is very important because it influences the conductivity within the dust layers on the collection plate. Wet ESPs are effective at collecting sticky particles and mist, help to cool and condition gas streams, and may provide for control of other aerosolized pollutants in the gas stream. ESPs in general are not suited for use in processes which are highly variable because they are very sensitive to fluctuations in gas stream conditions (flow rates, temperatures, particulate and gas composition, and particulate loadings). They have high capital costs and require large installation space. Dry ESPs are not recommended for removing sticky or moist particles. Wet ESPs can have potential problems with corrosion and they generate a wastewater slurry that must be handled.

### ***Fabric Filtration***

A fabric filter unit consists of one or more isolated compartments containing rows of fabric bags in the form of round, flat, or shaped tubes, or pleated cartridges. Particle laden gas passes up (usually) along the surface of the bags then radially through the fabric. Particles are retained on the upstream face of the bags, and the cleaned gas stream is vented to the atmosphere. The filter is operated cyclically, alternating between relatively long periods of filtering and short periods of cleaning. During cleaning, dust that has accumulated on the bags is removed from the fabric surface and deposited in a hopper for subsequent disposal.

Fabric filters collect particles with sizes ranging from submicron to several hundred microns in diameter at efficiencies generally in excess of 99 or 99.9%. The layer of dust, or dust cake, collected on the fabric is primarily responsible for such high efficiency. The cake is a barrier with tortuous pores that trap particles as they travel through the cake. Gas temperatures up to about 500°F, with surges to about 550°F, can be accommodated routinely in some configurations. Most of the energy used to operate the system appears as pressure drop across the bags and associated hardware and ducting.

Fabric filters are used where high efficiency particle collection is required and can be used in most any process where dust is generated and can be collected and ducted to a central location. Limitations are imposed by gas characteristics (temperature and corrosivity) and particle characteristics (primarily stickiness) that affect the fabric or its operation and that cannot be economically accommodated. Important process variables include particle characteristics, gas characteristics, and fabric properties. The most important design parameter is the air- or gas-to-cloth ratio (the amount of gas in ft<sup>3</sup>/min that penetrates one ft<sup>2</sup> of fabric) and the usual operating parameter of interest is pressure drop across the filter system. Fabric filters are usually made of woven or (more commonly) needle-punched felts sewn to the desired shape, mounted in a plenum with special hardware, and used across a wide range of dust concentrations.

Fabric filters provide high collection efficiency for both coarse and fine particles and are relatively insensitive to fluctuations in gas stream conditions. Operation is simple and fabric filters are useful for collecting particles with resistivities either too low or too high for collection with ESPs. Fabric filters have limited application for high temperatures and corrosive or moist exhaust.

### ***Wet Suppression***

Wet suppression systems use liquid sprays or foam to suppress the formation of airborne dust. The primary control mechanisms are those that prevent emissions through agglomerate formation by combining small dust particles with larger aggregate or with liquid droplets. The key factors that affect the degree of agglomeration and, hence, the performance of the system are the coverage of the material by

the liquid and the ability of the liquid to wet small particles. There are two types of wet suppression systems: liquid sprays which use water or water/surfactant mixtures as the wetting agent and systems which supply foams as the wetting agent. Wet suppression systems typically achieve PM control efficiencies of greater than 85%.

**Step 2: Eliminate Technically Infeasible Options:**

For material handling, all of the control technologies are considered technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
Fabric filter dust collectors (baghouses)	99+%
Electrostatic precipitators (ESP)	95-99%
Mechanical collectors (such as cyclones or multiclones)	70% - 90%
Wet scrubbers	70% - 90%
Wet suppression	50% - 90%

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLIC):

Rail Unloading - Coal

Facility - County, State	RBLIC ID / Permit # (Issuance Date)	Process (Emission unit)	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	railcar dump unloading facility, consisting of: Receiving Pits 1 & 2 Receiving Bins 1 & 2 Drag Flight Feeders 1 & 2 (EU-1000)	Negative pressure enclosure and baghouse EU-1000 Water spray dust suppression (hoppers and feeder only)	PM/PM10/PM2.5: 0.0022 gr/dscf 0.12 lb/hr 5% opacity (6-min avg.)	5,000 ton/hr
New Steel International	OH-0315 07-00587 (5/6/2008)	Scrap barge unloading to truck and Coal and Iron Ore barge unloading	baghouses 1A and 1B	PM/PM10: 0.0022 gr/dscf, 0.93 lb/hr and 4.07 tpy Fugitive PM: 6.15 tpy and fugitive PM10: 2.84 tpy	
0.0022 gr/dscf is the most stringent grain loading. Therefore, this has been determined to be BACT.					
Southeast Idaho Energy, LLC	ID-0017 P-2008.0066 (2/10/2009)	railcar unloading & storage	baghouses	PM: 0.0009 gr/dscf 0.09 lb/hr 99% CE 5% opacity PM10: 0.0004 gr/dscf 0.04 lb/hr 99% control efficiency	5,000 tons/hr
5% opacity is most stringent limit. Therefore this has been determined to be BACT.					
Permit cited in ID-0017, and later revision P-2009.0127, do not incorporate gr/dscf limits, only lb/hr and opacity. Value of gr/dscf calculated from lb/hr limit and air flow rate provided in the permit conflicts with the gr/dscf value in RBLIC. Therefore the gr/dscf value from OH-0315 is considered in determining BACT.					

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (Emission unit)	Control	BACT	Throughput (ton/yr)
Indiana Gasification - IN	IN-0166 T147-30464-00060 (6/27/2012)	Rail Unloading	Baghouse or dust extraction system	PM/PM10: 0.003 gr/dscf PM2.5: 0.0015 gr/dscf 99.0% CE	-

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
(EU-5010), loading hoppers (EU-5005, EU-5006), and residue transfer conveyors	(stack EU-5010)	PM <sub>10</sub> <sup>1</sup>	0.002	0.003
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.003
Residue swing storage silo (EU-5011), loading hoppers (EU-5007, EU-5008), and residue transfer conveyors	Filter EU-5011 (stack EU-5011)	PM	0.002	0.003
		PM <sub>10</sub> <sup>1</sup>	0.002	0.003
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.003
Lime silo (EU-6501)	Filter EU-6501 (stack EU-6501)	PM	0.002	0.01
		PM <sub>10</sub> <sup>1</sup>	0.002	0.01
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.01

*Notes:*

1. PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable.

- (2) Transfers from the loading hoppers to transports shall employ choke flow-practices
- (3) There shall be no visible emissions from transfers from the loading hoppers and from hoppers to transports.

**BACT Analysis Process fuel gas-fired heaters and boiler**

**PM/PM10/PM2.5**

**Step 1: Identify Potential Control Technologies**

PM/PM10/PM2.5 emissions can be controlled with the following control technologies:

- (1) Good Combustion Practices

**Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

**Step 2: Eliminate Technically Infeasible Options**

A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice for gas-fired combustion units is the best control for PM/PM10/PM2.5 emissions. Natural gas combustion is already efficient. It is possible to achieve PM/PM10/PM2.5 reductions from an add-on control device; however, any add-on control technology would not be cost effective since the PM/PM10/PM2.5 concentration in these units is relatively low. Good Combustion Practices are a technically feasible option.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Combustion Units (<100 MMBtu/hr) - PM/PM10/PM2.5**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	gas fuel, GCP <sup>2</sup>	PM (filterable): 0.11 lb/hr 0.0019 lb/MMBtu PM10: 0.42 lb/hr 0.0075 lb/MMBtu PM2.5: 0.42 lb/hr 0.0075 lb/MMBtu	55.80
		EU-2002 Treat gas heater		PM (filterable): 0.10 lb/hr 0.0019 lb/MMBtu PM10: 0.40 lb/hr 0.0075 lb/MMBtu PM2.5: 0.40 lb/hr 0.0075 lb/MMBtu	52.80
		EU-2003 Vacuum column feed heater		PM: 1.71E-02 lb/hr 0.0019 lb/MMBtu PM10: 6.75E-02 lb/hr 0.0075 lb/MMBtu PM2.5: 6.75E-02 lb/hr 0.0075 lb/MMBtu	9.00
		EU-6000 Boiler		PM (filterable): 0.13 lb/hr 0.0019 lb/MMBtu PM10: 0.53 lb/hr 0.0075 lb/MMBtu PM2.5: 0.53 lb/hr 0.0075 lb/MMBtu	68.50

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Holly Refinery & Marketing-Tulsa LLC	OK-0167 2012-1062-C(M-1)PSD (4/20/2015)	Process heaters	gas fuel	PM10: 0.0075 lb/MMBtu	10.00
				PM2.5: 0.0075 lb/MMBtu	25.00
					42.00
Holly Refinery & Marketing-Tulsa LLC	OK-0166 2010-599-C(M-3) (4/20/2015)	Process heater (refinery fuel gas)	gas fuel	PM10: 0.0075 lb/MMBtu PM2.5: 0.0075 lb/MMBtu	50.00
The entries above are the most restrictive limits found on a lb/MMBtu basis and are selected as BACT.					
ExxonMobil Oil Corp.	TX-0832 PSDTX768M 1, PSDTX799, PSDTX802 (1/9/2018)	F-2001 Kero HDT Charge Heater and F-2002 Kero HDT Stripper Reboiler (natural gas/refinery gas)	good combustion and use of gaseous fuel	PM: 0.67 lb/hr PM10: 0.67 lb/hr PM2.5: 0.67 lb/hr <i>(all filterable) (equivalent to 0.0078 lb/MMBtu)</i>	85.50
		F-3001 Diesel DHDT charge heater & F-3002 diesel DHDT stripper reboiler (natural gas /refinery gas)		PM: 0.49 lb/hr PM10: 0.49 lb/hr PM2.5: 0.49 lb/hr <i>(all filterable) (equivalent to 0.0074 lb/MMBtu)</i>	66.50
The entries above are the most restrictive found for work practices and are selected as BACT. Oklahoma citations are taken as combined filterable and condensable fractions and therefore more restrictive than the lower Texas value for filterable particulate matter only.

The Louisiana determination of good combustion practices as BACT is not considered applicable because IDEM finds that the operating permit does not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement.

Notes:

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

Combustion Units (>100 MMBtu/hr) - PM/PM<sub>10</sub>/PM<sub>2.5</sub>

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)

	Sasol GTL project reportedly cancelled in November 2017. Therefore these entries may not represent BACT for the proposed source.				
	LA-0303 PSD-LA-779 (5/23/2014)	Hot oil heater (EQT 1161) (process gas)	gas fuel, GCP	PM10: 1.79 lb/hr 6.53 tpy 0.0075 lb/MMBtu PM2.5: 1.79 lb/hr 6.53 tpy 0.0075 lb/MMBtu	240.00
Sasol complex is in SIC code 2869, not 2911 like the proposed source. Therefore these entries may not represent BACT for the proposed source.					

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Valero Refining- New Orleans LLC	LA-0213 PSD-LA- 619(M5) (11/17/2009)	heater 2008-4 (refinery fuel gas)	comply with 40 CFR 60, subparts NNN and RRR	-	108.00
		heater 2008-5			123.00
		heater 2008-7			122.00
		heater 2008-9			122.00
		heater/reboiler 6-81	gas fuel, GCP	-	135.00
The Louisiana determination of good combustion practices as BACT is not considered applicable because IDEM finds that the operating permit does not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement.					
Shintech Louisiana LLC	LA-0204 PSD-LA- 709(M-1) (2/27/2009)	Boilers A & B	natural gas, GCP	0.005 lb/MMBtu	250 ea
		Boilers C & D			
This source is in SIC code 2821, not 2911 like the proposed source. RBLC process code is 12.390, for "other gaseous fuels and gaseous fuel mixtures" but entries specify that the units burn natural gas. Therefore these entries may not represent BACT for the proposed source and have not been considered.					

Notes:

1. *tpy - tons per twelve (12) consecutive months*
2. *Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.*

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3, the Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the fuel combustion units listed in the table below shall be as follows:

Description	Unit ID
Coal dryer heater	EU-1007
Feed heater	EU-2001
Treat gas heater	EU-2002
Vacuum column feed heater	EU-2003
Fractionator heater	EU-2004
Package boiler	EU-6000

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.
- (c) Particulate matter emissions shall not exceed:

Emission Limitations

Notes:

1. tons/yr = tons per twelve (12) consecutive month period

## **SO<sub>2</sub>**

### **Step 1: Identify Potential Control Technologies**

Sulfur Dioxide (SO<sub>2</sub>) emissions result from the oxidation of fuel-bound sulfur, with emissions dependent upon the sulfur content of the fuel. Sulfur Dioxide (SO<sub>2</sub>) emissions are generally controlled with add-on control equipment designed to capture the emissions prior to the time they are exhausted to the atmosphere.

- (a) Flue Gas Desulfurization (FGD) System);
  - (1) Wet Scrubbing
  - (2) Spray Dryer Absorption (SDA)
  - (3) Dry Sorbent Injection (DSI)
- (b) Fuel Specification.
- (c) Good Combustion Practices

The choice of which technology is most appropriate for a specific application depends upon several factors, including particle size to be collected, particle loading, stack gas flow rate, stack gas physical characteristics (e.g., temperature, moisture content, presence of reactive materials), and desired collection efficiency.

### **Flue Gas Desulfurization (FGD) System (Dry and Wet Scrubbers)**

A flue gas desulfurization system (FGD) is comprised of a spray dryer that uses lime as a reagent followed by particulate control or wet scrubber that uses limestone as a reagent. FGD is an established technology. FGD typically operates at a temperature of approximately 300°F to 700°F (wet) and 300°F to 1830°F (dry). The FGD has a waste stream inlet pollutant concentration of 2,000 ppmv. Absorption of SO<sub>2</sub> is accomplished by the contact between the exhaust and an alkaline reagent, which results in the formation of neutral salts. Wet systems employ reagents using packed or spray towers and generate wastewater streams, while dry systems inject slurry reagent into the exhaust stream to react, dry and be removed downstream by particulate control equipment. Chlorine emissions can result in salt deposition within the absorber and in downstream equipment. Wet systems may require flue gas re-heating downstream of the absorber to prevent corrosive condensation. Inlet streams for dry systems must be cooled as appropriate, and dry systems require use of particulate controls to collect the solid neutral salts.

- (1) Wet Scrubbing Wet scrubbers are regenerative processes which are designed to maximize contact between the exhaust gas and an absorbing liquid. The exhaust gas is scrubbed with a 5 -

15 percent slurry, comprised of lime (CaO) or limestone (CaCO<sub>3</sub>) in suspension. The SO<sub>2</sub> in the exhaust gas reacts with the CaO or CaCO<sub>3</sub> to form calcium sulfite (CaSO<sub>3</sub>·2H<sub>2</sub>O) and calcium sulfate (CaSO<sub>4</sub>). The scrubbing liquor is continuously recycled to the scrubbing tower after fresh lime or limestone has been added.

The types of scrubbers which can adequately disperse the scrubbing liquid include packed towers, plate or tray towers, spray chambers, and venturi scrubbers. In addition to calcium sulfite/sulfate, numerous other absorbents are available including sodium solutions and ammonia-based solutions.

- (2) Spray Dryer Absorption (SDA) - An alternative to wet scrubbing is a process known as dry scrubbing, or spray-dryer absorption (SDA). As in wet scrubbing, the gas-phase SO<sub>2</sub> is removed by intimate contact with a suitable absorbing solution. Typically, this may be a solution of sodium carbonate (Na<sub>2</sub>CO<sub>3</sub>) or slaked lime [Ca(OH)<sub>2</sub>]. In SDA systems the solution is pumped to rotary atomizers, which create a spray of very fine droplets. The droplets mix with the incoming SO<sub>2</sub>-laden exhaust gas in a very large chamber and subsequent absorption leads to the formation of sulfites and sulfates within the droplets. Almost simultaneously, the sensible heat of the exhaust gas which enters the chamber evaporates the water in the droplets, forming a dry powder before the gas leaves the spray dryer. The temperature of the desulfurized gas stream leaving the spray dryer is now approximately 30 - 50°F above its dew point.

The exhaust gas from the SDA system contains a particulate mixture which includes reacted products. Typically, baghouses employing teflon-coated fiberglass bags (to minimize bag corrosion) are utilized to collect the precipitated particulates.

- (3) Dry Sorbent Injection (DSI) - This control option typically involves the injection of dry powders into either the furnace or post-furnace region of utility-sized boilers. This process was developed as a lower cost option to conventional FGD technology. Since the sorbent is injected directly into the exhaust gas stream, the mixing offered by the dry scrubber tower is not realized. The maximum efficiency realized for this SO<sub>2</sub> control technology is estimated to be fairly nominal. It is felt that if sufficient amounts of reactants are introduced into the flue gas, there is a possibility of some degree of mixing and reaction. The science is inexact and the coupling of reactant dosage and in-flue mixing which impacts the SO<sub>2</sub> control efficiency is susceptible to variability in SO<sub>2</sub> concentrations.

### **Dry Sorbent Injection**

A post-combustion technology in which a calcium or sodium-based sorbent reacts with SO<sub>2</sub> and SO<sub>3</sub> and is removed downstream by particulate control equipment. The system requires use of particulate controls to collect the reaction solids. Dry sorbent injection is not listed in the RBLC as BACT for the control of SO<sub>2</sub> emissions for auxiliary boilers. Technology has not been applied to natural gas combustion turbines due to very low SO<sub>2</sub> emissions. Controls would not provide any measurable emission reduction.

### **Fuel Specifications**

Combusting only clean natural gas, which has an inherently low sulfur content, rather than higher sulfur content fuels alone or in combination with natural gas has a very low potential for generating SO<sub>2</sub> emissions.

### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of

the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

**Step 2: Eliminate Technically Infeasible Options:**

FGD systems are not listed in the RBLC as BACT for the control of SO<sub>2</sub> emissions for process heaters and/or boilers. Technology has not been applied to natural gas units due to very low SO<sub>2</sub> emissions. Controls would not provide any measurable emission reduction and would not be economically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Good Combustion Practices and use of low-sulfur fuel gas are the only feasible option.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Combustion Units - SO<sub>2</sub>**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month, good combustion practices <sup>1</sup> .	0.35 tpy	55.80
		EU-2001 Feed heater		0.80 tpy	128.40
		EU-2002 Treat gas heater		0.33 tpy	52.80
		EU-2003 Vacuum column feed heater		0.06 tpy	9.00
		EU-2004 Fractionator heater		0.97 tpy	156.00
		EU-6000 Boiler		0.42 tpy	68.50
The source has proposed a more restrictive limit for fuel gas sulfur content than entries in the RBLC database. Therefore, this is determined to be BACT.					
ExxonMobil Oil Corp.	TX-0832 PSDTX768M 1, PSDTX799, PSDTX802 (1/9/2018)	F-1001 Crude Charge Furnace (natural gas/refinery gas)	use low sulfur gas fuel	162 ppmvd hourly 60 ppmvd annual	630.80
		F-2001 Kero HDT Charge Heater and F-2002 Kero HDT Stripper Reboiler (natural gas/refinery gas)	good combustion and use of gaseous fuel		85.50
		F-3001 Diesel DHDT charge heater & F-3002 diesel DHDT stripper reboiler (natural gas /refinery gas)			66.50
The entries above are the most restrictive found for work practices and are selected as BACT.

Notes:

1. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3, the Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the fuel combustion units listed in the table below shall be as follows:

Description	Unit ID
Coal dryer heater	EU-1007
Feed heater	EU-2001
Treat gas heater	EU-2002
Vacuum column feed heater	EU-2003
Fractionator heater	EU-2004
Package boiler	EU-6000

- (a) The units shall burn only natural gas and process off-gas.
- (b) The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month.
- (c) SO<sub>2</sub> emissions shall not exceed:

<b>SO<sub>2</sub> Emission Limitations</b>	
<b>Unit ID</b>	<b>tpy</b>
EU-1007	0.35
EU-2001	0.80
EU-2002	0.33
EU-2003	0.06
EU-2004	0.97
EU-6000	0.42

- (d) The units shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.

## **NO<sub>x</sub>**

### **Step 1: Identify Potential Control Technologies**

NO<sub>x</sub> emissions can be controlled with the following control technologies:

Post-combustion controls:

- (1) Selective Catalytic Reduction (SCR)
- (2) Selective Non-Catalytic Reduction (SNCR)

Combustion controls:

- (3) Low NO<sub>x</sub> Burner (LNB)/Ultra low-Nox burner (ULNB)
- (4) Flue Gas Recirculation (FGR)
- (5) Good Combustion Practices

### **Selective Catalytic Reduction (SCR)**

Selective Catalytic Reduction (SCR) process involves the mixing of anhydrous or aqueous ammonia vapor with flue gas and passing the mixture through a catalytic reactor to reduce NO<sub>x</sub> to water and N<sub>2</sub>. Under optimal conditions, SCR has a removal efficiency up to 90% when used on steady state processes. The efficiency of removal will be reduced for processes that are not stable or require frequent changes in the mode of operation.

The most important factor affecting SCR efficiency is temperature. SCR can operate in a flue gas window ranging from 480°F to 800°F, although the optimum temperature range depends on the type of catalyst and the flue gas composition. In this particular service, the minimum target temperature is approximately 750°F. Temperatures below the optimum decrease catalyst activity and allow ammonia to slip through; above the optimum range, ammonia will oxidize to form additional NO<sub>x</sub>. Flue gas temperatures for the process fuel gas-fired units range generally from 400°F to 525°F, with one unit (EU-2003) expected to operate at 800°F. Because of the non-optimum temperatures, IDEM assigns a low control efficiency to SCR in this application. SCR efficiency is also largely dependent on the stoichiometric molar ratio of NH<sub>3</sub>:NO<sub>x</sub> because variation of the ideal 1:1 ratio to 0.5:1 ratio can reduce the removal efficiency to 50%.

### **Selective Non-Catalytic Reduction (SNCR)**

With selective non-catalytic reduction (SNCR), NO<sub>x</sub> is selectively removed by the injection of ammonia or urea into the flue gas at an appropriate temperature window of 1600°F to 2000°F, without employing a catalyst. Similar to SCR without a catalyst bed, the injected chemicals selectively reduce the NO<sub>x</sub> to molecular nitrogen and water. This approach avoids the problem related to catalyst fouling but the temperature window and reagent mixing residence time is critical for conducting the necessary chemical reaction.

At the proper temperature, urea decomposes to produce ammonia which is responsible for NO<sub>x</sub> reduction. At a higher temperature, the rate of competing reactions for the direct oxidation of ammonia that forms NO<sub>x</sub> becomes significant. At a lower temperature, the rates of NO<sub>x</sub> reduction reactions become too slow resulting in urea slip (i.e. emissions of unreacted urea).

Optimal implementation of SNCR requires the employment of an injection system that can accomplish thorough reagent/gas mixing within the temperature window while accommodating spatial and production rate temperature variability in the gas stream. The attainment of maximum NO<sub>x</sub> control performance requires that the furnace exhibit a favorable opportunity for the application of this technology relative to the location of the reaction temperature range and steady operation within that temperature window.

### **Low NO<sub>x</sub> Burners (LNB)**

Using LNB can reduce formation of NO<sub>x</sub> through careful control of the fuel-air mixture during combustion. Control techniques used in LNBS includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NO<sub>x</sub> emissions can be realized using LNBS. The U.S. EPA reports that LNBS have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

### **Flue Gas Recirculation (FGR)**

Recirculating a portion of the flue gas to the combustion zone can lower the peak flame temperature and result in reduced thermal NO<sub>x</sub> production. The flue gas recirculation (FGR) can be highly effective technique for lowering NO<sub>x</sub> emissions from burners and it's relatively inexpensive to apply. FGR lowers NO<sub>x</sub> emissions in two ways; the cooler, relatively inert, recirculated flue gases act as heat sink, absorbing heat from the flame and lowering peak flame temperatures and when mixed with the combustion air, recirculated flue gases lower the average oxygen content of the air, starving the NO<sub>x</sub>-forming reactions for one of the needed ingredients.

### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

### **Step 2: Eliminate Technically Infeasible Options:**

<b>Technology</b>	<b>BACT Evaluation</b>
Selective Catalytic Reduction (SCR) Technically Feasible – <b>Yes</b>	Selective Catalytic Reduction (SCR) is technically feasible.

Technology	BACT Evaluation
Selective Non-Catalytic Reduction (SNCR) Technically Feasible – <b>No</b>	Riverview will operate at a wide range of load levels, with lower levels potentially unable to provide a temperature profile that maintains the range needed for effective control for sufficient residence time to achieve proper control.  Some ammonia will be emitted.  The combustion units used at Riverview combust a combination of gaseous fuels that are proportionally variable over relatively short time periods and results in short term NOx loading variations. This variability works against the limited temperature flexibility and difficulty of SNCR in adjusting to short term changes maintaining consistent NOx control during operation of these units. For these reasons, the SNCR is technically infeasible.
Low NOx Burner (LNB) Technically Feasible - <b>Yes</b>	LNB/ULNB is technically feasible.
Flue Gas Recirculation (FGR) Technically Feasible – <b>Yes</b>	Flue Gas Recirculation (FGR) is technically feasible.
Good Combustion Practices Technically Feasible – <b>Yes</b>	Good Combustion Practices are technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
LNB/ULNB	40-85%
SCR	70%-90%
SNCR	30%-50%
FGR	15%-50%
Good combustion practices	not determined

**Step 4: Evaluate the Most Effective Controls and Document the Results**

Review of similar sources found in the RBLC database does not identify any cases where good combustion practices were incorporated into a determination of BACT for NOx. The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units (<100 MMBtu/hr) - NOx

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	ULNB ( $\leq 0.030$ lb NOx/MMBtu)	1.67 lb/hr	55.80
		EU-2002 Treat gas heater		1.58 lb/hr	52.80
		EU-2003 Vacuum column feed heater		0.27 lb/hr	9.00
		EU-6000 Boiler		2.06 lb/hr	68.50

Notes:

1. tpy - tons per twelve (12) consecutive months

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 the Best Available Control Technology (PSD BACT), shall be the following:

- (a) The units shall burn only natural gas and process off-gas.

- (b) The units shall use ultra-low-NOx burners.
- (c) NOx emissions shall not exceed:

<b>Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
EU-1007	0.030	1.67
EU-2001	0.030	3.85
EU-2002	0.030	1.58
EU-2003	0.030	0.27
EU-2004	0.030	4.68
EU-6000	0.030	2.06

## **VOC**

### **Step 1: Identify Potential Control Technologies**

VOC emissions can be controlled with the following control technologies:

Post-combustion controls:

- (1) Thermal Oxidation
- (2) Catalytic Oxidation
- (3) Flares

Combustion controls:

- (4) Good Combustion Practices

#### **Post-combustion controls**

Post-combustion controls identified for natural gas combustion units all include systems that supply energy to destroy pollutants through addition of more fuel.

#### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

### **Step 2: Eliminate Technically Infeasible Options**

VOC emissions from boilers/heaters are the result of incomplete fuel combustion. A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice for gas-fired combustion units is the most-commonly cited control for VOC emissions. Natural gas combustion is already efficient. It is possible to achieve VOC reductions from an add-on control device; however, any add-on oxidation control technology would not be cost effective since the VOC concentration in these units is relatively low and supplemental fuel cost would be prohibitive.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

Review of similar sources found in the RBLC database does not identify any cases where good combustion practices were incorporated into a determination of BACT for VOC. The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units (<100 MMBtu/hr) - VOC

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)	
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	-	0.30 lb/hr 0.0054 lb/MMBtu	55.80	
		EU-2002 Treat gas heater		0.29 lb/hr 0.0054 lb/MMBtu	52.80	
		EU-2003 Vacuum column feed heater		0.05 lb/hr 0.0054 lb/MMBtu	9.00	
		EU-6000 Boiler		0.37 lb/hr 0.0054 lb/MMBtu	68.50	
Valero Refining- New Orleans LLC	LA-0213 PSD-LA-619(M5) (11/17/2009)	heater 2008-1 (natural gas and process fuel gas)	comply with 40 CFR 60, Subparts NNN and RRR	-	36.00	
		heater 94-21	gas fuel, good combustion practices	-	48.00

		heater 2008-7			122.00
		heater 2008-9			122.00
		heater/reboiler 6-81	gas fuel, good combustion practices		135.00
Louisiana determination of good combustion practices as BACT is not considered applicable because IDEM finds that the operating permits do not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement.					

**Notes:**

1. tpy - tons per twelve (12) consecutive months

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2 (PSD BACT), IDEM has established the following BACT:

BACT shall be the following:

- (a) The units shall burn only natural gas and process off-gas.
- (b) VOC emissions shall not exceed:

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-1007	0.0054	0.30
EU-2001	0.0054	0.69
EU-2002	0.0054	0.29
EU-2003	0.0054	0.05
EU-2004	0.0054	0.84
EU-6000	0.0054	0.37

**CO**

**Step 1: Identify Potential Control Technologies**

Emissions of carbon monoxide (CO) are generally controlled by oxidation. CO control technologies include:

Post-combustion controls:

- (1) Regenerative thermal oxidation;
- (2) Catalytic oxidation;
- (3) Flares

Combustion controls:

- (4) Good Combustion Practices

### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

### **Step 2: Eliminate Technically Infeasible Options**

Carbon monoxide emissions from boilers and heaters are the result of incomplete fuel combustion. While post-combustion control of CO emissions from an external combustion process may be possible in a physical sense, no demonstrated application of post-combustion control can be found. The EPA Air Pollution Control Cost Manual, 6th ed., (EPA/452/B-02-001, January 2002) has no information about controls for CO. Earlier references, such as Control Techniques for Carbon Monoxide Emissions (EPA-450/3-79-006, June 1979) offer no information about CO controls other than good combustion practices.

One very early reference, Control Techniques for Carbon Monoxide Emissions from Stationary Sources (AP-65, March 1970), notes that "The sources of CO in a petroleum refinery include: catalyst regeneration, coking operations, blanketing gas generators, flares, boilers, and process heaters. Only moving-bed catalyst regenerators and fluid cokers emit significant amounts of CO." The only control AP-65 suggests for CO in these processes, which are not found at Riverview Energy Corporation, are waste heat CO boilers that required a coke-burning rate of 18,000 pounds per hour for a reasonable payout.

In the absence of demonstrated success, post-combustion controls for CO such as RTO's, catalytic oxidation, and flares are considered technically infeasible. A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice and engineering design for gas-fired combustion units is the best control for CO emissions.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary. Good Combustion Practices are a feasible option.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLIC):

Combustion Units (<100 MMBtu/hr) - CO

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	Good combustion practices	2.04 lb/hr 0.0365 lb/MMBtu	55.80
		EU-2002 Treat gas heater		1.93 lb/hr 0.0365 lb/MMBtu	52.80
		EU-2003 Vacuum column feed heater		0.33 lb/hr 0.0365 lb/MMBtu	9.00
		EU-6000 Boiler		2.50 lb/hr 0.0365 lb/MMBtu	68.50
The source has proposed a limit of 0.0365 lb CO/MMBtu, which is more restrictive than the limits established for other sources in SIC code 2911. Therefore, this has been determined to be BACT.					
Conoco Phillips	OK-0136 2007-042-C PSD (2/9/2009)	NH-5 new no. 1 CTU tar stripper heater (refinery gas)	ULNB, good combustion practices	3.92 lb/hr 17.2 tpy 0.04 lb/MMBtu	98.00
		NH-3 new no. 4 CTU vacuum heater		1.80 lb/hr 7.90 tpy 0.04 lb/MMBtu	45.00
This entry includes the most restrictive work practices. Therefore, this has been determined to be BACT.

		HGT reactor charge heater		0.20 lb/hr 0.80 tpy 0.080 lb/MMBtu	2.22	
Facility was not built and limitations were never tested, therefore this source is not considered in establishing BACT.						

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Louisiana and Wyoming determinations of good combustion practices as BACT are not considered applicable because IDEM finds that the operating permits do not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement. Oklahoma BACT requirement for good combustion practices is control of excess oxygen, which IDEM considers as requiring the use of oxygen trim systems on each unit. Pennsylvania permit requirements for good combustion practices and any related monitoring or record keeping requirements were not found for review. Texas requirements in the draft determination cited were consistent with Oklahoma.					

Notes:

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

Combustion Units (>100 MMBtu/hr) - CO

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-2001 Feed heater	Good combustion practices	4.69 lb/hr 0.0365 lb/MMBtu	128.40
		EU-2004 Fractionator heater		5.69 lb/hr 0.0365 lb/MMBtu	156.00
The source has proposed a limit of 0.0365 lb CO/MMBtu, which is more restrictive than the limits established for other sources in SIC code 2911. Therefore, this has been determined to be BACT.

		Boilers C & D			
This source is in SIC code 2821, therefore this entry is not considered as establishing BACT for the proposed source, which is in SIC code 2911					
Louisiana and Wyoming determinations of good combustion practices as BACT are not considered applicable because IDEM finds that the operating permits do not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement. Pennsylvania permit requirements for good combustion practices and any related monitoring or record keeping requirements were not found for review. Pennsylvania requirement for good combustion practices considered as consistent with Oklahoma and Texas requirements cited in the table above for units <100 MMBtu/hr.					

**Notes:**

1. *tpy* - tons per twelve (12) consecutive months
2. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 the Best Available Control Technology (PSD BACT), shall be the following:

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall use good combustion practices. Good combustion practices shall include the installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.
- (c) CO emissions shall not exceed:

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-1007	0.0365	2.04
EU-2001	0.0365	4.69
EU-2002	0.0365	1.93
EU-2003	0.0365	0.33
EU-2004	0.0365	5.69
EU-6000	0.0365	2.50

**GHGs**

**Step 1: Identify Potential Control Technologies**

- (1) Energy efficiency measures
- (2) Post-combustion CO<sub>2</sub> capture and sequestration (CCS).

## **Step 2: Eliminate Technically Infeasible Options**

### **Energy efficiency measures**

An opportunity for reducing GHG emissions is to increase the energy efficiency. Because CO<sub>2</sub> emissions are a direct result of the amount of fuel fired (for a given fuel), the more efficient the process, the less fuel that is required and the less greenhouse gas emissions that result. Some energy efficiency measures that may be applied include the following:

#### **Coal Moisture Control**

The VCC process requires coal with specific properties in order to operate efficiently. Maintaining tight coal specifications to keep moisture to low levels would reduce energy requirements, and therefore reduce emissions.

#### **General Measures**

Some energy efficiency measures are built into combustion units, to the greatest possible extent, at the design stage. These are taken to include specification of refractories and insulating materials, and details of burners, combustion chambers, and heat exchangers. Design for the highest practical energy efficiency may be taken as a universal element of combustion systems because, if for no other reason, of the owner's interest in achieving the maximum energy recovery from the value of the fuel.

Systems to monitor and track performance of critical equipment and processes can help optimize operation. Using this information, research on machinery and equipment can be conducted, as could energy efficiency studies and other measures such as predictive maintenance. Scheduled preventive maintenance and rotation of redundant equipment helps minimize equipment downtime and optimize operation. Training programs appropriate to the functions of operating and maintenance personnel and good housekeeping programs as an element of preventive maintenance planning help decrease energy consumption.

Combustion equipment tune ups that may be required by applicable regulations, such as 40 CFR 63, Subpart DDDDD, contribute to achieving and maintaining the greatest possible level of energy efficiency. Such a requirement for tune ups, if applicable to a fuel gas combustion unit, is incorporated in permit conditions implementing the underlying regulation. Details of tune up requirements may not be included in permit BACT conditions if the requirements are easily found in other sections of a permit.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of energy efficiency is a technically feasible option for the heaters and boiler at this source.

### **Post-combustion CO<sub>2</sub> capture and sequestration (CCS)**

Post-combustion CO<sub>2</sub> capture is a relatively new concept. In EPA's recent GHG BACT guidance, EPA takes the position that, "for the purpose of a BACT analysis for GHGs, EPA classifies CCS as an add-on pollution control technology that is "available" for large CO<sub>2</sub>-emitting facilities including fossil fuel-fired power plants and industrial facilities with high-purity CO<sub>2</sub> streams". However, the heaters and boiler at Riverview do not fit into either of these categories. The EPA guidance document provides little specific guidance on whether or how to consider CCS in situations outside of the above quoted examples. However, some guidance specific to medium-sized natural gas boilers appears in its guidance document which presents an example GHG BACT analysis for a 250 MMBtu/hr natural gas fired boiler. In this EPA boiler example, carbon capture isn't listed or considered in the BACT analysis as a potentially available option.

Natural gas combustion heater/boiler exhaust streams have relatively low CO<sub>2</sub> concentrations (6-9% versus 12-15% for coal-boilers and >30% for high concentration industrial gas streams). This means that for a natural gas heater/boiler, a very large volume of gas needs to be treated to recover the CO<sub>2</sub>. Additionally, the low concentration and low pressure complicate the absorption and desorption of the CO<sub>2</sub>, which increases the energy required. Also, a low pressure absorption system creates a low

pressure CO<sub>2</sub> stream which requires a very high energy demand for compression prior to transport. All these factors make the application of CO<sub>2</sub> capture on any natural gas combustion exhaust extremely difficult and expensive. Additionally, the cost of capturing CO<sub>2</sub> for smaller sources is more expensive due to the lack of economy-of-scale.

The CO<sub>2</sub> must be reused or liquefied, transported and stored. Pipelines are the most common. The CO<sub>2</sub> must be compressed to high pressures, which requires considerable energy consumption. At this time, existing infrastructure to support the transportation of CO<sub>2</sub> does not exist. Therefore, transportation of the CO<sub>2</sub> stream would require the construction of a pipeline to the nearest sequestration site.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of post-combustion CO<sub>2</sub> capture is not a technically or economically feasible option for the operations at this source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units - CO<sub>2</sub>e

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	energy efficiency, good combustion practices, and gaseous fuel	29,127 tons/yr	55.80
		EU-2001 Feed heater		67,023 tons/yr	128.40
		EU-2002 Treat gas heater		27,561 tons/yr	52.80
		EU-2003 Vacuum column feed heater		4,698 tons/yr	9.00
		EU-2004 Fractionator heater		81,430 tons/yr	156.00
		EU-6000 Boiler		35,756 tons/yr	68.50
Production-based limits, e.g., lb/MMBtu or lb/1000 lb steams, cannot be considered as establishing BACT for the proposed source because of differences in fuel heating values and unit efficiencies, and because not all units are steam-generating equipment.					
Exxon Mobil Oil Corp.	TX-0832 PSDTX768M 1, PSDTX799, PSDTX802 (1/9/2018)	F-2001 kero HDT charge heater & F-2002 kero HDT stripper reboilers	stack temp 600°F, good combustion practices	-	85.50
		F-3001 diesel DHDT charge heater and F-3002 diesel DHDT stripper reboiler			66.50
This RBLC entry is labeled as draft, therefore limits are is not considered as establishing BACT for the proposed source because the limits have not been tested.

Lima Refining Co.	OH-0362 P0114527 (12/23/2013)	Vacuum unit II heater	low carbon gaseous fuel, good combustion practices	-	102.30	

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Louisiana determinations of good combustion practices as BACT are not considered applicable because IDEM finds that the operating permits do not incorporate monitoring and record keeping conditions that demonstrate compliance with the BACT requirement. Oklahoma BACT requirement for microprocessor control is considered as requiring the use of oxygen trim systems on each unit. Ohio requirement for good combustion practices is control of excess oxygen, which IDEM also considers as an oxygen trim system. Texas requirements in the draft determination cited were consistent with Oklahoma and Ohio.					

**Notes:**

1. *tpy - tons per twelve (12) consecutive months*

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 the Best Available Control Technology (PSD BACT), shall be the following:

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall be designed and operated to achieve the highest practical energy efficiency.
- (c) The units shall use good combustion practices. Good combustion practices shall include the installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.
- (d) CO<sub>2e</sub> emissions shall not exceed the value of tons per twelve (12) consecutive month period shown in the table below:

Emission Limitations	
Unit ID	CO <sub>2e</sub> Limit
EU-1007	29,127
EU-2001	67,023
EU-2002	27,561
EU-2003	4,698
EU-2004	81,430
EU-6000	35,756

**BACT Analysis  
 Sulfur Recovery/Tail Gas Treatment Unit (TGTU)**

The sulfur recovery process converts H<sub>2</sub>S (from the amine regeneration process and sour water stripping process) to elemental sulfur. In this case, the Claus process is used. Feed gases are burned with sufficient air to combust some of the H<sub>2</sub>S to promote the Claus reactions. This process creates emissions.

**PM/PM<sub>10</sub>/PM<sub>2.5</sub>**

The tail gas treatment units are the expected source and emission point of particulate matter emissions within the sulfur recovery process. Processing steps intended to maximize sulfur production recover sulfur in gas streams in the form of acid gas that is recycled to the start of the Claus train. The mechanism generating particulate matter is the combustion of gas fuel in the tail gas incinerators. The observation about mechanism is consistent with permit actions in other states, e.g., note to condition 10.b)(2)e, Ohio final PTI no. P0111667, BP-Husky Refining LLC, 9/20/2013, RBLC ID No. OH-0357, "The burning of gaseous fuels is the only source of PE from this emissions unit".

**Step 1: Identify Potential Control Technologies**

PM/PM<sub>10</sub>/PM<sub>2.5</sub> emissions can be controlled with the following control technologies:

- (1) Good Combustion Practices

**Step 2: Eliminate Technically Infeasible Options**

A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practices is the only control for PM/PM<sub>10</sub>/PM<sub>2.5</sub> emissions applied to Claus TGTU incinerators. Good combustion practices are a technically feasible option.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - PM/PM<sub>10</sub>/PM<sub>2.5</sub>

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners, good combustion practices	PM (filterable): 0.0019 lb/MMBtu 0.10 lb/hr, each PM10/PM2.5: 0.0074 lb/MMBtu 0.39 lb/hr (each) 10% opacity	111 (max, ea) 159 (comb, bottle-necked)
BP Products, North America	OH-0357 P0111667 (9/20/2013)	Claus SRU (incinerator)	None	PM10: 0.6 lb/hr 1.74 tpy based on AP-42, 7.6 lb/MMscf (equivalent to 0.0074 lb/MMBtu)	120 (32.15 MMBtu/hr)
This is the most stringent limit for PM10. Therefore, it has been determined to be BACT for PM10 and PM2.5.					
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-nox burners	PM10: 1.36 lb/hr and 5.96 tpy (12-month rolling avg.) and 0.08 lb/MMBtu 10% opacity (6-min avg.)	17 MMBtu/hr
This is the most stringent limit for opacity, therefore it has been included in BACT.					
Conoco Phillips Co.	MT-0030 2619-24 (11/19/2008)	Claus SRU TGTU	Proper equipment design, good combustion practices and use gaseous fuels	PM10: 6.26 lb/hr 186.3 lb/day 27.42 tpy	235
This is the most stringent limitation on design and operating practice, therefore it has been included in BACT. The RBLC entry does not include numeric limits on particulate matter, however the PM10 limit shown appears in the permit as applicable after completion of the project for which the permit cited was issued. The referenced permit does not appear to include a definition of "good combustion practices", however the BACT requirement is supported by testing requirements.					
CHS McPherson Refinery Inc	KS-0032 C-13055 (12/12/2015)	Sulfur Recovery Plant	ATS units	PM: 3.67 lb/hr PM10: 7.76 lb/hr	-
Not considered a representative comparison. PM/PM10 emissions from the sulfur recovery plant at this source are controlled by a mist eliminator. Ammonium thiosulfate (ATS) is produced by reacting elemental sulfur from a Claus system with ammonia, emissions are therefore not representative of a Claus TGTU. Permit cited does not appear to be available on line.					

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	VE: 20% Opacity PM10: 0.2 lb/hr (0.85 tpy) (AP-42)	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					

**Notes:**

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

**Step 5: Select BACT**

IDEM, OAQ has established PM/PM<sub>10</sub>/PM<sub>2.5</sub> BACT for TGTUA and TGTUB as:

- (a) PM (filterable) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0019 lb/MMBtu and 0.10 lb/hr, each.
- (b) PM<sub>10</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (c) PM<sub>2.5</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (d) Opacity shall not exceed ten percent (10%) on a six-minute average.
- (e) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.

**SO<sub>2</sub>**

**Step 1: Identify Potential Control Technologies**

The source selected the Claus sulfur recovery process to produce a product for sale from sulfur and its compounds that are found in the coal supply. The review of emissions control processes is therefore limited to options appropriate to Claus process tail gas. Manufacture of a different product for sale, such as ammonium thiosulfate, from elemental sulfur produced in a Claus process is not considered a different control technology, but only additional downstream processing that is not relevant to control of emissions from the sulfur recovery process. Tail gas treatment units (TGTU) are a possible control technology for the Claus process exhaust gas.

**Step 2: Eliminate Technically Infeasible Options**

A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates that a Claus unit equipped with a TGTU is the most stringent control technology for SO<sub>2</sub> emissions from a Claus SRU. The SCOT (Shell Claus off-gas treating) process named in one RBLC entry is a variant of tail gas treatment considered functionally the same as the process proposed by the source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - SO<sub>2</sub>**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners	150 ppmv @ 0% O <sub>2</sub> (annual) 167 ppmv @ 0% O <sub>2</sub> (12-hour avg) 26.30 lb/hr (ea)	111 (max, ea) 159 (comb, bottle-necked)
Conoco Phillips Co.	MT-0030 2619-24 (11/19/2008)	Claus SRU TGTU	TGTU	150 ppmv @ 0% O <sub>2</sub> (annual) 167 ppmv @ 0% O <sub>2</sub> (12-hour avg)	235
This is the most stringent limit for SO <sub>2</sub> - considered more restrictive than higher ppmv limits with specified control efficiencies. Therefore, this has been determined to be BACT.					
CHS McPherson Refinery Inc	KS-0032 C-13055 (12/12/2015)	Sulfur Recovery Plant	ATS units	90 ppmvd @ 0% O <sub>2</sub> (24 hr avg) SO <sub>2</sub> CEMS	-
Not considered a representative comparison. PM/PM10 emissions from the sulfur recovery plant at this source are controlled by a mist eliminator. Ammonium thiosulfate (ATS) is produced by reacting elemental sulfur from a Claus system with ammonia, emissions are therefore not representative of a Claus TGTU. Permit cited does not appear to be available on line.

Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Sunoco	PA-0256 06144 (1/29/2008)	Sulfur Recovery Unit	Tail gas combustion unit	250 ppm 31.72 lb/hr	
Navajo Refining	NM-0050 PSD-NM-195-M25 (12/14/2007)	Sulfur Recovery Unit	Tail gas incinerator	192 ppmv @ 0% O2 (12-hr rolling avg. and 365 day rolling avg.)	
Texstar	TX-0501 6051, PSD-TX-55M3 (7/11/2006)	Tail gas incinerator stack	-	350.0 lb/hr 1095.0 tpy	

**Step 5: Select BACT**

IDEM, OAQ has established SO<sub>2</sub> BACT for TGTUA and TGTUB as:

- (a) The SO<sub>2</sub> emissions from each tail gas treatment unit stack (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).
- (b) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 26.30 lb/hr, each.

**NOx**

NOx is generated from the combustion of fuel gas in the SRU tail gas thermal oxidizer.

**Step 1: Identify Potential Control Technologies**

As a combustion source, NOx emissions from the TGTU can be controlled with control technologies that are feasible for combustion sources, including:

- (1) Selective Catalytic Reduction (SCR)
- (2) Selective Non-Catalytic Reduction (SNCR)

Combustion controls:

- (3) Low NOx Burner (LNB)/Ultra low-Nox burner (ULNB)
- (4) Flue Gas Recirculation (FGR)
- (5) Good Combustion Practices

**Selective Catalytic Reduction (SCR)**

Selective Catalytic Reduction (SCR) process involves the mixing of anhydrous or aqueous ammonia vapor with flue gas and passing the mixture through a catalytic reactor to reduce NO<sub>x</sub> to water and N<sub>2</sub>. Under optimal conditions, SCR has a removal efficiency up to 90% when used on steady state processes. The efficiency of removal will be reduced for processes that are not stable or require frequent changes in the mode of operation.

The most important factor affecting SCR efficiency is temperature. SCR can operate in a flue gas window ranging from 480°F to 800°F, although the optimum temperature range depends on the type of catalyst and the flue gas composition. In this particular service, the minimum target temperature is approximately 750°F. Temperatures below the optimum decrease catalyst activity and allow ammonia to slip through; above the optimum range, ammonia will oxidize to form additional NO<sub>x</sub>. Flue gas temperatures for the process fuel gas-fired units range generally from 400°F to 525°F, with one unit (EU-2003) expected to operate at 800°F. Because of the non-optimum temperatures, IDEM assigns a low control efficiency to SCR in this application. SCR efficiency is also largely dependent on the stoichiometric molar ratio of NH<sub>3</sub>:NO<sub>x</sub> because variation of the ideal 1:1 ratio to 0.5:1 ratio can reduce the removal efficiency to 50%.

### **Selective Non-Catalytic Reduction (SNCR)**

With selective non-catalytic reduction (SNCR), NO<sub>x</sub> is selectively removed by the injection of ammonia or urea into the flue gas at an appropriate temperature window of 1600°F to 2000°F, without employing a catalyst. Similar to SCR without a catalyst bed, the injected chemicals selectively reduce the NO<sub>x</sub> to molecular nitrogen and water. This approach avoids the problem related to catalyst fouling but the temperature window and reagent mixing residence time is critical for conducting the necessary chemical reaction.

At the proper temperature, urea decomposes to produce ammonia which is responsible for NO<sub>x</sub> reduction. At a higher temperature, the rate of competing reactions for the direct oxidation of ammonia that forms NO<sub>x</sub> becomes significant. At a lower temperature, the rates of NO<sub>x</sub> reduction reactions become too slow resulting in urea slip (i.e. emissions of unreacted urea).

Optimal implementation of SNCR requires the employment of an injection system that can accomplish thorough reagent/gas mixing within the temperature window while accommodating spatial and production rate temperature variability in the gas stream. The attainment of maximum NO<sub>x</sub> control performance requires that the furnace exhibit a favorable opportunity for the application of this technology relative to the location of the reaction temperature range and steady operation within that temperature window.

### **Low NO<sub>x</sub> Burners (LNB)**

Using LNB can reduce formation of NO<sub>x</sub> through careful control of the fuel-air mixture during combustion. Control techniques used in LNBs includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NO<sub>x</sub> emissions can be realized using LNBs. The U.S. EPA reports that LNBs have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

### **Flue Gas Recirculation (FGR)**

Recirculating a portion of the flue gas to the combustion zone can lower the peak flame temperature and result in reduced thermal NO<sub>x</sub> production. The flue gas recirculation (FGR) can be highly effective technique for lowering NO<sub>x</sub> emissions from burners and it's relatively inexpensive to apply. FGR lowers NO<sub>x</sub> emissions in two ways; the cooler, relatively inert, recirculated flue gases act as heat sink, absorbing heat from the flame and lowering peak flame temperatures and when mixed with the combustion air, recirculated flue gases lower the average oxygen content of the air, starving the NO<sub>x</sub>-forming reactions for one of the needed ingredients.

### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

**Step 2: Eliminate Technically Infeasible Options**

Technology	BACT Evaluation
Selective Catalytic Reduction (SCR) Technically Feasible – <b>No</b>	TGTU oxidizer exhaust gases may contain SO <sub>2</sub> that would poison reduction catalysts.
Selective Non-Catalytic Reduction (SNCR) Technically Feasible – <b>No</b>	TGTU oxidizers may not achieve high enough temperatures for the SNCR reaction and the presence of sulfur may result in unwanted side reactions producing ammonium sulfur salts rather than the desired NO <sub>x</sub> reduction reaction.
Low NO <sub>x</sub> Burner (LNB) Technically Feasible - <b>Yes</b>	LNB/ULNB is technically feasible.
Flue Gas Recirculation (FGR) Technically Feasible – <b>Yes</b>	Flue Gas Recirculation (FGR) is technically feasible.
Good Combustion Practices Technically Feasible – <b>Yes</b>	Good combustion practices are technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
LNB/ULNB	40-85%
FGR	15%-50%
Good combustion practices	not determined

**Step 4: Evaluate the Most Effective Controls and Document the Results**

Ultra-low NO<sub>x</sub> burners are considered to offer higher control efficiency than other post-combustion controls. Review of similar sources found in the RBLC database does not identify any cases where good

combustion practices were incorporated into a determination of BACT for NOx. The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - NOx

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners, good combustion practices	0.1 lb/MMBtu 5.28 lb/hr, each	111 (max, ea) 159 (comb, bottle-necked)
BP Products, North America	OH-0357 P0111667 (9/20/2013)	Claus SRU	Low NOx burners	4.4 lb/hr 12.76 tpy (0.1 lb/MMBtu)	120 (32.15 MMBtu/hr)
This is the most stringent limit for NOx. Therefore, this has been determined to be BACT.					
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-NOx burners	2.55 lb/hr 11.17 tpy (12-month rolling avg.) 0.15 lb/MMBtu	17 MMBtu/hr
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	1224 lb/hr 7.35 tpy	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Conoco Phillips Co.	MT-0030 2619-24 (11/19/2008)	Claus SRU TGTU	Thermal Oxidizer with low NOx burner	none	235
Texstar	TX-0501 6051, PSD-TX-55M3 (7/11/2006)	Tail gas incinerator stack	-	8.46 lb/hr 37.05 tpy	

**Notes:**

1. tpy - tons per twelve (12) consecutive months

**Step 5: Select BACT**

IDEM, OAQ has established NOx BACT for TGTUA and TGTUB as:

- (a) The tail gas treatment units (TGTUA and TGTUB) shall each use low-NOx burners.
- (b) NOx emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.10 lb/MMBtu and 5.28 lb/hr, each.

**VOC**

In normal operations, the heat demand of the sulfur recovery process is supplied by combustion of hydrogen sulfide in the acid gas furnace. Natural gas is used to heat the acid gas furnace to operating temperatures before H<sub>2</sub>S is supplied to begin sulfur recovery processing. In normal operation the acid gas furnace is not a VOC source because the acid gas stream does not contain carbon compounds.

The TGTU thermal oxidizer always operates with a natural gas fuel supply.

### **Step 1: Identify Potential Control Technologies**

VOC emissions from natural gas combustion are the result of incomplete fuel combustion. VOC emissions can be controlled with the following control technologies:

Post-combustion Controls:

- (1) Thermal Oxidation
- (2) Catalytic Oxidation
- (3) Flares

Combustion controls:

- (4) Good Combustion Practices

#### **Post-combustion controls**

Post-combustion controls identified for natural gas combustion units all include systems that supply energy to destroy pollutants through addition of more fuel.

#### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

### **Step 2: Eliminate Technically Infeasible Options**

A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice for gas-fired combustion units is the most-commonly cited control for VOC emissions. Natural gas combustion is already efficient. It is possible to achieve VOC reductions from an add-on control device; however, any add-on oxidation control technology would not be cost effective since the VOC concentration in these units is relatively low and supplemental fuel cost would be prohibitive.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

Review of similar sources found in the RBLC database does not identify any cases where good combustion practices were incorporated into a determination of BACT for VOC. The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - VOC**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners	0.0054 lb/MMBtu 0.28 lb/hr, each	111 (max, ea) 159 (comb, bottle-necked)
The source has proposed limiting VOC to 0.0054 lb/MMBtu, which is more restrictive than other sources found in the RBLC. Therefore this has been determined to be BACT for the proposed source.					
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-nox burners	0.89 lb/hr 3.89 tpy (12-month rolling avg.) (equivalent to 0.052 lb/MMBtu) 60 ppmvd @ 0% O2	17 MMBtu/hr
BP Products, North America	OH-0357 P0111667 (9/20/2013)	Claus SRU	None	6.2 tpy each (equivalent to 0.04 lb/MMBtu)	120 (32.15 MMBtu/hr)
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	0.2 lb/hr (0.85 tpy) (AP-42)	23.5 ton/hr
Note: Source was not constructed and it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Conoco Phillips	IL-0103 06050052 (8/5/2008)	Sulfur Recovery Units E and F	Good combustion practices for thermal oxidizers on tail gas treating unit	VOC: 0.005 lb/MMBtu (3-hr avg.)	
This RBLC entry is identified as LAER, therefore it is not considered as establishing BACT for the proposed source.					

**Notes:**

1. tpy - tons per twelve (12) consecutive months

**Step 5: Select BACT**

IDEM, OAQ has established VOC BACT for TGTUA and TGTUB as:

- (a) VOC emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0054 lb/MMBtu and 0.28 lb/hr, each.

**CO**

In normal operations, the heat demand of the sulfur recovery process is supplied by combustion of hydrogen sulfide in the acid gas furnace. Natural gas is used to heat the acid gas furnace to operating temperatures before H<sub>2</sub>S is supplied to begin sulfur recovery processing. In normal operation the acid gas furnace is not a CO source because the acid gas stream does not contain carbon compounds.

The TGTU thermal oxidizer always operates with a natural gas fuel supply.

**Step 1: Identify Potential Control Technologies**

Emissions of carbon monoxide (CO) are generally controlled by oxidation. CO control technologies include:

Post-combustion controls:

- (1) Regenerative thermal oxidation;

- (2) Catalytic oxidation;
- (3) Flares

Combustion controls:

- (4) Good Combustion Practices

### **Post-combustion controls**

Post-combustion controls identified for natural gas combustion units all include systems that supply energy and oxygen to complete the combustion of CO to CO<sub>2</sub>.

### **Good Combustion Practices**

Good combustion practices are a form of preventive controls that may have only a small effect on pollutant formation except in combination with other controls. Some principles of good combustion practice are taken as incorporated at the equipment design stage, such as proper design of burners and firebox components and ensuring adequate residence time. Other principles, such as minimizing air infiltration and maintaining equipment in accordance with a manufacturer's specification, may be taken as incorporated into the preventive maintenance plan for a unit. The element of good combustion practices that may have the most direct effect, and that may be considered as a control technology, is the control of the fuel-to-air combustion ratio, which can be achieved manually through tuneups as required by the NESHAP, 40 CFR 63, Subpart DDDDD or through control equipment such as an oxygen trim system.

### **Step 2: Eliminate Technically Infeasible Options**

Carbon monoxide emissions from boilers and heaters are the result of incomplete fuel combustion. While post-combustion control of CO emissions from an external combustion process may be possible in a physical sense, no demonstrated application of post-combustion control can be found. The EPA Air Pollution Control Cost Manual, 6th ed., (EPA/452/B-02-001, January 2002) has no information about controls for CO. Earlier references, such as Control Techniques for Carbon Monoxide Emissions (EPA-450/3-79-006, June 1979) offer no information about CO controls other than good combustion practices.

One very early reference, Control Techniques for Carbon Monoxide Emissions from Stationary Sources (AP-65, March 1970), notes that "The sources of CO in a petroleum refinery include: catalyst regeneration, coking operations, blanketing gas generators, flares, boilers, and process heaters. Only moving-bed catalyst regenerators and fluid cokers emit significant amounts of CO." The only control AP-65 suggests for CO in these processes, which are not found at Riverview Energy Corporation, are waste heat CO boilers that required a coke-burning rate of 18,000 pounds per hour for a reasonable payout.

In the absence of demonstrated success, post-combustion controls for CO such as RTO's, catalytic oxidation, and flares are considered technically infeasible. A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice and engineering design for gas-fired combustion units is the best control for CO emissions.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary. Good combustion practices are a feasible option.

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - CO

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners, Good Combustion Practices	0.082 lb/MMBtu 4.33 lb/hr, each 65 ppmvd @ 0% O2 (30-day rolling avg.) CO CEMS	111 (max, ea) 159 (comb, bottle-necked)
BP Products, North America	OH-0357 P0111667 (9/20/2013)	Claus SRU	None	2.7 lb/hr each 8.07 tpy 84 lb/MMscf (equivalent to 0.082 lb/MMBtu)	120 (32.15 MMBtu/hr)
Chevron Products	MS-0089 1280-00058 (4/14/2009)	Tail Gas Treating Units for SRU IV, V, and VI	Two low-NOx thermal oxidizers	22.75 lb/hr (3-hr rolling avg.), 99.7 tpy (12-month rolling avg.) 65 ppmvd @ 0% O2 (30-day rolling avg.) CO CEMS	1,220
Conoco Phillips	IL-0103 06050052 (8/5/2008)	Sulfur Recovery Units E and F	Good combustion practices for thermal oxidizers on tail gas treating unit	0.082 lb/MMBtu	
These are the most stringent limits for CO. Therefore, these have been determined to be BACT. Language regarding good combustion practices in the referenced permit for Conoco Phillips cannot be verified, but is accepted as establishing BACT for that source.					
Chevron Products	MS-0089 1280-00058 (4/14/2009)	Sulfur Recovery Units II and III	Two low-NOx thermal oxidizers	16.92 lb/hr (3-hr rolling avg.) 49.42 tpy (12-month rolling avg.) 100 ppmvd @ 0% O2 (30-day rolling avg.) CO CEMS	290
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-nox burners	2.59 lb/hr 11.34 tpy (12-month rolling avg.) 0.15 lb/MMBtu incinerator	17 MMBtu/hr
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	52.5 lb/hr (incineration of tail gas, each unit) 0.32 tpy 3 startup/shutdown events per year for each unit	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Texstar	TX-0501 6051, PSD-TX-55M3 (7/11/2006)	Tail gas incinerator stack	-	3.69 lb/hr 15.9 tpy	
The source is a natural gas liquids facility in SIC code 132 (sic) (also provides NAICS code of 221210), therefore this entry should not be considered as establishing BACT for the proposed source.					

Notes:

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

### **Step 5: Select BACT**

IDEM, OAQ has established CO BACT for TGTUA and TGTUB as:

- (a) CO emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 65 ppmv @ 0% O<sub>2</sub>, shall not exceed 0.082 lb/MMBtu and 4.33 lb/hr, each.
- (b) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.

### **GHGs**

#### **Step 1: Identify Potential Control Technologies**

- (1) Energy efficiency measures
- (2) Post-combustion CO<sub>2</sub> capture and sequestration (CCS).

#### **Step 2: Eliminate Technically Infeasible Options**

##### **Energy efficiency measures**

An opportunity for reducing GHG emissions is to increase the energy efficiency. Because CO<sub>2</sub> emissions are a direct result of the amount of fuel fired (for a given fuel), the more efficient the process, the less fuel that is required and the less greenhouse gas emissions that result. Energy efficiency measures that can be applied include the following:

Some energy efficiency measures are built into combustion units, to the greatest possible extent, at the design stage. These are taken to include specification of refractories and insulating materials, and details of burners, combustion chambers, and heat exchangers. Design for the highest practical energy efficiency may be taken as a universal element of combustion systems because, if for no other reason, of the owner's interest in achieving the maximum energy recovery from the value of the fuel.

Systems to monitor and track performance of critical equipment and processes can help optimize operation. Using this information, research on machinery and equipment can be conducted, as could energy efficiency studies and other measures such as predictive maintenance. Scheduled preventive maintenance and rotation of redundant equipment helps minimize equipment downtime and optimize operation. Training programs appropriate to the functions of operating and maintenance personnel and good housekeeping programs as an element of preventive maintenance planning help decrease energy consumption.

Combustion equipment tune ups that may be required by applicable regulations, such as 40 CFR 63, Subpart DDDDD, contribute to achieving and maintaining the greatest possible level of energy efficiency. Such a requirement for tune ups, if applicable to a fuel gas combustion unit, is incorporated in permit conditions implementing the underlying regulation. Details of tune up requirements may not be included in permit BACT conditions if the requirements are easily found in other sections of a permit.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of energy efficiency is a technically feasible option for the heaters and boiler at this source.

##### **Post-combustion CO<sub>2</sub> capture and sequestration (CCS)**

Post-combustion CO<sub>2</sub> capture is a relatively new concept. In EPA's recent GHG BACT guidance, EPA takes the position that, "for the purpose of a BACT analysis for GHGs, EPA classifies CCS as an add-on pollution control technology that is "available" for large CO<sub>2</sub>-emitting facilities including fossil fuel-fired power plants and industrial facilities with high-purity CO<sub>2</sub> streams". However, the heaters and boiler at Riverview do not fit into either of these categories. The EPA guidance document provides little specific guidance on whether or how to consider CCS in situations outside of the above quoted examples. However, some guidance specific to medium-sized natural gas boilers appears in its guidance document which presents an example GHG BACT analysis for a 250 MMBtu/hr natural gas fired boiler. In this EPA boiler example, carbon capture isn't listed or considered in the BACT analysis as a potentially available option.

Natural gas combustion heater exhaust streams have relatively low CO<sub>2</sub> concentrations (6-9% versus 12-15% for coal-boilers and >30% for high concentration industrial gas streams). This means that for a natural gas heater, a very large volume of gas needs to be treated to recover the CO<sub>2</sub>. Additionally, the low concentration and low pressure complicate the absorption and desorption of the CO<sub>2</sub>, which increases the energy required. Also, a low pressure absorption system creates a low pressure CO<sub>2</sub> stream which requires a very high energy demand for compression prior to transport. All these factors make the application of CO<sub>2</sub> capture on any natural gas combustion exhaust extremely difficult and expensive. Additionally, the cost of capturing CO<sub>2</sub> for smaller sources is more expensive due to the lack of economy-of-scale.

The CO<sub>2</sub> must be reused or liquefied, transported and stored. Pipelines are the most common. The CO<sub>2</sub> must be compressed to high pressures, which requires considerable energy consumption. At this time, existing infrastructure to support the transportation of CO<sub>2</sub> does not exist. Therefore, transportation of the CO<sub>2</sub> stream would require the construction of a pipeline to the nearest sequestration site.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of post-combustion CO<sub>2</sub> capture is not a technically or economically feasible option for the operations at this source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):  
 Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - CO<sub>2</sub>e

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners, energy efficiency	40,872 tpy (combined)	111 (max, ea) 159 (comb, bottle-necked)
BACT proposed by the source. Tons per year limits at other sources are not considered applicable because unit capacities are not available for comparison.					
Dakota Prairie Refining	ND-0031 PTC12090 (2/21/2013)	Sulfur recovery unit	none	1137 tpy	

Notes:

1. tpy - tons per twelve (12) consecutive months

2. Energy efficiency is demonstrated by the application of good combustion practices including installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, and periodic tuneups that are required for units subject to 40 CFR 63, Subpart DDDDD.

**Step 5: Select BACT**

IDEM, OAQ has established GHG BACT for TGTUA and TGTUB as:

- (a) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.
- (b) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include installation and operation of an oxygen trim system, as defined at 40 CFR 63.7575, on each fuel gas combustion unit.

**Sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) mist**

**Step 1: Identify Potential Control Technologies**

Wet scrubbers using water or caustic solutions are a possible control technology for acid mists.

**Step 2: Eliminate Technically Infeasible Options**

The tail gas treatment unit returns acid gas to the acid gas furnace upstream of the Claus reactors to recover sulfur to the highest practical degree. Because of the extremely low concentration of sulfuric acid mist in the TGTU thermal oxidizer exhaust and the high temperature of the gas stream, the overall mass transfer driving force is considered too low for practical application.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - H<sub>2</sub>SO<sub>4</sub> mist**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners	H <sub>2</sub> SO <sub>4</sub> : 0.0244 lb/MMBtu and 1.29 lb/hr, each (equivalent to 0.28 lb/long ton S)	111 (max, ea) 159 (comb, bottle-necked)
Limits proposed by the source for sulfuric acid mist are more restrictive than any found in RBLC, therefore these are selected as BACT.					
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	H <sub>2</sub> SO <sub>4</sub> : 2.37 lb/hr (10.4 tpy) (equivalent to 0.10 lb/long ton)	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					

### **Step 5: Select BACT**

IDEM, OAQ has established sulfuric acid mist BACT for TGTUA and TGTUB as:

- (a) Sulfuric Acid Mist ( $H_2SO_4$  mist) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0244 lb/MMBtu and 1.29 lb/hr, each.

<b>BACT Analysis Flares</b>
---------------------------------

### **Step 1: Identify Potential Control Technologies**

The following control technologies have been identified to control emissions from the flare:

- (1) Flare design and good combustion practices;
- (2) Process flaring minimization practices; and
- (3) Flare Gas Recovery.

Add-on controls typically have not been utilized on flares.

### **Step 2: Eliminate Technically Infeasible Options**

Flare design and good combustion practices

Flare design, good combustion practices and monitoring are key elements in emissions performance of flares. The flare must be properly operated and maintained in order to achieve the anticipated emission rates guaranteed by the flare manufacturer.

The use of proper flare design and good combustion practices is a technically feasible control option.

Process flaring minimization practices

To the extent actions can be taken to minimize the volume of gas going to the flare, emissions of CO will be less. Flaring minimization practices are feasible and are evaluated in the analysis of BACT.

The use of process flaring minimization practices is a technically feasible control option.

Flare Gas Recovery

Flare gas recovery is not a feasible option. These flares do not operate constantly; only the pilot flame does. There would not be anything to recover except in the rare case of a process upset – which would preclude the use of any heat recovered.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Flare - PM/PM<sub>10</sub>/PM<sub>2.5</sub>

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (MMBtu/hr)
Riverview Energy	Proposed	Loading flare	Operate in accordance with 40 CFR 60.18 Implement a Flare Management Plan as required by 40 CFR 60, Subpart Ja	sweep & pilot operation: use gaseous fuel PM (filterable): 0.0019 lb/MMBtu SB: 1.62E-03 lb/hr LP: 0.014 lb/hr HP: 0.014 lb/hr loading: 4.22E-04 lb/hr PM10/PM2.5: 0.0074 lb/MMBtu SB: 6.32E-03 lb/hr LP: 0.053 lb/hr HP: 0.053 lb/hr loading: 1.64E-03 lb/hr Flare stream operations: VE: 0% except for 5 min during 2 cons. hrs	0.20

IDEM is aware that that the above control technologies may be able to periodically achieve control efficiencies that exceed 98% under certain operating conditions. However, BACT must be achievable on a consistent basis under normal operational conditions. BACT limitations do not necessarily reflect the highest possible control efficiency achievable by the technology on which the emission limitation is based. The permitting authority has the discretion to base the emission limitation on a control efficiency that is somewhat lower than the optimal level. There are several reasons why the permitting authority might choose to do this. One reason is that the control efficiency achievable through the use of the technology may fluctuate, so that it would not always achieve its optimal control efficiency. In that case, setting the emission limitation to reflect the highest control efficiency would make violations of the permit unavoidable. To account for this possibility, a permitting authority must be allowed a certain degree of discretion to set the emission limitation at a level that does not necessarily reflect the highest possible control efficiency, but will allow the Permittee to achieve compliance consistently. While we recognize that greater than 98% may be achievable as an average during testing, IDEM allows for sources to include a safety factor, or margin of error, to allow for minor variations in the operation of the emission units and the control device.

Therefore, the proposed VOC control of 98% is considered the top BACT for this operation.

Flare - CO

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (MMBtu/hr)
Riverview Energy	Proposed	<i>Loading flare</i>	<i>Operate in accordance with 40 CFR 60.18</i>	<i>sweep &amp; pilot operation: use gaseous fuel CO: 0.083 lb/MMBtu SB: 7.09E-02 lb/hr LP: 0.60 lb/hr HP: 0.60 lb/hr loading: 1.84E-02 lb/hr Flare stream operations: CO: 0.31 lb/MMBtu</i>	0.20
		<i>Sulfur block flare</i>			0.77
		<i>Hydrogen plant flare</i>			6.50
		<i>High pressure flare</i>			6.50
0.31 lb CO/MMBtu, considered as while actively flaring in conformance with 40 CFR 60.18 because that is how the emission factor is defined in AP-42, Chapter 13.5 is most stringent for CO. Therefore this is considered BACT for CO.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The units shall burn only natural gas and process off-gas as supplemental and pilot fuel.
- (b) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the flares shall be as follows:
  - (1) Particulate matter emissions while operating in sweep and pilot mode shall not exceed:

<b>Emission Limitations</b>			
<b>Unit ID</b>	<b>Pollutant</b>	<b>Ib/MMBtu</b>	<b>Ib/hr</b>
HP Flare	PM (filterable)	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
LP Flare	PM (filterable)	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
SB Flare	PM (filterable)	0.0019	1.62E-03
	PM <sub>10</sub>	0.0074	6.32E-03
	PM <sub>2.5</sub>	0.0074	6.32E-03
Loading Flare	PM (filterable)	0.0019	4.22E-04
	PM <sub>10</sub>	0.0074	1.64E-03
	PM <sub>2.5</sub>	0.0074	1.64E-03

(2) The HP Flare and LP Flare shall operate with no visible emissions, except for periods not to exceed a total of five (5) minutes during any two (2) consecutive hours when flaring a process stream.

(c) The Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the flares shall be as follows:

(1) The Permittee shall burn only natural gas and process off-gas in any flare as supplemental or pilot fuel gas.

(2) SO<sub>2</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>SO<sub>2</sub> Emission Limitations</b>	
<b>Unit ID</b>	<b>Ib/hr</b>
HP Flare	0.013
LP Flare	0.013

(3) SO<sub>2</sub> emissions from the SB Flare shall not exceed 0.069 Ib/hr when operating in sweep and pilot mode.

(4) SO<sub>2</sub> emissions from the Loading Flare shall not exceed 0.069 Ib/hr when operating in pilot mode.

(d) The Best Available Control Technology (PSD BACT) for NO<sub>x</sub> for the flares shall be as follows:

(1) NO<sub>x</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>NOx Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.099	0.71
LP Flare	0.099	0.71
SB Flare	0.099	8.46E-02
Loading Flare	0.099	2.20E-02

(2) NOx emissions shall not exceed 0.068 lb/MMBtu (LHV) when flaring a process stream.

(e) The Best Available Control Technology (PSD BACT) for VOC for the flares shall be as follows:

(1) VOC emissions while operating in sweep and pilot mode shall not exceed:

<b>VOC Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.0054	0.039
LP Flare	0.0054	0.039
SB Flare	0.0054	4.62E-03

(2) VOC destruction and removal efficiency shall not be less than 98% when flaring a process stream.

(3) VOC emissions while operating in pilot mode shall not exceed:

<b>VOC Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
Loading Flare	0.0054	1.20E-03

(f) The Best Available Control Technology (PSD BACT) for CO for the flares shall be as follows:

(1) CO emissions while operating in purge and pilot mode shall not exceed:

<b>CO Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.083	0.60
LP Flare	0.083	0.60
SB Flare	0.083	7.09E-02
Loading Flare (pilot only)	0.083	1.84E-02

(2) CO emissions shall not exceed 0.31 lb/MMBtu (LHV) when flaring a process stream.

- (g) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the flares listed in the table below when operating in purge and pilot mode shall not exceed the values shown per twelve (12) consecutive month period, with compliance determined at the end of each month.

Emission Limitations	
Unit ID	CO <sub>2</sub> e Limit
Sulfur Block Flare	448
LP Flare	3,781
HP Flare	3,781
Loading Flare	559

### VOC BACT Analysis Tanks

#### **Step 1: Identify Potential Control Technologies**

##### Add-on controls:

There are two general categories of control methods for volatile organic compounds (VOCs): destruction methods and reclamation methods. Destruction control methods reduce the VOC concentration by high temperature oxidation into carbon dioxide and water vapor. Reclamation control methods consist of capturing VOCs for reuse or disposal. These are discussed in more detail below.

##### *Destruction Control Methods*

The destruction of organic compounds usually requires temperatures ranging from 1200°F to 2200°F for direct thermal oxidizers or 600°F to 1200°F for catalytic systems. Combustion temperature depends on the chemical composition and the desired destruction efficiency. Carbon dioxide and water vapor are the typical products of complete combustion. Turbulent mixing and combustion chamber retention times of 0.5 to 1.0 seconds are needed to obtain high destruction efficiencies.

Fume oxidizers typically need supplemental fuel. Concentrated VOC streams with high heat contents obviously require less supplementary fuel than more dilute streams. VOC streams sometimes have a heat content high enough to be self-sustaining, but a supplemental fuel-firing rate equal to about 5% of the total oxidizer heat input is usually needed to stabilize the burner flame. Natural gas is the most common fuel for VOC oxidizers, but fuel oil is an option in some circumstances.

Destruction control methods include:

- (a) Thermal Oxidizer:

Thermal oxidation is the process of oxidizing VOC in a waste gas stream by raising the temperature above the VOC's auto-ignition point in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The residence time, temperature, flow velocity and mixing, and the oxygen concentration in the combustion chamber affect the oxidation rate and destruction efficiency. Thermal oxidizers operating costs are relatively high, since they typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. In general, thermal oxidizers are less efficient at treating waste gas streams with highly variable flowrates, since the variable flowrate results in varying residence times, combustion chamber temperature, and poor mixing. In addition, thermal oxidizers are also not generally cost-effective for low-concentration, high-flow organic vapor streams.

Thermal oxidizers can achieve 95-99.99+% VOC control efficiency and can be used over a wide range of organic vapor concentrations, but perform best at inlet concentrations of around 1,500-

3,000 ppmv. Thermal oxidizers are typically designed to have a residence time of 0.3 to 1.0 second and combustion chamber temperatures between 1,200 and 2,000°F. In order to meet 98% or greater control or a 20 parts per million by volume (ppmv) compound exit concentration of non-halogenated organics, thermal oxidizers should typically be operated at a residence time of at least 0.75 seconds, a combustion chamber temperature of at least 1600°F, and with proper mixing. While thermal oxidation provides efficient VOC control, other pollutants such as nitrogen oxides and carbon monoxide are formed from the combustion process.

Thermal oxidizers are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases. It may be necessary to install a post-oxidation acid gas treatment system in such cases, depending on the outlet concentration. This would likely make incineration an uneconomical option. For halogenated VOC streams, a combustion temperature of 2000°F, a residence time of 1.0 second, and use of an acid gas scrubber on the outlet is recommended.

The three types of thermal oxidation systems include direct flame, recuperative, and regenerative thermal oxidizers, which are differentiated by the type of heat recovery equipment used.

(1) Direct Flame Thermal Oxidizer

A direct flame thermal oxidizer is comprised of a combustion chamber and does not include any heat recovery of exhaust air by a heat exchanger.

(2) Recuperative Thermal Oxidizer

A recuperative thermal oxidizer is comprised of the combustion chamber, a heat exchanger for preheating the untreated VOC gas stream, and, if cost-effective, a secondary energy recovery heat exchanger. In a recuperative thermal oxidizer, the untreated VOC gas stream entering the oxidizer is preheated using the heat content of the treated gas stream exiting the oxidizer using a heat exchanger, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. Recuperative thermal oxidizers usually are more economical than direct flame thermal oxidizers because they typically recover 40 to 70% of the waste heat from the exhaust gases.

(3) Regenerative Thermal Oxidizer

A regenerative thermal oxidizer typically consists of a set of 2 or 3 packed ceramic beds that are used to recover heat from hot combustion gases that are generated during combustion of the VOC gas stream and auxiliary fuel, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. An "inlet" bed is used to pre-heat the untreated VOC gas stream, an "outlet" bed is used to recover heat from the treated gas stream, and one bed is in a purge cycle. The purge cycle is needed to prevent emission spikes each time the gas flow is redirected. The oxidizer is operated on a rotating schedule, where the gas flow through the ceramic beds is redirected periodically using a set of gas flow dampers. Once the heat energy of the "inlet" ceramic bed has been depleted, the flow through the system is redirected so that the untreated VOC gas stream entering the oxidizer is directed through the previously heated "outlet" ceramic bed. Regenerative thermal oxidizers have much higher heat recovery efficiencies than recuperative thermal oxidizers, recovering 85 to 95% of the heat from the treated gas stream, and therefore have lower auxiliary fuel requirements. However, compared to direct flame and recuperative thermal oxidizers, regenerative thermal oxidizers typically have higher capital (equipment and installation) costs, are larger and heavier, and have higher maintenance costs.

(b) Catalytic Oxidizer:

Catalytic oxidation is the process of oxidizing organic contaminants in a waste gas stream within a heated chamber containing a catalyst bed in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The catalyst is used to lower the activation energy of the oxidation reaction, enabling the oxidation to occur at lower reaction temperatures compared to thermal oxidizers. The residence time, temperature, flow velocity and mixing, the oxygen concentration, and type of catalyst used in the combustion chamber affect the oxidation rate and destruction efficiency. Catalytic oxidizers typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. Catalytic oxidizers operate at lower temperatures and require less fuel than thermal oxidizers, they have a smaller footprint, and they need little or no insulation. The catalyst bed is usually composed of the following: (1) the substrate, typically ceramic or metal honeycombs, grids, mesh pads, or beads; (2) the carrier, a high surface area inorganic material such as alumina that is bonded to the substrate that contains a complex pore structure; and (3) the catalyst, a thin layer of material deposited onto the carrier. The most widely used catalysts for VOC oxidation are noble metals, such as platinum, palladium and rhodium or mixtures thereof. Base metal catalysts, such as oxides of chromium, cobalt, copper, manganese, titanium, and vanadium may also be used for VOC oxidation. Similar to thermal oxidizers, catalytic oxidizers may use regenerative or recuperative heat recovery to reduce auxiliary fuel requirements, where the untreated VOC gas stream entering the catalytic oxidizer is preheated using the heat content of the treated gas stream exiting the catalytic oxidizer.

Catalytic oxidizers can achieve 90-99% VOC control efficiency, depending on the oxidizer design and waste stream characteristics. Catalytic oxidizers are typically designed to have a residence time of 0.5 seconds or less and combustion chamber temperatures between 600 and 1,200°F. Catalytic oxidation is most suited to waste gas streams with little variation in the flow rate and type and concentration of VOC to be treated. In addition, catalytic oxidizers should not be used for waste gas streams that have a high concentration of particles, silicone, sulfur, halogen compounds, and/or heavy hydrocarbons that can cause fouling or masking of the catalyst, and for waste gas streams that contain metals such as mercury, phosphorus, arsenic, antimony, bismuth, lead, zinc, and/or tin that can cause catalyst poisoning.

(c) Flare:

Flaring is the process of oxidizing VOC in a waste gas stream by piping the waste gas to a remote, usually elevated location and burning it in a flame using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing. Flares are generally categorized in two ways: (1) by the height of the flare tip (i.e., ground or elevated), and (2) by the method of enhancing mixing at the flare tip (i.e., steam-assisted, air-assisted, pressure-assisted, or non-assisted). Flares can be used to control almost any VOC stream, and can typically handle large fluctuations in VOC concentration, flow rate, heating value, and inert species content. Flaring is appropriate for continuous, batch, and variable flow vent stream applications, but the primary use is that of a safety device used to control a large volume of pollutant resulting from upset conditions. Flares have primarily been used in petroleum production, petroleum refineries, and chemical plants to control waste gas streams containing low molecular weight VOC with high heating values.

A properly operated flare can achieve 98+% VOC control efficiency when controlling emission streams with heat contents greater than 300 British thermal units per standard cubic foot (Btu/scf). If the waste gas stream has a heat content less than 300 Btu/scf, auxiliary fuel must be introduced in sufficient quantity to make up the difference. The VOC destruction efficiency of a flare depends upon the waste gas characteristics (density, flammability, heating value, and VOC component autoignition temperatures) and the combustion zone conditions (temperature, residence time, mixing, and available oxygen). While flares can provide efficient VOC control,

other pollutants such as nitrogen oxides (NO<sub>x</sub>) and carbon monoxide (CO) are formed from the combustion process. Flares are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases.

#### *Reclamation Control Methods*

Organic compounds may be reclaimed by one of three possible methods: adsorption, absorption (scrubbing), or condensation. In general, the organic compounds are separated from the emission stream and reclaimed for reuse or disposal. Depending on the nature of the contaminant and the inlet concentration of the emission stream, recovery technologies can reach efficiencies of 98%.

#### (d) Carbon Adsorption Unit:

Carbon adsorption is a process where VOCs are removed from a waste gas stream when it is passed through a bed containing activated carbon particles, which have a highly porous structure with a large surface-to-volume ratio. Carbon adsorption systems usually operate in two phases: adsorption and desorption. During adsorption, the majority of the VOC molecules migrate from the gas stream to the surface of the activated carbon (through the activated carbon pores) where it is lightly held to the surface by weak intermolecular forces known as van der Waals' forces. As the activated carbon bed approaches saturation with VOC, its control efficiency drops, and the bed must be taken offline to be replaced or regenerated. Typically, two activated carbon beds are utilized on a rotating schedule, where a second bed (containing fresh or previously regenerated activated carbon) is brought online to continue controlling the VOC gas stream while the first bed is being replaced or regenerated. In regenerative systems, most VOC gases can be desorbed and removed from the activated carbon bed by heating the bed to a sufficiently high temperature, usually via steam or hot air, or by reducing the pressure within the bed to a sufficiently low value (vacuum desorption). The regenerated activated carbon can be reused and the VOCs that are removed from the bed can be reclaimed or destroyed.

Carbon adsorber size and purchase cost depend primarily on the gas stream volumetric flow rate, temperature, pressure, VOC composition, VOC mass loading, and moisture and particulate contents. The adsorptive capacity of an activated carbon bed for a VOC gas tends to increase with the VOC gas phase concentration, molecular weight, diffusivity, polarity, and boiling point. Carbon adsorption systems can be used for VOC gas concentrations from less than 10 ppm to approximately 10,000 ppm. Carbon adsorption systems (in general) are usually limited to waste gas streams with VOC compounds having a molecular weight of more than 50 and less than approximately 200 lb/lb-mole, since low molecular weight organics usually do not adsorb sufficiently and high molecular weight compounds are difficult to desorb and remove during the desorption cycle. Industrial applications of adsorption systems include control for dry cleaning, degreasing, paint spraying, solvent extraction, metal foil coating, paper coating, plastic film coating, printing, pharmaceuticals, rubber, linoleum, and transparent wrapping.

Carbon adsorption systems can achieve 95-99% VOC control efficiency. Carbon adsorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the activated carbon bed. Particulate matter and high moisture concentrations present in the gas stream compete with the VOC for pore space within the activated carbon and thereby reduce the VOC adsorptive capacity and control efficiency of the carbon adsorption systems. In addition, particulate matter and moisture can become entrained within the carbon bed, causing operating problems such as increased pressure drop across the bed.

#### (e) Gas Absorption (wet scrubber):

A wet scrubber is an absorption system in which a waste gas stream is interacted with a scrubbing fluid inside a contact chamber in order to strip particulate or gaseous pollutants from

the waste gas stream through the processes of diffusion and dissolution. In many cases, an additive such as an acid, a base, or a VOC oxidizing agent is dissolved in the scrubbing fluid so that the dissolved gaseous pollutant chemically reacts with the scrubbing fluid to form a non-volatile or soluble product, thereby allowing additional gaseous pollutant to be absorbed by the scrubbing fluid. The four types of wet scrubber systems include packed towers, plate (or tray) columns, venturi scrubbers, and spray chambers. Gas and liquid flow through an absorber may be countercurrent, crosscurrent, or cocurrent. When used as an emission control technique, wet scrubbers are typically used for controlling particulate, acid gases, halogen gases, and highly soluble gases such as sulfur dioxide and ammonia.

If a wet scrubber is used for VOC control, the scrubbing fluid chosen should have a high solubility for the VOC gas, a low vapor pressure, a low viscosity, and should be relatively inexpensive. Water is the most commonly used scrubbing fluid for absorbing highly water-soluble (hydrophilic) VOC compounds such as methanol, ethanol, isopropanol, butanol, acetone, and formaldehyde. Other scrubbing fluid such as mineral oils, nonvolatile hydrocarbon oils, and aqueous solutions containing surfactants or amphiphilic block copolymers may be used for absorbing water-insoluble (hydrophobic) VOC compounds. Physical absorption is typically enhanced by lower temperatures, greater scrubbing fluid contacting time and surface area, higher scrubbing fluid to VOC ratio, and higher VOC concentrations in the gas stream.

Wet scrubber systems can achieve 70-99% VOC control efficiency, depending on the VOC solubility in the scrubbing fluid, the VOC-scrubbing fluid temperature, the scrubbing fluid contacting time and surface area, the scrubbing fluid to VOC ratio, the VOC concentration in the gas stream, and whether the scrubbing fluid contains a VOC oxidizing agent. Wet scrubber absorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the wet scrubber. When used to control VOC, the spent scrubbing fluid must be regenerated, treated, or shipped offsite for proper disposal.

(f) Condensation Unit:

Condensation is the separation of VOCs from an emission stream through a phase change, by either increasing the system pressure or, more commonly, lowering the system temperature below the dew point of the VOC vapor. Three types of condensers are used for air pollution Controls: (1) conventional non-refrigeration systems (such as cold-water direct contact condensers similar to wet scrubbers and cold-water indirect heat exchangers); (2) refrigeration systems (including mechanical compression refrigeration using chlorofluorocarbons (CFCs) and hydrofluorocarbons (HFCs) and Reverse Brayton Cycle refrigeration); and (3) cryogenic systems that utilize liquid nitrogen (including direct contact condensers and indirect heat exchangers).

Condensation units control VOC more efficiently when they are used for gas streams containing high concentrations of VOC and with low exhaust volumes. Condensation units are typically utilized at sources where there is a significant cost benefit to recovering the organic liquid for reuse, where the recovered organic liquids do not contain multiple organic compounds or water that require separation, and where the heat content of gas stream will not overload the refrigeration system. In addition, condensation units are typically used only on gas streams that have little or no particulate contamination, which can cause fouling within the condensation equipment and reduced heat transfer efficiency. Some industrial applications where refrigerated condensers are used include the dry cleaning industry, degreasers using VOC or halogenated solvents, transfer of volatile organic liquid or petroleum products, and vapors from storage vessels.

Cold-water (non-refrigeration) condensation systems can achieve 90-99% VOC control efficiency, depending on the vapor pressures of the specific compounds. Condensation units using mechanical compression refrigeration (using CFC or HFC) can achieve 90+% VOC control

efficiency, condensation units using Reverse Brayton Cycle refrigeration can achieve 98% VOC control efficiency, and condensation units using cryogenic (liquid nitrogen) cooling can achieve 99+% VOC control efficiency.

#### *Other Control Methods*

- (g) Bio-filtration is a process in which a waste gas stream is passed through a bed of peat, compost, bark, soil, gravel, or other inorganic media in order to strip organic contaminant gases from the waste gas stream through the process of dissolution in the bed moisture and adsorption to the bed media. Under aerobic conditions, microorganisms naturally present in the bed oxidize the organic contaminant gases within the bed to carbon dioxide, water, and additional biomass through metabolic processes. If the temperature of the waste gas stream is too high, the gas stream must be cooled to an optimum temperature before it can be treated in the biofilter in order to maintain the viability of the microorganisms. In addition, the bed must be monitored and maintained at an optimum moisture content and pH in order to prevent cracking of the bed media and to maintain the viability of the microorganisms.

Bio-filtration systems are designed to follow three basic steps. First, a pollutant in the gas phase is passed through a biologically active packed bed. The pollutant then diffuses into the biofilm immobilized on the packing medium. Finally, microorganisms growing in the biofilm oxidize the pollutant as a primary substrate or co-metabolite and in the process convert contaminants into the benign end products of carbon dioxide, water and additional biomass.

Three primary bioreactor configurations are available to treat stationary sources of air pollution: bio-filters, bio-trickling filters, and bio-scrubbers.

(1) Bio-Filters

Bio-filters are the simplest and oldest of the three vapor-phase bioreactors and involve passing a contaminated air stream through a reactor containing biologically-active packing material. The contaminants are transferred from the air stream into a bio-film immobilized on the support media and are converted by the microorganisms into CO<sub>2</sub>, water, and additional biomass. Moisture is typically supplied to the bio-film in a humid inlet waste gas stream. Packing media used in bio-filter beds can be broadly categorized as either "natural" or "synthetic". Natural media include wood chips, peat, and compost, with compost by far the most widely used. Synthetic media include activated carbon, ceramic pellets, polystyrene beads, ground tires, plastic media, and polyurethane foam. Natural organic packing media generally contain a supply of nutrients as a naturally occurring component of the packing itself. When a synthetic support medium is used, nutrients must be added for microbial growth.

(2) Bio-Trickling Filters

Bio-trickling filters are similar to bio-filters with the exception that there is a liquid nutrient medium continuously recirculating through the column. To facilitate the recirculation of the liquid phase, rigid synthetic media is used as the packing medium. Microorganisms grow primarily as a fixed film on inert packing media but may also be present in the liquid phase because they can both grow suspended in the liquid phase and because the flowing liquid imparts sufficient force to detach biomass from the solid support media. Contaminants are transferred from the air stream into the liquid phase and bio-film for subsequent degradation.

Potential disadvantages of bio-trickling filter operations include: clogging of the pore space if the filter is treating high VOC loads or if the filter is provided excess nutrients, and the need to manage the liquid stream. An additional disadvantage is that bio-trickling

filters may have more difficulty treating poorly soluble compounds since the specific surface area in bio-trickling filters is generally lower.

(3) Bio-Scrubbers

Bio-scrubbers combine physical and chemical treatment with a biological treatment in two separate reactors. In the first reactor, the contaminated air stream is contacted with water in a reactor packed with inert media, resulting in contaminant transfer from the air phase to the liquid phase. The liquid is then directed into an activated sludge reactor where the contaminants are biologically degraded. The separated activated sludge tank allows the reactor to treat higher concentrations of compounds than bio-filters can handle. In addition since compound transfer and degradation occur in separate reactors, optimization of each reactor can take place separately. As with bio-trickling filters, bio-scrubbers offer greater operator control over nutrient supply, acidity, and the build-up of toxic by-products.

A potential disadvantage of bio-scrubbers is that slower growing microorganisms may be washed out of the system and disposal of excess sludge is required.

*Other control options*

(a) Submerged Fill

Loading losses occur in cargo carrier loading as the organic vapors are displaced as the liquid product is loaded. The organic vapors can contain residual vapors from the last product loaded, vapors transferred to the tank in a vapor balance system and vapors generated in the tank as new product is loaded. The amount of vapors generated can be controlled by the type of loading method used. In splash loading, the fill pipe is only lowered part way into the tank. This results in large amounts of turbulence in the liquid and results in close contact of the VOC with the vapor which increase emissions. The submerged fill method is an alternate filling method used to reduce the amount of vapor/liquid contact. In the submerged fill method, the fill pipe extends below the liquid surface. As the liquid is transferred to the tank, the submerged fill pipe significantly reduces turbulence, air/liquid contact and results in lower overall VOC emissions.

(b) Tank Color

Color selection can contribute to elevated emissions of VOC. Black or darker colored tanks absorb more frequencies of light. This energy is transferred to the contents of the tank as heat through conduction in the tank wall. As the liquid heats, the vapor pressure rises and potential VOC emissions increase. The reverse is true for light colored or reflective tanks.

(c) Floating Roof Tanks

VOC emissions from storage tanks may be controlled through the use of floating roof tanks. Floating tanks control VOC emissions by reducing the amount of organic vapor that is in the tank at any one time. This is accomplished by having a roof that floats on top of the liquid in the tank and is sealed in a manner that does not allow vapor loss around the edges of the floating roof. By floating the roof, no vapor zone above the liquid can form.

**Step 2: Eliminate Technically Infeasible Options**

There are some add-on control devices that are considered technically feasible, however, due to the relatively low PTE of VOC for each tank, there are no add-on control devices that are considered economically feasible.

Submerged fill and tank color are considered feasible control options.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Since floating roof tanks, submerged fill and tank color are considered the only feasible control options, a ranking is not necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

(a) VOL (as defined at 40 CFR 60.111b) tanks, T1, T2, and T6, shall use internal floating roofs.  
 (b) Emissions from the slop tank, T16, shall be controlled by the LP Flare at all times and the slop tank throughput shall not exceed the value shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.  
 (c) Emissions from the sour water tanks, T18 - T21, shall be controlled by the Sulfur Block Flare at all times and the sour water tank throughputs shall each not exceed the values shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.  
 (d) All tanks shall use white tank shells.  
 (e) All tanks shall use submerged filling.  
 (f) All tanks shall use good maintenance practices based on generally-accepted industry standards, including but not limited to API 650 Welded Steel Tanks for Oil Storage and API 653 Tank Inspection, Repair, Alteration, and Reconstruction.  
 (g) Tanks shall comply with the following limitations:

Tank ID	Product Stored	Storage Temperature (°F)	VOC Emissions Limit (tons/yr)	Throughput Limit (kgal/yr)
T25	Fresh Amine	ambient	0.48	-
T26	Amine Containment	ambient	0.48	-
EU-6005	Emergency generator diesel fuel	ambient	1.14E-02	-
EU-6008	Emergency fire pump diesel fuel	ambient	1.14E-02	-

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Capacity (gallons)
Magellan Pipeline Terminals, LP	TX-0613 94433, N134 (4/23/2012)	tanks - misc	Internal floating roof	9.0 lb/hr (8.0 ton/yr)	various from 1.68 to 14.7 million gal
An internal floating roof is the most stringent control for tanks containing Volatile Organic Liquids as defined at 40 CFR 60.111b. Therefore, this has been determined to be BACT for tanks T1, T2, and T6.					
ENI US Operating Co., Inc.	FL-0328 OCS-EPA-R4007 (10/27/2011)	Various diesel storage tanks ranging from 50 gal to 610,000 gal	Use of good maintenance practices based on the current manufacturer's specifications for each tank	0.27 ton/yr	-
This has been determined BACT for all tanks.					
Union Co. Lumber Co.	AR-0124 2348-AOP-R0 (8/3/2015)	diesel oil tanks	light color tanks	0.4 lb/hr	
This has been determined BACT for all tanks.					
Agrium	AK-0083 AQ0083CPT 06 (1/6/2015)	Two Methyl-diethanol Amine (MDEA) Storage Tanks	Submerged fill	0.002 tpy	
Submerged fill has been determined BACT for all tanks.					
In addition, the source has proposed the use of a flare for tanks T16, and T18-T21. Therefore, this has been determined to be BACT for tanks T16, and T18-T21.					
CF Industries Nitrogen	IA-0106 PN 13-037 (7/12/2013)	Diesel Belly Tanks	None	VOC: 0.1 ton/yr	various
		Methyl-diethanol Amine (MDEA) Storage Tank	Nitrogen blanket	0.1 tpy	

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Capacity (gallons)
A nitrogen blanket is not considered BACT for the MDEA tanks, T24-T26. A nitrogen blanket is not a control technology for VOC emissions from a tank because the blanket does not affect the partial pressure of the stored liquid or the vapor phase concentration exhausted from the tank.					
LBC Houston	TX-0783 123325, N206 (2/6/2016)	tanks (24) vapor pressure <0.52 psia	submerged fill pipes and are painted white	0.01 tpy	
		tanks (16)	internal floating roofs with welded seams, mechanical shoe primary seals, rim-mounted secondary seals and welded deck seams and vapor combustor	0.26 tpy for (6) and 0.15 tpy for (10) NSPS Kb 99.9% CE	
Ticona Polymers	TX-0774 123216, PSDTX1438 and GHGPSDTX (11/12/2015)	crude and methanol tanks	Submerged fill, white tanks with internal floating roofs	NSPS Kb & MACT G 6.86 tpy	
Union County Lumber Company	AR-0124 2348-AQP-R0 (8/3/2015)	diesel storage tanks	None	VOC: 0.4 lb/hr	various
		oil storage tanks	None	VOC: 0.3 lb/hr	various
Florida Power and Light Co.	FL-0346 0110037-011-AC (4/22/2014)	Three ULSD fuel oil storage tanks	Pressure relieve valves/vapor condensers, or tanks with internal floating roofs or equivalent		-
Old Dominion Electric Corp.	MD-0042 CPCN Case No. 9327 (4/8/2014)	fuel oil tanks	LAER: periodic maintenance to minimize fugitive emissions	0.001 ton/yr	80000, 150000, 75000 bbl
Indiana Gasification, LLC	IN-0166 T147-30464-00060 (6/27/2012)	Sulfuric acid tanks	fixed roof and submerged fill	none	866500 gal each
This source was never constructed and the permit was revoked. Therefore the reference is not considered in determining BACT					
Valero Refining	LA-0213 PSD-LA-619(M5) (11/17/2009)	tanks - for light materials, sour water, naphtha, raffinate	Floating roofs	Comply with 40 CFR 60, Subpart Kb or 40 CFR 63, Subpart CC	various
This reference is not considered BACT for the sour water tanks. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Diesel Tank (Fixed Roof)	Submerged fill	VOC: 0.8 ton/yr	262,500 gal/day
		Naphtha Tank (Internal floating roof)	Submerged fill and floating roof	VOC: 0.88 ton/yr 99% CE	
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Conoco Phillips	IL-0103 06050052 (8/5/2008)	sour water tank	Internal floating roof	none	3,360,000 gal
This reference is not considered BACT for the sour water tanks at the proposed source. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Navajo Refining Co., LLC	NM-0050 PSD-NM-195-M25 (12/14/2007)	tanks - naphtha, or vol liq up to 11.0 psi	External floating roof	none	100,000 bbl thrpt (4.2 million gal)
		Sour Water Tank and Naphtha tank	External floating roof	none	20000 BBL

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Capacity (gallons)
BACT for the proposed source includes internal floating roofs for VOL tanks. External floating roofs are not considered a more restrictive control. This reference is not considered BACT for the sour water tanks at the proposed source. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Progress Energy Florida	FL-0285 PSD-FL-381, 1030011-010-AC (1/26/2007)	tanks - Distillate	None	keep records establishing vapor pressure is below 3.5KPa	3.5 million gal. (ea.)
Florida Power and Light Co.	FL-0286 PSD-FL-354, 0990646-001-AC (1/10/2007)	tanks - Distillate (ULSD)	None	keep records establishing vapor pressure is below 3.5KPa; MSDS is acceptable	6.3 million gal. (ea.)
Marathon Petroleum Co. LLC	LA-0211 PSD-LA-719 (12/27/2006)	tanks - petroleum products	fixed roof and internal floating roofs	40 CFR 63 Subpart CC	various
Citgo Refining and Chemicals Co.	TX-0478 PSD-TX-408M3 (4/20/2015)	tanks - petroleum products	None	1.6 lb/hr (3.9 tpy)	various
		tanks - petroleum products	None	4.4 lb/hr (3.3 tpy)	various
		tanks - petroleum products	None	0.8 lb/hr (1.4 tpy)	various
Continental Carbon Co.	TX-0464 P1014 (3/18/2005)	tanks - low vapor pressure oil	Fixed roof	0.01 lb/hr	NA

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (Control Technology Review; Requirements), IDEM has established the following BACT:

- (a) All tanks shall use white tank shells.
- (b) All tanks shall use submerged filling.
- (c) All tanks shall use good maintenance practices based on generally-accepted industry standards, including but not limited to API 650 Welded Steel Tanks for Oil Storage and API 653 Tank Inspection, Repair, Alteration, and Reconstruction.
- (d) Tanks shall comply with the following controls and limitations:

Tank ID	Product Stored	Storage Temperature (°F)	Vapor Pressure <sup>1</sup> (psia)	Throughput Limit <sup>2</sup> (kgal/yr)
T1	Naphtha Product	ambient	1.15	-
T2	Naphtha Product	ambient	1.15	-
T3	Diesel Product	ambient	2.29	-
T4	Diesel Product	ambient	2.29	-
T5	Diesel Product	ambient	2.29	-
T6	Naphtha Product	ambient	1.15	-
	Diesel Product	ambient	0.17	-
T10	Residue <sup>3</sup>	505	1E-04	-
T11	Residue	505	1E-04	-
T12	Residue	505	1E-04	-
T13	VGO	505	0.175	-

Tank ID	Product Stored	Storage Temperature (°F)	Vapor Pressure <sup>1</sup> (psia)	Throughput Limit <sup>2</sup> (kgal/yr)
T14	VGO	505	0.175	-
T16	Slop tank <sup>4</sup>	-	-	305,467
T17	Diesel Fuel	ambient	1.14E-02	-

T22	Stripped Non-Phenolic Sour Water	ambient	0.48	-
T23	Stripped Phenolic Sour Water	ambient	0.48	-
T24	Amine Surge/Deinventory	ambient	0.48	-
T25	Fresh Amine	ambient	0.48	-
T26	Amine Containment	ambient	0.48	-
EU-6005 <sup>6</sup>	Emergency generator diesel fuel	ambient	1.14E-02	-
EU-6008	Emergency fire pump diesel fuel	ambient	1.14E-02	-

Notes:

- Vapor pressure for products stored at ambient temperature taken at the highest monthly average daily temperature for Evansville, IN from meteorological data in TANKS 4.0.9d, 78.3°F.
- kgal/yr = kgal per twelve (12) consecutive month period, with compliance determined at the end of each month. kgal = 1,000 gallons
- Vapor pressure at elevated storage temperature from process modeling provided by the source.
- Diesel fuel taken as representative of slop oil
- Vapor pressure of wastewater streams and 40% MDEA solution ("amine") taken as water at 78.3°F, Table 3-5, *Perry's Chemical Engineers' Handbook, 6th Ed.*, because of the low partial pressures of the organic compounds.
- Throughput for emergency engine fuel tanks does not include operation during emergencies.

**VOC BACT Analysis  
 Loading Racks**

**Step 1: Identify Potential Control Technologies**

**Cooling and Condensing System**

Refrigerated condensers, also sometimes known as Vapor Recovery Units (VRUs) are used as air pollution control devices for treating emission streams with high VOC concentrations (e.g., gasoline bulk terminals, storage, etc.). Condensation is a separation technique in which one or more volatile compounds of vapor mixture are separated from remaining vapors through saturation followed by a phase change.

The reported efficiency is around 80%. Refrigerated condensers are used as air pollution control devices for treating emission streams with high VOC concentrations (usually > 5,000 ppmv). Removal efficiencies above 90% can be achieved with coolants such as chilled water, brine solutions, ammonia, special filter media, etc. depending upon the emission stream characteristics.

**Thermal Oxidizer**

Thermal oxidation systems operate in three (3) stages: a burner generates hot combustion gases, combustion products mix with the exhaust from the process lines, and the mixture is oxidized. Thermal incineration is performed at much higher temperatures than catalytic incineration, typically between 1200°F and 2000°F. Thermal incinerators operate at peak efficiency when oxidizing concentrated organic exhaust streams just above or below the upper and lower explosive limits. This is because the oxidation rate is directly proportional to the organic concentration, the local heat of reaction during

oxidation, and the increased concentration of free radicals which participate in the oxidation reaction. Thermal oxidation destruction efficiency ranges from 95% to 99%.

### **Catalytic Thermal Oxidizer**

This type of thermal oxidizer is a better system than the straight-shot thermal oxidizer. It uses a heated catalytic (platinum coated ceramic beads) system to destroy VOCs at a much lower temperature (around 650°F) and consumes less natural gas. A catalyst is an element or compound that speeds up a reaction at lower temperatures compared to thermal oxidation without undergoing change itself. Catalytic oxidizers require approximately 1.5 to 2.0 ft<sup>3</sup> of catalyst per 1000 standard ft<sup>3</sup> per gas flow rate. Even though this type of control system can normally reach over 98% destruction efficiency, its catalytic media is very expensive to upkeep and has to be replaced every 5 years or so. It also has an odor problem due to the lower combustion temperature.

### **Carbon Adsorbers**

Carbon adsorbers use activated carbon to remove VOC from low to medium concentration gas stream by adsorption. Adsorption itself is a phenomenon where gas molecules passing through a bed of solid particles (e.g., activated carbon) are selectively held there by attractive forces which are weaker and less specific than those of chemical bonds. During adsorption, a gas molecule migrates from the gas stream to the surface of the solid when it is held by physical attraction releases energy which typically equals or exceeds the heat of condensation. Most adsorbers can be cleaned by heating to a sufficiently high temperature, usually using steam or hot combustion gases or by lowering the pressure to a low value (vacuum). This cleaning process created a waste product, which will have to be properly disposed.

VOC and acid gases can be controlled with control efficiencies greater than 90%. Common problems with carbon adsorbers can be plugging and fouling of the activated carbon exposed to wet or heavily concentrated particulate gas streams. Sources may experience significant issues with maintenance and repair that result in unacceptable downtime for the control units.

### **Flare**

Flaring is a combustion control process for VOC's in which the waste gas stream is piped to remote, usually elevated, location (for safety reasons) and burned in an open flame in the open air using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing for nearly complete (>98%) VOC destruction. Complete combustion in VCU is governed by flame temperature, residence time in the combustion zone, turbulent mixing of the components to complete the oxidation reaction, and available oxygen for free radical formation.

## **Step 2: Eliminate Technically Infeasible Options**

The test for technical feasibility of any control option is whether it is both available and applicable in reducing VOC emissions. All the control technologies listed in the step 1 are considered technically feasible options.

## **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

<b>Control Option</b>	<b>Expected Control Efficiency</b>
Flare	98%
Thermal Oxidation	98%
Condenser	98%
Carbon Adsorber	95%
Cooling and Condensing Systems	80%

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Naphtha loading operation and diesel loading operation	Loading flare (EU-4002)	98% CE naphtha: 0.049 lb/kgal diesel: 1.02E-03 lb/kgal Submerged loading	
Countrymark	IN-0244 T103-35351-00011 (12/3//2015)	Truck Loading Rack	Flare vapor combustion unit, relief stack and vapor knockout box	35 mg/liter gasoline/ethanol loaded (equivalent to 0.292 lb VOC/kgal) 0.014 lb/kgal diesel loaded 0.016 lb/kgal kerosene loaded Leak Prevention measures (including submerged loading)	
Marathon	IN-0243 T129-34987-00005 (8/14/2015)	Truck Loading Rack	vapor recovery unit (VRU)	0.159 lb/kgal gasoline/ethanol loaded 0.014 lb/kgal diesel loaded Leak Prevention measures	
Countrymark	IN-0231 T055-35558-00003 (6/30/2015)	Truck loading rack	Flare vapor combustion unit, relief stack and vapor knockout box	VOC: 0.014 lb/kgal diesel loaded Leak prevention measures	
<p>VOC limits for gasoline loading are not comparable to naphtha, which has a lower vapor pressure. Therefore the BACT for naphtha loading is established as the lb/kgal emission factor after control by a flare with DRE equal to 98% which is consistent with a flare operating in conformance with 40 CFR 60.18.                      VOC limit of 0.014 lb/kgal is the most stringent for diesel loading. Therefore, it is chosen as BACT.</p>					
Castleton Commodities (CCI)	TX-0756 116072, PSDTX1388 (6/22/2015)	Truck loading diesel	None	VOC: 1.99 lb/hr (4.53 tpy)

Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Chelsea Sandwich LLC	MA-0040 MBR-08-IND-007 (8/20/2008)	Loading rack - residual oil	RTO	VOC: 1.77 ton/mo (3.54 tpy) 90 % capture eff. and 99% destruction eff.	
Marathon Pipeline - Zachary Station	LA-0212 PSD-LA-721 (2/1/2007)	Loading Rack	Vapor combustor (products >1.5 psia)	VOC: 10 mg/L	

Riverview has proposed the use of a flare as BACT. A search of the RBLC shows that in addition to a flare, there are other types of control. A flare is considered top BACT for this type of operation. IDEM is aware that that the above control technologies may be able to periodically achieve control efficiencies that exceed 98% under certain operating conditions (such as 99.8%). However, BACT must be achievable on a consistent basis under normal operational conditions. BACT limitations do not necessarily reflect the highest possible control efficiency achievable by the technology on which the emission limitation is based. The permitting authority has the discretion to base the emission limitation on a control efficiency that is somewhat lower than the optimal level. There are several reasons why the permitting authority might choose to do this. One reason is that the control efficiency achievable through the use of the technology may fluctuate, so that it would not always achieve its optimal control efficiency. In that case, setting the emission limitation to reflect the highest control efficiency would make violations of the permit unavoidable. To account for this possibility, a permitting authority must be allowed a certain degree of discretion to set the emission limitation at a level that does not necessarily reflect the highest possible control efficiency, but will allow the Permittee to achieve compliance consistently. While we recognize that greater than 98% may be achievable as an average during testing, IDEM allows for sources to include a safety factor, or margin of error, to allow for minor variations in the operation of the emission units and the control device.

Therefore, the proposed use of a flare with control of 98% is considered the top BACT for this operation.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The Product Loading Flare shall be designed and operated in accordance with 40 CFR 60.18.
- (b) The Best Available Control Technology (PSD BACT) for VOC for the product loading rack shall be as follows:
  - (1) The Product Loading Rack shall use only submerged loading.
  - (2) The overall VOC control efficiency, including capture efficiency and destruction efficiency, for the Product Loading Flare shall be 98% or greater.
  - (3) VOC emissions shall not exceed:

Emission Limitations	
Product	lb/kgal <sup>1</sup>
naphtha	0.049
Diesel	1.02E-03

Notes:

1. kgal = 1,000 gallons

<b>VOC BACT Analysis Residue Solidification Units</b>
---

VCC Residue is the bottoms product of the VCC Vacuum Distillation Tower wherein Vacuum Gas Oil (VGO) is extracted for recycle. The residue is a heavy bitumen type flowable liquid at ~ 500 degree F with limited volatile organic content, i.e, sufficient only to enable pumping. A small amount of hydrocarbon is initially released. The potential VGO emissions are limited due to: 1) incorporation of VGO in the residue matrix, 2) initial quick cooling of the pastille bottom surface and hemi-spherical top surface, forming an initial hard coating and 3) reduction of VGO vapor pressure in the pastille and coating with travel along the cooling line. A limited volume of exhaust air flow is extracted from the front one-third portion of the enclosures to aid cooling.

### **Step 1: Identify Potential Control Technologies**

#### Add-on controls:

There are two general categories of control methods for volatile organic compounds (VOCs): destruction methods and reclamation methods. Destruction control methods reduce the VOC concentration by high temperature oxidation into carbon dioxide and water vapor. Reclamation control methods consist of capturing VOCs for reuse or disposal. These are discussed in more detail below.

#### *Destruction Control Methods*

The destruction of organic compounds usually requires temperatures ranging from 1200°F to 2200°F for direct thermal oxidizers or 600°F to 1200°F for catalytic systems. Combustion temperature depends on the chemical composition and the desired destruction efficiency. Carbon dioxide and water vapor are the typical products of complete combustion. Turbulent mixing and combustion chamber retention times of 0.5 to 1.0 seconds are needed to obtain high destruction efficiencies.

Fume oxidizers typically need supplemental fuel. Concentrated VOC streams with high heat contents obviously require less supplementary fuel than more dilute streams. VOC streams sometimes have a heat content high enough to be self-sustaining, but a supplemental fuel-firing rate equal to about 5% of the total oxidizer heat input is usually needed to stabilize the burner flame. Natural gas is the most common fuel for VOC oxidizers, but fuel oil is an option in some circumstances.

Destruction control methods include:

(a) Thermal Oxidizer:

Thermal oxidation is the process of oxidizing VOC in a waste gas stream by raising the temperature above the VOC's auto-ignition point in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The residence time, temperature, flow velocity and mixing, and the oxygen concentration in the combustion chamber affect the oxidation rate and destruction efficiency. Thermal oxidizers operating costs are relatively high, since they typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. In general, thermal oxidizers are less efficient at treating waste gas streams with highly variable flowrates, since the variable flowrate results in varying residence times, combustion

chamber temperature, and poor mixing. In addition, thermal oxidizers are also not generally cost-effective for low-concentration, high-flow organic vapor streams.

Thermal oxidizers can achieve 95-99.99+% VOC control efficiency and can be used over a wide range of organic vapor concentrations, but perform best at inlet concentrations of around 1,500-3,000 ppmv. Thermal oxidizers are typically designed to have a residence time of 0.3 to 1.0 second and combustion chamber temperatures between 1,200 and 2,000°F. In order to meet 98% or greater control or a 20 parts per million by volume (ppmv) compound exit concentration of non-halogenated organics, thermal oxidizers should typically be operated at a residence time of at least 0.75 seconds, a combustion chamber temperature of at least 1600°F, and with proper mixing. While thermal oxidation provides efficient VOC control, other pollutants such as nitrogen oxides and carbon monoxide are formed from the combustion process.

Thermal oxidizers are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases. It may be necessary to install a post-oxidation acid gas treatment system in such cases, depending on the outlet concentration. This would likely make incineration an uneconomical option. For halogenated VOC streams, a combustion temperature of 2000°F, a residence time of 1.0 second, and use of an acid gas scrubber on the outlet is recommended.

The three types of thermal oxidation systems include direct flame, recuperative, and regenerative thermal oxidizers, which are differentiated by the type of heat recovery equipment used.

(1) Direct Flame Thermal Oxidizer

A direct flame thermal oxidizer is comprised of a combustion chamber and does not include any heat recovery of exhaust air by a heat exchanger.

(2) Recuperative Thermal Oxidizer

A recuperative thermal oxidizer is comprised of the combustion chamber, a heat exchanger for preheating the untreated VOC gas stream, and, if cost-effective, a secondary energy recovery heat exchanger. In a recuperative thermal oxidizer, the untreated VOC gas stream entering the oxidizer is preheated using the heat content of the treated gas stream exiting the oxidizer using a heat exchanger, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. Recuperative thermal oxidizers usually are more economical than direct flame thermal oxidizers because they typically recover 40 to 70% of the waste heat from the exhaust gases.

(3) Regenerative Thermal Oxidizer

A regenerative thermal oxidizer typically consists of a set of 2 or 3 packed ceramic beds that are used to recover heat from hot combustion gases that are generated during combustion of the VOC gas stream and auxiliary fuel, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. An "inlet" bed is used to pre-heat the untreated VOC gas stream, an "outlet" bed is used to recover heat from the treated gas stream, and one bed is in a purge cycle. The purge cycle is needed to prevent emission spikes each time the gas flow is redirected. The oxidizer is operated on a rotating schedule, where the gas flow through the ceramic beds is redirected periodically using a set of gas flow dampers. Once the heat energy of the "inlet" ceramic bed has been depleted, the flow through the system is redirected so that the untreated VOC gas stream entering the oxidizer is directed through the previously heated "outlet" ceramic bed. Regenerative thermal oxidizers have much higher heat recovery efficiencies than recuperative thermal oxidizers, recovering 85 to 95% of the heat from the treated gas

stream, and therefore have lower auxiliary fuel requirements. However, compared to direct flame and recuperative thermal oxidizers, regenerative thermal oxidizers typically have higher capital (equipment and installation) costs, are larger and heavier, and have higher maintenance costs.

(b) Catalytic Oxidizer:

Catalytic oxidation is the process of oxidizing organic contaminants in a waste gas stream within a heated chamber containing a catalyst bed in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The catalyst is used to lower the activation energy of the oxidation reaction, enabling the oxidation to occur at lower reaction temperatures compared to thermal oxidizers. The residence time, temperature, flow velocity and mixing, the oxygen concentration, and type of catalyst used in the combustion chamber affect the oxidation rate and destruction efficiency. Catalytic oxidizers typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. Catalytic oxidizers operate at lower temperatures and require less fuel than thermal oxidizers, they have a smaller footprint, and they need little or no insulation. The catalyst bed is usually composed of the following: (1) the substrate, typically ceramic or metal honeycombs, grids, mesh pads, or beads; (2) the carrier, a high surface area inorganic material such as alumina that is bonded to the substrate that contains a complex pore structure; and (3) the catalyst, a thin layer of material deposited onto the carrier. The most widely used catalysts for VOC oxidation are noble metals, such as platinum, palladium and rhodium or mixtures thereof. Base metal catalysts, such as oxides of chromium, cobalt, copper, manganese, titanium, and vanadium may also be used for VOC oxidation. Similar to thermal oxidizers, catalytic oxidizers may use regenerative or recuperative heat recovery to reduce auxiliary fuel requirements, where the untreated VOC gas stream entering the catalytic oxidizer is preheated using the heat content of the treated gas stream exiting the catalytic oxidizer.

Catalytic oxidizers can achieve 90-99% VOC control efficiency, depending on the oxidizer design and waste stream characteristics. Catalytic oxidizers are typically designed to have a residence time of 0.5 seconds or less and combustion chamber temperatures between 600 and 1,200°F. Catalytic oxidation is most suited to waste gas streams with little variation in the flow rate and type and concentration of VOC to be treated. In addition, catalytic oxidizers should not be used for waste gas streams that have a high concentration of particles, silicone, sulfur, halogen compounds, and/or heavy hydrocarbons that can cause fouling or masking of the catalyst, and for waste gas streams that contain metals such as mercury, phosphorus, arsenic, antimony, bismuth, lead, zinc, and/or tin that can cause catalyst poisoning.

(c) Flare:

Flaring is the process of oxidizing VOC in a waste gas stream by piping the waste gas to a remote, usually elevated location and burning it in a flame using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing. Flares are generally categorized in two ways: (1) by the height of the flare tip (i.e., ground or elevated), and (2) by the method of enhancing mixing at the flare tip (i.e., steam-assisted, air-assisted, pressure-assisted, or non-assisted). Flares can be used to control almost any VOC stream, and can typically handle large fluctuations in VOC concentration, flow rate, heating value, and inert species content. Flaring is appropriate for continuous, batch, and variable flow vent stream applications, but the primary use is that of a safety device used to control a large volume of pollutant resulting from upset conditions. Flares have primarily been used in petroleum production, petroleum refineries, and chemical plants to control waste gas streams containing low molecular weight VOC with high heating values.

A properly operated flare can achieve 98+% VOC control efficiency when controlling emission streams with heat contents greater than 300 British thermal units per standard cubic foot

(Btu/scf). If the waste gas stream has a heat content less than 300 Btu/scf, auxiliary fuel must be introduced in sufficient quantity to make up the difference. The VOC destruction efficiency of a flare depends upon the waste gas characteristics (density, flammability, heating value, and VOC component autoignition temperatures) and the combustion zone conditions (temperature, residence time, mixing, and available oxygen). While flares can provide efficient VOC control, other pollutants such as nitrogen oxides (NO<sub>x</sub>) and carbon monoxide (CO) are formed from the combustion process. Flares are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases.

#### *Reclamation Control Methods*

Organic compounds may be reclaimed by one of three possible methods: adsorption, absorption (scrubbing), or condensation. In general, the organic compounds are separated from the emission stream and reclaimed for reuse or disposal. Depending on the nature of the contaminant and the inlet concentration of the emission stream, recovery technologies can reach efficiencies of 98%.

#### (d) Carbon Adsorption Unit:

Carbon adsorption is a process where VOCs are removed from a waste gas stream when it is passed through a bed containing activated carbon particles, which have a highly porous structure with a large surface-to-volume ratio. Carbon adsorption systems usually operate in two phases: adsorption and desorption. During adsorption, the majority of the VOC molecules migrate from the gas stream to the surface of the activated carbon (through the activated carbon pores) where it is lightly held to the surface by weak intermolecular forces known as van der Waals' forces. As the activated carbon bed approaches saturation with VOC, its control efficiency drops, and the bed must be taken offline to be replaced or regenerated. Typically, two activated carbon beds are utilized on a rotating schedule, where a second bed (containing fresh or previously regenerated activated carbon) is brought online to continue controlling the VOC gas stream while the first bed is being replaced or regenerated. In regenerative systems, most VOC gases can be desorbed and removed from the activated carbon bed by heating the bed to a sufficiently high temperature, usually via steam or hot air, or by reducing the pressure within the bed to a sufficiently low value (vacuum desorption). The regenerated activated carbon can be reused and the VOCs that are removed from the bed can be reclaimed or destroyed.

Carbon adsorber size and purchase cost depend primarily on the gas stream volumetric flow rate, temperature, pressure, VOC composition, VOC mass loading, and moisture and particulate contents. The adsorptive capacity of an activated carbon bed for a VOC gas tends to increase with the VOC gas phase concentration, molecular weight, diffusivity, polarity, and boiling point. Carbon adsorption systems can be used for VOC gas concentrations from less than 10 ppm to approximately 10,000 ppm. Carbon adsorption systems (in general) are usually limited to waste gas streams with VOC compounds having a molecular weight of more than 50 and less than approximately 200 lb/lb-mole, since low molecular weight organics usually do not adsorb sufficiently and high molecular weight compounds are difficult to desorb and remove during the desorption cycle. Industrial applications of adsorption systems include control for dry cleaning, degreasing, paint spraying, solvent extraction, metal foil coating, paper coating, plastic film coating, printing, pharmaceuticals, rubber, linoleum, and transparent wrapping.

Carbon adsorption systems can achieve 95-99% VOC control efficiency. Carbon adsorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the activated carbon bed. Particulate matter and high moisture concentrations present in the gas stream compete with the VOC for pore space within the activated carbon and thereby reduce the VOC adsorptive capacity and control efficiency of the carbon adsorption systems. In addition, particulate matter and moisture can become entrained within the carbon bed, causing operating problems such as increased pressure drop across the bed.

(e) Gas Absorption (wet scrubber):

A wet scrubber is an absorption system in which a waste gas stream is interacted with a scrubbing fluid inside a contact chamber in order to strip particulate or gaseous pollutants from the waste gas stream through the processes of diffusion and dissolution. In many cases, an additive such as an acid, a base, or a VOC oxidizing agent is dissolved in the scrubbing fluid so that the dissolved gaseous pollutant chemically reacts with the scrubbing fluid to form a non-volatile or soluble product, thereby allowing additional gaseous pollutant to be absorbed by the scrubbing fluid. The four types of wet scrubber systems include packed towers, plate (or tray) columns, venturi scrubbers, and spray chambers. Gas and liquid flow through an absorber may be countercurrent, crosscurrent, or cocurrent. When used as an emission control technique, wet scrubbers are typically used for controlling particulate, acid gases, halogen gases, and highly soluble gases such as sulfur dioxide and ammonia.

If a wet scrubber is used for VOC control, the scrubbing fluid chosen should have a high solubility for the VOC gas, a low vapor pressure, a low viscosity, and should be relatively inexpensive. Water is the most commonly used scrubbing fluid for absorbing highly water-soluble (hydrophilic) VOC compounds such as methanol, ethanol, isopropanol, butanol, acetone, and formaldehyde. Other scrubbing fluid such as mineral oils, nonvolatile hydrocarbon oils, and aqueous solutions containing surfactants or amphiphilic block copolymers may be used for absorbing water-insoluble (hydrophobic) VOC compounds. Physical absorption is typically enhanced by lower temperatures, greater scrubbing fluid contacting time and surface area, higher scrubbing fluid to VOC ratio, and higher VOC concentrations in the gas stream.

Wet scrubber systems can achieve 70-99% VOC control efficiency, depending on the VOC solubility in the scrubbing fluid, the VOC-scrubbing fluid temperature, the scrubbing fluid contacting time and surface area, the scrubbing fluid to VOC ratio, the VOC concentration in the gas stream, and whether the scrubbing fluid contains a VOC oxidizing agent. Wet scrubber absorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the wet scrubber. When used to control VOC, the spent scrubbing fluid must be regenerated, treated, or shipped offsite for proper disposal.

(f) Condensation Unit:

Condensation is the separation of VOCs from an emission stream through a phase change, by either increasing the system pressure or, more commonly, lowering the system temperature below the dew point of the VOC vapor. Three types of condensers are used for air pollution Controls: (1) conventional non-refrigeration systems (such as cold-water direct contact condensers similar to wet scrubbers and cold-water indirect heat exchangers); (2) refrigeration systems (including mechanical compression refrigeration using chlorofluorocarbons (CFCs) and hydrofluorocarbons (HFCs) and Reverse Brayton Cycle refrigeration); and (3) cryogenic systems that utilize liquid nitrogen (including direct contact condensers and indirect heat exchangers).

Condensation units control VOC more efficiently when they are used for gas streams containing high concentrations of VOC and with low exhaust volumes. Condensation units are typically utilized at sources where there is a significant cost benefit to recovering the organic liquid for reuse, where the recovered organic liquids do not contain multiple organic compounds or water that require separation, and where the heat content of gas stream will not overload the refrigeration system. In addition, condensation units are typically used only on gas streams that have little or no particulate contamination, which can cause fouling within the condensation equipment and reduced heat transfer efficiency. Some industrial applications where refrigerated condensers are used include the dry cleaning industry, degreasers using VOC or halogenated

solvents, transfer of volatile organic liquid or petroleum products, and vapors from storage vessels.

Cold-water (non-refrigeration) condensation systems can achieve 90-99% VOC control efficiency, depending on the vapor pressures of the specific compounds. Condensation units using mechanical compression refrigeration (using CFC or HFC) can achieve 90+% VOC control efficiency, condensation units using Reverse Brayton Cycle refrigeration can achieve 98% VOC control efficiency, and condensation units using cryogenic (liquid nitrogen) cooling can achieve 99+% VOC control efficiency.

#### *Other Control Methods*

- (g) Bio-filtration is a process in which a waste gas stream is passed through a bed of peat, compost, bark, soil, gravel, or other inorganic media in order to strip organic contaminant gases from the waste gas stream through the process of dissolution in the bed moisture and adsorption to the bed media. Under aerobic conditions, microorganisms naturally present in the bed oxidize the organic contaminant gases within the bed to carbon dioxide, water, and additional biomass through metabolic processes. If the temperature of the waste gas stream is too high, the gas stream must be cooled to an optimum temperature before it can be treated in the biofilter in order to maintain the viability of the microorganisms. In addition, the bed must be monitored and maintained at an optimum moisture content and pH in order to prevent cracking of the bed media and to maintain the viability of the microorganisms.

Bio-filtration systems are designed to follow three basic steps. First, a pollutant in the gas phase is passed through a biologically active packed bed. The pollutant then diffuses into the biofilm immobilized on the packing medium. Finally, microorganisms growing in the biofilm oxidize the pollutant as a primary substrate or co-metabolite and in the process convert contaminants into the benign end products of carbon dioxide, water and additional biomass.

Three primary bioreactor configurations are available to treat stationary sources of air pollution: bio-filters, bio-trickling filters, and bio-scrubbers.

#### (1) Bio-Filters

Bio-filters are the simplest and oldest of the three vapor-phase bioreactors and involve passing a contaminated air stream through a reactor containing biologically-active packing material. The contaminants are transferred from the air stream into a bio-film immobilized on the support media and are converted by the microorganisms into CO<sub>2</sub>, water, and additional biomass. Moisture is typically supplied to the bio-film in a humid inlet waste gas stream. Packing media used in bio-filter beds can be broadly categorized as either "natural" or "synthetic". Natural media include wood chips, peat, and compost, with compost by far the most widely used. Synthetic media include activated carbon, ceramic pellets, polystyrene beads, ground tires, plastic media, and polyurethane foam. Natural organic packing media generally contain a supply of nutrients as a naturally occurring component of the packing itself. When a synthetic support medium is used, nutrients must be added for microbial growth.

#### (2) Bio-Trickling Filters

Bio-trickling filters are similar to bio-filters with the exception that there is a liquid nutrient medium continuously recirculating through the column. To facilitate the recirculation of the liquid phase, rigid synthetic media is used as the packing medium. Microorganisms grow primarily as a fixed film on inert packing media but may also be present in the liquid phase because they can both grow suspended in the liquid phase and because the flowing liquid imparts sufficient force to detach biomass from the solid support media.

Contaminants are transferred from the air stream into the liquid phase and bio-film for subsequent degradation.

Potential disadvantages of bio-trickling filter operations include: clogging of the pore space if the filter is treating high VOC loads or if the filter is provided excess nutrients, and the need to manage the liquid stream. An additional disadvantage is that bio-trickling filters may have more difficulty treating poorly soluble compounds since the specific surface area in bio-trickling filters is generally lower.

(3) Bio-Scrubbers

Bio-scrubbers combine physical and chemical treatment with a biological treatment in two separate reactors. In the first reactor, the contaminated air stream is contacted with water in a reactor packed with inert media, resulting in contaminant transfer from the air phase to the liquid phase. The liquid is then directed into an activated sludge reactor where the contaminants are biologically degraded. The separated activated sludge tank allows the reactor to treat higher concentrations of compounds than bio-filters can handle. In addition since compound transfer and degradation occur in separate reactors, optimization of each reactor can take place separately. As with bio-trickling filters, bio-scrubbers offer greater operator control over nutrient supply, acidity, and the build-up of toxic by-products.

A potential disadvantage of bio-scrubbers is that slower growing microorganisms may be washed out of the system and disposal of excess sludge is required.

## **Step 2: Eliminate Technically Infeasible Options**

There are some add-on control devices that are considered technically feasible, however, due to the relatively low PTE of VOC for each unit, there are no add-on control devices that are considered economically feasible.

## **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no technically feasible control options.

## **Step 4: Evaluate the Most Effective Controls and Document the Results**

A search in the EPA's RACT/BACT/LAER Clearinghouse (RBLC) did not produce any results for this type of unit.

## **Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

BACT shall be the following:

- (a) VOC emissions from residue solidification unit EU-5001a-5001d (stack S-5001) shall not exceed 1.40 lb/hr.
- (b) VOC emissions from residue solidification unit EU-5002a-5002d (stack S-5002) shall not exceed 1.40 lb/hr.
- (c) VOC emissions from residue solidification unit EU-5003a-5003d (stack S-5003) shall not exceed 1.40 lb/hr.

- (d) VOC emissions from residue solidification unit EU-5004a-5004d (stack S-5004) shall not exceed 1.40 lb/hr.

**Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis  
 Cooling Tower**

**Step 1: Identify Potential Control Technologies**

PM emissions from cooling towers are typically controlled through one of the following mechanisms:

- (1) Drift eliminators.
- (2) Minimizing total dissolved solids (TDS).

**Step 2: Eliminate Technically Infeasible Options:**

For the cooling tower, the above listed control technologies are considered technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

The control technologies for cooling towers are ranked as follows:

- (1) Drift eliminators.
- (2) Minimization of total dissolved solids (TDS).

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Cooling Tower

**Step 5: Select BACT**

IDEM, OAQ has established BACT for the cooling towers as:

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) PM, PM10, and PM2.5 emissions from the cooling tower (EU-6001, EU-6002 and EU-6003) shall be controlled by the use of drift eliminators with a maximum drift rate of no more than 0.0005%.
- (b) Total dissolved solids (TDS) in the circulating cooling water shall not exceed 2,395 mg/l.
- (c) VOC emissions from the cooling towers (EU-6001, EU-6002 and EU-6003) shall not exceed 1.34 lb/hr.

**BACT Analysis**  
**Emergency Engines - PM/PM10/PM2.5, NOx, SO2, VOC, CO and CO2e**

**Step 1: Identify Potential Control Technologies**

PM/PM10/PM2.5, NOx, SO2, VOC, CO and CO2e emissions can be controlled with the following control technologies:

- (1) Good Combustion Practices
- (2) Low sulfur diesel

**Step 2: Eliminate Technically Infeasible Options**

Good Combustion Practices is the only technically feasible option.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Emergency Generators

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (hp)

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

(a)

Emission Unit	ID	Pollutant	Limitation
Emergency Diesel Generator	EU-6006	PM	0.20 g/kW-hr
		PM10	0.20 g/kW-hr
		PM2.5	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	6.40 g/kW-hr
		CO	3.50 g/kW-hr
		Opacity	Acceleration: 20% Lugging: 15% Peak: 50%
		CO <sub>2e</sub>	811 tons per twelve (12) consecutive month period with compliance determined at the end of each month
Emergency Diesel Firewater pump	EU-6009	PM	0.20 g/kW-hr
		PM10	0.20 g/kW-hr
		PM2.5	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	4.00 g/kW-hr
		CO	3.50 g/kW-hr

(c) Emergency generator (EU-6006) and emergency fire pump (EU-6009) shall use good combustion practices and shall use energy efficiency. Use of good combustion practices and energy efficiency is defined as operation of engines certified to meet applicable emissions standards in accordance with the manufacturers' recommendations for operation and maintenance or according to a maintenance plan that complies with 40 CFR 60.4211(g). Good combustion practices may include but are not limited to the following:

- (1) Prepare and maintain a preventive maintenance plan.
- (2) Change oil and filter every 500 hours of operation or annually, whichever comes first.
- (3) Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first, and replace as necessary.
- (4) Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.
- (5) During periods of startup the Permittee must minimize the engine's time spent at idle and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes.

<b>BACT Analysis Hydrogen Plant</b>

## **NO<sub>x</sub>**

### **Step 1: Identify Potential Control Technologies**

NO<sub>x</sub> emissions can be controlled with the following control technologies:

Post-combustion controls:

- (1) Selective Catalytic Reduction (SCR)
- (2) Selective Non-Catalytic Reduction (SNCR)

Combustion controls:

- (3) Low NO<sub>x</sub> Burner (LNB)/Ultra low-Nox burner (ULNB)
- (4) Flue Gas Recirculation (FGR)

#### **Selective Catalytic Reduction (SCR)**

Selective Catalytic Reduction (SCR) process involves the mixing of anhydrous or aqueous ammonia vapor with flue gas and passing the mixture through a catalytic reactor to reduce NO<sub>x</sub> to water and N<sub>2</sub>. Under optimal conditions, SCR has a removal efficiency up to 90% when used on steady state processes. The efficiency of removal will be reduced for processes that are not stable or require frequent changes in the mode of operation.

The most important factor affecting SCR efficiency is temperature. SCR can operate in a flue gas window ranging from 480°F to 800°F, although the optimum temperature range depends on the type of catalyst and the flue gas composition. In this particular service, the minimum target temperature is approximately 750°F. Temperatures below the optimum decrease catalyst activity and allow NH<sub>3</sub> to slip through; above the optimum range, ammonia will oxidize to form additional NO<sub>x</sub>. SCR efficiency is also largely dependent on the stoichiometric molar ratio of NH<sub>3</sub>:NO<sub>x</sub>; variation of the ideal 1:1 ratio to 0.5:1 ratio can reduce the removal efficiency to 50%.

#### **Selective Non-Catalytic Reduction (SNCR)**

With selective non-catalytic reduction (SNCR), NO<sub>x</sub> is selectively removed by the injection of ammonia or urea into the flue gas at an appropriate temperature window of 1600°F to 2000°F, without employing a catalyst. Similar to SCR without a catalyst bed, the injected chemicals selectively reduce the NO<sub>x</sub> to molecular nitrogen and water. This approach avoids the problem related to catalyst fouling but the temperature window and reagent mixing residence time is critical for conducting the necessary chemical reaction.

At the proper temperature, urea decomposes to produce ammonia which is responsible for NO<sub>x</sub> reduction. At a higher temperature, the rate of competing reactions for the direct oxidation of ammonia that forms NO<sub>x</sub> becomes significant. At a lower temperature, the rates of NO<sub>x</sub> reduction reactions become too slow resulting in urea slip (i.e. emissions of unreacted urea).

Optimal implementation of SNCR requires the employment of an injection system that can accomplish thorough reagent/gas mixing within the temperature window while accommodating spatial and production rate temperature variability in the gas stream. The attainment of maximum NO<sub>x</sub> control performance requires that the furnace exhibit a favorable opportunity for the application of this technology relative to the location of the reaction temperature range and steady operation within that temperature window.

#### **Low NO<sub>x</sub> Burners (LNB)**

Using LNB can reduce formation of NO<sub>x</sub> through careful control of the fuel-air mixture during combustion. Control techniques used in LNBs includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NOx emissions can be realized using LNBs. The U.S. EPA reports that LNBs have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

**Flue Gas Recirculation (FGR)**

Recirculating a portion of the flue gas to the combustion zone can lower the peak flame temperature and result in reduced thermal NOx production. The flue gas recirculation (FGR) can be highly effective technique for lowering NOx emissions from burners and it's relatively inexpensive to apply. FGR lowers NOx emissions in two ways; the cooler, relatively inert, recirculated flue gases act as heat sink, absorbing heat from the flame and lowering peak flame temperatures and when mixed with the combustion air, recirculated flue gases lower the average oxygen content of the air, starving the NOx-forming reactions for one of the needed ingredients.

**Step 2: Eliminate Technically Infeasible Options:**

Technology	BACT Evaluation
Selective Catalytic Reduction (SCR) Technically Feasible – <b>Yes</b>	Selective Catalytic Reduction (SCR) is technically feasible.
Selective Non-Catalytic Reduction (SNCR) Technically Feasible – <b>No</b>	Riverview will operate at a wide range of load levels, with lower levels potentially unable to provide a temperature profile that maintains the range needed for effective control for sufficient residence time to achieve proper control.  Some ammonia will be emitted.  The combustion units used at Riverview combust a combination of gaseous fuels that are proportionally variable over relatively short time periods and results in short term NOx loading variations. This variability works against the limited temperature flexibility and difficulty of SNCR in adjusting to short term changes maintaining consistent NOx control during operation of these units. For these reasons, the SNCR is technically infeasible.
Low NOx Burner (LNB) Technically Feasible - <b>Yes</b>	LNB/ULNB is technically feasible.
Flue Gas Recirculation (FGR) Technically Feasible – <b>Yes</b>	Flue Gas Recirculation (FGR) is technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
LNB/ULNB	40-85%
SCR	70%-90%
FGR	15-50%

**Step 1: Identify Potential Control Technologies**

For CO, PM/PM10/PM2.5, SO2, VOC and CO2e, the available control technologies are the same as listed under "BACT Analysis Natural gas-fired heaters and boiler" section above.

**Step 2: Eliminate Technically Infeasible Options and**

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness:**

For CO, PM/PM10/PM2.5, SO2, VOC and CO2e, there are no add-on control devices that are considered feasible; therefore no ranking is necessary. See "BACT Analysis Natural gas-fired heaters and boiler" above for evaluations of each pollutant.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Hydrogen Plant - PM/PM10/PM2.5**

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The units shall burn only gaseous fuels.
- (b) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions from each reformer shall not exceed:

Emission Limitations <sup>1</sup>	
Pollutant	lb/MMBtu
PM	0.006
PM <sub>10</sub> *	0.006
PM <sub>2.5</sub> *	0.0048

Notes:

1. PM shall include only filterable PM. PM<sub>10</sub> and PM<sub>2.5</sub> shall include filterable and condensable.

- (c) Sulfur content of the fuel gas delivered to each reformer shall not exceed 0.005 gr/scf.
- (d) The units shall use selective catalytic reduction (SCR) with low-NO<sub>x</sub> burners for NO<sub>x</sub> control.

- (e) NOx emissions from each reformer shall not exceed:

<b>Emission Limitations</b>	
<b>Pollutant</b>	<b>lb/MMBtu</b>
NOx	0.0065

- (f) VOC emissions from each reformer shall not exceed:

<b>Emission Limitations</b>	
<b>Pollutant</b>	<b>lb/MMBtu<sup>1</sup></b>
VOC	0.0015

Notes:

1. 1-hr average

- (g) CO emissions from each reformer shall not exceed:

<b>Emission Limitations</b>	
<b>Pollutant</b>	<b>lb/MMBtu</b>
CO	0.020

- (h) The CO<sub>2</sub>e emissions from Block 7000 hydrogen production operations shall not exceed the values shown in the table below per twelve (12) consecutive month period, with compliance determined at the end of each month.

<b>Emission Limitations</b>	
<b>Unit ID</b>	<b>CO<sub>2</sub>e Limit (tons)</b>
EU-7001	987,271
EU-7002	987,271
EU-7003	1,080
EU-7004	1,080

- (h) VOC emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 3.20 b/hr, each.

- (i) CO emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 1.06 lb/hr, each.

<b>BACT Analysis Wastewater Treatment</b>
---

**Step 1: Identify Potential Control Technologies**

IDEM, OAQ has identified the following control technologies for control of VOC emissions from wastewater treatment processes:

- (a) VOC destruction methods
- (b) VOC removal methods
- (c) Wastewater treatment process design

**Step 2: Eliminate Technically Infeasible Options**

- (a) VOC destruction methods  
 VOC destruction processes, e.g., incineration, are not technically feasible for wastewater streams containing minor amounts of organic compounds. The fuel value of the VOC content is insufficient to support vaporization of the water phase without very substantial use of supplemental fuel. Application of destruction technology to a wastewater stream also requires entirely different unit construction from typical air pollution control devices, i.e., a liquid injection incinerator rather than a flare.
- (b) VOC removal  
 Certain removal processes, such as activated carbon adsorption, are applicable to removal of contaminants from water streams. However, these are generally applied as point-of-use systems for removing trace contaminants from clean streams like drinking water. Oily contaminants and unpredictable suspended solids loading cause plugging in activated carbon systems so adsorption processes are not feasible for wastewater treatment at the proposed source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

IDEM, OAQ has ranked the control technologies in order of effectiveness as follows:

- (a) Conformance with the requirements of 40 CFR 60, Subpart QQQ; 40 CFR 61, Subpart FF; and 40 CFR 63, Subpart CC; including but not limited to covered oil-water separators, water seal drains, and closed vent systems. (estimated 96% control based on AP-42 Section 5.1)

The applicant proposed a wastewater collection and treatment system compliant with 40 CFR 60, Subpart QQQ which is top BACT. Therefore, a ranking is not required.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Wastewater treatment	-	VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and MH1 (EU-8003) shall not exceed 20 ppmvd, each	NA
Castleton Commodities International Corpus Christi	TX-0756 116072 & PSDTX1388 (6/19/2015)	Wastewater treatment plant	Overall system to achieve 90% of VOC from treated wastewater. Oil/water separator is enclosed and routed to a carbon adsorption system (CAS). Process drains to be equipped with a water seal. Wastewater sewers will be enclosed. Aerobic digesters will be enclosed and directed to a CAS.	4.56 lb/hr 9.04 tpy 90% overall control	-

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Magellan Processing LP	TX-0731 118270 & PSDTX1398 (4/10/2015)	Petroleum refining wastewater and wastewater treatment	Process wastewater shall be immediately directed to a covered system. All lift stations, manholes, junction boxes, conveyances, and any other wastewater facilities shall be covered and all emissions routed to a vapor combustor with a guaranteed DRE of 99% for control.	0.4 tpy	-
Specification of DRE is considered as specific for the emissions control device (i.e., vapor combustor), not as an achievable overall control efficiency for VOC emissions from wastewater collection and treatment processes.					
Valero Refining New Orleans LLC	LA-0213 PSD-LA-619 (M5) (11/17/2009)	Wastewater collection & treatment: refinery	WW (EQT0255): comply with LA refinery MACT WWTU (EQT0359): comply with 40 CFR 61 subpart FF CRUIDS (sic) (EQT369): comply with 40 CFR 63 subparts F & G	-	-
Sunoco Inc	OH-0308 04-01447 (2/29/2009)	wastewater streams	-	91.19 tpy	-
This entry is identified as MACT, therefore it is not considered to establish BACT for the proposed source.					
Conoco Phillips	IL-0103 06050052 (8/5/2008)	wastewater treatment plant	Good air pollution control practices	-	-
This entry is identified as LAER, therefore it is not considered to establish BACT for the proposed source.					

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM, OAQ has established the following as VOC BACT for wastewater collection and treatment operations:

- (a) VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and manhole no. 1 (EU-8003) shall not exceed 20 parts per million by volume (dry) (ppmvd), each.

**BACT Analysis  
 VOC Leaks**

**Step 1: Identify Potential Control Technologies**

IDEM, OAQ has identified the following control technologies for VOC control from fugitive emission sources:

- (a) Leak Detection and Repair Program (LDAR)
- (b) No Control Option

**Step 2: Eliminate Technically Infeasible Options**

- (a) Leak Detection and Repair Program (LDAR)  
 A leak detection and control program (LDAR) is a systematic method of finding and eliminating fugitive emissions from leaking pumps, valves, compressors, pipe fitting, sampling connections, etc. LDAR is a work practice that assists sources identify leaking equipment so that emissions can be reduced through systematic repair or replacement. The key to the effectiveness of fugitive emission control is the regularly scheduled inspections and a defined

repair/replacement schedule. The use of an LDAR program is a technically feasible control option for the fugitive VOC emissions.

- (b) No Control Option  
 It is possible that fugitive emissions from a source are so small that the time and cost required to establish and implement an LDAR program are not cost effective. Fugitive VOC emissions were estimated by the source at 14.39 tons per year. The use of no control is a technically feasible control option for the fugitive VOC emissions.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

IDEM, OAQ has ranked the control technologies in order of effectiveness as follows:

- (a) LDAR (98% control)  
 (b) No Control (0% control)

The applicant proposed an LDAR program which is top BACT. Therefore, a ranking is not required.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Fugitive VOC	LDAR Program per 40 CFR 60, Subpart GGGa	Block 2000: 151.18 tpy Block 4000: 25.04 tpy	NA
Gravity Midstream Corpus Christi LLC	TX-0812 9342A, 9343A, PSDTX963M 1 (10/31/2016)	equipment leaks	quarterly monitoring, 40 CFR 60, subparts GGG & GGGa	8.72 tpy	-
Motiva Enterprises LLC	TX-0759 6056, PSDTX1062 M2, GHG121 (7/31/2015)	hydrocracking and hydrotreating fugitive components	enhanced LDAR program, 500 ppmv leak definition	147.66 tpy	-
Although described as "enhanced LDAR program" with a 500 ppmv threshold, IDEM does not find that the requirements described in the referenced RBLC entry are substantially different from the requirements of 40 CFR 60, subpart VVa incorporated in Subpart GGGa.					
Phillips 66 Co	LA-0283 PSD-LA-696 (M-3) (8/14/2015)	unit fugitives for low sulfur gasoline unit (294-FF, FUG 0004)	LDR: Louisiana MACT determination for refinery equipment leaks (fugitive emission sources) dated 7/26/1994	15.43 lb/hr 67.59 tpy	-
Valero, Hydrogen Plant	LA-0245 PSD-LA-750 (12/15/2010)	hydrogen plant fugitives (FUG0030)	LDAR pgm that meets LA refinery MACT with consent decree enhancements (7/26/1994)	23.74 tpy	NA

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Arizona Clean Fuels Yuma, LLC	AZ-0046 1001205 (4/14/2005)	equipment leaks	LDAR program, 40 CFR 63, subpart H	-	-
Source may not have been constructed under this permit, therefore this citation is not considered representative of BACT.					
Sources listed below are informative because they are located in Indiana or are somewhat similar operations in different SIC codes. These are not considered to represent BACT for the proposed source.					
Midwest Fertilizer Corporation	IN-0173 T129-33576-00059 (6/4/2014)	fugitive emissions (F-1)	LDAR Program 40 CFR 60, Subpart VVa	None	NA
Source is a fertilizer plant in SIC code 2873. Indicative of the level of control that may be achieved in steam-hydrocarbon reforming processes that produce hydrogen. Requirements are consistent with BACT determined for the proposed source.					
Sasol Chemicals (USA) LLC	LA-0291 PSD-LA-778 (5/23/2014) (GTL unit)	GTL unit fugitive emissions (FUG 15)	LDAR program per 40 CFR 63, subpart FFFF	none	89.13 tpy
GTL project was reportedly cancelled in November 2017.					
Ohio Valley Resources	IN-0179 T147-32322-00062 (9/25/2013)	process fugitive VOC	LDAR Program 40 CFR 60, Subpart VVa	-	NA
Source was a fertilizer plant in SIC code 2873. Indicative of the level of control that may be achieved in steam-hydrocarbon reforming processes that produce hydrogen. Requirements are consistent with BACT determined for the proposed source. The permit for this source was revoked.					
Southeast Renewable Fuels	FL-0322 PSD-FL-412, 0510032-001-AC (12/23/2010)	Fugitives FUG0030	LDAR Program 40 CFR 60, Subpart VVa	6.52 tpy	NA
Source is in SIC code 2869.					
Sabina Petrochemicals	TX-0575 N018M1 (8/20/2010)	ALKFUG, BDEFUG, UTILFUG	state LAER LDAR program	9.01 tpy	NA
Requirements for this source are LAER and therefore not applicable in determining BACT for the proposed source.					
Highlands Ethanol Facility	FL-0318 PSD-FL-406, 0550061-001-AC (12/10/2009)	Fugitive VOC Emissions	LDAR Program 40 CFR 60, Subpart VVa	19.60 tpy	NA
Source is in SIC code 2869.					
Ohio River Clean Fuels LLC	OH-0317 02-22896 (11/20/2008)	equipment leaks	use of leakless/sealless or low-emission pumps, valves, and compressors.  LDAR program, 40 CFR 60, subpart GGa	1.70 tpy	-
Source was to be a coal-to-liquids operation in SIC code 2869, but was not constructed; therefore, it was not demonstrated that this limit can be complied with.					

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT) and 326 IAC 8-1-6 (New Facilities; General Reduction Requirements), IDEM, OAQ has established the following as VOC BACT for fugitive VOC emissions:

- (a) Fugitive VOC emissions shall be controlled by a Leak Detection and Repair (LDAR) program. The leak detection and repair program specified in 40 CFR 60, Subpart GGa shall serve as BACT for VOC fugitive emissions.
  - (1) Fugitive VOC emissions from Block 2000 VEBA Combi Cracker operations shall not exceed 151.18 tons per twelve (12) consecutive month period.

- (2) Fugitive VOC emissions from Block 4000 offsites operations shall not exceed 25.04 tons per twelve (12) consecutive month period.

<b>Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis Roads</b>
---

### **Step 1: Identify Potential Control Technologies**

Emissions of particulate matter (PM), particulate matter with an aerodynamic diameter less than or equal to ten (10) micrometers (PM<sub>10</sub>) and PM<sub>2.5</sub> from fugitive sources are generally controlled with measures to prevent the emissions from occurring. Generally, fugitive PM, PM<sub>10</sub> and PM<sub>2.5</sub> emissions from roadways are controlled through one of the following mechanisms:

- (1) Paving of Roadways
- (2) Wet Suppression or Chemical suppression
- (3) Good Housekeeping (cleanup spilled material)

Add-on particulate control devices such as cyclones, scrubbers, baghouses or ESP's are not possible alternatives because the roadways cannot be enclosed and vented to a point source control device.

### **Step 2: Eliminate Technically Infeasible Options**

Wet Suppression or Chemical suppression:

Wet suppression systems use liquid sprays or foam to suppress the formation of airborne dust. The primary control mechanisms are those that prevent emissions through agglomerate formation by combining small dust particles with larger aggregate or with liquid droplets. The key factors that affect the degree of agglomeration and, hence, the performance of the system are the coverage of the material by the liquid and the ability of the liquid to wet small particles. There are two types of wet suppression systems: liquid sprays which use water or water/surfactant mixtures as the wetting agent and systems which supply foams as the wetting agent. Wet suppression systems typically achieve PM control efficiencies of greater than 85%.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of a Wet Suppression or Chemical suppression is a technically feasible option for the roads at this source.

Paving Roadways and Good Housekeeping

Paving all haul roads and prompt cleanup of any spilled or eroded materials are effective at minimizing dust emissions from vehicle traffic.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

- (1) Paving haul roads reduces vehicle dust emissions versus unpaved surfaces and is feasible.
- (2) Wet or chemical suppression (frequent use of water or chemical surfactants) can significantly reduce airborne dust emissions from both paved and unpaved roadways.
- (3) Particulate emission from paved roadways can also be minimized with good housekeeping, i.e. cleaning up spills of solid material or dirt eroded onto the road surfaces.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Paved Roadways and Parking areas

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT
Riverview Energy	Proposed	Paved Roads	All roads shall be paved	VE: 0% except for 1 min. in any 1-hr period  Development, maintenance, and implementation of a fugitive dust control plan.
V&M Star	OH-0344 P0107088 (1/27/2011)	Paved Roads	watering, sweeping, chemical stabilization, or suppressants applied at sufficient frequencies	Paved & Unpaved roads PM: 38.3 tpy PM10: 7.7 tpy VE: 0% except for 1 min. every 60
Sun Coke Energy	OH-0332 P0104768 (5/20/2010)	Paved Roads	Watering	PM: 1.08 tpy PM10: 0.21 tpy PM2.5: 0.05 tpy fugitive VE: No VE except for any 1 min in any 60 min.
New Steel International, Inc.	OH-0315 07-00587 (5/6/2008)	Paved Roads	wet suppressants, watering, speed reduction and vacuuming or sweeping	PM: 153.4 tpy PM2.5: 29.9 tpy VE: 0% except for 1 min. every 60
Paving roads with watering, sweeping, chemical stabilization, or suppressants applied at sufficient frequencies is the most stringent. Therefore, this has been determined to be BACT. VE: 0% except for 1 min. every 60 is the most stringent. Therefore, this has been determined to be BACT.				
Midwest Fertilizer Corp.	IN-0173 T129-33576-00059 (6/4/2014)	Paved Roads	paving all haul roads, daily sweeping with wet suppression and prompt cleanup of any spilled materials	PM/PM10/PM2.5: 90 % control
90% control of fugitives is the most restrictive and is determined to be BACT.				
Ohio Valley Resources, LLC	IN-0179 T147-32322-00062 (9/25/2013)	Paved Roads	paving all plant haul roads, wet or chemical suppression and prompt cleanup of any spilled materials	PM/PM10/PM2.5: 90 % control
Note: This permit has been revoked and it is not clear whether the limits were tested, therefore this source is not considered in determining BACT for the proposed source.				
Indiana Gasification, LLC	IN-0166 T147-30464-00060 (6/27/2012)	Paved Roads	paving all plant haul roads, wet or chemical suppression and prompt cleanup of any spilled materials	PM/PM10/PM2.5: 90 % control
Note: This permit has been revoked and it is not clear whether the limits were tested, therefore this source is not considered in determining BACT for the proposed source.				
Rumpke Sanitary Landfill	OH-0330 07-00574 (12/30/2008)	Paved Roads	water flushing, sweeping	PM: 58 tpy (paved & unpaved) PM10: 15.1 tpy (paved & unpaved) VE: 5% opacity as 3-min avg.

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Paved Roads	Reduce speed limit, sweeping, watering and good housekeeping	PM: 79.0 tpy PM10: 15.39 tpy VE: No VE except for any 1 min in any 60 min.
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.				
Argos USA	SC-0132 0900-0004- EF-R2 (12/14/2007)	Paved Roads	Best mgmt practices consisting of sweeping and/or water flushing	PM
Entergy Louisiana, LLC	LA-0221 PSD-LA-720 (11/30/2007)	Paved Roads	Newly constructed roads will be paved	PM10: 4.07 lb/hr (17.2 tpy)
Mesabi Nugget	MN-0061 13700318- 001 (6/26/2005)	Paved Roads	Fugitive dust control plan	VE: 5% opacity
Martco Limited Partnership	LA-0203 PSD-LA-710 (6/13/2005)	Paved Roads	Limited access	PM10: 2.6 lb/hr
Louisiana Generating, LLC	LA-0223 PSD-LA- 660M1 (1/8/2008)	Paved Roads	Pave all roads	PM10: 1.21 lb/hr 3.54 tpy

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

BACT shall be:

- (a) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the paved roads shall be the development, maintenance, and implementation of a fugitive dust control plan, which shall include but not be limited to vacuum sweeping and water flushing as necessary and the implementation of a speed reduction plan.
- (b) Visible emissions from truck traffic on plant roads shall not exceed one (1) minute in any one (1) hour period.

**Air Quality Analysis**  
**Appendix C - Addendum to the Technical Support Document**  
**Riverview Energy Corporation**  
**Dale, Indiana (Spencer, County)**  
**Tracking and Plant ID: 147-39554-00065**

**Proposed Project**

Riverview Energy Corporation (REC) plans to construct a Direct Coal Hydrogenation facility in Spencer County near Dale, Indiana. The facility will convert Indiana Number 5 high sulfur coal into low-sulfur liquid fuel products such as diesel, naphtha, and other saleable products. The site will be located south of Interstate 64 and east of U.S. 231. The Potential to Emit (PTE) is over 100 tons per year (TPY) for nitrous oxides (NO<sub>x</sub>), carbon monoxide (CO), sulfur dioxide (SO<sub>2</sub>), volatile organic compounds (VOCs), and over 25 TPY for particulate matter with an aerodynamic diameter of 10 micrometers and smaller (PM<sub>10</sub>) and particulate matter with an aerodynamic diameter of 2.5 micrometers and smaller (PM<sub>2.5</sub>). In addition, the facility will emit over 25 TPY of Hazardous Air Pollutants (HAPs). The HAP with largest emissions from the proposed facility is Methanol. Kellogg Brown and Root (KBR) were the consultants that submitted the modeling for REC.

**Analysis Summary**

Based on the potential emissions after controls, a Prevention of Significant Deterioration (PSD) air quality analysis was triggered for SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, CO, NO<sub>x</sub>, VOCs, and HAPs. The significant impact analysis for 1-hour NO<sub>2</sub>, all averaging times for SO<sub>2</sub>, 24-hour and annual PM<sub>2.5</sub> showed that modeled concentrations exceeded the respective significant impact levels (SILs). A cumulative analysis was therefore required for those pollutants. No violation of the National Ambient Air Quality Standards (NAAQS) was found within the modeling domain for any of the required NAAQS analyses. Pre-construction monitoring is not required since modeled concentration for the applicable pollutants were below the significant monitoring concentration thresholds. Existing monitoring is available for all pollutants and averaging times. An additional impact analysis was conducted and showed no further impact to vegetation, soils, visibility, endangered species, or economic growth. In addition a secondary ozone and PM<sub>2.5</sub> analysis was performed and no significant impacts were found from this proposed source. Finally, a Hazardous Air Pollutant (HAP) analysis was performed since emissions of one HAP (Methanol) were greater than 10 TPY. Based on the HAPs modeling results, the source will not pose a health concern.

**Air Quality Impact Objectives**

The purpose of the air quality impact analysis in the permit application is to accomplish the following objectives; each objective is individually addressed in this document in each section below.

- A. Establish which pollutants require an air quality analysis based on Prevention of Significant Deterioration (PSD) significant emission rates.
- B. Provide analyses of actual stack heights with respect to Good Engineering Practice (GEP), the meteorological data used, a description of the model used in the analysis, and the receptor grid used for the analyses.
- C. Determine the significant impact level, the area impacted by the source's emissions, and background air quality levels.
- D. Demonstrate that the source will not cause or contribute to a violation of the National Ambient Air Quality Standards (NAAQS) or PSD increment if the applicant exceeds significant impact levels.

- E. Perform a qualitative analysis of the source's impact on general growth, soils, vegetation, and visibility in the impact area with emphasis on any Class I areas. The nearest Class I area is Kentucky's Mammoth Cave National Park.
- F. Perform a secondary ozone and PM<sub>2.5</sub> analysis if the applicant is major for NO<sub>2</sub>, VOCs, or SO<sub>2</sub>.
- G. Conduct a Hazardous Air Pollutant (HAP) analysis to determine cancer risk and hazard screening.
- H. Summarize the Air Quality Analysis.

## Section A – Pollutants Analyzed for Air Quality Impact

### Applicability

The PSD requirements, 326 Indiana Administrative Code (IAC) 2-2, apply in attainment and unclassifiable areas and require an air quality impact analysis of each regulated pollutant emitted in significant amounts by a major stationary source or modification. Significant emission levels for each pollutant are defined in 326 IAC 2-2-1 and in the Code of Federal Regulations (CFR) 52.21(b)(23)(i). The proposed site in Spencer County is an attainment area for all applicable NAAQS.

### Proposed Project Emissions

NO<sub>x</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, CO, SO<sub>2</sub>, VOCs, Lead (Pb) and HAPs are the pollutants that will be emitted from REC and are summarized in Table 1. NO<sub>2</sub>, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, VOCs, and HAPs exceed the PSD significant emission rates; and air quality analysis is required for these pollutants.

**TABLE 1**  
**Significant Emission Rates for PSD**

POLLUTANT	SOURCE EMISSION RATE (TPY)	SIGNIFICANT EMISSION RATE (TPY)	PRELIMINARY AQ ANALYSIS REQUIRED
NO <sub>x</sub>	156.83	40	YES
CO	301.67	100	YES
PM <sub>2.5</sub>	57.51	10	YES
PM <sub>10</sub>	68.57	15	YES
SO <sub>2</sub>	224.37	40	YES
VOCs	303.22	40	YES
Pb	0.00117	0.6	NO
HAPs	60	25 <sup>1</sup>	YES
H <sub>2</sub> S <sup>2</sup>	5.11	10	NO

<sup>1</sup>10 tpy for a single HAP.

<sup>2</sup>There are no NAAQS for H<sub>2</sub>S; however, there are monitoring concentrations thresholds for pollutants above the de minimis levels.

## **Section B – Good Engineering Practice (GEP), Meteorological Data, Model Used, Receptor Grid**

### **Stack Height Compliance with Good Engineering Practice (GEP)**

#### **Applicability**

Stacks should comply with GEP requirements established in 326 IAC 1-7-4. If stacks are lower than GEP, excessive ambient concentrations due to aerodynamic downwash may occur. Dispersion modeling credit for stacks taller than 65 meters or 213 feet is limited to GEP for the purpose of establishing emission limitations. The GEP stack height takes into account the distance and dimensions of nearby structures, which would affect the downwind wake of the stack. The downwind wake is considered to extend five times the lesser of the structure's height or width. A GEP stack height is determined for each nearby structure by the following formula:

$$H_g = H + 1.5L$$

Where :  $H_g$  is the GEP stack height  
H is the structure's height  
L is the structure's lesser dimension (height or width)

#### **New Stacks**

Since the new stack heights are below GEP stack height, the effect of aerodynamic downwash will be accounted for in the air quality analysis for the project.

#### **Meteorological Data**

The meteorological data used in the American Meteorological Society Environmental Protection Agency Regulatory Model (AERMOD) consisted of 2012 through 2016 surface meteorological data from the Evansville Regional Airport National Weather Service (NWS) Automated Surface Observing System (ASOS) station merged with the upper air data from the Lincoln, Illinois NWS. Additionally, the 1-minute ASOS wind speed and wind direction data were processed with the AERMINUTE preprocessor version 15272. The meteorological data were preprocessed into an AERMOD ready format by the Office of Air Quality (OAQ) using U.S. EPA's AERMET Version 16216, meteorological preprocessor for AERMOD. The meteorological data was processed with the adjusted  $u^*$  values in accordance with Appendix W guidance as a regulatory option.

#### **Model Description**

OAQ used the most recent version of AERMOD (Version 18081 at the time the applicant submitted a modeling analysis) to determine maximum off-property concentrations or impacts for each criteria pollutant. AERMOD is U.S. EPA's preferred near field dispersion model and all regulatory default options were utilized in the U.S. EPA approved model, as listed in the 40 CFR Part 51, Appendix W "Revision to the Guideline on Air Quality Models." The Auer Land Use Classification Scheme was used to determine land use in the area. The area is considered primarily rural; therefore, a rural classification was used.

#### **Receptor Grid**

The receptor grid used by the consultants, KBR, was also used by OAQ. The grid was extended to a distance approximately 10 kilometers from the plant. Receptors were closely spaced at 50 meters along the plant fence line and out to a 0.5 km away from the plant fence line. A finely spaced grid with a 100 meter spacing extended out to a distance of 1.5 kilometers. A medium density Cartesian grid extended from 1.5 kilometers out to 3 kilometers with receptor spacing of 250 meters. Finally receptors were spaced 500 meters apart from 3 kilometers to 10 kilometers from the facility center.

## Section C - Significant Impact Levels and Background

An analysis was conducted to determine the modeled impacts of the proposed facility. The highest 1<sup>st</sup> high concentrations for each pollutant and averaging time was determined and are shown below in Table 2. It was found that 1-hour NO<sub>2</sub>, 1-hour, 3-hour, 24-hour and annual SO<sub>2</sub> were above their respective SILs. In addition, 24-hour and annual PM<sub>2.5</sub> were above their respective SILs. All other pollutants and averaging times for NAAQS and PSD analysis were below the SIL. A cumulative NAAQS analysis is required for pollutants and averaging times above their respective SILs. In determining the maximum modeled impacts presented in the SIL table below, care was taken to identify the worst case operating scenario of the facility. This involved modeling scenarios when flaring operations are planned. These flaring scenarios vary in duration from an hour to as long as a week. To ensure that the hourly standards were protected, the highest hourly rate was modeled for each hour over the 5 years of met data in order to match the highest hourly emissions with the worst case meteorological conditions. Appendix A to this document lists all of the scenarios modeled.

The flares were modeled as pseudo-point sources within AERMOD. Effective stack diameters were calculated according to a method used by the Texas Commission on Environmental Quality. In order to calculate the effective stack diameter, the gross heat release from the flare was calculated. The formula to calculate the effective diameter is shown below.

$$D_s = \sqrt{q_n * 10^{-6}}$$

where  $q_n$  is the net heat release in calories per second and calculated as follows:

$$q_n = q * (1 - 0.048 * \sqrt{MW})$$

where  $q$  is the gross heat release from the stack and  $MW$  is the mean molecular weight of the gas going to the flare.

The consultant for the source, KBR, has stated that when the flares are operating, the rest of the facility will be at a diminished operating capacity. IDEM has modeled the facility at or near full capacity for NO<sub>2</sub> and CO. The consultant presented a worst case flaring scenario for SO<sub>2</sub> during which the facility will be at partial capacity. The consultants' worst case SO<sub>2</sub> flaring scenario is reflected in Table 2. An error was discovered in the annual PM<sub>10</sub> modeling for the fugitive road sources. The Annual PM<sub>10</sub> modeling was re-run and the correct value is reflected below. In addition, 24-hour PM<sub>10</sub>, and PM<sub>2.5</sub> modeling was changed due to increased modeled emissions from emergency equipment. Because the 24-hour and annual PM<sub>2.5</sub> modeling was conducted within the same model run, annual PM<sub>2.5</sub> concentrations also increased as a result of the emergency generators running at their maximum hourly rate. The annual PM<sub>2.5</sub> concentration below is likely an overestimate, however, as these units are limited to a maximum of 100 and 200 hours respectively of operation within a given year.

**TABLE 2**  
**Significant Impact Levels**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED IMPACTS (µg/m <sup>3</sup> )	SIGNIFICANT IMPACT LEVEL (µg/m <sup>3</sup> )	ABOVE SIL?
NO <sub>2</sub>	1-hour	12.03	7.5	YES
NO <sub>2</sub>	Annual	0.71	1	NO
CO	1-hour	32.53	2000	NO
CO	8-hour	14.40	500	NO
PM <sub>2.5</sub>	Annual	0.34	0.2 <sup>2</sup>	YES
PM <sub>2.5</sub>	24-hour	2.59	1.2	YES
PM <sub>10</sub>	Annual <sup>1</sup>	0.993	1	NO
PM <sub>10</sub>	24-hour	4.583	5	NO
SO <sub>2</sub>	1-hour	36.49	7.8	YES
SO <sub>2</sub>	3-hour	32.10	25	YES
SO <sub>2</sub>	24-hour	10.76	5	YES
SO <sub>2</sub>	Annual	1.18	1	YES

<sup>1</sup>The annual PM<sub>10</sub> NAAQS standard was revoked on October 17, 2006; however, the PSD standard remains in effect.

<sup>2</sup>The PM<sub>2.5</sub> SIL for the annual standard is 0.3 and unchanged in 40 CFR 51.165(b)(2). EPA has recently released guidance on SILS for ozone and fine particulates. A SIL of 0.2 is recommended for the annual standard in EPA's guidance.

**Pre-construction Monitoring Analysis**

**Applicability**

The PSD rule, 326 IAC 2-2-4, requires an air quality analysis of the new source or the major modification to determine if the pre-construction monitoring threshold is triggered. In most cases, monitoring data taken from a similar geographic location can satisfy this requirement if the pre-construction monitoring threshold has been exceeded. Also, post construction monitoring could be required if the air quality in that area could be adversely impacted by the applicant's emissions. REC did not exceed the de minimis levels for any of the pollutants or averaging times considered for preconstruction monitoring, as shown below in Table 3.

**TABLE 3**  
**Preconstruction Monitoring Analysis**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED IMPACTS (µg/m <sup>3</sup> )	DEMINIMIS LEVEL (µg/m <sup>3</sup> )	ABOVE DE MINIMIS LEVEL
NO <sub>2</sub>	Annual	0.71	14	NO
PM <sub>10</sub>	24-hour	4.58	10	NO
PM <sub>2.5</sub>	24-hour	2.59	4 <sup>1</sup>	N/A
SO <sub>2</sub>	24-hour	10.76	13	NO

<sup>1</sup> On January 22, 2013, the DC Circuit Court of Appeals vacated the 24-hour PM<sub>2.5</sub> SMC (see Sierra Club v. EPA, 705 F.3d 458 (D.C. Cir. 2013)). U.S. EPA promulgated rules on December 9, 2013 changing the PM<sub>2.5</sub> SMC at 40 CFR §§ 51.166(i)(5)(i) and 52.21(i)(5)(i) to 0 µg/m<sup>3</sup>, meaning that there is no preconstruction monitoring exemption available (see 78 FR 73698).

## Background Concentrations

### Applicability

U.S. EPA's "Ambient Monitoring Guidelines for Prevention of Significant Deterioration" (EPA-450/4-87-0007) Section 2.4.1 is cited for approval of the monitoring sites chosen for this area.

### Background Monitors

Representative background concentrations used in the NAAQS analysis are listed in Table 4. The background monitors used for the NAAQS analysis were monitor number 18-141-0015, located in South Bend, IN for 1-hour NO<sub>2</sub>, monitor number 18-163-0021, located in Evansville, IN, for 1-hour, 3-hour, 24-hour, and annual SO<sub>2</sub> and finally monitor number 18-147-0009 located in Dale, IN, for annual and 24-hour PM<sub>2.5</sub>. The latest 3-year design value (2015-2017) for each of these monitors was used in the modeling analysis. These sites are considered the most representative sites with complete data relative to REC. For NO<sub>2</sub> background values, there are only two monitors within the state that have complete and quality assured data, both of which are in northern Indiana. The monitor in South Bend, Indiana is located in a more rural area than the Gary IITRI monitor, which is located in a more industrialized area. The more rural location of the NO<sub>2</sub> monitor in South Bend is comparable to the proposed location for REC.

**TABLE 4**  
**Background Concentrations**

POLLUTANT	AVERAGING PERIOD	MONITOR ID	MONITOR LOCATION	MONITOR COUNTY	CONCENTRATION (µg/m <sup>3</sup> )
NO <sub>2</sub>	1-hour	18-141-0015	South Bend	St. Joseph	67.68
SO <sub>2</sub>	1-hour	18-163-0021	Evansville	Vanderburgh	33.0
SO <sub>2</sub>	3-hour	18-163-0021	Evansville	Vanderburgh	22.6
SO <sub>2</sub>	24-hour	18-163-0021	Evansville	Vanderburgh	16.3
SO <sub>2</sub>	Annual	18-163-0021	Evansville	Vanderburgh	3.6
PM <sub>2.5</sub>	24-hour	18-147-0009	Dale	Spencer	19
PM <sub>2.5</sub>	Annual	18-147-0009	Dale	Spencer	8.7

## Section D - NAAQS and PSD Analysis

Based on the significant impact analysis, 1-hour NO<sub>2</sub>, all SO<sub>2</sub> averaging times, as well as annual and 24-hour PM<sub>2.5</sub> were above their respective SILs and therefore required a refined NAAQS analysis. A PSD increment analysis was necessary for 3-hour, 24-hour, and annual SO<sub>2</sub> in addition to 24-hour and annual PM<sub>2.5</sub>. U.S. EPA has not established PSD increments for 1-hour NO<sub>2</sub> and SO<sub>2</sub>. Inventory sources included in the NAAQS modeling are listed in Table 5 below. Table 8-2 of Appendix W to 40 CFR Part 51, Guideline for Air Quality Models was utilized in determining appropriate modeled emissions for the inventory sources. Actual operating levels from Continuous Emission Monitoring Systems (CEMS) data was averaged over the most recent two-year period for sources for which this data was available. These sources with available operating level data from CEMS are as follows: ALCOA Power Plant, Indianapolis Power and Light – Petersburg, and Indiana Michigan Power – Rockport. Once the operating levels were established for each of the units located at the separate facilities, the emission limit for each of the units was multiplied by the operating factor in accordance with Table 8-2 of Appendix W to 40 CFR Part 51. Inventories from Kentucky were also compiled and included in the modeling for a conservative analysis.

**TABLE 5**  
**NAAQS Inventory**

<b>POLLUTANT</b>	<b>TIME AVERAGING PERIOD</b>	<b>INVENTORY SOURCE NAME</b>	<b>DISTANCE FROM PROPOSED SOURCE (km)</b>
NO <sub>2</sub>	1-hour	Indiana Michigan Power – Rockport	30
NO <sub>2</sub>	1-hour	ALCOA Power Plant	44
NO <sub>2</sub>	1-hour	ALCOA Operations	43
NO <sub>2</sub>	1-hour	IPL – Petersburg	45
NO <sub>2</sub>	1-hour	Owensboro Grain - KY	47
NO <sub>2</sub>	1-hour	Owensboro Municipal - KY	45
NO <sub>2</sub>	1-hour	Big Rivers Electric - KY	66
NO <sub>2</sub>	1-hour	Domtar Paper - KY	42
NO <sub>2</sub>	1-hour	Century Aluminum - KY	32
NO <sub>2</sub>	1-hour	SIEGCO F.B. Culley	44
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Indiana Michigan Power – Rockport	30
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	ALCOA Power Plant	44
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	ALCOA Operations	43
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	IPL-Petersburg	45
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Owensboro Grain – KY	47
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Owensboro Municipal – KY	45
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Big Rivers Electric – KY	66
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Domtar Paper – KY	42
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	Century Aluminum - KY	32
SO <sub>2</sub>	1-hour / 3-hour 24-hour / Annual	SIEGCO F.B. Culley	44
PM <sub>2.5</sub>	24-hour / annual	Indiana Michigan Power – Rockport	30
PM <sub>2.5</sub>	24-hour / annual	ALCOA Power Plant	44
PM <sub>2.5</sub>	24-hour / annual	ALCOA Operations	43
PM <sub>2.5</sub>	24-hour / annual	IPL-Petersburg	45
PM <sub>2.5</sub>	24-hour / annual	Owensboro Grain – KY	47
PM <sub>2.5</sub>	24-hour / annual	Owensboro Municipal – KY	45
PM <sub>2.5</sub>	24-hour / annual	Big Rivers Electric – KY	66
PM <sub>2.5</sub>	24-hour / annual	Domtar Paper – KY	42

POLLUTANT	TIME AVERAGING PERIOD	INVENTORY SOURCE NAME	DISTANCE FROM PROPOSED SOURCE (km)
PM <sub>2.5</sub>	24-hour / annual	Century Aluminum - KY	32
PM <sub>2.5</sub>	24-hour / annual	Masterbrand Cabinets	10
PM <sub>2.5</sub>	24-hour / annual	SIEGCO F.B. Culley	44

Table 6 presents the results of the cumulative NAAQS modeling. All pollutants and averaging times were under their respective standards when representative background concentrations were included. For annual and 24-hour PM<sub>2.5</sub>, only the Significant Impact Area (SIA) receptors were included in the cumulative NAAQS modeling. The SIA receptors were those for which REC was found to exceed the SIL. For NO<sub>2</sub>, a Tier I approach was used. This approach is the most conservative approach because it assumes that all modeled NO<sub>x</sub> is converted to NO<sub>2</sub>. No Tier II Ambient Ratio Method II (ARM II) approach was necessary. The PSD increment analysis is shown in Table 7. No pollutant consumed more than 80% of the available PSD increment. The form of the standard for 3-hour and 24-hour SO<sub>2</sub> is the high second high. The previous modeling used the high first high, a more conservative value. The update to the SO<sub>2</sub> values below reflect the addition of F.B. Culley to the inventory and the use of the high second high. Similarly, previous modeling used the highest first high value for 24-hour PM<sub>2.5</sub>. The modeling results comparison for 24-hour PM<sub>2.5</sub> is based on the highest eighth high. The highest eighth high value is therefore reflected below.

**TABLE 6**  
**NAAQS Analysis**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED CONCENTRATION (µg/m <sup>3</sup> )	BACKGROUND CONCENTRATION (µg/m <sup>3</sup> )	COMBINED IMPACT (µg/m <sup>3</sup> )	NAAQS (µg/m <sup>3</sup> )	NAAQS VIOLATION
NO <sub>2</sub>	1-hour	73.22	67.68	140.90	188.6	NO
SO <sub>2</sub>	1-hour	122.36	33.0	155.36	196.2	NO

PM <sub>2.5</sub>	Annual	0.96	4	24.00	NO

## Section E - Qualitative Additional Impacts Analysis

### Additional Impact Analysis

All PSD permit applicants must prepare an additional impact analysis for each pollutant subject to regulation under the Act. This analysis assesses the impacts on growth, soils and vegetation, endangered species, and visibility caused by any increase in emissions of any regulated pollutant from the source. The REC modeling submittal provided an additional impact analysis prepared by KBR. IDEM reviewed their analysis and provides its review of the analysis below.

### Economic Growth

The purpose of the growth analysis is to quantify project associated growth and estimate the air quality impacts from this growth either quantitatively or qualitatively. It is estimated that 200 jobs will be created as a result of this project and growth impacts related to the NAAQS and PSD increments are expected to be negligible. The proposed facility should not hinder other industrial growth in the area.

### Soils and Vegetation Analysis

Soil types included clay and sandy clay over sandstone and shale. The land surrounding the site is primarily agricultural and the maximum modeled concentrations from REC are well below the threshold limits necessary to have adverse impacts on the surrounding vegetation. Crops in Spencer County and nearby areas consists mainly of corn, soybeans, wheat, and hay. Livestock in Spencer County consists of turkeys, hogs, and cattle and should not be adversely impacted from the facility. Trees in the area are mostly hardwoods and IDEM agrees with KBR's analysis that no adverse impact is expected to the trees from this facility.

### Federal and State Endangered Species Analysis

Federal and state endangered species are listed by the U.S. Fish and Wildlife Service; Division of Endangered Species for Indiana. This species list includes 4 birds, 10 fish, 3 mammals, 11 mussels, 2 reptiles, 3 insects and 6 plants. Of these species, 2 mussels, 1 bird, and 3 mammals are found within Spencer County. These species are found along rivers and lakes and in caves near water bodies and wooded areas. There are no federally endangered plant species found in Spencer County. Modeled impacts from REC are not expected to adversely impact these species.

### Visibility Analysis

A visibility impairment analysis is conducted to demonstrate that emissions from the proposed project do not cause an impairment of visibility. A visibility impairment analysis must address near and

long-range Class I area impacts and localized visibility. The Federal Land Managers' Air Quality Related Values Work Group (FLAG) recommends procedures for proposed source locations near (within 50 km) and at large distances (greater than 50 km) from Class I areas. The nearest Class I area to the proposed source is Mammoth Cave National Park (120 km). For long range distances, FLAG recommends applying the Q/D initial screening test to determine whether or not further Class I area visibility analysis is necessary. Q is the total emissions of SO<sub>2</sub>, NO<sub>2</sub>, PM<sub>10</sub>, and H<sub>2</sub>SO<sub>4</sub> annual emissions from the proposed source and D is the total distance in kilometers from the Class I area. If Q/D is 10 or less, the proposed source is considered to have negligible visibility impacts on the Class I area. The results of the Q/D test for REC are shown in Table 8 below. Since Q/D is below 10 for the facility, no negligible visibility impairment is expected from the proposed source on the Class I area.

**TABLE 8**  
**Results of the Q/D Visibility Test on Mammoth Cave**

Class I Area	NO <sub>x</sub> Emissions (tpy)	SO <sub>2</sub> Emissions (tpy)	PM <sub>10</sub> Emissions (tpy)	H <sub>2</sub> SO <sub>4</sub> Emissions (tpy)	Total Emissions (Q, tpy)	Distance (D, km)	Q/D	Q/D ≤ 10
Mammoth Cave	156.83	224.37	68.57	16.99	449.77	120	3.75	YES

The VISCREEN model is designed as a screening model to determine the visual impact parameters from a single source plume on localized visibility. It is used to determine whether or not a plume is visible as an object itself. The visibility impairment analysis considers the impacts that occur within the impact area of the source as defined by the user distances. The user distances are determined by the nearest interstate or airport. For the current source, the nearest interstate would be I-64, 1 kilometer away from the proposed facility location. The background visual range used in this analysis was 25 km as suggested in Figure 9 in U.S. EPA's Workbook for Plume Visual Impact Screening and Analysis.

The NO<sub>x</sub> and PM<sub>10</sub> emission limits were used to run a local visibility Level 1 analysis. VISCREEN was used to determine if the color difference parameter (Delta-E) or the plume (green) contrast limits were exceeded. Delta-E was developed to specify the perceived magnitude of color and brightness changes and is used as the primary basis for determining the perceptibility of plume visual impacts. The plume constant can be defined at any wavelength as the relative difference in the intensity (called spectral radiance) between the viewed object and its background. This is used to determine how the human eye responds differently to different wavelengths of light. Worst case emissions were used for the Riverview facility. The results of the VISCREEN Level 1 analysis are presented in Table 9. The potential emission rates used in this analysis are 64.15 tons/year of particulates and 184.53 tons per year of Nitrous Oxides (NO<sub>x</sub>). None of the critical criteria values for the color contrast and Green contrast were exceeded for the Riverview project. IDEM used a background visual range of 25 km for this analysis.

**TABLE 9**  
**Results from the VISCREEN Level 1 Analysis**

Distance	Background	Theta (degrees)	Azimuth (degrees)	Distance (km)	Alpha (degrees)	Color Contrast – DELTA E		Green Contrast	
						Criteria	Plume	Criteria	Plume
1 km	SKY	10	1	1	168	2	1.500	0.05	0.015
1 km	SKY	140	1	1	168	2	0.169	0.05	-0.009
1 km	TERRAIN	10	1	1	168	2	1.846	0.05	0.022
1 km	TERRAIN	140	1	1	168	2	0.488	0.05	0.020

An additional VISCREEN analysis was requested for impacts on Lincoln Boyhood National Memorial in Lincoln City, Indiana. This source is approximately 10 km away from the proposed source. Federal Land Managers requested using a background visual range of 180 km. Other commenters suggested use of 70 km as the background visual range based on the approximated visual range at Mammoth Cave National Park, a federally protected Class I Area. IDEM believes that the use of the 70km

visual range is an appropriate background visual range for this analysis. Using this value, the analysis for the Lincoln Boyhood National Memorial is presented below.

**TABLE 10**  
**Results from the VISCREEN Level 1 Analysis – Lincoln Boyhood National Memorial**

Distance	Background	Theta (degrees)	Azimuth (degrees)	Distance (km)	Alpha (degrees)	Color Contrast – DELTA E		Green Contrast

### Section F – Secondary Analysis for PM<sub>2.5</sub> and Ozone Formation

Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants. Secondary PM<sub>2.5</sub> and ozone (O<sub>3</sub>) are closely related in that they share common sources of emissions and are formed in the atmosphere from chemical reactions with similar precursors. Assessing the formation of secondary pollutants such as O<sub>3</sub> and PM<sub>2.5</sub> is useful for interpreting modeled impacts of precursor pollutants due to changes in emissions from new PSD major sources or PSD major modifications to that area.

In order to address this issue, the U.S. Environmental Protection Agency released updated version of the *Guideline on Air Quality Models* (published as Appendix W to 40 CFR Part 51). A significant modification to Appendix W addresses single-source impacts on ozone and secondary PM<sub>2.5</sub>. Prior to releasing the final version of Appendix W, on December 2<sup>nd</sup>, 2016, U.S. EPA released the draft *Guidance on the Development of Modeled Emission Rates for Precursors (MERPS) As a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program (MERPS Guidance)*. This guidance provides states, local agencies, and tribes with modeled emission rates of hypothetical facilities that emit precursor pollutants to ozone and PM<sub>2.5</sub> that a source could use to determine its contribution to secondary pollution formation. If a future source or modification to a source emits less than a pollutant's MERP based on a representative hypothetical facility, then the new source or modification would not be considered as contributing to an exceedance of a critical air quality threshold for that pollutant, and further air quality analysis is not required. If the source or modification does not pass a Tier 1 demonstration, then a Tier 2 analysis utilizing refined assessment methods including photochemical grid models would be needed.

#### MERPS Assessment

Within the MERPS Guidance, there were three hypothetical facilities modeled in Indiana, located in Dubois, Grant, and Porter Counties. The lowest MERP value for each pollutant was selected for a conservative analysis. Table 11 lists the MERPS values used for this analysis. The significant impact level (SIL) for each pollutant's NAAQS was selected as the critical air quality threshold value for this MERP analysis. The SIL are as follows: 8-hour ozone – 1 part per billion (ppb); 24-hour PM<sub>2.5</sub> – 1.2 micrograms per cubic centimeter (µg/m<sup>3</sup>); and annual PM<sub>2.5</sub> – 0.3 µg/m<sup>3</sup>.

**TABLE 11**  
**Default MERP Values (tpy) for Riverview**

Precursor	8-Hour Ozone	24-hour PM <sub>2.5</sub>	Annual PM <sub>2.5</sub>
NO <sub>x</sub>	234	2308	12500
SO <sub>2</sub>	----	305	4688
VOC	1163	----	----

Riverview Energy Corporation (REC) has submitted an air permit application with the Indiana Department of Environmental Management (IDEM) to construct a direct coal hydrogenation facility in

Spencer County, Indiana. REC's proposed annual emissions were calculated to be 156.8 tons per year of oxides of nitrogen (NO<sub>x</sub>), 303.2 tons per year of Volatile Organic Compounds (VOCs), and 224.4 tons per year of sulfur dioxide (SO<sub>2</sub>).

All of REC's emissions are below the MERP values for Indiana that the U.S. EPA provides in the MERPS Guidance. Therefore, REC is not expected to cause or contribute to a violation of the 8-hour ozone, 24-hour PM<sub>2.5</sub>, or Annual PM<sub>2.5</sub> National Ambient Air Quality Standards (NAAQS) based solely on each precursor pollutant emission rate.

### SIL Assessment

The MERPS Guidance offers additional details on the analysis when both precursor pollutants are emitted at rates below the MERPS but above the Significant Emission Rate (SER). When this occurs, the cumulative impact of the pollutants must be analyzed and compared to the SIL. The following equations are used for the SIL analysis:

$$\text{For 8-hour ozone: } \frac{EMIS_{NO_X}}{MERP_{NO_X}} + \frac{EMIS_{VOC}}{MERP_{VOC}}$$

$$\text{For PM}_{2.5}: \frac{EMIS_{NO_X}}{MERP_{NO_X}} + \frac{EMIS_{SO_2}}{MERP_{SO_2}}$$

If the sum of these ratios is less than or equal to 1, then the source's impact would be expected to be below the SIL.

REC's results are as follows:

For 8-hour ozone, this sum of ratios is 0.931.

For 24-hour PM<sub>2.5</sub>, this sum of ratios is 0.804.

For Annual PM<sub>2.5</sub>, this sum of ratios is 0.060.

REC's primary PM<sub>2.5</sub> emissions are above the SER threshold of 10 tons per year, so dispersion modeling was conducted for primary PM<sub>2.5</sub>. Therefore, a MERP analysis for the cumulative impacts of REC's primary PM<sub>2.5</sub> and precursor emissions compared to the SIL is necessary. The following equation is used for this analysis:

$$\text{For PM}_{2.5}: \frac{HMC_{PM_{2.5}}}{SIL_{PM_{2.5}}} + \frac{EMIS_{NO_X}}{MERP_{NO_X}} + \frac{EMIS_{SO_2}}{MERP_{SO_2}}$$

where  $HMC_{PM_{2.5}}$  is the highest modeled concentration of PM<sub>2.5</sub>.

If the sum of these ratios is less than 1, then the source will not have an impact above the SIL. REC's maximum modeled PM<sub>2.5</sub> dispersion impacts are 2.59  $\frac{\mu g}{m^3}$  for the 24-hour NAAQS and 0.34  $\frac{\mu g}{m^3}$  for the annual NAAQS.

REC's results are as follows:

For 24-hour PM<sub>2.5</sub>, this sum of ratios is 2.962.

For Annual PM<sub>2.5</sub>, this sum of ratios is 1.194.

Based on the Tier 1 SIL analysis, REC's proposed emissions are not expected to have an impact above the SIL for the 8-hour Ozone NAAQS. However, a Tier 1 cumulative analysis of REC's impact on the 24-hour and Annual PM<sub>2.5</sub> NAAQS is required.

### Cumulative Assessment

IDEM utilizes guidance from the Georgia Department of Natural Resources – Environmental Protection Division on completing the cumulative analysis for the 24-hour PM<sub>2.5</sub> NAAQS. This guidance uses the following equation:

$$\text{Background}_{PM_{2.5}} + DV_{PM_{2.5}} + \left[ \left( \frac{EMIS_{SO_2}}{MERPSO_2} + \frac{EMIS_{NO_X}}{MERPNO_X} \right) \times SIL_{PM_{2.5}} \right]$$

where  $DV_{PM_{2.5}}$  is the maximum modeled dispersion impact of either the project source or the project source and inventory sources, depending on the location of the background PM<sub>2.5</sub> monitor in relation to the project source. In this case, IDEM is using the Dale PM<sub>2.5</sub> monitor as the background monitor. This monitor is relatively close to the project source, and would already account for inventory sources. Therefore, for this project  $DV_{PM_{2.5}}$  is the maximum 24-hour and annual modeled impact from Riverview,  $2.59 \frac{\mu g}{m^3}$  and  $0.34 \frac{\mu g}{m^3}$  respectively. The 24-hour background PM<sub>2.5</sub> value is  $19 \frac{\mu g}{m^3}$ , while the annual background value is  $8.7 \frac{\mu g}{m^3}$ . If the result of this equation is less than or equal to the NAAQS, then the project does not cause or contribute to a violation of the NAAQS. Using the values given, the result of this equation for the 24-hour NAAQS is  $22.55 \frac{\mu g}{m^3}$ , which is less than the standard of  $35 \frac{\mu g}{m^3}$ . For the Annual NAAQS, the result of the equation is  $9.05 \frac{\mu g}{m^3}$ , less than the standard of  $12 \frac{\mu g}{m^3}$ . Therefore Riverview's emissions are not expected to cause or contribute to a violation of the 24-hour or Annual PM<sub>2.5</sub> NAAQS.

### Summary of Secondary Pollutant Analysis

In summary, based on this Tier 1 MERPS analysis, REC's NO<sub>x</sub>, SO<sub>2</sub>, and VOC emissions are not expected to exceed the SIL for the 8-hour Ozone NAAQS, or cause or contribute to a violation of the 24-hour PM<sub>2.5</sub> NAAQS and the annual PM<sub>2.5</sub> NAAQS.

## Section G – Hazardous Air Pollutant (HAP) Analysis

The Office of Air Quality currently requests data concerning the emission of 189 HAPs listed in the 1990 Clean Air Act Amendments (CAAA) that are either carcinogenic or otherwise considered toxic and may be used by industries in the State of Indiana. These substances are listed as air toxic compounds on the State of Indiana, Department of Environmental Management, Office of Air Quality's construction permit application Form GSD-08.

REC's potential emissions of aggregate HAPs are estimated to be over 60 tons per year. Methanol is approximately 28 tons per year for a single HAP.

The Unit risk factor (URF) is the upper-bound excess lifetime cancer risk estimated to result from continuous inhalation exposure to a pollutant over a 70 year lifetime. Multiplying the estimated concentration by the URF will produce a cancer risk estimate. The cancer risk estimate is the conservative probability of developing cancer from exposure to a pollutant or mixture of pollutants over a 70 year lifetime, usually expressed as the number of additional cancer cases in a given number of people, e.g. one in a million. For screening purposes at REC, the cancer estimates for each pollutant are considered to be additive when deriving the cumulative maximum individual cancer risk.

Non-cancer health effects are determined using the Reference Concentration (RfC). The RfC is an estimate of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. Dividing the estimated pollutant concentration by the RfC will determine the pollutant's Hazard Quotient (HQ). All of the HAPs' Hazard Quotients were added together to determine REC's Hazard Index (HI).

This HAP screening analysis uses health protective assumptions that overestimate the actual risk associated with emissions from REC. Estimates 1) assume a 70 year exposure time, 2) assume that all carcinogens cause the same type of cancer, 3) assume that all non-carcinogens have additive health effects, 4) assume maximum permit allowable emissions from the facility, and 5) use conservatively derived dose-response information. The risk analysis cannot accurately predict whether there will be observed health problems around REC; rather it identifies possible avenues of risk. Table 12 lists the Hazardous Air Pollutants associated with Riverview Energy and the HAP analysis. IDEM received updated data from the consultant regarding HAPs data during the public notice period, including updated emissions from one of the emission units. In addition, IDEM's modeling review determined HAPs impacts increased due to revised downwash considerations as a result of the updated data.

TOTALS (HAZARD INDEX)				1.2889E-05			1.55E-01
IDEM STANDARD				< 1E-06			< 1
COMPARISON				ABOVE			BELOW

The Hazard Index for the project does not exceed 1. Pollutants with a Hazard Quotient (HQ) greater than 1 are considered to be at concentrations that could represent a health concern. Hazard

Quotients above 1 do not represent areas where adverse health effects will be observed but indicate that the potential exists.

The cumulative cancer risk estimate from all HAPs is 1.29 additional cancer cases in one hundred thousand people ( $1.29 \times 10^{-5}$ ). This means if an individual was exposed to these HAPs continuously for 70 years, the risk of getting cancer from this exposure would be 1.29 in one hundred thousand. Benzene is the main pollutant among the modeled HAPs concentrations with the fugitive emissions as the largest portion of those modeled impacts. The "actual risk" that individuals face is a complex combination of many factors, including genetic predisposition, diet, lifestyle choices, and environmental contribution. For chronic exposure, IDEM evaluated pollutants for the reasonable upper-bound probability of causing harm for non-cancer health effects when exposed to pollutants over a lifetime. IDEM conservatively assumed that individuals would be exposed to the pollutant continuously (24 hours a day, 7 days a week, and 52 weeks a year for 70 years). IDEM also considered sensitive population (i.e., those with conditions making them more susceptible to the effects of pollution, like children or the elderly) when evaluating the modeled concentrations. Generally, U.S. EPA considers risk estimates over one hundred in a million ( $1.0 \times 10^{-4}$ ) to be at levels where action or more investigation is required. Risks that fall between one in a million ( $1.0 \times 10^{-6}$ ) and 100 in a million ( $1.0 \times 10^{-4}$ ) levels may generate discussion with a facility and possible action to be taken, taking into account the assumptions used to determine the emission estimates and modeling analysis. The assumptions used in the HAPs analysis, as described earlier, are conservative in nature and over-estimate emissions and exposure. In fact, benzene emissions would have to increase seven times from the permitted rates in order to approach the U.S. EPA threshold level of  $1.0 \times 10^{-4}$ , which would require action or investigation.

## Section H – Summary of Air Quality Analysis

Riverview Energy Corporation applied for a permit to construct a Direct Coal Hydrogenation facility in Spencer County, Indiana. The facility had emissions above the significant emission rates for  $\text{NO}_x$ , VOCs,  $\text{PM}_{2.5}$ ,  $\text{PM}_{10}$ , CO,  $\text{SO}_2$ , and HAPs. The facility had modeled concentrations above the SIL for 1-hour  $\text{NO}_2$ , all averaging times for  $\text{SO}_2$ , and 24-hour and annual  $\text{PM}_{2.5}$ . Because these pollutants were above the SIL, a refined air quality impact analysis was required. Nearby large emitters were compiled and included in the NAAQS and PSD increment modeling. Several sources in Indiana and Kentucky were included in the NAAQS and PSD Increment modeling. After background concentrations were added to the NAAQS modeling results, the final resulting concentrations were under the NAAQS and PSD increments for all averaging times and pollutants.

An analysis of secondarily formed  $\text{PM}_{2.5}$  and ozone was conducted. It was determined that no significant impact from the facility was found from secondarily formed ozone. Cumulative assessment of 24-hour and annual  $\text{PM}_{2.5}$  showed Riverview would not cause or contribute to a violation of the 24-hour and annual  $\text{PM}_{2.5}$  NAAQS. In addition, an additional impacts analysis on vegetation, soils, visibility, and wildlife in the area was examined and found to show no adverse impacts on the surrounding area. The cumulative cancer risk estimate from all HAPs are above the IDEM threshold level but well below the U.S. EPA risk estimates over one hundred in a million, representing the excess cancer risk to the upper range of acceptability with an ample margin of safety. Benzene emissions are the largest portion of the HAPs impacts. Therefore, based on the conservative nature of the estimates of HAPs emissions, especially Benzene fugitive emissions, no additional action is anticipated to be necessary. No significant impacts are expected from the proposed facility for the secondary pollutant formation or the HAPs.

		Annual	0.71	2012
PM <sub>2.5</sub>	Normal Operation	24-hour	2.59	2012-2016
		Annual	0.34	2012-2016
PM <sub>10</sub>	Normal Operation	24-hour	2.18	2012-2016
		Annual	0.99	2012

<sup>1</sup>The facility was assumed to be operating at normal (full) capacity. The facility will actually not be operating under normal (full) capacity during the flaring scenario. Emissions in the flaring scenario presented here, therefore, are likely overestimated.

<sup>2</sup>The consultant, KBR, presented IDEM with several worst case scenarios. The rest of the facility will only be operating at partial capacity during these scenarios. The results presented represent the facility at partial capacity.

<sup>3</sup>The annual average result for flaring event reflects running the scenario for all hours of a given year. This is an overestimate as the actual number of hours for these scenarios is much smaller.

Office of Air Quality**

Appendix D - Public Hearing Statements and IDEM Responses  
Addendum to the Technical Support Document (ATSD)  
for a PSD/New Source Construction and Part 70 Operating Permit

**Source Description and Location**

<b>Source Name:</b>	<b>Riverview Energy Corporation</b>
<b>Source Location:</b>	<b>4702 E 2000 N, Dale, IN 47523</b>
<b>County:</b>	<b>Spencer</b>
<b>SIC Code:</b>	<b>2911 (Petroleum Refining), 2999 (Products of Petroleum and Coal, Not Elsewhere Classified)</b>
<b>Operation Permit No.:</b>	<b>T 147-39554-00065</b>
<b>Permit Reviewer:</b>	<b>Douglas Logan, P.E.</b>

**Background Information**

On December 5, 2018, a public hearing was held at Heritage Hills High School, 3644 E CR 1600 N, Lincoln City, Indiana 47552 regarding the draft PSD/New Source Construction and Part 70 Operating Permit for Riverview Energy Corporation (herein referred to as "Riverview", "Riverview Energy", "Riverview Energy Corporation", and "REC").

IDEM, OAQ thanks all of the commenters and attendees at the public hearing for their interest in the proposed permit and their participation in the permit review process.

This appendix contains the statements/comments made by the public hearing attendees and IDEM's responses. Since many statements/comments were similar and general in nature, IDEM has provided one (1) response for each type of general statement/comment at the beginning of the ATSD under the General Statements and IDEM Responses section. Several of IDEM responses in this appendix refer back to the General Statements and IDEM Responses section of the ATSD.

**Ms. Thorton Anderson, Statements and IDEM Responses**

**Ms. Thorton Anderson Statements:**

At a time when Indiana has garnered national notoriety for its concentration of super polluters not far from here and their accompanying dismal air qualities, it's inconceivable to me that a plant such as the Riverview proposal is receiving favorable consideration.

The call for reduction in greenhouse gas emissions is an international one, borne out of the specifically scientifically recognized needs of not only our planet, but our species. Just today, this very day, the World Health Organization spoke on the extreme health costs of air pollution. Rather than working to improve our condition, we are racing in the exact opposite direction if we endorse a plant which will spew enormous amounts of greenhouse gases and particulate matter.

The only possible explanation that I can fathom for our state's apparent willingness to go ahead with this proposal is that our beautiful southern end of the state has been silently designated a sacrifice zone, shortsightedly sacrificing its citizens' health, and not fully exploring other avenues of far less harmful economic development.

**IDEM Response to Ms. Thorton Anderson Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Utter of Lincolnland Economic Development, Statements and IDEM Responses</b>
---

**Mr. Utter Statements:**

Recognizing the process that IDEM has gone through over the last many months to pull together this permit to protect the environment and let us bring in industrial development and create an industrial base and maintaining one, I urge IDEM to go ahead. I recommend that you go ahead and authorize -- issue the permit as you've drafted it.

Thank you very much.

**IDEM Response to Mr. Utter Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Ms. Valerie Schmidt, Statements and IDEM Responses</b>
---

**Ms. Valerie Schmidt, Statements:**

Hi. I'm here for our youth. We want our youth to have opportunities. With Riverview Energy -- with Riverview Energy, there are opportunities for our youth. My children would like to stay in Spencer County. They do not want to work minimum-wage jobs. I am a huge proponent of Riverview Energy, and Go C2D.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Sandy Troth, Statements and IDEM Responses</b>
---

**Ms. Sandy Troth, Statements:**

As I begin my statement, I would like to support the comments of Southwest Indiana Citizens for Quality of Life and Earth Justice.

As a lifelong resident of Spencer County, I am deeply concerned about the possibility of this plant coming to our community. Recent research has been done on Spencer County and the toxic air we breathe. I have studied our air quality and the significant effect pollutions have on our health and environment.

Spencer County has been labeling as the sacrifice zone of Southwestern Indiana. In 2016, Spencer County was ranked 23rd in the nation for counties that release the most toxic -- most

toxins into the environment. It is also noted that in 2016, Indiana released more toxic chemicals into the environment than 44 other states.

This plant will be less than one mile from a nursing home and an elementary school. Our health is the most important thing we as human beings possess, and without clean air to breathe, clean water to drink, and uncontaminated soil to grow our crops, we have no chance at a long, healthy, disease-free life.

In 2015, I was diagnosed with bilateral breast cancer. In the last three years, I have lost three close friends to this horrible disease. I am not naive enough to think that toxic air is the only thing that causes cancer, but any doctor will tell you that the air we breathe plays a significant role in our overall health.

I am here tonight to ask your help in stopping the construction of this plant. We can do much better. I am all for the growth of Spencer County, and if this would be a good thing, I would be its biggest cheerleader. More air pollution is not a good thing. We need clean air, not toxic air that is already polluting Spencer County.

Please, I beg you to help the citizens of Spencer County by putting your of disapproval on this project. Out lives in Southwest Indiana are at stake.  
Thank you.

#### **IDEM Response to Ms. Sandy Troth, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

No changes to the draft permit were made as a result of this statement.

<b>Ms. Nancy Schroer, Statements and IDEM Responses</b>
---

#### **Ms. Nancy Schroer, Statements:**

I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice. Please accept my comments. My name is Nancy Schroer, and I have lived in the town of Dale, Indiana for 54 years. I am deeply concerned about the future of our tranquil, beautiful farming community.

Without public awareness or discussion, the Dale Town Council, Town Attorney, and Lincolnland Economic Development Director took steps to make Riverview Energy's coal-to-diesel fuel refinery possible. Contrary to what they want you to believe, the opposition to this refinery is huge.

My deep concerns are this refinery will be a major source of air, water, light, smell, and noise pollution, as well as the site of the refinery itself. The proposed site is inside our town, and less than one mile from David Turnham Elementary School -- that's kindergarten through sixth grade -  
- Willowdale Nursing Facility, Core Nursing and Rehab Center, and residential housing.

Riverview Energy's proposed coal-to-diesel fuel refinery is to be built inside the city limits of Dale, and so close to my home that I will actually see it from my front porch. I will see the four 100-foot-tall flare stacks that will burn the chemicals, and I will see the lights of the refinery that will be illuminated 24/7.

I will hear the noise that 100 cars of coal being delivered by rail each day, that 5,000 tons of coal per hour to be pulverized and will involve using and creating extremely hazardous carcinogenic chemicals, and I will, on damp, moist days, smell the odor of rotten eggs from hydrogen sulfite, a deadly poison derived from sodium sulfite and its hydrates. But the most horrific pollutant is air pollution. I, along with all of the citizens of Dale, Spencer County and Southwestern Indiana, will be left to breathe the toxic air and suffer illnesses such as stroke, heart disease, lung cancer and asthma, just to make a few.

Pollution matters. Thousands of studies have shown that air pollution does harm people. Our state is 44th worst in the United States for air pollution, and according to the Environmental Protection Agency, Spencer County, Indiana ranks 23rd worst in toxic air pollution out of all 3,142 counties in the United States.

For IDEM to allow any more toxic emissions be added to our air quality is just wrong. We deserve better, our children deserve better, and our grandchildren deserve better. How can IDEM make and back up their statement that Riverview Energy's coal-to-diesel fuel refinery will essentially have no significant impact on our region's health, environment, visual beauty, and our quality of life?

Above all, I ask that you please consider in your decision the human beings that will be adversely affected.

Thank you.

#### **IDEM Response to Ms. Nancy Schroer, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Ms. Sue Krampe, Statements and IDEM Responses</b>
--

#### **Ms. Sue Krampe, Statements:**

I am a resident of Ferdinand, Indiana, also a resident of Spencer County. I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice. I oppose Riverview Energy's coal-to-diesel project.

I'm just going to talk on a few points this evening, number one being jobs. This are already has so many employers that cannot find employees; they don't need these jobs.

I'm going to talk about all of the very hard-working boilermakers that we have here in the audience tonight that I am sure this project will last two to three years to construct this plant, so that would give them two to three years of employment, after which they will travel back to their homes all across the area, all across the United States, because we all know that boilermakers travel all over for projects.

So, they will have a temporary job that will leave us with permanent pollution. I'm all for the boilermakers. I'm all for their construction of worthwhile projects, schools, hospitals, plants that won't produce, but would employ hundreds, distribution centers. I am not for them building this plant.

The other point is, in the drat permit IDEM did not adequately study the air quality in the area, because there currently are not monitors in Spencer County, except for one to measure particulate matter, 2.5. I understand that one of the monitors used in the study was in South Bend, Indiana. There's a whole State of Indiana between South Bend and Dale.

I oppose this plant.

#### **IDEM Response to Ms. Sue Krampe, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Ms. Mary Hess, Statements and IDEM Responses</b>
---

#### **Ms. Mary Hess, Statements:**

I also support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice.

I stand here before you tonight not as someone from a multibillion-dollar industry in Houston, Texas or a refinery in Greenwich, Connecticut. I stand before you as a resident of the State of Indiana, and according to IDEM's motto on their Web site, it says, "We protect Hoosiers and our environment."

I beg to differ. You have spent the last nine months rewriting Riverview Energy's air quality application at the expense of Hoosier taxpayers. Why are we spending Hoosier taxpayers' money to rewrite a permit for companies from Texas and Connecticut?

I also do not believe the controls used in this draft permit are from the actual operation of a VEBA Combi Cracker anywhere in the world. Has IDEM received any information from the plants in China and Russia? Do we know if they are still in operation and using coal as a feedstock? Why are there so few of these refineries in operation, and after a hundred years, there are no such refineries in the Western Hemisphere?

We are not being told what that reason is. Instead, we are being told that the State of Indiana wants to allow a 512-acre refinery inside our town limits that will, according to their permit, allow 60 tons per year of hazardous air pollutants, including benzene and hexane, toluene and xylenes, which are all known carcinogens. The refinery will also, according to the permit, emit over 2.2 million tons of carbon dioxide per year.

According to recent reports by the U.N. our own U.S. Government, we need to reduce carbon emissions by 2030. Indianapolis is even setting forth a plan to become carbon neutral. But yet IDEM wants to allow Riverview Energy to freely emit over 2.2 million tons of CO<sub>2</sub> per year into our state.

Our county has only one monitor and it measures fine particulates. The reason there's only one monitor is monitors are placed on guidance, which is often based on population. So, you had to go 282 miles away, in South Bend, Indiana, to get your modeling numbers.

You released a statement to the press stating that no significant impacts are expected from the proposed facility. Sixty tons of known carcinogens, 2.2 million tons of carbon dioxide, only one monitor in our county. I believe this statement is either inaccurate, if not negligent, and how dare you be negligent when it comes to our health?

I ask you reject this draft permit for Riverview Energy.

**IDEM Response to Ms. Mary Hess, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

With regard to the VEBA Combi Cracker (VCC) technology, see the ATSD IDEM Response to Valley Watch Comment 12.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Randy Vaal, Statements and IDEM Responses</b>
--

**Mr. Randy Vaal, Statements:**

My name is Randy Vaal. I live in Santa Claus, Indiana, about five miles from the proposed site of this plant. I support the comments of the Southwestern Indiana Citizens for Quality of Life and Earth Justice.

The IDEM notice of period for public comment on Part 70 operating permit for Riverview's coal-to-diesel plant contains the blanket statement, quote, no significant impacts are expected from the proposed facility. And I read it tonight again in the Citizens Guide.

And yet your permit will allow Riverview to dump hundreds of tons of particulate matter, sulfur dioxide, hydrogen oxides, volatile organic compounds, carbon monoxide, sulfuric acid, hydrogen sulfide, which is a deadly gas, and ammonia into our air every year, not to mention over 2.2 million tons of greenhouse gases that you will allow Riverview to emit into our air every year.

In addition, IDEM, by its own admission, does not address impacts from land use, odor, noise, rail and truck traffic, light or visual pollution. So, why would you claim that there is simply, quote, no significant impact, unquote? And why would you release that statement to the press just days before a public forum was held right here at Heritage Hills to speak out against this plant? Your statement that there are no significant impacts is simply false, and the timing of that statement is questionable.

A company called Sasol, which pioneered coal-to-liquids technology under an embargo with Apartheid South Africa, is getting out of this polluting industry. Quote, categorically, we won't build another coal-to-liquids plant again, said Sasol President Stephen Cornell.

Quote, the basic business case is challenged in terms of making a return on the investment, plus he says, quote, the carbon footprint is extremely large. Yet IDEM is putting its stamp of approval on this kind of plant that even post-Apartheid South Africa has decided is not responsible anymore.

You know, sometimes we say people can't see the forest for the trees. For a year now, IDEM has worked closely with Riverview and KBR to craft a permit that may allow each one of Riverview's trees to pass your view. But you've missed the forest. The forest is Dale and Southwestern Indiana, and your permit will grant Riverview the right to destroy our forest.

Please respect us and the forest that is our home and deny this permit.

Thank you.

**IDEM Response to Mr. Randy Vaal, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 2 - Particulate Matter

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Mr. Joseph Nickolick, Statements and IDEM Responses</b>
--

**Mr. Joseph Nickolick, Statement 1:**

Thank you for this -- having this hearing. I'm very disappointed that it has to be held. I'm very disappointed that I have to be here, because that means you all aren't doing your job. Your job is to protect the environment, not to be the Better Business Bureau, not to be the Chamber of Commerce, not to rubber stamp.

And the name "Management" in your name says it all. You think you can manage pollution. You can't. Any pollution's too much. It has a cumulative effect, and you're going to hear from two doctors who are going to tell you about the cumulative effect, and you're going to do your best to ignore that.

It's sad that these people have to be here when you don't even have a baseline monitor here. How can you call anything of what you're doing scientific? The actuarial numbers will speak for themselves once you get a monitor, but you don't have a monitor. That's an insult to this community. You've got -- you already know where it stands in the nation as far as pollution, yet you're going to have the nerve to say that there's going to be no cumulative effect here.

If these were your children -- there's nobody in this room, jobs or otherwise, that wishes harm to children, and I'm sure you don't either, and you don't wish harm to elder adults. They are the people who are at risk. You're supposed to be representing them. If you were doing your job, we wouldn't be here.

In ancient times, when somebody couldn't do their job, the honorable thing was they fell on their sword. So, if you don't feel like you can, in conscience, not sign this, at least turn it around and don't sign it, and then resign.

Because this is not what Indiana deserves. This is not what you deserve. We deserve better than this.

Thank you.

**IDEM Response to Mr. Joseph Nickolick, Statement 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Mr. John Blair, Statements and IDEM Responses</b>
--

**Mr. John Blair, Statement 1:**

I'm here representing Valley Watch, whose purpose is to protect the public health and environment of the Lower Ohio River Valley. We've been in business since 1981, and I have to say that we've failed miserably since 1981 in Spencer County.

This project is not likely to be built. I really feel sorry for all of the people who are expecting to build it, because this is just not an economic thing to do.

I'd like to point out something, too. I was looking through my file a while ago, and I found a Citizens Summary here dated January 25th, 2012 for a project called Indiana Gasification. IDEM issued a permit for that, then they issued a renewal of that permit. Now, this was six -- almost seven years ago now.

They issued the permit. Indiana Gasification had a 2.8-billion-dollar loan guarantee, 2.8-billion-dollar loan guarantee, from the Federal Government. They had legislation from the State of Indiana that said the State of Indiana would be their only customer, and that every commercial and residential customer of gas in Indiana would have to buy the product from the State of Indiana.

Pretty good deal. I mean this is the kind of -- I call it the Communist Chinese model of business, which it was. It's where the state runs everything. But wait a minute. Did you guys -- did any of you guys build Indiana Gasification? Did it get built? Did Ohio Valley Resources get built? That was another two-and-half-billion-dollar project that Mr. Utter brought into the county.

When are we going to grow up in Southwestern Indiana and realize that there's jobs to be had in real employment and not these dreams of using fossil fuels for destroying our health? When are we going to realize that? One time I turned to Mr. Utter in one of these hearings and I asked, "What kind of project would you have moral compunction about, that you would say, 'No, I don't want it'?" He had no answer.

You know, I -- I don't live in Spencer County, but I spend a lot of time in this county. I love it dearly, and I'm fed up with having to come over here from Evansville to try to deal with health issues that shouldn't be -- that I shouldn't have to deal with, that are just dreams of somebody that's going to enrich them.

In this case, the enrichment is going to go to a single family in Greenwich, Connecticut. Is that what you want? Do you want to destroy the health of your neighbors and friends to have one guy in Greenwich, Connecticut become a billionaire? Is that what you want?

You know, there's better ways to earn a living. Indiana Gasification didn't make it. This is not going to make it. We are not going to let it happen, regardless of what IDEM does.

And IDEM's confidence is really questioned here. You know, they didn't even -- this hearing was originally scheduled for November at Southridge High School. I had to get on the phone and say, "Wait a minute. That's not even in the same time zone as the project. It's not in the same county."

You know, this -- the modeling that's been done. You know, people mentioned the South Bend monitor. Why on Earth? There's an NO<sub>2</sub> monitor in Evansville. Apparently it wouldn't fit the model right so they had to change it to the one in South Bend.

You know, the meteorological data comes from the Evansville Airport, which I think everybody around here knows that there's a weather line that goes -- it kind of follows I-64. I don't think 64 has anything to do with it, but what happens north of I-64 and immediately around it is very different than what north of I-64 and immediately around it is very different than what happens in Evansville, very different, and I think that you've all observed that.

You know it's time that IDEM start doing their job. They did not do their modeling correctly, they did not do their -- this Clean Air Act, 7475 of the Clean Air Act requires that an applicant take a year's worth of preconstruction monitoring at the site that they're going to use.

There was not a monitor ever put out here. There's been plenty of time to do it, but this applicant didn't want to do that, because they knew that IDEM would provide a fix, and they did.

This -- you know, they're going to grant the permit. You can rest assured that they're going to grant the permit. Everything they've done so far indicates that this permit is going to be, "Here, have it. You can do whatever you want."

And then whenever they don't burn Illinois 6 coal in it and decide to use petroleum coke or whatever, they'll get a permit modification. Whenever they want to raise their emissions limits, they'll get a permit modification. And your health will be affected. Everybody in this room's health will be affected.

Is that what you want?

#### **IDEM Response to Mr. John Blair, Statement 1:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 8 - The Validity of Meteorological Data Inputs to the AERMOD Dispersion Model
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

## Erica Hohl, Statements and IDEM Responses

### Erica Hohl, Statements:

I'm Erica Hohl, and I live in nearby St. Henry, Indiana, where my husband and I are raising our three young children on a farm that's been in our family for seven generations now.

I support the statements of Southwestern Citizens of Quality of Life and Earth Justice, and my comments start off with in Appendix A, Table 1 of your permit, it states that over 175 tons of volatile organic compounds will be released as fugitive emissions per year. 326 IAC 2-7-1 defines fugitive emissions as those emissions that could not reasonably pass through a stack chimney vent or other functionally equivalent opening.

Are we to believe that 175 tons per year of VOC's could not be controlled with stacks or chimneys? How can you trust IDEM to protect our environment with permits like this? Such allowances seem irresponsible, especially when considering a proposed plant's proximity to a school, nursing home, park, and residential areas.

I, too, speak on behalf of our youth when I say please, please protect our youth and give them the most important opportunity, that of health and longevity.

### IDEM Response to Erica Hohl, Statements:

As indicated by the commenter, 326 IAC 2-7-1 defines fugitive emissions as those emissions that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. Additional guidance on fugitive emissions is provided in a U.S. EPA memorandum entitled "Interpretation of the Definition of Fugitive Emissions in Parts 70 and 71", dated February 10, 1999 which can be found at the following website: <https://www.epa.gov/sites/production/files/2015-07/documents/fug-def.pdf>.

The following guidance is provided in the above EPA memorandum:

In determining whether emissions could reasonably be collected (or if any emissions source could reasonably pass through a stack, etc.), "reasonableness" should be construed broadly. The existence of collection technology in use by other sources in a source category creates a presumption that collection is reasonable. Furthermore, in certain circumstances, the collection of emissions from a specific pollutant emitting activity can create a presumption that collection is reasonable for a similar pollutant-emitting activity, even if that activity is located within a different source category.

For this proposed direct coal hydrogenation (DCH) facility and other sources in the same source category (e.g., refineries), leaks from valves, pump seals, flanges/connectors, pressure relief valves, compressor seals, open-ended lines/valves, sampling connections, water seal process drains are considered fugitive, since they could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. Typically, sources in this source category (e.g., refineries) are required to minimize leaks through a leak detection and repair (LDAR) program required in an applicable New Source Performance Standard (NSPS). LDAR is a work practice that assists sources identify leaking equipment so that emissions can be reduced through systematic repair or replacement. The key to the effectiveness of fugitive emission control is the regularly scheduled inspections and a defined repair/replacement schedule.

For this proposed facility, an LDAR program specified in the Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006 (40 CFR 60, Subpart GGGa) was determined to be the Best Available Control Technology (PSD BACT) for controlling fugitive VOC emissions

(see Condition D.12.1 of the proposed permit and the PSD BACT analysis for VOC Leaks included in Appendix B of this Addendum to the Technical Support Document).

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Kathy Reinke, Statements and IDEM Responses</b>
--

**Ms. Kathy Reinke, Statements:**

Hi. Thank you folks for being here.

I am from Santa Claus, but have been a resident of Dale for the past 23 years. I attended David Turnham Educational Center in Dale, as did my husband, our daughters, and our son is currently a fifth grader at David Turnham. My husband is a fourth-generation farmer in Dale, and I'm the Executive Director for the Spencer County Regional Chamber of Commerce. Please know that I'm not a rubber stamper.

The Secretary -- I am also the Secretary and 20-year member of the Dale Fall Festival Committee, the Secretary and two-year board member of Spencer County Catalyst Group, lifelong member of Santa Claus United Methodist Church, and serve on the Carter Fire District Auxiliary, where my husband has been on the department for 30 years and has been Fire Chief for the past ten years.

I tell you this not because I'm in a job interview, but because I want you to understand how invested and engaged my family and I are in this community, and we absolutely love our community.

Businesses and industry move in and out of Spencer County and every other county on a regular basis, but not often does a 2.5-billion-dollar direct coal hydrogenation plant make itself present, along with the abundance of opportunity that Riverview Energy brings, such as the thousands of tradesmen, trades crafts that will be put to work during the construction of the facility, to the approximate 250 people that will be full-time employed, to the multitude of supportive companies and services that will receive ongoing business throughout the life of Riverview Energy, to the economic growth opportunities that will be garnered in the Dale area as well as throughout Spencer County.

Along with the mecca of opportunities, however, comes concern, uncertainty and fear of the unknown, which I totally understand. It is unfortunate as to the amount of animosity that has arisen between friends and neighbors due to differing opinions either in favor or against the plant. It seems that it's been more indecisive than even when we were dealing with Trump versus Hillary.

I have heard numbers of emittance that will be put out, but we also need to understand those numbers don't include those that are captured. And friends, what it comes down to is, though, whether it abides by local, state and federal law. That is what it is. That is the bottom line: Are they abiding by the law?

As the Chamber Director, I am welcoming of this opportunity and the possibilities it brings with it. I've worked hard to create relationships with state and local officials, and have worked to ensure that everyone is maintaining responsibility for the allowances and tolerables that are set forth.

I am thankful to our Dale Town Council for believing in their convictions, and that they will continue to do what is right for the progressive of Dale's future. That is why they were elected. I can only hope that we will all come together for the future of Dale and Spencer County.

Abraham Lincoln said, "You cannot escape the responsibility of tomorrow by evading it today. Let us together -- not indecisively, let us together go forward in responsibility and good stewardship, business and community, that the law allows.

**IDEM Response to Ms. Kathy Reinke, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Kris Lasher-Emmert, Statements and IDEM Responses</b>
--

**Kris Lasher-Emmert, Statements:**

Hello. My name is Kris Lasher-Emmert. I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice.

The promise of jobs, jobs, jobs is one of the approaches used by River Energy [sic] when marketing the refinery to the community. Our current unemployment rate in Spencer County and Indiana as a whole is around three percent.

I spent a little time on-line this past weekend just checking out current manufacturing job openings within a short distance from Dale. The Kimball Santa Claus plant, just a few hundred yards from here, has eight full-time openings, and the Kimball Corporation as a whole have dozens more.

I found 16 jobs on-line for Rockport Steel in the areas of engineering, production and maintenance. Spencer Industries in Dale has openings in production and maintenance, Masterbrand Cabinets in Ferdinand has 19 full-time job openings right now, Best Home Furnishings in Ferdinand has openings in manufacturing, including a couple of management job openings as well.

I found construction jobs on-line for AEP in Rockport. Toyota in Princeton had at least 20 jobs in the areas of engineering, production and maintenance. Waupaca in Tell City has openings in production, engineering and maintenance.

And Thermwood in Dale has full-time positions open in production and field service. According to what I found on-line for them, they even offer a thousand-dollar new-employee signing bonus program. Even on-line, I did find dozens of jobs for boilermakers as well, even within a four-hour radius of us here.

This evening, several folks, local folks, have shared their concerns about air pollution that Riverview will impose upon us. I understand that it's unrealistic to be a pollution-free community, but I would like to share some research secured by a local citizen, Blake Voges.

To create these comparisons, Blake reviewed Riverview's permit as well as spoke to local HR staff and conducted some on-line searches. Based on Riverview Energy's permit, they plan to emit up to 10,000 tons of air pollution per employee per year, 10,000 tons of air pollution per employee per year.

In comparison, Masterbrand will only emit 6.6 tons per employee per year; Toyota, 1.4 tons; and Waupaca, only 670 tons, still considerably less than the 10,000 tons of air pollution per employee per year. I'm not sure why we should accept such additional pollution for jobs that I'm not sure we really actually need.

Why should we risk the health of our area's citizens unnecessarily? So, I please ask you to protect us. We need you to put our health and well being ahead of the financial gain of the individual from the Connecticut-based company.

Thank you.

<b>Dr. Norma Kreilein, Statements and IDEM Responses</b>
--

#### **Dr. Norma Kreilein, Statements:**

Hello. My name is Norma Kreilein. I'm from Jasper, Indiana, and I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice. I'm a board-certified pediatrician in this region for nearly 30 years.

I've been voicing concerns, but have been ignored by local governments, IDEM, and the ISCH for nearly seven years. Fortunately I'm not alone here tonight, but I am a scientifically published expert on what you all refuse to look at.

My first scientific paper dealing with the deliberate disconnect between pollution and infant mortality was published by the Catholic Medical Association in 2014. My second paper was published by the section on bioethics of the American Academy of Pediatrics in 2015.

My third paper on flaws in Indiana air quality science, your science, was approved and published and exhibited, approved by the scientific committee and presented at the International Congress of Pediatrics in Vancouver, British Columbia, Canada in August of 2016. I spoke at the University of Notre Dame, and my Catholic Medical Association lecture on the flaws in your science was certified for CME and published.

I was notified this past week that my article on the lack of scientific integrity of IDEM and Governor Holcomb regarding this plant was accepted for presentation at the 2019 International Congress of Pediatrics in Panama City, Panama.

Five minutes isn't enough time to explain the science of how children are harmed, but one study showed only six hours of modern metropolitan air pollution produced brain changes in mice

consistent with autism and early schizophrenia. Autism clusters with pollution, not vaccines, and I suggest you update yourself on the research of that.

California researchers demonstrated a 25-percent drop in prematurity after coal-fired power plants were closed, and the effect was the most pronounced within a couple of miles of the plant. I see that on the ground, in a state that categorically refuses to connect its waste to its injured and dead babies, and wants to add more, and tells us it doesn't matter.

I didn't stay at a Holiday Inn Express last night. I carry over 150 hours of continuing medical education a year and continuous board certification, and I connect with my professional organization on a national and state level. Your department refused to meet with me for several years on these concerns, then it did nothing, even though you know you don't have health experts and you know the Health Department cannot even talk or consider pollution.

Loopholes are consistently used in Indiana to hide the effects that pollutants are having on our children. Ruth Etzel, the longtime Director of the Office of Child Health Protection at the EPA, has been silenced and benched during the current presidential administration, so please do not pretend that permitting and deregulation constitutes a safe environment for our children when both the state and national environmental regulatory bodies lack and deliberately dismiss pediatric concerns and oversight.

Densely populated urban states like California, New York, North Carolina and Massachusetts have been able to consistently improve their infant mortality rates to 4.5 or less. Indiana is stuck at a 7.5. Indiana refuses to even consider pollution in its infant mortality work, despite the fact that Indiana basically ranks rock bottom among 50 states on air and water quality. And when you pull it out of the air, matter can neither be created or destroyed. It goes somewhere.

Pollutants profoundly affect placentas as well as the brain development of the child attached to that placenta. With all due respect, your agency needs integrity, not industrial bias. We need monitors, not modeling, and your science is flawed.

Thank you.

**IDEM Response to Dr. Norma Kreilein, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

Regarding infant mortality in Indiana and southwest Indiana, please see the ATSD IDEM Response to Dr. Norma Kreilein Comment 1.

No changes to the draft permit were made as a result of this statement.

## Mr. Rock Emmert, Statements and IDEM Responses

### Mr. Rock Emmert, Statements:

My name is Rock Emmert. I'm from Ferdinand, and I also support the comments of our group, Southwestern Indiana Citizens for Quality of Life and Earth Justice.

What we know can harm us. As an educator, I see an issue that gets little to no attention in our state related to one we all care about, the well being of our kids. While manufacturers can contribute to learning disabilities, exposure to pollution during pregnancy and early childhood is one of them. Expectant moms and their toddlers cannot escape the air they breathe.

Under your watch, Indiana consistently gets a failing grade, 44th to 50th in air quality in study after study after study, year after year after year, an embarrassing 10 percent or lower. To maintain the near bottom ranking pollution levels, which you intentionally do not even monitor here, and now want to increase, will have had no significant effect on our unborn children and toddlers is illogical, dangerous and reckless.

And you are funded by us, the taxpayers. We're not talking about a mild allergy or discomfort. We're talking about, for example, a common weather pattern here called thermal inversion that traps emissions close to the ground. It happens all of the time.

We're talking about a harmful dose of benzene, methanol, hexane, formaldehyde, ammonia or nickel, or a host of other toxins, all approved to be released in this permit into an unsuspecting home in Mariah Hill at week 14 of a pregnancy.

We've talking about a resulting pervasive disability a child and his or her parents did not ask for and do not deserve that follows one for life as the child learns to cope. The long-term cost of just a few lower IQ points has staggering effects on families, one's quality of life, and our state's economy. The research is extensive.

According to the U.S. Government, the percentage of Special Ed students in our nation's schools is 13 percent. The Indiana Department of Education released the following numbers from these neighboring schools just last year. Keep in mind, federal reports, national average, 13 percent.

North Spencer, 2017 stats, Chrisney Elementary, 24 percent; Nancy Hanks, 21; South Spencer Rockport Ohio Elementary, 24 percent; Warrick County Schools, Elberfeld, 21; Lynnville, 25; Lowell, 23; Warrick County Preschool, 97; Tennyson, 30; Bloomfield High School, 26; Bloomfield Middle, 23; Chandler, 23; Mount Vernon High School, 22; Mount Vernon Junior High, 21; West Elementary, 30; Farmersville, 30. The national average is 13.

North Posey Elementary, 25; East Gibson, Wood Memorial Junior High, 24; Oakland City Elementary; 33; North Gibson, near one of the super polluters, 28, 29, 22, 26. The national average is 13. South Gibson, Fort Branch, 21; Owensville, 26; Pike County Winslow, 24; Petersburg Elementary, 22 percent Special Ed.

I could go on. I'll stop there, except Washington, Indiana, where Norma works, 28 percent, over twice the national average. Why in the world would we even consider taking a risk with more pollution with numbers like these in this area? That's one of my questions, and I'm looking forward to that answer.

To quote Shakespeare in Hamlet, "Something is rotten in the State of Denmark." Well, there's something rotten in the State of Indiana. We owe our children answers and the intense scientific root-cause analysis initiated by our elected officials, with everybody at the table, especially the

medical community, to determine why so many of our children here are born, through no fault of their own, with immediate and lifelong disadvantage.

Deny this permit. If Governor Holcomb meant what he said down the road at Santa Claus back on June 7th when he said we won't do anything to harm public health, deny this permit, and work with a new generation of thinkers and innovators to move our state forward in education, job training, healthier work environments for our workers, clean and sustainable energy, and conservation. Please deny this permit.

**IDEM Response to Mr. Rock Emmert, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring

Regarding the 2017 special education enrollment for southwest Indiana schools, please see the ATSD IDEM Response Mr. Rock Emmert Comment 1.

The 2017 special education enrollment data provided by the commenter does not represent the complete data set for all schools in the southwest Indiana school corporation areas cited. The 2017 average percentage of special ed students in schools located in the southwest Indiana schools corporation areas cited by the commenter was 17.15%. Using 2017 data for all schools in Indiana, the 2017 average percentage of special ed students in Indiana schools was 15.13%. These percentages are more in line with the national average of 13% as cited by the commenter.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Michael Schrief, Statements and IDEM Responses</b>
---

**Mr. Michael Schrief, Statements:**

Hello. My name is Michael Schriefer, and I'm from Santa Claus. I am retired, but I spent 35 years in education here in the North Spencer County School Corporation.

When AK Steel and one of their supporting companies, Amehox [phonetic], came to Spencer County in 1999, then Spencer County Emergency Management Director Hal Purdue met with me with concerns about the emissions from the two plants. He organized a drill for the schools here in North Spencer, because of his fears that with the prevailing winds, they might be affected by a leak.

From that point on, the schools had participated in a shelter-in-place drill. The new plant, because of the prevailing winds, will affect ten area schools. So, I would assume they would initiate shelter-in-place drills in their schools, because of the possibility of the accidental release of harmful chemicals.

These drills have caused many fears in our younger students. With David Turnham Elementary School only one mile from the proposed site, their time to shelter in place in the event of an accident may be nonexistent. Please keep this in mind as you make your decision.

Thank you.

**IDEM Response to Mr. Michael Schrief, Statements:**

IDEM, OAQ understands the commenters concern for personal safety related to accidental release of harmful chemicals. However, IDEM, OAQ is not authorized to consider emergency preparedness and response capabilities, unforeseen disasters such as fires, explosions, accidental chemical spills, terrorism, or extreme meteorological events, or other extraordinary conditions in the issuance of Part 70 Operating Permits. Please contact your local emergency management officials for these concerns.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Mr. John Pund, Statements and IDEM Responses</b>
---

**Mr. John Pund, Statements:**

My name is John Pund. I'm from Ferdinand, Indiana, about seven to eight miles east of the proposed plant I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice, and I oppose Riverview Energy's coal-to-diesel project.

I work at Thermwood Corporation here in Dale, Indiana. We're a C&C manufacturer, with many high-tech jobs. We've been here for 40 years supplying these jobs to the Town of Dale. We employ approximately 100 individuals with jobs such as electrical, mechanical and software engineers. We employ electronics techs, electricians, welders, painters, et cetera.

I would like to discuss VOC's, volatile organic compounds. These are the solids released from many of these chemicals that we're talking about. I took over as our Safety Environmental Manager about three years ago. The first thing that the previous manager taught me to do was keep a close eye on our VOC's.

They must stay low. We always try to buy low-VOC paints and chemicals, to keep our VOC count down as well as we can. There are two chemicals that we keep locked up so only the qualified individuals who need to use them can use them. One of these chemicals is naphtha.

Naphtha is also one of the chemicals that is going to be produced by this plant. Naphtha is 100 percent a VOC product. If left exposed to the air, it'll evaporate completely into the atmosphere. The naphtha safety data sheet indicates humans should avoid any contact with skin, eyes, ingestion or inhalation.

It can cause serious skin blistering, as we had an incident at Thermwood where the guy simply spilled a bit on his pant leg and did not do anything about it. Within half an hour he had serious chemical burns. We had to send him to INET. This is the kind of stuff we're talking about that is going to be produced just north of Dale. It can cause many different problems, but prolonged exposure can cause organ toxicity.

It is also environmentally hazardous, causing acute and long-term damage to aquatic life. Do we want our lakes and streams permanently damaged by this product? Will we still be able to eat the fish we catch?

What kind of effect will it have on our wildlife? Do you know that Spencer County is home to 23 endangered, threatened and rare species? You can find this on Indiana's own Web site under DNR. It includes six mussels, two fish, one amphibian, being the Northern Cricket Frog. It also has two reptiles on the list, nine birds, including the Barn Owl.

The reason I mention the frog and the barn owl is both amphibians and birds are considered indicator species. They are the first ones who are affected by this kind of chemical. There are possibilities of exposure to that single chemical, not to mention the countless other chemicals used in the production of the diesel and naphtha. Spencer County is already ranked no. 23 most polluted county in the nation. This is one instance that we do not want to be no. 1.

We at Thermwood have been good stewards of the local environment and have provided good, high-tech jobs for Dale for 40 years. We already have great difficulty finding enough qualified applicants to maintain our current level of production with unemployment at such low levels in the area.

And if there are any members of the local Chamber of Commerce, or even the Dale Town Council, our President and CEO has made it very clear he is displeased with this plant locating here, as this location will cause more problems in finding good workers to come work at Thermwood.

And we wish -- we do not wish for what he plans to do if this happens. He has indicated to those entities if we do not -- if this plant locates here, we will then have to locate elsewhere to find proper employment.

Is it worth trading our 100 jobs that have been here for a number of years for 200 that will be here in the future? We do not need the jobs. We need quality workers for our existing loyal employees. Please deny this permit.

#### **IDEM Response to Mr. John Pund, Statements:**

The proposed permit contains all health-based and technology-based standards established by the U.S. EPA and the Indiana Environmental Rules Board, which will limit the amount of emissions from the facility to the very lowest level allowed by law. In addition, IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County

- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Ms. Jane Schipp, Statements and IDEM Responses</b>
---

**Ms. Jane Schipp, Statements:**

My name is Jane Schipp. I live in Santa Claus, and I support the statements of Southwestern Indiana Citizens for Quality of Life and Earth Justice.

First of all, I'm probably not your typical opponent of the coal industry. I only resigned my position as a CFO two years ago, after working in the coal industry for nearly 25 years. The corruption just got to be too much. Bribes and kickbacks are alive and well in the coal industry.

I've had dinner with industry officials who laughed at how great a farce the clean coal campaign is and how it was the best money they ever spent. I've seen bottom ash buried in unlined pits, I've seen toxic runoff water pumped into the river in the dark of the night, I've seen bribes given for permits and kickbacks given for contracts.

Donations to the political super PAC's are a must, and a huge part of who gets recognized with grants and contracts. In fact, I'm quite sure that contributions are the no. 1 reason you do not find many government officials who will speak out against this plant.

Just as an FYI, did you know the coal industry is subsidized by taxpayers to the tune of one billion dollars a year? Did you also know there are six corporations that sponsor the Indiana Economic Development Commission? Five of those six corporations are -- you guessed it -- coal-fired power plants.

So, what do you know about Spencer County, other than the fact that Huntingburg is not in Spencer County? Spencer County is already home to one of the largest super polluters in the nation and has four coal-fired super polluters within an hour's drive.

Per the permit application, this refinery will release another 1.5 million pounds -- I'm talking about pounds -- of toxic chemicals, and 4.4 billion pounds of greenhouse gases year after year. Fifty-two thousand pounds of known carcinogens will be released into our area's atmosphere each year.

IDEM's mission statement is to protect human health and the environment. What part of this permit shows you give a damn about our health? How could IDEM -- state "This refinery will not have a significant impact on the environment and the overall health in the region? This is an utter lie. Have you learned anything -- or nothing from Franklin." I guarantee you, if you could be held personally liable for providing such a reckless statement it never would have been issued.

Spencer County relies on tourism. We are home to Lincoln State National Park and the Lincoln Pioneer Village, one of the world's largest water parks, a beautiful monastery and beautiful historic churches, campgrounds, trails, golf courses. It is a beautiful landscape. Best of all, we are home to the real Santa Claus.

You are destroying our fairy tale. You will destroy the tourism dollars that the state reaps and spends in the surrounding counties. When the Wal-Mart greeter of our county becomes a 512-acre refinery, no one will want to visit here.

Spencer County has just over 20,000 residents. That means this plant will, free of charge, want it or not, give each man, woman and child 71.5 pounds of toxic chemicals and over 215,000 pounds of greenhouse gases each and every day -- every year, sorry.

And while I realize that with a windy day Spencer County may get lucky and it may bypass us, someone will suffer: Vernon will, or Paoli or New Albany, someone will suffer because of this plant. And on days when there's no wind, "Merry Christmas, Spencer County. Each of you hereby receives 216,000 pounds of toxic chemicals and gases each and every year for the next 50-plus years."

This may be a quick decision for IDEM, but it is truly a life-changing event for the people of this area, one that we will live with for decades to come. Please deny this permit.

#### **IDEM Response to Ms. Jane Schipp, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

<b>Mr. Wayne Werne, Statements and IDEM Responses</b>
---

#### **Mr. Wayne Werne, Statements:**

I'd like to start off by saying that as a resident of Spencer County, I oppose this plant, and by definition, the approval of this air permit that is being proposed. Since the parameters of this hearing specifically concern just the air permit and its' approval process by IDEM, I will specifically address just that component of my opposition.

To start with, IDEM's acronym officially stands for Indiana Department of Environmental Management, not the Department of Industrial Development. Therefore, I would remind you that, by definition, IDEM's primary purpose and duty to the citizens of this state is to oversee and enforce environmental standards in the in the state, not to rubber stamp industrial development projects due to political pressures.

Consequently, my concern, along with many other here, is that there could very well -- there could be very real acute and chronic releases of harmful chemicals if this plant is ever built, leading to both acute environmental effects and chronic health effects to the surrounding community.

The only way to ensure that in-plant operations are within standards would be to have a series of air monitors permanently put in place surrounding and in very close vicinity to this proposed plant, to permanently monitor whether they would be in compliance to the proper standard.

It is certainly not too much to ask that proper compliance is assured by the placement of such monitors. Much like smoke detectors are required in all public buildings, air quality monitors should also be part of any plan to build this plant. Such monitors would be in addition to any in-plant monitoring that the company running the plant would already have to place. It's not acceptable to have the fox guarding the henhouse, so to speak.

It is the duty and responsibility of IDEM to ensure basic minimal adherence to air quality standards by having multiple monitoring stations in place that are either -- that they are in charge of reading and reporting to the public who is expected to endure this plant being put in their backyard.

I would ask that before any thought of approving this permit goes forward, that IDEM would add a section requiring the permanent placement of multiple air quality monitors surrounding and in close vicinity to this plant for daily, monthly and annual measurements of nitrogen oxides, sulfur oxides, carbon monoxide, volatile organic compounds and particulate matter.

It is contingent upon IDEM to adhere to their stated purpose and responsibility to safeguard citizens of this state by doing this bare minimum to measure the effects of an experimental plant on the air quality beyond just a promise made by the company that they won't possibly ever have any problems, which we all know is not true and disingenuous at best.

The readings and results from these air quality monitors should be publicly available on a Web site, so that any resident of the area can check to see if indeed the emissions remain within compliance or not. This is the basic expectation of any citizen in this state and IDEM, whose job it is to ensure air quality is maintained.

Finally, I would strongly disagree with the contention made by IDEM that this plant will not have significant cumulative negative impacts to the air quality of Spencer County and the surrounding region. There is literally no way this is a true statement considering the existing impacts of the nearby coal-fired power plants and AK Steel, among others.

Therefore, I feel this plant's air permit should not be approved, as an operation of such size and magnitude certainly will have a negative impact to our air quality, and only add to the existing burden of negative impacts caused by the large point sources of air pollution already in place nearby.

**IDEM Response to Mr. Wayne Werne, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"

No changes to the draft permit were made as a result of this statement.

**Agnes Kovacs, Statements and IDEM Responses**

**Agnes Kovacs, Statements:**

Good evening. My name is Agnes Kovacs, and I'm a resident of Santa Claus, Indiana.

Unlike so many of the people filling this room, I cannot claim having roots here that goes back generations. I am a relatively recent transplant who will have the opportunity to move away, should this proposed coal-to-diesel plant become a reality. But many living in the area will not have that chance.

So, I'm here tonight to highlight a particular perspective in the midst of deliberations about this proposal. That perspective is one of faith, of Christian specifically, of Catholic Christian faith that shaped the lives of those who originally settled this region, and continue to shape the life of many still.

Concepts that the dignity of the human person, the common good, solidarity, and stewardship might seem like so much highfalutin church talk, but the seven years I've lived here taught me that the people of Southern Indiana have a keen sense and sensibility about what those church teachings mean. They live it as they till the fields, raise cattle, work in factories, care for family, friends and neighbors both near and far, and come together to address issues that the communities face.

Tonight I'd like to say a few words about stewardship, a topic very close to Pope Francis' heart. Stewardship recognizes that all of creation is gift, that we, human beings, are entrusted by God to care for and cultivate these gifts. While no individual or generation owns these gifts -- they are meant be shared and passed down from generation to generation -- Pope Francis is also adamant that each of us has a personal responsibility to care for creation.

As people of faith, we cannot ignore the moral and ethical dimensions of stewardship: How do our decisions and actions affect the most vulnerable among us? As responsible stewards of God's creation, we are called to appreciate the God-given beauty and wonder of nature; to protect and preserve the environment; to respect human life, shielding life from threat and assault, doing everything that can be done to enhance this gift and make life flourish; and to develop this world through noble human effort, physical labor, the trades and professions, the arts and sciences.

In light of the church's consistent and clear teaching about stewardship, how do the details of the proposal measure up? How does this proposed facility help us appreciate the beauty and wonder of nature, unless by providing a stark contrast to it? How does increased air pollution help protect and preserve our environment? How does the risk of exposure to harmful, poisonous chemicals enhance human life? Ultimately, how will future generations judge our stewardship?

I urge the Indiana Department of Environmental Management to reconsider its position and deny the air permit to Riverview Energy.

Thank you.

**IDEM Response to Agnes Kovacs, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Paul Kovacs, Statements and IDEM Responses</b>
---

**Paul Kovacs, Statements:**

Good evening. My name is Paul Kovacs. I'm a resident of Santa Claus, Indiana. I have a Ph.D. in Physical Chemistry, have extensive professional experience in orthopedic implant material research; that is, in how the human body reacts to manmade materials.

I've had technology transfer projects for environmentally friendly technologies, and I served for five years on the Economic Development Commission of a Memphis, Tennessee suburb. I only say these things because I want to indicate that I have appreciated some of the various possibilities from this complex issue we are considering.

I moved to the U.S. at the age of 32 in the hope of finding the Land of Common Sense for the Common Good. Now, 32 years later, I find myself in a situation in which neither of those seem to be important.

It pains me to see that the hardworking people of Spencer County are treated by their elected and appointed officials as citizens of a third-world country. For their political and financial gains, they implement so-called "economic development" projects that endanger the health and wellbeing of the current and future generations.

They adopt an assimilative-capacity approach, because the questions asked in that process support extractive and polluting activities and related policy making. The question they ask is this: How much more pollution can be tolerated in exchange for perceived economic benefits?

The proposed coal-to-diesel plant by Riverview Energy is promoted by the following selling points: One, a 2.5 billion investment of unknown origin. Is that a declaration of "for money, we do anything"?

Two, the first implementation of an advanced technology, which was invented 100 years ago, and only used by oppressive regimes in dire needs. Is it so advanced that no other U.S. community would welcome it? Or is Southern Indiana considered to be a place where no one would notice the difference?

Three, it would result in reduced property taxes. But it also would result in fast declining property values as well. Who would like to live near an industrial age monster?

Four, it would create jobs. But what kind of jobs and when? Construction jobs now, and future health care and special education jobs by the thousands. Is this "economic development" we should support and celebrate?

In contrast to marketing brilliance, the EPA calls for a Prevention of Significant Deterioration (PSD) process, which, as I look at it, has two main components. One is the technical-legal aspect, which requires the following: Installation of the best available control technology (BACT); an air quality analysis; additional impact analysis; and public involvement. This is what the Indiana Department of Environmental Management has been doing. Furthermore, IDEM's stated mission reads: "We protect Hoosiers and our environment."

And this leads me to the other aspect of the PSD project, which was that it does not guarantee the sources from increasing the emissions, but it was designed to: One, protect public health and welfare; Two, preserve, protect and enhance the air quality in national parks, national wilderness areas, national monuments, national seashores, and other areas of special national and regional natural, recreational, scenic and historic value; And three, ensure that economic growth will occur in a manner consistent with the preservation of existing clean air resources, and assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision, and after adequate procedural opportunities for informed public participation in the decision-making process.

So, my being able to be here to ask to deny is not an act of kindness by the proponents, it is required by your group, as I understand it.

Just to show how I see the present process by using a Rubik cube, and I don't have to go through the details, but I look at the EPA asking for a process like this, to have proposed as to regulate them and have the public to tell it, and that's a perfect process.

If you take one part of it, which is this air quality permit, you get that there is a proposal at hand that's turned upside down, and then everything should fit that stated outcome. Why I'm saying it is because looking at the proposed permit, I notice a few inconsistencies are in this approach. The IDEM, of course, many people mentioned tonight, have been mentioning, the conclusions that there will be no significant impact of several hundreds of tons per year of toxic chemicals, but I notice that while IDEM does not operate air quality detections, the proposed permit states that existing monitoring is available for all pollutants and averaging times. It doesn't state where and how. I note that there is none here, but the statement is very misleading.

Then preconstruction monitoring is not required since modeled concentrations for the applicable pollutants were below the significant monitoring concentration thresholds. Why do you model concentrations when you say that existing monitoring is available? Why do you need data from a monitoring site in South Bend, Indiana? Is that the closest or most desired input for the model concentrations? Is a 350-percent increase in the three-hour sulfur dioxide emission, what your data shows, is insignificant and protects Hoosiers and the environment? That's not consistent with the conclusion.

And is Mammoth Cave, at 120 kilometers away, the closest area of special national or regional natural, recreational, scenic or historic value to be included in the air permit consideration? Southern Indiana has so many national -- state parks, other recreational areas, not to mention Holiday World and the Lincoln Memorial -- Boyhood Memorial. There are many other considerations, so --, based on these deficiencies in protecting public health and welfare as mandated, I urge IDEM to reconsider your position and deny the air permit to Riverview Energy.

**IDEM Response to Paul Kovacs, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

With regard to the VEBA Combi Cracker (VCC) technology to be used in this facility, see the ATSD IDEM Response to Valley Watch Comment 12.

With regard to so much of the comment as refers to Mammoth Cave National Park and other local valued areas, please see the ATSD IDEM Response to Paul Kovacs, Ph.D. Comment 2.

No changes to the draft permit were made as a result of this statement.

<b>Ms. Charlene Hess, Statements and IDEM Responses</b>
---

**Ms. Charlene Hess, Statements:**

My name is Charlene Hess. I live in Santa Claus, Indiana. My home is just up the road from AEP, AK Steel, Alcoa, FB Culley Power Plant. I know from personal experience that their emitted toxic pollutants are harmful to us, who have no choice but to breathe the air around us.

According to the Toxic Release Inventory of 2016, the top four toxic chemicals emitted by AEP alone were hydrogen fluoride, sulfuric acid, hydrochloric acid, and ammonia. All four cause other respiratory problems such as eye and nose and throat irritation, coughing, chest pains, and can damage lung tissue.

Of the many chemicals to be emitted, according to Riverview Energy's air permit, I would like to name just three of them: Nitrogen dioxide, sulfur dioxide, and more ammonia. These toxins also cause upper-respiratory problems, along with more severe wheezing and worsening of asthma symptoms. It is a known scientific fact that air and gas molecules move among themselves and for long distances.

Now, these toxins just mentioned will combine with other toxins from AK Steel, Alcoa, the Culley Power Plant, et cetera, et cetera, et cetera. Common sense tells us that toxins causing upper-respiratory distress, plus more toxins causing upper-respiratory distress, adds up to even more severe upper-respiratory problems.

Common sense also tells us that the first coal-to-diesel plant built during World War II in Germany must not have been all that great, because it was shut down in the 1980's. Only three other coal-to-diesel plants have been built in the past 90 years? And none have been built in North America.

Common sense should tell us that if a coal-to-diesel plant is such a clean and wonderful thing, one would find many, many of these plants all throughout the world. The fact is, we don't. That should be a red flag to you and to all of us here.

Please deny the air permit for Riverview Energy.

#### **IDEM Response to Ms. Charlene Hess, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

No changes to the draft permit were made as a result of this statement.

<b>Mr. Rick McKee, Statements and IDEM Responses</b>
--

#### **Mr. Rick McKee, Statements:**

My name is Rick McKee. I'm with the Indiana Kentucky Ohio Regional Council of Carpenters and Millwrights. We represent approximately 2,000 construction workers that live here in Southwest Indiana.

I'd like to thank IDEM for coming out tonight and all of the proponents of the project, and I'd also like to thank the environmentalists that are here tonight. You guys definitely make a difference with all of the work you do, your efforts. You know, we wouldn't -- the world would be -- is a much cleaner place because of your efforts.

And those efforts have also meant many man-hours for our members, whether it's installing new environmental upgrades for existing plants or building clean energy plants like the one we're talking about tonight.

Riverview is a poster-child plant for a clean energy plant. Are there cleaner? Are there cleaner? Sure. You've got wind, you've got hydro and you've got solar, and, you know, those are cleaner sources. But -- you know, and there's some studies going on right now for some wind farms here in Southwest Indiana.

But we don't have the sustained wind speed for those like in Northern Indiana or out west. We do have a few hydro plants smattered across the area, which are great. We don't have the 365-day-a-year sunlight to sustain the solar.

But with each of these that we claim we like, we always see signs saying, "No solar, no wind." I've see them all over town here. I mean you see them already. It's crazy. So, we want it on one hand and we don't want it on the other. So, we're not sure what we're -- what we want.

Anyway, with that, you know, one thing that we do have in this area is an overabundance of dirty, nasty coal, which we do have, but we also have a partner in Riverview Energy, you know, that's willing to take this terrible product and responsibly turn it into a cleaner energy product, using a process that, when the final studies are complete, and I believe IDEM will find that they will not be as harmful as some here tonight would have you believe.

And when these facts and these final studies come in, and I believe they will, I move that IDEM expeditiously approve this permit for Riverview Energy.

Thank you.

**IDEM Response to Mr. Rick McKee, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Kristin Moran, Statements and IDEM Responses</b>
---

**Kristin Moran, Statements:**

My name is Kristin Moran. I live in Dale, Indiana. I support the comments of Southwest Indiana Citizens for Quality of Life and Earth Justice.

My parents moved here in 1997, when I was in college studying Wildlife Science at Purdue University. I spent my first summer working at Lincoln State Park as a seasonal naturalist. I'm sorry; my voice is shaking. I haven't spoke in public in a while.

I spent that summer talking with children, teenagers, adults from the local area as well as all over the country. I learned so much about the natural resources here and in Southwest Indiana during that summer, because, again, I was not originally from Southwest Indiana. I graduated from high school in Northern Indiana.

I had talked with people who came because they were going to Holiday World, and they wanted to have a nice place to camp and relax in the evening, after spending the day at the water park and riding the roller coaster.

I talked to other people who came because they wanted to learn more about our 16th President. They wanted to learn what it was like to break ground in Indiana when it had trees that were 24 feet in diameter.

I talked with other people that came because of the rare wildlife that's here. I learned the Mississippi kite, which is a bird of prey similar to a hawk, its northernmost location in the United States is Lincoln State Park. I learned so much, and I continue to learn so much about this area, and it's beautiful.

I moved away for a few years, and when I moved back four years ago, I noticed that a lot of local businesses had closed. But the two areas that I noticed had improved were tourism-related businesses and wineries. Wineries require clean water, clean air and good soil. Tourism requires clean air, because nobody is going to come to a theme park or a state park or a national memorial or any of the other beautiful sites we have if the air smells like rotten eggs. Maybe some people will.

I -- I support all of the science that my colleagues have spoken about, and I decided to speak from the heart today.

I would like to end my comments with a quote from President George H. W. Bush, who's being laid to rest today: "Every American expects and deserves clean air, and then we act on that belief, then we will set an example for the rest of the world to follow." He said that in 1989.

Why are we considering following in the steps of Nazi Germany, who developed the coal-to-diesel technology, and Apartheid South America [sic]? We need to be innovating and stepping forward.

Thank you.

#### **IDEM Response to Kristin Moran, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Christopher Weintraut, Statements and IDEM Responses</b>
---

#### **Christopher Weintraut, Statements:**

Thank you. My name is Chris Weintraut, and I'm the Executive Director for the Indiana Chapter of the American Academy of Pediatrics.

I'm here on behalf of over 900 pediatricians, pediatric residents, subspecialists and nurse practitioners throughout the State of Indiana to express concern about the adverse effect of air pollution on our youngest and, most vulnerable citizens in the state. Our members treat patients in Spencer, Dubois and Daviess Counties, among others in the area.

In 2004, the American Academy of Pediatrics published its policy statement on ambient air pollution and the hazards that it poses to children. That statement was updated and reaffirmed in 2010, and provides guidance on why this is a continuing health issue. As documented in that statement, children and infants are among the most susceptible to air pollution.

In addition to association between air pollution and respiratory symptoms, asthma exacerbations and asthma hospitalizations, recent studies have found links between air pollution and preterm birth, infant mortality, deficits in lung growth, and possible development of asthma. These are serious and, in some cases, lifelong conditions that can affect children due to unhealthy air in the communities in which they reside.

The health of all citizens in this community, and of children in particular, should be at the forefront of any decision made on this issue. The children in this community deserve for us to have a full and complete understanding of any health effects that this plant might produce, especially as we do not fully understand the implications of this rarely seen technology. This community needs a better understanding about how IDEM came to its determination, and further, that information needs to be in language that citizens outside of IDEM can digest and comprehend, and we need a better understanding about how IDEM came to the determination that this plant would not have a significant impact on the community, and that determination needs to be scrutinized.

With all of this in mind, we urge the IDEM and the local decision makers here in Spencer County to reconsider moving forward with this project until and unless all of those issues are adequately addressed to the satisfaction of those who live, work and breathe in this community.

Further, if the proposal does move forward, we urge that a stringent monitoring protocol be implementing to track the actual output of this plant and its effect on the community.

The proposed location of this plant is within a mile of both an elementary school and a nursing home, two populations especially vulnerable to air pollution.

At the very least, a robust monitoring protocol should be part of any plan that receives approval to move forward, to track what pollutants this plant is actually putting into this community's air.

I understand that a fine particulate monitor will be in Dale. This plant will not just emit fine particulate matter. Monitors need to be both present in this community, and for all of the harmful emissions that will come from this plant.

Thank you very much.

#### **IDEM Response to Christopher Weintraut, Statements:**

- IDEM Response to General Statement 6 - Air Monitoring

Regarding infant mortality in Indiana and southwest Indiana, please see the ATSD IDEM Response to Dr. Norma Kreilein Comment 1.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jim Gardner, Statements and IDEM Responses</b>
---

#### **Mr. Jim Gardner, Statements:**

I've been a resident of Spencer County for 45 years. I've raised five children. I've got nine grandchildren. Of the five children that I've got, I have three of them that had to move to other states to seek jobs. I would like to see them be able to come back someday and live in close proximity of myself.

I really don't have a speech planned, but as I listened to some of the comments of the people that are opposed to this plant, it seems as though they think this is going to cause cancer or we're going to have birth defects, something negative. They're not thinking about the positive things.

I'm in favor of this plant. I may not be around, or even working to get this plant built, but a lot of my union brothers here would love to build it. We've got high-skilled people in this area that would love to expand this area and build this plant.

We have people, we have agencies in place, that will take care of any problems we have with pollution or anything like that. I believe that this plant would be a good plant for this area. It would

be -- it would -- a lot of jobs would be created, good paying jobs. A lot of construction workers would benefit from this.

I don't know what else to say about it, but I believe this plant should be built, and I would love to see it and I would love to help build it. That's all I've got.

**IDEM Response to Mr. Jim Gardner, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>James McCarthy, Statements and IDEM Responses</b>
--

**James McCarthy, Statements:**

My name is James McCarthy. I'm a retired boilermaker. I'm also a military brat. I've lived on the other side of the globe six years. I've been out of the country four times in the last three years. I've done some military contracts when I was younger.

I was in charge of the dust collector at Edwardsport when we built that plant. I wound up being a general foreman on that. I have helped on a lot of emission controls. We don't have the same pollution that we had when our grandparents were in coal in every single house. We burn it in a centralized location now. We squeeze the pollution out of it. The scrubber takes out quite a bit.

I'm going to say some things about our children's health. I've heard some professionals talk about how many special-needs kids we have. I've heard that before, so I Googled it. At any given hour in the United States, there are 19,000 mothers addicted carrying a baby. Nobody's given any credit to that. I don't think it's all from power plant pollution.

The biggest point I was going to make is: What are we actually doing this plant for? Are we doing it for wages? Are we doing it for the quarter million dollars it'll bring into the community every day? We're doing it to get ourselves off of our addiction to Arab oil.

Growing up on the other side of the planet, I've seen out some different windows. We pay homage to these people every time we fill our cars, every single time. I have made that statement in break rooms before with our union guys who are driving nice trucks, and shut up entire break rooms. It's a point that even my co-workers can't argue.

We finance terrorism daily. We have done it since before I was born. It's something that we need to quit. If you can read the news about Saudi Arabia, those people never were our friends. They never will be. If you keep after the news in Dubai, how they treat women is shameful.

What we're going to do with this plant if it goes through, we're going to make a fractional change in world balance, giving power back to the United States, keeping money in the United States that otherwise would have left. I think that's one of the more important things we have to look at tonight.

We all want a better quality of life for our children. Yes, we want our kids to breathe clean air. We also don't want our kids to have to go off to war and come back in the shape that a lot of them came home [sic]. I'm sure we have veterans in here on both sides of the fence. You look at what it's done to your families. We really need to cut the money off going to where it's going. I think that's what I can say tonight.

Thank you for your time.

**IDEM Response to James McCarthy, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Ms. Daley Atchinson, Statements and IDEM Responses</b>
---

**Ms. Daley Atchinson, Statements:**

My first statement that I did not have written in my speech was if you want to worry about your children growing up in a healthy environment, we should worry about our own country's rape stats and teach our children not to rape instead of not to get raped.

My name is Daley Atchinson. I am a 16-year-old junior at Heritage Hills High School. I'm also a student in Mrs. Holly McCutchan's environmental science class. Lately we have been learning about pollution and the different kinds of air effects.

Lately we have learned that there's no such thing as clean coal, because the main component is hydrogen, which causes cancer, skin irritation and ulcers. I guess you could say we've also learned that it's more likely to see a pig fly than a doctor who supports C2D. There's just a few side effects -- those are just a few side effects.

I also attended a three-hour No C2D meeting a month ago in this very auditorium. Now, I know I'm still a child, and many would call me a rotten millennial, but it doesn't take a genius to know that a C2D plant has more negative than positive effects.

Sure, you can think about the posi -- positively about the 2,000 jobs it will provide for the time being with the construction, and the very few, 250, people that would actually keep -- they will actually keep to work full time at this plant, which is according to an article written by Dan McGowan of Inside Indiana Business.

Or we can be worried about the 2.5 million pounds of coal dust it will put off a year that will spread up to five miles, all of the way to Santa Claus, or the rotten egg smell it will put 18 off 24/7.

And the 40 kids who got cancer over a ten-year time span after a plant similar to this one was put upstate that the Indiana State Department of Health said they could not track because it was air pollution. Imagine your child getting cancer because your neighbor wanted people to get some jobs that were promised to locals.

The special needs children researched for these pediatricians' speeches have been based off of polluted areas. Don't let me forget that the president of this proposed plant, who lives all of the way in Connecticut, is putting old data into his Web site to prove how minimal the effects of this plant will be, old data that has been disproven because of the later realizations of these negative effects of this plant, and the fact that Spencer County is not equipped with an ozone monitor.

So, we will be oblivious to the ozone pollution caused by this plant, which is all according to pediatricians Dr. Erin Marchand and Dr. Norma Kreilein, who sit in this auditorium right now with us. I may be young and, to some, stupid, but I will not sit around and let some ignorant men and women who think they know what's best for my future to ruin it because they don't have to worry about it in 30 years.

For all those who think the youth wants this for better jobs and more opportunities, you're wrong. If your children aren't willing to travel an extra ten miles for a good job, then you've raised them wrong. And if you want to wait two years for this plant to be built so your precious -- for your precious job, then you've been raised wrong, too.

I, too, want to live in Spencer County for the rest of my life. I want to be an AP English teacher in this very building. I want my kids to graduate from Heritage Hills and live out their lives here. But I do not want to worry about increased cancer rates that my children would be susceptible to and the smell that they would have to grow up with instead of clean blue air. I will not allow this C2D plant in my community.

**IDEM Response to Ms. Daley Atchinson, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

<b>Mike Kendall, Statements and IDEM Responses</b>
--

**Mike Kendall, Statements:**

I want to talk to you Hearing Officer, and I want to talk to you, union members. And I want to very quickly establish some credibility to talk to you.

I -- I used to live here, and I moved back in August, to Jasper. I'm here with my wife, Teresa, who's sitting back here somewhere, who is a teacher, and she is with Bev Alles from Jasper, whose father used to be the Mayor of Jasper. And I'm here with Tom Bier, who's an attorney from there and a friend from way back.

I'm a union lawyer. My dad was a factory worker for Jasper Cabinet Company. My uncle was the leader of the strike in Jasper in 1950, was blackballed and couldn't get a job in Jasper, and had to go to Indianapolis to get a job at RCA. And when he got a job at RCA, the factory owners in Jasper tried to get him fired up there, but the union saved him.

My parents sent me to Notre Dame for three degrees, and my aunt sold insurance policies to the factory owners to pay for that education. When I came back home, I worked for the workers, and when I worked for the workers, I got involved in the Indiana Death Strike. After the Indiana Death Strike, my partner quit and moved out because I was working for a union.

I stayed. A bank said they wouldn't do business with me anymore. I had to move my money to an AFL-CIO bank in Indianapolis, thanks to the President of the AFL-CIO. I was voted Outstanding State Senator by the AFL-CIO, the mine workers, the building trades unions.

I was a business rep for the steelworkers, and I went inside the factories in Jasper and Ferdinand and Huntingburg and negotiated grievances for the workers. After I got done doing that, I started representing workers all around the state at plant closings, plant closing of Kraft against Phillip Morris in Evansville, plant closings in Chicago, with Emery, and I spent my whole life doing that.

There's one other thing I did, too, though, is I fought for the environmental safety and I fought for environmental protection, and I want my friends in the union and I want the Board to listen to this. Think about this. What I learned is you can't trust the guys you think are going to give you a job any more than you can trust some of the people you work for now, and that's why you have a union.

And if you think that this is going to be your panacea, you're wrong. I worked on and helped stop Marble Hill, I helped stop BASP -- I helped stop -- I fought against Indiana Michigan Electric building that power plant here.

And you should know that they got to build those thousand-foot towers without any air pollution control equipment on it, because they snuck in under the Clean Air Act amendments. We had to go to Washington, D.C. to try to appeal it.

And after they built it, they set up two 765,000 kilovolt power lines that went right through the land of people like Mr. and Mrs. Pounds, and after that was over with, Pharmed of Ohio came in put Pharmed of Indiana in this county, and they simply used Spencer County as a trash dump, there was so much air pollution.

The workers at the plant had a union. They had no filter equipment, they had no air pollution control, they had no smoke stacks, and the workers in the plant worked inside those fumes. So, stop and think what you're going to get here, because this is very much like Marble Hill. Marble Hill was going to be built by Public Service Indiana, now Duke. They never built a nuke. This company has never built one of these plants, ever, anywhere.

Number two, one of the problems with the plant was they didn't hire a general contractor who ever built one. Well, these guys aren't going to hire a general contractor who had ever built a nuke or a gasification plant, because the only people who built one like this are in China and Russia.

When they did build it, what they did -- and the reason the Nuclear Regulatory Commission shut it down is because PSI had all of the core cooling parts shipped to Mexico, a false union stamp was put on them that said they had been stress tested with an x-ray, then they shipped them back across the border and back up here, and not a union hand touched those damn pipes.

And that's what caused the NRC to shut it down, that's what caused the cost to overrun, and that brings us to Riverview. They don't have the money. They're out scrambling for the money right now, and they want Huntingburg -- anybody here from Dubois County -- Huntingburg to give them the wastewater treatment for free.

Now, last but not least, those are going to be bombs driving out of there. Those trucks are going to be loaded. Where they've had some gasification out west, towns as many as two to three hundred, four hundred people have been destroyed in accidents there. This is real serious stuff.

So, I say to you, watch it. And I say to you union guys here, watch it. These guys are not your buddies. They don't want to see you make more money. They don't give a shit if you have a job when they're done.

And you need to not let them use you to fight these guys, because they're worried about living with it, because one of these days it's going to be your backyard.

**IDEM Response to Mike Kendall, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Mr. Chuck Botsko, Statements and IDEM Responses</b>
--

**Mr. Chuck Botsko, Statements:**

My name's Chuck Botsko, and my wife and I live in Spencer County. My wife's family has been here for over 70 years.

If this refinery was being planned in the City of Indianapolis or in one of your neighborhoods, would you have worked so closely with KBR and Riverview to craft a permit that just met the letter of the law? Would that draft permit look any different than it does now?

For many years, coal-to-liquid projects have been proposed in many locations in the country. Various departments in the government have done studies through CTL projects. There has been even a project considered in -- to be located at Crane Naval Base, sponsored by and supported by the government. It never happened.

Where's the data coming from? The couple of projects that are in the world using this technology aren't using coal as a feedstock. Who's coming up with this data? Not a single coal-to-diesel experimental project anywhere in the United States. We do not want this experiment here.

Mrs. Logan, one of your permit people that studied this permit, at one time had written, "There seems to be something of a cottage industry going into a coal country and announcing a new plant, but nothing seems to get past real world economics and citizens' opposition."

When that didn't work out -- I'm sorry -- the promoters of this facility worked for ten year -- six years to place it in Vermillion County, and you've probably been in contact with them already, previously to them coming here.

Since 2010 to 2016 they tried to get the plant up there. They had 1500 acres optioned, promising 500 jobs and over a three-billion- dollar project. It didn't happen there, so they reduced their size of the project to 2.5 billion dollars, 225 employees, and lo and behold, they found Dale in Spencer County.

With it, it brings to mind the term "carpetbaggers," but in this case, instead of politicians coming into an area, we have out-of-state promoters that are coming out of -- coming into the area with a promise of economic development and jobs. If it doesn't get built here, guess what? They're just going to take the project somewhere else until it sticks somewhere.

To everyone here and in the entire area, this is not the end of the fight against this proposed project. It's just the beginning. IDEM has issued permits before, it's been mentioned, and even extended them. The Leucadia project, it was over a seven-year fight. Ohio Valley Resources, the

fertilizer plant, it wasn't that long, but they did have an extension. But neither of those projects materialized.

We support the comments submitted by the Earth Justice representatives, the Valley Watch representatives, and the Southwest Indiana Citizens for Quality of Life. We have a booming economy here, the tourist industry, attracting over a million visitors a year to this county and surrounding area.

After industrializing the southern entry point of Spencer County, our economic development leaders now want to bring another large industrial facility to the north entry of the county. Is this what we want to welcome our visitors to see? Who's going to accept the blame if existing tourist-related businesses start losing visitors?

This refinery depends on running 24 hours a day, 365 days a year. That means lights all around the facility would be on all night, every night, noise from the operation, rail and truck comings and goings at all times of the day.

This type of facility requires 1.8 million gallons of water per day and needs a wastewater pipeline to discharge the water back into the Ohio River, according to their paperwork. The location is 20 miles from the river and the aquifer. What kind of promise has the state, county and LEDC officials made to Riverview Energy and their backers about getting this done for them?

What are they telling the potential investors about the possible expansion of this facility at this site? They had a larger facility planned in Vermillion. Now it's got 500 acres instead of 15. What is their plan for expanding it? Surely they're telling their investors something about that.

Any slowdown and restart in the production would mean that -- the increase in pollution because of the flares. The production from this facility wouldn't necessarily be just for domestic use; Mr. Merle's told us that. Shipping overseas to other markets is an option. Where's the shortage of diesel fuel, according to the NDUS? There isn't any way we are -- isn't any, because, for my friend, we are exporting oil. We have become an oil exporter.

Anyway, the other final thing, you know that we've got to follow the money also. BP is a company that had this process, the BCC process. They had joined and signed an agreement with KBR to license it to other companies. Are they going to be investors in this plant? Mr. Merle has been overseas trying to get investments. Who was he talked to? What kind of investments are we having from foreign investors?

Thank you very much. I appreciate it.

**IDEM Response to Mr. Chuck Botsko, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

No changes to the draft permit were made as a result of this statement.

<b>Ms. Marsha Cooper, Statements and IDEM Responses</b>
---

**Ms. Marsha Cooper, Statements:**

I am Marsha Cooper, and I live in Dale, right here in Spencer County. I've lived here over 40 years. My husband is a lifelong resident. The only time he wasn't here was four years in the Air Force. And this is the place I call home.

I want to also -- if anybody didn't know it, I do support Citizens for Quality of Life and Earth Justice, and at the top of -- too, before I get started -- I don't have a whole lot to say here, but it's going to be from my heart, but, you know, the top here, it actually -- this paper, this handout, says, "Indiana Department of Environmental Management," it says, "We protect Hoosiers and our environment."

You know, I kept reading that and reading that, and I think -- and I want to thank all of the speakers before me. It's been very insightful, and makes me upset that -- if anything would go forward in this is just -- and I, too, would be looking at this unit, day in and day out. I would be listening to this noise 24/7.

And there's the pollution. I mean it goes for miles away, but it'd be falling down right there in Dale and surrounding within five miles, and then -- okay. What I actually wrote down to say, okay. It says, "The state's environmental agency has determined that the emissions would not exceed any legal limits."

But as it was also stated, Indiana is one of the highest polluted states, causing us to be maxed out in hazardous pollutants already. Any more of this kind of pollution will lead to greater harm to this area in Southwest Indiana, increased ozone and added pollutants to the air, water, farmland, national and state parks, tourism, and religious landmarks in this area. And in turn, suffered by the extra pollutants and smell of rotten eggs at times.

And like different ones have said before, the tourism, it grows by thousands of people daily to this area. We cannot have something coming in here to, like I said, especially, like I said, the smell of rotten eggs. How far -- on a daily basis, depending on the wind, you know, how far can that spread out? It's -- it's scary, it really is.

And two, I am a cancer survivor, matter of fact, my cancer has metastasized, and I will be on chemo the rest of my life. It's -- like I said, there is pollution concerns in this area since we're already maxed out. Please do not permit IDEM to go forward with this.

Thank you.

- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jerry Steckler, Statements and IDEM Responses</b>
--

**Mr. Jerry Steckler, Statement 1:**

Good evening. My name is Jerry Steckler. I own and operate a certified organic grass-fed dairy farm and livestock farm just one mile east of the proposed plant site, where we process our milk into cheese, as well as raise other livestock for meat, all in harmony with the nature.

As a side note, I might add that we have a lot of people come to the farm to buy product to try to regain their health that they've lost, in large part to the pollution that we are forced to live in.

I oppose this plant on many levels, and I'm here tonight in defense of my children, my neighbors, all of mine and my neighbors' livestock, and the environment in which we raise the food that nourishes us and our customers.

In order to run a successful organic farm, we must create an environment in which our plants and animals can thrive and survive. Our livestock faces the same challenges as people do, when forced to endure the pollutants of an industrial world and this plant would bring to us.

The particulate matter from this plant would create the same added conception, fetal development, surviving the birth process, and growth and development challenges described by the doctors. That will be a new reality for the people living in the expansive fallout zone of this proposed plant.

Heat stress on our livestock will increase due to the increased ozone generated to -- due to the admitted release of nitrogen oxide from this proposed plant. This increased heat stress will undoubtedly reduce production of our animals and increase the cost of maintaining animal comfort. As farmers, we can fully expect greater costs and smaller returns if this plant were to go in.

I don't understand the thinking that we need to hurry up and exhaust our coal supplies as soon as possible, so there's none left for our succeeding -- for the succeeding generations to come. This process is not responsible stewardship of nature's resources. The process itself squanders a portion of the energy used just to reform it into diesel, when we already have a plentiful supply, a more easily refinable source of diesel -- or for the diesel.

A standard law of nature is that an organism cannot only -- an organism can only thrive in its ideal environment, and without that environment, it will not survive. We are here asking for your help in maintaining what meager environment we have left here in this area. It has always been my naive belief that IDEM is in a place to manage the biological environment of our state for the betterment of the citizens, not to be swayed by the economical benefit of the elite.

Thank you.

**IDEM Response to Mr. Jerry Steckler, Statement 1:**

<b>Ms. Ann K. Wahl, Statements and IDEM Responses</b>
---

**Ms. Ann K. Wahl, Statements:**

I am from Spencer County. I'm also a female Desert Storm vet. I've been hearing a lot about what H. W. did, Bush did, for Desert Storm, Saudi Arabia in 1991.

I was a female 50 miles from the oil fighters then. I was refueling helicopters. I got jet fuel burns, and I breathed in that air. When I came home, the first thing I had to do was see a nose-throat specialist because I had Zoster and sores in my nose, ears and throat when other people were getting sick, so that all came from that, oil fires.

I support the comments of Southwestern Indiana Citizens for Quality of Life and Earth Justice. I served many of them, taking care of their kids, delivering papers. Marion Hess and I drove all over Indiana playing softball for years in our -- my 20's.

And that's another thing. In this area we have very great sports teams. A lot -- all of my brothers went to college on sports scholarships. The baseball fields and the softball fields are not very nice. The band can't even practice if they can't breathe.

And the V.A. is taking care of my cancer treatment. I'm a breast cancer survivor of six years. This week I've had four CT scans, and last week, four CT scans and a complete bone scan because they were looking for cancer. They didn't find it again, but they were looking for it.

I'm high risk. I was almost in four stage cancer, and the V.A. is taking care -- they've taken care of me in the last six years. I'm seeing more women, I'm seeing women of different ages. They're trying, but they're making up for things they didn't do before. I know that.

I've had no problems with them, but, you know, I want to breathe. I do everything I can to live. They tell me I'm in high risk. They have to remind me of that. So, exercising and breathing and mindfulness and taking care of each other, we are all one.

And I met very nice people in Saudi Arabia. I didn't know much about them, but they were respectful, they looked me in the eye. I met their daughters when we were playing volleyball outside of our little base. There's nice people everywhere, and people don't want to hurt kids.

And some of us are at war and, you know, we just want school money, and we're trying to be peaceful and sending people home and being real about it. And I made it home, so in Spencer County, I live in St. Meinrad, Indiana. I grew up in Dale, Indiana. I just want to breathe. I want to keep breathing.

Thank you

**IDEM Response to Ms. Ann K. Wahl, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Jean Webb, Statements and IDEM Responses</b>
---

**Ms. Jean Webb, Statements:**

I'm Jean Webb, from Evansville, Indiana.

I'm here to ask that the Indiana air monitoring systems be corrected, investigated for corruption, and then appropriately monitored for a baseline of at least three years prior to approving any new polluting industries.

An important new study released September 12th of this year used NASA satellite readings and concluded that EPA has failed to classify 54 counties as nonattainment for fine particulate standards. I've attached the study, and I'll hand it to you after I speak tonight.

Refer to the map on page 25 and you'll see that both Vanderburgh County, where I live, and Spencer County, where this plant is to be built, is shaded as being out of attainment, yet misclassified as attainment due to faulty monitoring.

The study found evidence that suggested that monitors are either not placed or placement is intentionally selected to make NAAQS compliance easier. Additionally, readings may not be continuous, and industries are alerted to when the monitors will or will not be operating.

Satellite data indicates that Spencer County should have a State Implementation Plan, SIP, to reduce particle pollution, not consider building a plant that will increase pollution. The consequence of misclassification is that we will have more premature deaths.

It's not a mystery to me why Indiana has such a high rate of infant and maternal deaths, since Indiana has more misclassified counties than any other state in the nation. 2.8 million Hoosiers live in misclassified counties. As a state, pollution is killing us.

When asked about the study, EPA spokeswoman Molly Block said that the agency officials would be looking closely at the study's data sources, methodologies, definitions and assumptions that -- underlying the study and its conclusion.

Let's hold off on adding more pollution until the monitoring systems are brought into 21st Century technology and become free from manipulation from the fossil fuel interests and their corrupt government lackeys.

Ms. Webb:

P.S., IDEM personnel and other government officials to become whistle blowers for the sake of our children. Don't let the data that is supposed to protect us be manipulated, and instead be used to make it okay to sicken us.

Thank you.

**IDEM Response to Ms. Jean Webb, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source
- IDEM Response to General Statement 6 - Air Monitoring
- IDEM Response to General Statement 9 - Modeling Background Concentrations and Monitoring
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

Regarding infant mortality in Indiana and southwest Indiana, please see the ATSD IDEM Response to Dr. Norma Kreilein Comment 1.

IDEM appreciates the information concerning use of satellite data to determine air quality concentrations in areas with no monitors in a specific location. Despite the research and work conducted for the Sullivan/Krupnick research abstract, this technology is yet unproven to determine concentrations or provide reliable information that meets U.S. EPA standards for monitoring data to be credibly used in designation, state/federal permitting or rulemaking processes. IDEM, OAQ relies on the Clean Air Act and U.S. EPA regulations and guidance to assess the air quality concentrations from ambient air monitors. U.S. EPA continues to work with National Oceanic and Atmospheric Administration (NOAA) and other entities to use satellite imagery and other technologies for analyzing air pollutants in the future.

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jude Koch, Statements and IDEM Responses</b>
---

**Mr. Jude Koch, Statements:**

Hi. I'm Jude Koch. I live in Evansville, Indiana.

I don't want this plant to be built, because it will make climate change worse. The United Nations warns we have 12 years to avoid a climate change catastrophe. Building this plant is the opposite of what we need to do.

I'm ten years old right now. What kind of future I have will depend on you today. Climate change will mean that I will face food shortages, floods, drought, stronger tornados, and diseases from mosquitos and ticks. Please don't build this plant.

Thank you.

**IDEM Response to Mr. Jude Koch, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Mr. Blake Voges, Statements and IDEM Responses</b>
---

**Mr. Blake Voges, Statements:**

My name is Blake Voges. I'm here with my wife, Allison, and our two-year-old is on his way. My wife and I are both fourth-generation residents of Spencer County. I graduated from Purdue University in school technology, and we own our own small business.

As a family striving to give our children the tools to live a long and fulfilling life, oftentimes hoping they do better than ourselves, a large part of that is -- a large part of that equation is quality of life, how we live our lives and how we interact with our surroundings.

I must say that the quality of life has increased in Spencer County since I was a kid. We should always fight for a better future for our children, and that is what I intend to do tonight. I will admit that our air quality has increased greatly since the 2000's. The American Lung Association now gives us an A rating. However, don't be fooled. That only reflects the data from the fine particulate monitor in Dale. We don't have an ozone monitor.

The other metric which the American Lung Association uses to assign ratings -- I'm sorry; let me go back. We don't have an ozone monitor, the other metric which the American Lung Association uses to assign ratings.

The counties around us that have ozone monitors are Perry, Warrick, Vanderburgh, and in Kentucky, Daviess and Hancock. Their ratings paint a different picture: C, D, D, F, C, D, respectively.

This plant will result in more ground-level ozone, leading to more action days, and those are days that our children and elderly should not be outside, should not be exerting themselves, and people like us should not be working hard outside.

In your draft permit for the Riverview Energy coal-to-diesel plant, you can conclude -- you can conclude that no significant impacts are expected from the proposed facility. I would like to talk about HAP's, hazardous air pollutants, pollutants that are known to or are suspected to cause cancer or other serious health effects such as reproductive effects or birth defects.

According to the TRI data from the EPA Web site, Indiana is ranked number one in the nation for all releases of HAP's. Spencer and our surrounding upland counties, Warrick, Daviess and Hancock collectively, place us in the top 3.4 percent of counties in the nation for hazardous air pollutants to air.

Spencer County alone released 228 tons of HAP's. Riverview proposes to emit up to another 3. tons a year [sic]. That is a 14-percent increase in HAP's, hazardous air pollutants released to the air in our county, our air, the air we breathe.

Our air might be better than it was ten years ago, but we need to continue to fight for cleaner air and fewer HAP's. While we and our surrounding counties ranked in the top 50 percent of HAP's released to air, we should not add even another ton of HAP's to our air. Do not approve this permit. I want better air for my son tomorrow, not worse.

**IDEM Response to Mr. Blake Voges, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

- IDEM Response to General Statement 10 - Toxic Release Inventory Data and Ranking for Spencer County
- IDEM Response to General Statement 11 - Regarding Determination that "No significant impacts are expected from the proposed facility"
- IDEM Response to General Statement 12 - Ozone, PM<sub>2.5</sub>, and NO<sub>2</sub> Monitoring

No changes to the draft permit were made as a result of this statement.

<b>Mr. Blanchard, Statements and IDEM Responses</b>
---

**Mr. Blanchard, Statements:**

I am Rock Blanchard and I'm Chickasaw. I'm a Chickasaw citizen residing here in Spencer County. I've lived here 55 years, my whole life, except for the four years that I served our Armed Forces in the United States Army.

My people have many sayings, like [speaking Chickasaw], which means water is life, [speaking Chickasaw], we're all related, we have a relationship to each other, we have a relationship to Mother Earth. We come from the Earth. God created us from Earth. The Earth is our mother, the sky is our father.

When God created man, he reached down upon the Earth and took a handful of dirt and said, "Let there be man." Then he opened his hand and man was created. He held us, man, in his hand. It seems today that we take what so many hold sacred and destroy it, we rip it open, we spit on it. Is that what we want? Is that what we want for our children?

By being related, we have a responsibility. We have a responsibility to each other. Not only are we related to each other, but we are related to all living things: the birds, the fish, even the creepy crawlers. We have a relationship with them, for they, like the coyote, the possum, they eat dead things. The buzzard, he eats the dead things. The coyote, hawk, eagle, they're hunters. They help maintain -- even the wolf, they help maintain a balance upon everything upon the Earth.

That's what we need. We need a balance. If you create this polluter, it's going to make us even more out of balance than we already are. I stand before you with an imbalance, imbalance with my fellow workers over here and my fellow brothers and sisters over here that love the Earth so much.

Chief Joseph once said, "When the last tree is gone, the last fish is dead, only then you'll find out you cannot eat money."

I hold an annual event of the business people every year at the other end of the county, in Rockport, where -- that's the end of the county I grew up in. I was bred, raised there. It's beautiful country. I bring -- people come from Florida, Colorado, Kansas, Ohio, we've had people from West Virginia, people from Michigan.

When they see fodder, the first thing they ask me, "Is that a nuke?" No, it's coal fodder. But yet, you know, as I said, we have a responsibility. The young lady that spoke up here before you, she's a good young lady. She's bright. She has a good heart.

I ask you to look at your hearts. Is your heart good? Is your heart a holy bone, like [speaking Chickasaw], Creator God? I may get something dropped on me tomorrow, but that's beside the point, because I have a responsibility as a human being, a child of God, as we all are, to protect God's creation.

God created our -- let me tell you a little story. A young boy went up on the mountain. He sat down upon a rock one day and he looked down, and there laid a rattlesnake. It startled him, but yet he sat there. The rattlesnake, "Little brother." The young boy looked around, he didn't see nobody.

"Little brother." He looked around again, didn't see nothing.

"Little brother, down here on the ground," because at that time the animals would speak to us. The little boy looked down, and he said, "Little brother, I'm so cold. Please take me down off the mountain."

The little boy said, "No, keo, no. You're a snake. You'll bite me."

The rattlesnake said, "No, no, keo, little brother. I won't bite you. I'll give you my world."

The little boy, brother, "Hmm, I don't know."

The rattlesnake, "Please, please, I'm just so cold and miserable being up here on this cold mountain. Please take me down off the mountain."

So, the young man reached down and picked the rattlesnake up and put him in his shirt and started down off the mountain. He come down off the mountain and started getting warm, and the rattlesnake started getting warm. He started crawling around inside his shirt.

He takes the rattlesnake out and puts him on the ground. The rattlesnake reaches up and bites him on the leg. The little boy, "Oh, rattlesnake, you bit me. Why'd you bite me? You promised you wouldn't bite me."

The rattlesnake, "I'm a rattlesnake, and that's what rattlesnakes do."

**IDEM Response to Mr. Blanchard, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

## Mary Lee Hillenbrand, Statements and IDEM Responses

### Mary Lee Hillenbrand, Statements:

First of all, I want to thank everybody for speaking. I feel I've learned more this evening than I have in all my interest in keeping the environment safe for all of us, but I do appreciate the statistics. I had none. I had my conscience, and that's from where I am speaking.

My name is Mary Lee Hillenbrand, from this tri-state -- tri-county area. I support the comments of Southwestern Indiana Citizens for Quality of Life and Justice for the Earth. In spite of being 82 years old, I still have a few marbles left. I have insights, life experiences, and a memory of the importance of how and when to make decisions that affect people outside of my own world.

I have found that decisions made during emotional highs or lows, in heated arguments, in which little logical thinking is in the mix, and made quickly, put all of the people at risk. My comments are the result of much reflection, wisdom from the past, and remembering the words of Chief Seattle: "We are all part of the web of life. What we do to others, we do to ourselves."

There is no private ownership of the air we breathe and the water we drink, that I know of, unless I have lost the rest of my marbles, or unless there may be an Indiana regulation of which I am not aware. All of us share these life-giving resources. Why, then, are companies permitted to use the air and water on which all of us depend for their own purposes, and without the approval of the majority of us?

In spite of the fact that the Riverview Energy plant will produce minimal pollution, as explained by one of their representatives from Connecticut, where is the data to back this up? I understand that their plants in China and Russia have closed. Regardless of if they have or haven't, why cannot the data be released from those companies to help us, especially since we would be the first in the United States to be their test experiment?

I am questioning why any one of us who may still have the use of logic, marbles or not, would want added air and perhaps water pollution to an already polluted environment here in Southern Indiana.

I am understanding that Riverview will provide many jobs, which may be a quick answer to a need and promote tourism, making us look good, but I'm also reading info saying that the need for jobs is not as urgent here.

I also understand from the research done by physicians, chemists and scientists that in long-term results, air and water pollution present a danger to health, especially to the most vulnerable among us, mainly fetuses, children and the elderly.

What about those who would work in the Riverview plant? Would their health be jeopardized? Would they be spending a hunk of their salary on their own health care? What about our youth, who may be searching for a cleaner and healthier environment in which to settle and raise a family?

There are common-sense quotes I remember from childhood: "An ounce of prevention is worth a pound of cure; haste makes waste." Are we not all endowed with a considerable amount of common-sense and creative energy, too?

Einstein has been quoted as saying, "Most people only use about ten percent of their intelligence." Why not begin now to prove this to be untrue? Why not be attentive to making wise decisions rather than quick ones that we may later regret? Could not all of us use our beautiful minds to work together for a better, cleaner, healthier environment for Southern Indiana, for our country, for the world, for our web of life?

**IDEM Response to Mary Lee Hillenbrand, Statements:**

<b>Ms. Jeana Visel, Statements and IDEM Responses</b>
---

**Ms. Jeana Visel, Statements:**

Hi. I'm Jeana Visel. For religious reasons, I chose to move from another state to live in Southern Indiana, and I have made a life commitment to this community. I now work in Spencer County, just ten minutes drive from Dale

As we all now know, the proposed plant is due to process ungodly quantities of coal each days, pulverizing it to dust and submitting it to intense heat and pressure in order to yield sulfur and the compound needed for diesel.

While I am not a trained scientist, I've read a portion of the permit request and have listened to several doctors, chemists and engineers speak on the nature of the pollution due to be emitted. Their words were not encouraging.

As of 2016, Indiana already emits 133 million pounds of pollution per year, the sixth worst in the nation. Spencer County is already 23rd worst in the nation for emitting toxic chemicals. We are home to multiple super polluters. Why would anyone think it is a good idea to add another?

When I moved to Southern Indiana in 2003, I was surprised by how many people had cancer, or had had it in the past. I looked at American Cancer Society maps and saw that all along the Ohio River cancer rates are higher than elsewhere. I lost first one friend, then another, then another from my community.

At a certain point, I was so disgusted I contacted a number of different university epidemiologists to see if anyone might be willing to do a local study on why we have so much cancer. Eventually a doctor from Indiana University looked into it.

But when I started listing for him all of the different kinds of cancer we have experienced and the different potential sources of pollution that might contribute to it, he gave up. Why try to pinpoint something that is already drowning in carcinogens?

Eventually it was my turn, 11 years after moving here. Though I have no immediate family history of breast cancer, at just age 35 I had my first lumpectomy. While I'm grateful to have survived my own scare, I ask you: Should a choice to live in this part of Indiana mean a death sentence?

I'm concerned that the IDEM standards for air quality are insufficient as things stand. People are already dying from pollution in this state. Children are being born with birth defects. The standards we have are not strict enough, and adding this plant will only make things worse, even if it promises to stay within the current standards.

From a broader view, I cannot understand why some think this proposed plant is a good idea. Our unemployment rate is very low, as baby boomers head into retirement and are replaced by a smaller generation. Coal is being superseded by more sustainable forms of energy, and everyone knows coal will not last forever.

Why invest billions of dollars in a plant that most likely would need to be abandoned as a toxic site within a matter of decades? I cannot imagine this plant operating without using at least some coal mined by means of mountaintop removal, an appropriate that has already proven to poison soil and water and cause sickness among people affected by it.

I have visited these great plans, and they are not beautiful. We must account for the whole environmental impact, including the soil, air and water of West Virginia and Kentucky, as well as that of Indiana. Is there not a more sustainable alternative for economic development which does not potentially poison our Earth and destroy the health of the people?

This proposal seems very short-sighted, aimed at making a few people a lot of money at the long-term expense of many others whom the highest beneficiaries will never see or know. Besides all of this, I am concerned about the economic impact of such a plant, particularly should the emitted sulfur end up in the air. How could it not?

The surrounding counties are comprised of state and national forests and major tourist attractions, as well as several educational institutions. Should the smell of sulfur waft out over the area, these other local economic drivers will suffer. If we could account for the true cost of such pollution to the health, well being and livelihood of citizens, it might not appear to be such a good deal.

In light of the already egregious quantities of pollution in Southern Indiana air, I beg you to review the air quality standards we have, and consider whether a tighter regulation might be proposed and enforced. Consider the whole quantity of pollution being emitted, and refuse the addition of major polluters such as this proposed plant.

Those of us against it do not have billions of dollars with which to defend ourselves, but we do have common sense and a desire for the common good, including the good of those who will come after us.

Thank you.

<b>Ms. Caroline Nellis, Statements and IDEM Responses</b>
---

**Ms. Caroline Nellis, Statements:**

Hi. I'm Caroline Nellis, from Evansville. I used to live in Ferdinand, and my brother was five years at St. Meinrad, so I have a special feeling for this part of the country.

And when I saw the reports that there was going to be -- this plant would spew out 2.2 million tons of carbon dioxide every year, I decided I had to make the trip up from Evansville to speak out, because I care about this part of the country and about the world in general.

You heard that little girl speaking about climate change, and now you're going to hear an old crone speak about climate change. This fall, the Intergovernmental Panel on Climate Change, which is the premier experts on climate the world over, they had gathered to put all of the information they had on what's happening in various parts of the world.

And the report they put out said that global warming is happening much faster than anybody expected, and that we basically have 12 years left to make a change, a radical change, or we're going to be past the tipping point. And there will be catastrophes that will result, and parts of the world will be left uninhabitable.

I think -- you know, we don't look -- we're looking at the immediate. We have got to look a little bit further in the future. Twelve years is not that far. That is certainly maybe not my lifetime, but it's certainly our children and our children's children.

And quite a few of you young people here in this audience will be living in a dozen years, and what's to come after that? If that air quality -- if they put out that many pollutants, that much more carbon dioxide, which is the premier driver of climate change, this carbon dioxide, we should be putting the brakes on every bit of carbon dioxide pollution we possibly can, not adding 2.2 million more out of one plant, two million tons every single year.

You know, they're seeing -- we're not -- we've been blessed here in the Midwest. We have not seen that much of climate change yet. But if you're on the coastlines, they've already started seeing the impacts. My nephew moved away from this area and he went to Bend, Oregon, and he told me that the smoke from the last two years has been so bad that when he's out working in a plumbing job, he said he comes home at night feeling like he smoked a pack of cigarettes. That whole coastline, the air has hardly been -- it's been horrible for people to breathe. A lot of people are walking around with masks.

And you know, one of the other effects of climate change and this carbon dioxide is that it slows storms down, and if you've noticed a lot of storms now, there's a lot larger release of -- they stay longer in an area, and there's deluges, just like when the hurricane hit down in Houston, Texas. There was between 40 to 48 inches of water. It just sat there on them.

When the hurricane hit this year in the Carolinas, it sat there on them and it flooded the whole areas. It's going to -- it's happening here. There was a -- last -- no -- yeah, it was this year, earlier this year up, up in St. Joe, that county up around that area in Northern Indiana, they had floods of historic proportions, the water just -- the storm sat on top of them.

Purdue University is very respected, and Purdue said climate change is happening, it's human caused, and it's going to have some pretty drastic effects. You know, we owe it to the future generations not to just think about money right now, and I know -- I know these young guys want jobs, and I can totally understand it. A lot of good manufacturing has gone overseas, and there are not the jobs that pay well for the middle class that were here when I was young.

But, you know, why can't there be plants put up for making solar panels, for vertical-axis wind turbines.

There are good jobs to be made off of the changes that are coming in our society. This could be a huge industrial boon time, but we've got to stop trying to save the old ways. We've got to start moving towards the new ways and save -- save our planet for the future generations.

I think Pope Francis said in his Papal Encyclical, Laudato si, he said there are two things that are really threatening humankind, and one is climate change and the other is greed, and the two are intertwined.

<b>Mr. Zach Goldman, Statements and IDEM Responses</b>
--

#### **Mr. Zach Goldman, Statements:**

Hi. I'm Zach Goldman. I'm from Birdseye, Indiana, just a few miles up the road.

I want to start by thanking all of the police officers that are here tonight. Thank you for keeping us all safe.

I'm sure you had other things to do than to come and listen to this tonight, but I really appreciate it.

You know, six years ago, I would have been -- possibly been here for the other side of the argument. Most likely I would have been ambivalent about the thing and stayed home and watched Modern Family, but I've got a DVR, so it's not over for me tonight anyway.

But then my nephew was born, and I want to talk about him tonight. He was born six years ago, and he's the coolest kid you could possibly imagine. He -- the other day somebody got hurt on the playground and had to go in, and he saw him getting ready to go back into the classroom, so he decided he wanted to give him a hug so he'd feel better, but he didn't want everybody else to feel bad, so he stood outside the classroom and gave everybody a hug as they walked in.

He always comes up to me and grabs my hat off my head and says, "I'm Uncle Zach. Howdy, howdy, howdy." He gets this from Toy Story. He is just, as I said before, the coolest little kid, and, you know, we love him to death, but he has autism, and his autism isn't very severe, but it is enough to, you know, change the course of his life. And as Dr. Kreilein pointed out, there's a correlation between autism hot spots and air pollution.

He's -- I'm trying not to use his name. I told his mother I wouldn't use his name tonight, so if you -- if I have some stalling in what I'm talking -- or in my speech, it's because I'm trying not to refer to him by name. But he is absolutely wonderful, and I know his parents wouldn't change anything about him if they could, but if they could flip a switch and make him healthy and make sure he knew that he would live a normal life, I'm sure they would flip that switch.

And that's the irony of it is that it's the flip of a switch that -- it could be the flip of a switch to get him into this situation, flipping on power plants, flipping on your light switches in your homes, not that you shouldn't have light in your homes, not that we shouldn't have power plants, but do we need them to the extent that we have them now, especially with all of the new technology that we have?

When you tell me that I live in a sacrificial zone, that irritates me, but I sacrifice my own lungs. I -- as it was pointed out to me a little bit ago, I vape, which is probably worse for me than anything that would come out of the plant down here. But when you tell me that my son, my nieces and my nephews live in sacrifice zones, that straight-up pisses me off.

So, think about it, and if you would, do not approve this plant from coming in. Thank you.

**IDEM Response to Mr. Zach Goldman, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Ms. Janice Schrader, Statements and IDEM Responses</b>
---

**Ms. Janice Schrader, Statements:**

Hello. I live in Newburgh, on the Ohio River.

I understand that the main focus of this hearing is air emissions, but it's also about permission to build this facility. I oppose the construction of this facility for many reasons, including the resulting air pollution and hazardous material storage, handling and production.

But my comments today relate to water. I am concerned about the water usage, 1.8 million gallons per day from the Ohio River, and discharging wastewater into Pigeon Creek or the Ohio River, a drinking source for millions of people.

Before construction is approved, I would like to see more information on the impact on the Ohio; specifically, how is the Ohio River, including its aquatic life, how will it be impacted by withdrawing 1.8 million gallons per day?

What pollutant will be discharge, in what quantity, and are any of them considered toxic? What is the compliance history of Riverview Energy Company and parent companies with existing or previous permits? And who will be paying for the construction of the pipelines related to this permit?

Thank you.

**IDEM Response to Ms. Janice Schrader, Statements:**

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

IDEM OAQ was not able to locate any compliance history information for Riverview Energy Company and parent companies with existing or previous permits.

No changes to the draft permit were made as a result of this statement.

<b>Niles Rosenquist, Statements and IDEM Responses</b>
--

**Niles Rosenquist, Statements:**

Thank you for this opportunity to speak. I'll try to be brief. My name's Niles Rosenquist. I'm a resident of Evansville, the Chair of the local Sierra Club group, and I'm speaking on behalf of that group tonight. Our group's territory within the Sierra Club includes ten counties in Southwest Indiana, including Spencer County.

This coal-to-diesel plant is inappropriate on a number of different levels. For Spencer County, it is clear from other comments this evening that a great number of residents find it entirely incompatible with the lifestyle they've chosen for themselves and their children. They do not want a massive industrial facility built in the middle of their community, a facility that will emit toxic chemicals, sulfur odors and flared gases, and that will be served by hundreds of open coal rail cars.

Spencer County is known best regionally for its tourism destinations and natural areas. One resident has been quoted in the newspaper, "It makes me sad to think that the first impression people will have of the county will be this huge plant with flares and hundred-foot stacks of coal."

For Evansville and the rest of Southwest Indiana, this plant will add to the already poor regional air quality. Four of the nation's 22 super polluters, as defined by air emissions of toxic chemicals and carbon dioxide, surround Evansville. One national media report has characterized Southwest Indiana as an environmental sacrifice zone.

Clearly, for the well being of residents and to enhance the reputation of this region, and in order to retain and attract the people and businesses that will contribute to healthy future regional economic and job growth, we need to aggressively move forward, not -- certainly not backward, on efforts to create a healthy future environment for the region.

Nationally, this plant is tech -- this plant and its technology are simply backward looking. Decades ago there was concern with automation and dependence on foreign oil, and plants such as this one were projected by some as a solution to the problem. Presently, the United States has grown to be the world's largest producer of petroleum.

There is simply no need in 2018 for construction of this technically and economically dubious plant using untested technology with pipe that has never been built in the United States or any

other country with high environmental standards. IDEM does not even know important specific details of the plant design and plant operation.

Most importantly, looking forward, it's clear that our nation is rapidly moving away from its dependence on fossil fuels. Specifically, future demand for petroleum products, as the price of oil and demand for oil is highly uncertain due to improved fuel efficiency, environmental concerns, electric and hybrid vehicles, mass transit, and the growth of all sorts of novel and efficient transportation modes. It's highly uncertain, therefore, what the economic viability of this plant would be.

Our only viable energy for our nation will be based on sustainable energy. Some regions of the country have already moved rapidly toward solar and wind, and have clearly demonstrated their feasibility. With reducing costs and technological improvements for wind and solar, and recognition of the costs and environmental burdens of burning fossil fuel, it will only be a matter of time until the rest of the nation catches up.

Finally, just for the kind of technical detail and critical analysis of the permit application, we endorse the comments, detailed comments, of Earth Justice.

<b>Mr. Bart Heath, Statements and IDEM Responses</b>
--

#### **Mr. Bart Heath, Statements:**

Hi. My name is Bart Heath. I'm from Newburgh, and I'm kind of torn here, because I'm a retired construction worker, a union construction worker, so I know what you guys are going through. You're looking for jobs. I've gone county to county, state to state, moved here to Indiana, halfway across the country even, chasing work.

But I'm also part of the environmental community, because we just can't keep taking the beating that we're taking here with our atmosphere. And some people have talked about the water, and I believe that the water is an issue that hasn't really been addressed enough.

All of the elements in burning coal, coal is a compound, so if you break it down, it comes to its elements. You can't destroy elements. This company is saying that everything's going to be fine, you know, there's not going to be any pollution, that it's all -- it's all good. Well, where are those elements going, like arsenic, lead, mercury? They're going somewhere. They don't just disappear. They don't have a magic wand to make them go away.

So, I find that a lot of what they're saying to be ridiculous, and I don't need a science degree to tell me that. Logic is there. We can't -- you can't tell me that the water is going to be clean, it's going to come out crystal clean.

They tout that this person with a Nobel Prize is -- his prize-winning glory of a process is so wonderful. Well, let's see. I know the name Madam Curie. She did something with radiation or x-rays. Her work is still -- still pertinent today. Marconi, he invented the wireless. Well, the wireless was immediately adopted, and Madam Curie's work.

Does anybody know the name of this guy? He invented this stuff in 1931, and it's been tried in four or five places throughout the country, so what's the problem? There's something wrong. So, I think that this is -- this needs a whole lot more work.

And John forgot to mention that there was a coal gasification plant that they were going to put in in Basket, Kentucky, I think it was back in the '80's, and that plant -- I was praying for that plant, because I was out of work. I was near to losing my house. And it would have been real nice to have that job, but I'm really glad that it went away, and I'll tell you why it went away, because oil prices went down, so when the oil prices went down, that process was no longer feasible.

If the oil prices go down and they start building this plant, they've got private money in it. Guess what they're going to want to happen. They're going to want you, all of you, all of us, they're going to want all of us on the hook with them to pay for that plant, to get it operational, even though it may not ever operate.

So, I think that what we're doing here is we're fighting for scraps. They're sending plants down here that they don't want anywhere else in the state. The good jobs, they'll keep them all up north, you know, the green jobs. Well, what I want for us is I want green jobs. I want jobs. I want jobs that'll keep you working, keep your kids working, keep your kids healthy, keep you healthy. And the problem is, is that they keep bringing stuff like this and presenting it, and then they've got you begging for scraps. I don't want you begging for scraps. I want you demanding steak.

I want you to I want you to not just jump at the first offer. I was going to the senior prom. I asked a girl to the prom and she turned me down, so the next girl, I asked her. Well, she knew I asked the first girl, so what do you think?

You keep begging and you get nothing. So, I think -- I think that -- I think that you can hold out for better and keep them from just throwing these things out at you, and that when that happens and they start bringing the jobs down here, the green jobs, the good jobs for you, that we won't be sitting here with white hats and yellow shirts. We will be -- sitting here, all of us wearing white hats and all of us wearing yellow shirts, and instead of telling these people how we're embarrassed of them, we'll be telling them that we're proud of them.

So, I love you all. I hope you're working, but I think we need to push this one to the rear and tell them, you know, "You bring us something worthwhile."

Thank you very much, and I wish the other guys had stayed, because I would like to talk to all of the other guys and girls in labor and tell them.

I'm going down to -- I go to the -- Evansville, to the City Council meeting. I've been going down there for months. I get to talk for about three minutes at a time, and I tell them that what we need are green jobs, we need a clean environment.

And instead of being here begging for a job like this, I feel like all of us need to be down there at the city, at the county, wherever the jobs are being grown, and tell them we want the good stuff. Come with me. We'll do that, and we'll go for the good stuff instead of begging for the scraps.

### **IDEM Response to Mr. Bart Heath, Statements:**

The proposed permit contains all health-based and technology-based standards established by the U.S. EPA and the Indiana Environmental Rules Board, which will limit the amount of emissions from the facility to the very lowest level allowed by law. In addition, IDEM, OAQ performed an air quality analysis for this proposed facility that concluded that the proposed facility will not pose a threat to public health or the environment (see Appendix C to this ATSD for the revised air quality analysis in its entirety).

Inorganic hazardous air pollutants (HAPs) emissions (antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, nickel, selenium) from this proposed facility would primarily be associated with the particulate matter emissions that are emitted from the coal handling operations, each controlled by baghouse controls. The baghouse controls will control the particulate matter emissions, as well as, the inorganic HAP emissions. Section D.1 of the proposed permit contains the applicable particulate matter (PM/PM10/PM2.5) limitations and standards for the coal handling operations and contains all applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis. Emission of particulate matter and inorganic HAPs after baghouse controls would be emitted to the atmosphere.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Aime Smiley, Statements and IDEM Responses</b>
---

### **Ms. Aime Smiley, Statements:**

Thank you so much for being here.

I'd also like to say that I want to support all of these union workers as well, and you all deserve the best what you can get. You should have a great paying job that keeps you healthy and your family healthy, and I will stand with you any day to help you get that job, because we are --

I'm not on any side here tonight. We are one community together, and we all want the same thing, and we all deserve the same thing. We deserve good jobs, we deserve clean air, clean water, and good soil for our farmers, who are trying to make a good, decent living right here in Southern Indiana.

And I'm so proud to be a part of this community, and I want to thank all of you for showing up tonight to just give your voice and to share your heart, because this matters so much. This matters so much.

You have people's lives in your hands, and I know you know that, on a daily basis, and I believe that you take that very seriously, and I want to thank you for your heart, and your kindness, and for your sole. Thank you for being people of integrity, for great respect, and for caring for our community. Thank you.

And I know, because you're smart and you study these things with the environment and the pollution, you know this factory's going to bring cancer to our community, going to bring leukemia, it's going to destroy our water. It's like shooting a shotgun of pollution bullets up in the air and seeing where they drop. And it's going to kill some people, and it's going to disfigure babies and kill them while they're in their mothers' wombs. It's going to kill old people sooner than they should leave.

I really pray that you look into your heart and your soul, and you know you want to live a good life of integrity, and you care about your kids and your family. Please consider us your family. Please consider us your family, because we are, and we matter.

So, when you consider this permit, please, I know there's no real information or data on this, and you know that, too, so you're kind of guessing from your highest intelligence and experience, and I'm trusting, we're all trusting, that you're operating from integrity and not from any kind of greed or influence or outside influence.

You have our lives in your hands, and not just ours, but our children's, and their children's. And not even just the children's; you have our trees and our streams and our deer. You have everything in your hands, and we pray that you treat it with the same care that you treat your own environment and your own home.

Now, you know very well that climate change is a reality and it's upon us now, and this is exactly the last thing we should be doing, and you know as well that we are America and we're innovators, and we should not be following and being Guinea pigs of China and Russia technology.

We should be leading in green technology, and we have the ability to do that. All we have to do is hold the vision. As a community, we have to demand it and hold the vision, so that we can create these jobs and this future, a real future, because the truth is: Coal is going away, y'all. They're already -- they're taking out investment.

Ireland has turned away from fossil fuels, the entire country has turned away. Universities, states, governments, they're all saying, "No more fossil fuels," because they realize the circumstance that we're in. This is a dead past that we have to move away from.

But together, we can create a future of jobs that are good for everyone, where you can profit and feel good about your life and your jobs, and we can feel good about our community, where there are no sides, and we all move forward together for the benefit of us all and the future generations.

Thank you all so much. I love you.

**IDEM Response to Ms. Aime Smiley, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

<b>Ms. Renee Ananda, Statements and IDEM Responses</b>
--

**Ms. Renee Ananda, Statements:**

A lot of people here tonight have been sharing critical facts about the dangers to the health of individuals and our environment if this plant is allowed.

I want to amplify all of those concerns by speaking to your hearts tonight, to your hearts tonight, to this community, to surrounding communities, to my neighbors here tonight, because you're all my neighbors, every single one of you, and I care about every single one of you. And to leaders here tonight, who we depend on to protect us.

I'm a daddy's girl, and I lost my dad last year. I lost him to acute myeloid leukemia, as a result of exposure to benzene. My heart is broken. I miss my dad so much. He was only 71 years old, and his name was Steve. I called him "Poppy."

You may think, "That's just personal to her," and it is, and it should be to you, too, because this proposed -- proposed plant is going to release toxic carcinogens like benzene and other toxins and pollutants, placing you and your loved ones at risk of disease and loss of life, as me and my family have had to experience this past year. It's been hard.

You may cite that this plant is not going to have a significant impact. I'm surviving right now from the significant impact of losing my dad to exposure from benzene. I can't get my dad back. I couldn't save him from leukemia, because we weren't aware that his exposure was making him sick until it was too late.

In this case, with this coal-to-diesel plant, we're aware of the dangers of carcinogens and pollutants which will cause disease and death, and we can save you and your loved ones by stopping this proposed plant from being built.

My dad raised me to believe in our Creator and to honor this creation. My dad raised me to believe in "do unto others." I want you to think right now of the person or persons that you love the most. Everyone in this room loves someone deeply with all their heart, and I want to know what financial gain is worth the personal loss of life for you.

You're aware that if you support this, you would be putting your loved ones at risk. Is there any financial gain that is worth more, any financial gain that is worth more than those you love? What

is your price? I'm going to tell you something: My dad was priceless. There was no amount of money, personally or for the entire economy, that would be worth my dad's life.

What is worth more than preserving and protecting those you love? Think about it. Feel it. You still have time to save them. What if knowing what you know right now, what if knowing what you heard tonight could save somebody you've already lost, someone that you loved, or someone that you love that you haven't lost? There's still time. I can't get my dad back, but you can save the ones you love.

My dad was diagnosed with acute myeloid leukemia on December 18th, and that anniversary is coming up, and we lost him on January 13th. He passed away that quickly. My dad was a successful businessman, and his career was very important to him, but in his last few days in the hospital, you know, all he cared about was who he loved and how he loved.

Ultimately that's all that is going to matter to each and every one of you here. So, choosing what is eternal, which is love, and not a job or the economy that you will leave behind when you leave this life, is what matters most. As someone who's experienced the personal loss of my daddy, I encourage you to choose what will be lasting and eternal. You're my neighbor. We belong to each other. We are family. We're human family.

To our leaders here tonight, we count on you to serve us by protecting us. Please listen to the hearts of everyone here tonight that has reached out to you, please. Please listen to the dangers and risks to the health of our environment and individuals from what is released from this plant.

Please preserve our environment that we love so much. Please protect us and help us protect our families that we love so deeply. Please hear my heart. Please hear the hearts of everyone here tonight in this community, and refuse to allow this plant to be built. Please protect us and deny this permit.

Thank you.

**IDEM Response to Ms. Renee Ananda, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Ms. Kimberly Baker, Statements and IDEM Responses</b>
--

**Ms. Kimberly Baker, Statements:**

Good evening. Thank you for being here with us tonight, and for extending the conversation so that everyone has a chance to participate. I am Kimberly Baker. I'm a resident of North Spencer County. My home is about ten miles downwind from the proposed plant.

As I listen to all of the comments tonight, all of the stories, all of the statistics, I keep thinking, "Well, what more do I have to contribute to this conversation?" So, maybe a brief simple story would help to illustrate some of what we've been hearing tonight.

I was dumbfounded when I learned that Spencer County ranks 23rd among all U.S. counties in terms of the amount of toxic chemicals released into the air, land and water. Twenty-third? Our county, 23rd in the whole entire nation?

First, I was shocked because I looked around and I thought, "How could such a beautiful area, a rural area of Southwest Indiana, produce that much pollution." And second, I was stunned because I thought, "I think I now understand why I have so many respiratory illnesses since I moved here in 2012."

So, here's just a tiny, brief glimpse at one life behind the statistics. Before moving to Southwest Indiana, I usually would get maybe one mild cold a year, hardly anything to even think about; rarely took any kind of medicine. Every few years, like maybe every five, seven, ten years, maybe I'll have a little more intense cold. I used to joke that I could make one box of Kleenex last a year. That includes the four years I lived outside of Pittsburgh, in a town that had a steel mill. I just kind of took it for granted.

Since moving here, I generally have at least two colds a year, sometimes three, and it's not just that I have colds, they're more intense, and they linger. I'll have a lingering cough for a couple of weeks after my two-week cold, and I carry cough drops with me all year, because I frequently think, "Is there something tickling in my throat? Am I going to start coughing?" And in fact, tonight -- I haven't had my cold for the fall yet, but I've already used two cough drops just while I've been in this meeting tonight.

Well, the past two years my colds have gotten worse, and in the past two years I've had more severe respiratory infections, still nothing compared to some of the stories others have been telling, but for someone who can make a box of Kleenex last a year, this was huge. So, the past two years I've had more intense respiratory infections that have been intense and have lasted for two weeks, and then I've had lingering symptoms for a couple more weeks after that.

And I think the Kleenex count says it all. During these two weeks of the past few years when I've had these intense colds, I would use one and a half boxes of Kleenex over the course of two weeks, and then that doesn't count, you know, the lingering symptoms. And when I started realizing how much I was buying Kleenex, I thought, "What happened to the girl that used to be able to make a box last for a year?" Now when I'm sick, one and a half boxes over the course of two weeks. And so, I had to come up with a new joke, and so, my new joke is that CVS has become a second home to me, and that I could find the Robitussin aisle with my eyes closed because I've spent so much time in it.

And what really shocked me was my new friends and neighbors in the area, they were surprised that I thought it was odd that I would need as much Kleenex as I do, and that I would take as much Robitussin as I do, and that I drink as much hot tea as I do, and that I -- they take this for granted that that's normal, whereas that's the total opposite of what my normal had been.

And apparently it's not just me. I think of two new friends that I have who moved to the area this year. One of my new friends, from the time she first arrived for her job interview, started sniffing, and I can remember, she said, "I don't know what's wrong. I guess I have an allergy or something." She went back home, she got the job, she moved here, and pretty much the whole time she's been here she's been sniffing, and she keeps saying, "I think I have some kind of allergy."

She went away for Thanksgiving, was gone for a whole week. When she came back, she said, "You know, the strangest thing: When I was away, I didn't feel sick at all, but as soon as I got back, that allergy came back." I didn't have the heart to connect the dots for her yet, because I felt, "She's still new and I hope she stays."

"But then just a few days ago, as I was thinking, "What would I want to say if I had a chance to speak at this meeting?" I was talking to another person who moved to the area just a few months ago, and he said, "You know, the strangest thing: I had like a little bit of a cold, and I got better, but every now and then I feel like something is tickling in my throat."

And I thought, "Here we go. Here's the next newcomer who's like, 'There's something weird that's happening with me.'" And again I didn't connect the dots for him, but I thought, "I want to bring that story here tonight."

I can't prove that it has anything to do with the air quality here. It just strikes me as quite a coincidence that as we move here from other places, people with strong immune systems moving here are now going, "Why do I keep getting colds? Why do I keep coughing? Why do I need cough drops all of the time?" It makes me nervous.

And then I think about, "What about those who are more vulnerable, certainly the young, children, the elderly, people who do have compromised immune systems for different reasons? What are they experiencing?" So, as I think about that, and then I look at the statistics, "Wow, we're the 23rd in the U.S. for releasing toxic chemicals."

Even if this new plant is able to meet the federal standards, can we afford even one more ton of pollutants, let alone 750 tons of pollutants every year, not counting the carbon dioxide?

So, I hope that you'll keep us in mind, keep our coughs and sneezes in mind, and then certainly those with asthma, COPD, and the other types of respiratory illnesses. Keep us in mind as you make your decision, and maybe you'll think about that Kleenex box and think, "How many Kleenex are we going through in Spencer County, and what might that say about our current air quality, and what can we do about it?"

So, thank you very much for your time, and for your work on behalf of the people in Indiana.

<b>Ms. Allison Voges, Statements and IDEM Responses</b>
---

#### **Ms. Allison Voges, Statements:**

Thank you. I actually do have a cold right now. Thank you for being here this evening. I know we've all been here for four hours now, and I know that's a long time to sit and listen to but I appreciate you taking the time, and I hope you actually do listen to what we have to say.

I grew up in Spencer County. My parents, my grandparents, my great-grandparents all grew up here. And while I love to travel and explore the world, this is where I planted my roots and expected to raise my family. I'm sorry.

But the ease in which this permit has been accepted while we already struggle with failing air quality, and while Indiana is ranked 48th in the nation by the U.S. News and World Report for quality of life, it's made me second-guess myself.

How can I send my son, who's also in this audience and has been here for four hours, how can I send him to an elementary school less than a mile from where this facility, which produces tons of hazardous chemicals each day, is going to be?

How can I expect him to want to grow up in a place with half a dozen super pollutants so close? Why would he want to live someplace that may end up smelling like rotten eggs? Do you honestly think people are going to want to move here, with even more facilities like this one?

I remember looking at colleges with my -- with two of my best friends my senior year here at high school, and we -- you know, I looked at Ball State, ISU, USI, et cetera, but those areas just seemed so dirty, and I ended up going to Western Kentucky University mainly because they looked polluted, and they weren't places I wanted to spend any time.

Those two friends I looked at those colleges with, one ended up doing chemo with my grandfather, and the other passed away with a stroke.

I'm not a scientist. I'm not one of these doctors here who are dealing with our children every day, who are telling you that there's a correlation. I can see it. I've been seeing it in the sky since I was in high school. You can see the brown streaks across the sky. But the facts are also there, and maybe you haven't seen those brown streaks, and maybe you don't believe me, but Spencer County is ranked 23rd out of 3,142 counties in the USA for total toxins released.

And many of our doctors have shared this evening, in fact, about the impact that this is having on our health, the health of our children, and the unborn. Pollution plays a role in things such as diabetes, asthma, cancer, infertility, premature death, respiratory disease, autism, stroke, multiple sclerosis, and the list goes on and on.

We can't control what you do, but you keep approving companies like Riverview who will do more harm than good, so who exactly is it that you're protecting? The IDEM Web site states that "We protect Hoosiers and our environment," but we are ranked sixth in the U.S. for total counts -- sorry -- total counts of toxic chemicals released in the environment, and according to Riverview's air permit application, they can emit millions of tons more into the atmosphere each year. And we haven't even begun to speak of what they claim to do with our water supply.

It takes a truly concerned group of people to stand up for a cause like this and come out and speak out. I have friends that -- I'm not against the union workers and the boilermakers. I have plenty of friends who work in the coal industry. I want us all to be successful, I want us all to have jobs, and I want my son to have a future and be happy and healthy here.

So, please do what you promised and protect us Hoosiers and our environment. Thanks.

**IDEM Response to Ms. Allison Voges, Statements:**

### **Dr. Erin Marchand, Statements and IDEM Responses**

#### **Dr. Erin Marchand, Statements:**

So, my name is Erin Marchand. I'm a resident of Dale. I'm a family physician, and I practice in the nearby Town of Santa Claus. As a physician, I'm well versed in the concept of risk versus benefits, as I'm sure you are as well.

Oftentimes, to help a patient, we have to take on certain risks. Certainly anyone who's experienced a side effect from a medication, the complication from a surgery, or the ravaging effects of chemotherapy can attest to the fact that often, in the quest to do good, we do harm.

So, in terms of risks and benefits, this plant has claimed that it will provide over 2,000 construction jobs and 212 long-term jobs. They talk about progress, and see pollution as a necessary harm, when according to the EPA's Web site, and I quote, for more than 45 years the Clean Air Act has cut pollution as the U.S. economy has grown. We do not have to accept harmful pollution along with progress.

In terms of risk, they claim that the health effects would be minimal. I would like to offer a counterargument to that. According to the American Lung Association's State of the Air 2018, Spencer County has 9,197 residents who are most at risk from the effects of air pollution. That's 44 and a half percent, like that's -- of our county. That's almost half our county.

These are people living in our county who have asthma, COPD, lung cancer, cardiovascular disease, diabetes, and those who live in poverty, because they are especially at risk. This group of people, this nearly 45 percent, are especially sensitive to the effects of pollution, not just long-term, but on a day-to-day basis, and they are sensitive to the effects of pollution even at levels considered safe.

To keep within the time limit, I just want to talk about one air pollutant: Particulate matter 2.5. The EPA considers an average yearly exposure of 12 micrograms per meter squared to be safe. Well, in 2012, Dale had an average level of 10.9. That's just 1.1 below the threshold considered safe. How much more will this plant contribute to that particular matter? How much closer are we going to get to that threshold?

Research is showing that even at levels considered safe by current EPA standards, harm can still occur. In fact, on days when the particulate matter increases by ten, even within safe limits, there's an eight-percent increase in hospitalizations for respiratory and cardiovascular health.

Long-term effects of children who grow up in an area of higher particulate matter show that they have smaller lungs, lower lung function, and higher incidence of asthma. Perhaps even more telling is that when these children move away from pollution, their lungs improve, but for those who remain in polluted areas, they continue to show decreased lung growth and function into adulthood.

Pregnant women who live in areas of higher pollution have increased risk of premature birth and low-birthweight babies, but when those pollution -- those polluting industries are shut down, their risk of premature birth and low birthweight go down. The babies get healthier and the women get healthier.

These are real facts based on real research, and so, the comment earlier that other things like prenatal exposure to illicit drugs can cause health effects, that's true, but these studies control for this. They take into consideration all of the other effects going on and they single out pollution as they look, "Is pollution the cause? Is pollution what's harming these kids?" And it is.

So, in speaking earlier about risk population, they gave you the number of people in Spencer County who are at risk. When you consider our neighboring counties of Dubois, Warrick and Perry, the total jumps to 49,970 vulnerable people. That's 42 percent of the population. That's almost 50,000 people.

So, according to your mission statement, your "...mission is to implement federal and state regulations to protect human health and the environment while allowing the environmentally sound operations of industrial, agricultural commercial and government activities vital to a prosperous economy." I urge you to consider the risks and benefits. Is the benefit of 2,000 construction jobs and 212 long-term jobs worth the risk of harming, at a minimum, 50,000 people?

I know that numbers can get a bit obscure, and statistics and graphs and charts are very impersonal, but please remember that when you talk about cancer risk and health risk, you're talking about real people, our children, my children, our grandparents, our neighbors, our friends, my patients, and fellow Hoosiers.

Please remember that these statistics, these numbers, although they're within the limit considered safe, the EPA has changed that threshold three times since 1997, so levels that once were considered safe are not safe.

And even though you may say, "We're doing it within the letter of the law," if that level is not safe, you will still harm people. Three times since 1997 they've lowered that level. That's for particulate matter only. They've lowered the levels for other things as well. So, please just remember that these numbers, these statistics, these are real people. These are us.

#### **IDEM Response to Dr. Erin Marchand, Statements:**

The American Lung Association (ALA) report, The State of the Air 2018, is inaccurate. The ALA has established their own grading system which is not consistent with the National Ambient Air Quality Standards (NAAQS) established by the U.S. EPA. Based upon the NAAQS, Spencer County is meeting the annual PM2.5 standard.

EPA's NAAQS are established to provide an adequate margin of safety for sensitive populations. In their studies they look at children pregnant mothers and the elderly. The standards that they establish take these people into account.

Most EPA standards, such as PM2.5, are a three year average. The latest three years average PM2.5 for Spencer County is 8.4 micrograms per cubic meter, which is well below the standard of 12.0. The air quality modeling which was done adds the impact of the Riverview facility to the existing air quality to arrive at a total impact.

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 2 - Particulate Matter
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Mr. Thomas Brown, Statements and IDEM Responses</b>
--

**Mr. Thomas Brown, Statements:**

Good afternoon. My name is Tom Brown, Spencer County Commissioner here in Spencer County. A couple of weeks ago, the Commissioners took action and passed a resolution in favor of the Riverview Energy project. You should have received that resolution.

I sort of felt like I was switching between CNN and Fox News tonight, you know, just kind of going back and forth. There's been a lot of opinions, a lot of things said, and what I'd challenge IDEM with is, while everybody has an opinion -- and I don't think any of us want pollution that would harm people -- your responsibility is going to be to make sure that this permit that you have reviewed meets the letter of the law.

I understand the opponents want stricter regulations, and I suppose that could be done through the legislature, but whatever regulations we have, we expect you to make sure that if this permit is -- meets those requirements, we expect you to pass that.

And so, I trust you. I know a lot of folks don't. You took a lot of heat tonight. I appreciate you sitting there and taking it. Politicians we take it all of the time. But, the truth of the matter is you have a job to do. We're trusting you to do that job, and do it within the limits of the law.

And so, for that cause, I just want to let you know I do trust your decision. I know that you'll do your best, and we expect and encourage a positive outcome, and ask for your support of this air permit.

Thank you.

**IDEM Response to Mr. Thomas Brown, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

**Mr. Andrew Vest, Statements and IDEM Responses**

**Mr. Andrew Vest, Statements:**

Hello. My name is Lloyd Vest. I'm a senior from the University of Southern Indiana. I'm graduating this December. While I probably should be spending my time writing papers, studying for finals, or job searching, I decided to come here tonight because this issue is very important to me.

I came here tonight to openly oppose this proposed coal-to-diesel plant. This plant will be harmful both to the environment and to the humans living near it. There's a tiny minority of people who will benefit from this coal-to-diesel plant; namely, the owners and those who work for them. Everyone else living and breathing in this region will be harmed if this diesel plant gets constructed.

Renewable energy is not only viable in Indiana, it's the right economic choice. NIPSCO, the Northern Indiana Public Service Company, a utility company, did an in-depth feasibility analysis on what is the best way to generate power for their utility company just this year, and they came to the conclusion that renewable energy is the best economic choice for them, or in other words, renewable energy is the cheapest way to generate energy in modern times.

Now, I know this proposed plant isn't designed to generate electricity; rather, it's designed to generate diesel. But relying on fossil fuels to generate any form of energy will cause more harm than good to the residents in the area.

I realize this plant would bring jobs and money into the community, but it will also bring pollution and medical bills with it. The negative health implications of this plant dramatically outweigh the economic benefits. The people in this area of the country already breathe some of the dirtiest air known to man, and approving this plant will just make it worse.

Only those who benefit economically should be in support of this plant. Those who benefit economically and live near the plant will still face the negative health effects. There are untaxed negative externalities that are not being factored into the cost of this plant, and the lower and middle class families will bear the biggest burden of these externalities.

This area of the country is already a brain drain due to the high amounts of pollution and political corruption. If you want educated young people to leave this region, I recommend you pass this permit. Right now, as we speak, a Green New Deal is being created, similar to the New Deal FDR passed close to a century ago.

This Green New Deal will help solidify the death of the fossil fuel industry and the birth of a thriving renewable energy -- a thriving renewable energy industry. If this Green New Deal is passed, green jobs will be created en masse. We will no longer need fossil-fuel jobs to pay our bills.

This is a pivotal moment in history. You can either approve this permit and be remembered infamously, or you can do the right thing and deny this permit and be remembered famously.

I would also like to speak to what the last gentleman who was just up here speaking mentioned. This permit may be to the letter of the law, but when the law is corrupt, we should not and ought not follow that law.

Thank you for your time.

**IDEM Response to Mr. Andrew Vest, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Ms. Lyn Stoll, Statements and IDEM Responses</b>
---

**Ms. Lyn Stoll, Statements:**

I actually am a professional advocate, so I study right and wrong for a living, and one of the things that our businesses look at is what's fair, and I don't think that putting this plant here is going to be fair.

The philosopher Kristin Schrader-Frechette, who is at the University of Notre Dame, she says when we're making policy decisions, we should follow the principle of prima facie political equality. The idea here is that when you're looking at distributing benefits and burdens, they should be distributed fairly.

Spencer County already is bearing way too much of a burden. They have the highest -- right here in Southern Indiana in general, we have the highest concentration of super-polluting coal-burning power plants in the entire nation, and Spencer County is one of the hardest hit already by air pollution.

Southwest Indiana, as others have noted, has been called a sacrifice zone. In fact, adding more pollution to this place is the equivalent of kicking a dog while they're down. They have already borne far too high of a burden. The people here have suffered too much.

This permit will allow over 60 tons of pollution, including benzene, particulate matters, carbon dioxide, sulfur dioxide, VOC's and more. Particulate matter has already -- globally, seven million people die every single year due to exposure to particulate matter. Do we want more people here to be counted among their number?

In terms of the greenhouse gas emissions, there's going to be a carbon dioxide equivalent of 2,277,884 tons each year. The rest of the world is thinking about cutting back, and we're doubling down on dated technology?

Particulates decrease lung function. They can even cause premature death for those with heart or lung disease. Sulfur dioxide causes breathing and health problems. Nitrous oxide causes respiratory problems. People here will literally not be able to breathe air that will allow them to be healthy.

However we define right and wrong, we have not, we are not meeting our collective moral obligation to leave our children a world as livable as the one our parents and grandparents left for us.

As has been noted before, the Intergovernmental Panel on Climate Change has said we have, at most, 12 years to cut these greenhouse gas emissions, and we're going to emit even more? It just doesn't make sense.

If we don't cut emissions, millions more people will face greater food insecurity. While the rest of the world is moving forward to cut emissions, here we're planning on going backwards. Indiana should be moving towards the future, not doubling down on a toxic past that probably won't even help us in the long run anyway.

Climate change means that 250,000 more people will die each year due to its impacts, according to the World Health Organization. To stay within that 1.5 degree Celsius total warming from human emissions, they will have to drop 55 percent by 2030, and here, you want to approve, again, the carbon dioxide equivalent of 2,277,884 tons per year additional. That is the wrong direction.

Thank you.

**IDEM Response to Ms. Lyn Stoll, Statements:**

No changes to the draft permit were made as a result of this statement.

<b>Mr. Brian Meyer, Statements and IDEM Responses</b>
---

**Mr. Brian Meyer, Statements:**

Good evening. I'm Brian Meyer, from Jasper, Indiana. I spoke at Albert Presbyterian Church a couple of months ago.

A good friend and neighbor as I was growing up, he was in the building trades and he was a machinist and just well known. He always told me to look at problems and -- not to dwell on problems, but to look at problems and try to figure out how to get beyond them before -- during your plan.

So, what I see is this as a problem, and when you're dealing with a rattlesnake, be aware of the rattlesnake or have somebody tell you about the rattlesnake, just like when we were spelunking, we were exploring a cave, just -- my wife and I are both nature lovers. And we had several people tell us -- well, one of them -- about a rattlesnake that was off the edge of the path there, and so, we were aware of our circumstances.

So, as a society, we need to be aware of that and have a voice, which is what's great about democracy in the United States, you have a voice, but be willing to stand up. So, I've been told by several people that had contact with the state that this is a done deal. Hopefully it's not.

So, with your hope and with the power of your voice, you know, hopefully we can get beyond this, find alternative industries and get beyond old technology. I don't know where the aspects of Guinea pigs came in, so I don't understand -- we're testing with just mice and rats.

But anyway, I don't want us to be Guinea pigs, because it's just not Spencer County, it's the area that, you know, through our trade winds that carry this pollution for miles and miles, and, you know, across continents. So, we need to look at those aspects.

We were dealing with the biomass issue in Jasper several years ago, and walking into the Statehouse on crutches across ice and waiting for at least we get a chance here and they didn't cut us off after an hour and a half over at the Statehouse.

So, I just stood up and -- so, they told us then, too, "Well, we'll change the regulations." Well, this was a fast track issue with biomass wasn't a green industry, it was the carbon footprint with it.

And so, the answer was fast back, and getting somebody to run for office that -- anyway it was fast tracked, it was voted in, and through a trail of looking through, using the letter of the law to understand it, and these folks understanding the letter of the law.

That's how with this -- with Lincoln understanding about the change of slavery, he said, "If we can get enough individuals to understand the letter of the law, we can change the law."

So, how we can get folks to make a quicker impact of getting IDEM to increase their standards? With the biomass issue, with the fine particulate matter -- those state standards do not cover the fine particulate matter, you know, at least from my understanding. So, how quickly can we get this -- these details to change?

I know each state has their own individual rights on it, so I don't know if -- you know, which -- if IDEM or, you know, the EPA, who was the higher control of these laws and regulations, but that's what it going to take to change is to set those standards high enough.

And if it's through technology and it's workable, you know, but there's other things, pollution -- but then the safety, to whether -- I don't think it's -- they're probably not going to make more money with all of these other chemicals in on the diesel fuel. If you look at everything that's coming out of it and the cost for pipe and these other materials, they're probably going to make more on it than on the diesel fuel.

So, it's just, you know -- so, I thank you for coming out this evening, and again, just through hope and prayers that -- you know, and I love the environment, and that's why I tried myself to share, and I teach in high school through an ag program with understanding our carbon footprint. It's how that carbon's actually captured in the environment, you know, to hold it and to -- because everything's pretty well based in carbon, so you have to understand carbon to truly know that -- the cause-and-effect relationships.

So -- and the main thing is through brotherly love that we understand each other and we -- through funds to have the opportunity to travel, to experience the world and enjoy the environment that is mentioned, you know, with the park system and the trails. And my wife and I have been traveling through the National Park systems and growing up here and walking through the trails around the lake at Lincoln State Park, and later years to the National Memorial.

So, this is a fine area. We don't want it to be a blighted landscape like up in Sudbury, Canada, where the past ages and -- with a gentleman on my Face page said that their industry destroyed their environment, and it's taken over 80 years for them to rebuild that environment from the refined -- or the melting of the ore, you know, that went and destroyed -- they were burning the trees, and all of the pollution.

So, we don't want this to become catastrophic as that has, so - and you never know -- I'm not a research scientist, I just love this world, and thank you for the opportunity to make a point and put one more aspect going along with the coalition and all of the thoughts of everybody else put together for this evening.

Thank you.

**IDEM Response to Mr. Brian Meyer, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Ms. Charlene Urbancic, Statements and IDEM Responses</b>
---

**Ms. Charlene Urbancic, Statements:**

Thank you for allowing me to speak tonight. I'm very nervous standing here. I am not prepared. I came here to listen and learn, and I feel compelled to say something.

I've looked at this with my heart and mind and intelligence and soul, with all of the comments that have been made. I really don't think there's two sides to this story. I think we're all one group. We all want good jobs, we want our families to be healthy and live and prosper.

I feel -- I have recently personally talked to three different people from the Indiana Department of Environmental Management and asked a simple question: How does the input from tonight impact your decision? And how do we as people know that our voices have been heard? When do we get to know the answer to our questions?

And I was told, unfortunately, that the decision has basically already been made, long before we knew the plant was being conceived by the Parish Council, by the Zoning Commissions, who passed it very quickly, and when that happened, it went to IDEM.

But they -- I almost feel like you have been threatened tonight to some extent by some people that have come up here and said, "You must follow the letter of the law, and unless this plant is violating any laws on the books, you have an obligation to say yes, that you have no choice." You have to say yes, it's a done deal, it's already been said.

And there's people out there that I've also come across that will profit from this financially, and it's not the majority, it's the minority, and they're very fat, dumb and happy tonight, because they believe this is a done deal.

In my heart of hearts, and God is telling me that that can't possibly be the case. You -- I feel like the Indiana Department of Environmental Management's job is to manage the environment, and if the existing laws on the books do not protect us -- why would they?

You know, this plant has never been built before in this country, and where it was, it was a catastrophe. So, your laws will not say, "Deny this permit," and you might even be threatened legally if you don't approve it.

But I believe a court would hear our concerns and maybe get a consideration. I don't think the decision has to be made on the existing laws, because the existing laws will not protect us, because they do not exist on this subject.

And so, I ask you to make recommendations based not on the existing laws, but on the evidence that's been presented, which is scientific research, indisputable, and make the recommendations of managing the environment that are necessary to delay this permit and not allow it to go unchallenged.

Thank you.

#### **IDEM Response to Ms. Charlene Urbancic, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

<b>Mr. Jerry Steckler, Statements and IDEM Responses</b>
--

#### **Mr. Jerry Steckler, Statement 2:**

Hello again, and I'm to apologize to you, because it has nothing to -- well, let me rephrase that -- it has something to do with everyone in here, not to the IDEM thing -- or to the permit

I'm just here as a messenger on this air issue. Allan Savory is a gentleman from South Africa, and he's a scientist that has been studying the global warming issue, and to his credit, he has come up with what he believes is the only solution to the global warming issue.

It has to do with planned grazing. Of course, I'm a proponent of that, because that's what I do. Everybody thinks that what they do is the right thing to do, but this has the potential of changing how we as humans affect environment in a large canvas.

Our current production of -- our ag production of row crops leaves our soils bare for far too long. The percentage of actual green growing time is way too short. So, what we need -- what we need to do is get back to a more natural process there.

We can know that that works due to the feet of topsoil that has been built across the plains by the buffalo for generations, you know, centuries, of doing just that. They walk down the majority of the plant life, they eat part of it and they shit on the rest of it.

And it's that word that -- the bacteria that come out of those bovines that is the yeast that gets the soil life going. When you get the soil life going, they produce -- ammonia is the -- one of the major things that benefits us in this process.

The ammonia from the bacteria in the soil has a property -- it has a property about it that the warmer the atmosphere gets, the cooler the ground gets, so it equalizes, it has a way of

tempering our environment, and you conversely know it. Whenever it gets really cold, it keeps the soil warm.

We've messed that up, and the only way that we will survive as a civilization is by reversing that. If we're getting down to the wire where we have to change something to effect our climate change, it's his assertion that that is the only factor that will be successful. We will fall as Rome fell if we refuse to admit our folly here.

So, I would encourage everyone to Google that. We all love to search things on our electronic instruments. Savory Institute," or "Allan Savory 2013" should get you there. It was a presentation that he gave to a world organization on that very subject. It's climate change. So, I've done what I've been -- felt compelled to do. Now it's up to you follow through and do your research, but we all need to educate ourselves and then be proponents of that very thing.

The management -- it takes management with that livestock. That's available jobs, they're green jobs, so all of the union workers, everybody that hates their job, they can get back out to the Mother Earth and work with Mother Earth.

I very much appreciated the gentleman who spoke from the Indian -- the Native American side of life, that -- we had so much to learn from them, and still do. We can get back in the harmony with life, to our benefit.

So, if anybody has any questions, somebody knows somebody that can find me, I think.

**IDEM Response to Mr. Jerry Steckler, Statement 2:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 1 - Greenhouse Gas Emissions and Climate Change
- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

<b>Mr. John Blair, Statements and IDEM Responses</b>
--

**Mr. John Blair, Statement 2:**

Yeah, I -- I realize that this isn't a numbers game, but I've been keeping track tonight, and there have been 47 people speak against this plant, and seven speak for it.

**IDEM Response to Mr. John Blair, Statement 2:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

**Dr. Norma Kreilein, Statements and IDEM Responses**

**Dr. Norma Kreilein, Statements:**

Yes, I understand the law. I also understand that the mission of IDEM is to protect, and children are important.

I would like to reiterate what Mr. Weintraut said, that this needs to be held until further research is done. It should not be approved at this time; there's not enough information.

And health professionals need to be involved and at the table, and they are not, and that is fundamentally inappropriate if you're going to make health decisions, and that ultimately is what environmental regulation and permitting should be about. So, I would respectfully ask that that be done as a process in this plant in the most polluted part of the country.

Thank you.

**IDEM Response to Dr. Norma Kreilein, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 5 - Local Air Quality, Health Statistics, and Impact of Additional Air Pollution from this Source

No changes to the draft permit were made as a result of this statement.

**Mr. Joseph Nickolick, Statements and IDEM Responses**

**Mr. Joseph Nickolick, Statement 2:**

We have a model of the public suing municipalities and suing government organs [sic] in Flint, Michigan, where the people did not do their diligence. It is incumbent upon all of us that Indiana not be a party to this, because you have not done your diligence. We're expecting you to do your diligence. These people have done us proud, themselves proud, and you proud. Now we expect you to us proud in doing your diligence on this.

Thank you.

**IDEM Response to Mr. Joseph Nickolick, Statement 2:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit

No changes to the draft permit were made as a result of this statement.

**Mr. Chuck Botsko, Statements and IDEM Responses**

**Mr. Chuck Botsko, Statements:**

For your record, and also for some people that might not be Spencer County residents, Ms. Reinke, the Chamber of Commerce person, mentioned the fact that there's been division within

Dale, and the town zoned the property into the city limits. The Zoning Board, seven members, voted four to three for the zoning.

The town is split. The County Commissioners took up a resolution a couple of weeks ago, as Mr. Brown mentioned, three Commissioners. The vote was two to one. So there's not a lot of even support behind it. You have a situation where this is splitting the communities, those that are for and those that are against it, and hopefully this doesn't happen.

Thank you

#### **IDEM Response to Mr. Chuck Botsko, Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 4 - Employment, Quality of Life, Noise, Odor, Light Pollution, Safety, Traffic, Property Values, Tourism, Zoning, Sustainability Issues, Costs/Technology Issues, Funding Uncertainties, Profits, Possible Future Expansion, Possible Future Violations, Water Usage, Water Pollution, and Land Pollution

No changes to the draft permit were made as a result of this statement.

<b>Dr. Erin Marchand Statements and IDEM Responses</b>
--

#### **Dr. Erin Marchand Statements:**

I feel a little late to the game, because I just started reading this like two minutes ago, so I've just hung on this line, "If a permit applicant demonstrates that it will be able to comply with all federal and state laws regarding air pollution control, IDEM is required by law to issue the air permit."

I get it. It puts you in a tight spot. But the problem is that they are giving you numbers without any real basis, just modeling. And I appreciate all of the engineering and the computer programming that goes into those models, but please make them do due diligence.

Get the actual numbers, if they can, from Russia or China, or if anything, make the actual model something smaller than this, to where they can actually give you real numbers and not made-up data. They've already fallen back and said, "Wait a minute, wait a minute. Well, those were just estimates," and they've already gone back and forth and back and forth.

And so, please make them demonstrate that they'll be able to comply, as best as you can. If that's -- if that's all you can fall back on, to say, "Look, nothing like this has ever been produced here. You don't have real hard-core data for us." Make them prove it, please.

#### **IDEM Response to Dr. Erin Marchand Statements:**

Please see the following IDEM responses at the beginning of the ATSD under the General Statements and IDEM Responses section:

- IDEM Response to General Statement 3 - Issuance of the Permit
- IDEM Response to General Statement 7 - Emission Factors and Calculation Methodologies Used In Determining the Potential to Emit and the Associated Air Quality Analysis

The responsible official designated for a source that is applying for an air permit is required to certify the truth, accuracy, and completeness of all information contained in an air permit application on the Air Permit Application Cover Sheet form, otherwise the application would be deemed incomplete. Based on the information provided by the applicant in an air permit application, IDEM, OAQ determines the potential to emit and all applicable state and federal requirements for of all emission units at the source.

This proposed permit includes all applicable state and federal rules and regulations related to air pollution, including best available control technology (BACT) requirements for units with emissions that exceed the thresholds for Prevention of Significant Deterioration (PSD), applicable control device operating requirements, monitoring requirements, testing requirements, and associated record keeping and reporting requirements to assure that all permit limitations are enforceable as a practical matter and to assure that the source can demonstrate compliance with all applicable state and federal rules on a continuous basis.

If the information provided by the applicant in an air permit application indicates that that the Permittee will be able to comply with all permit requirements, IDEM is required by law to issue the air permit.

No changes to the draft permit were made as a result of this statement.

**Indiana Department of Environmental Management  
Office of Air Quality**

Technical Support Document (TSD) for a PSD/New Source Construction  
and Part 70 Operating Permit

**Source Description and Location**

<b>Source Name:</b>	<b>Riverview Energy Corporation</b>
<b>Source Location:</b>	<b>4702 E 2000 N, Dale, IN 47523</b>
<b>County:</b>	<b>Spencer</b>
<b>SIC Code:</b>	<b>2911 (Petroleum Refining), 2999 (Products of Petroleum and Coal, Not Elsewhere Classified)</b>
<b>Operation Permit No.:</b>	<b>T 147-39554-00065</b>
<b>Permit Reviewer:</b>	<b>Douglas Logan, P.E.</b>

**Existing Approvals**

There have been no previous approvals issued to this source.

**County Attainment Status**

The source will be located in Spencer County.

Pollutant	Designation
SO <sub>2</sub>	Better than national standards.
CO	Unclassifiable or attainment effective November 15, 1990.
O <sub>3</sub>	Unclassifiable or attainment effective July 20, 2012, for the 2008 8-hour ozone standard. <sup>1</sup>
PM <sub>2.5</sub>	Attainment effective October 27, 2011, for the annual PM <sub>2.5</sub> standard for Ohio Township. Unclassifiable or attainment effective April 5, 2005, for the annual PM <sub>2.5</sub> standard for the remainder of the county.
PM <sub>2.5</sub>	Unclassifiable or attainment effective December 13, 2009, for the 24-hour PM <sub>2.5</sub> standard.
PM <sub>10</sub>	Unclassifiable effective November 15, 1990.
NO <sub>2</sub>	Cannot be classified or better than national standards.
Pb	Unclassifiable or attainment effective December 31, 2011.
<sup>1</sup> Unclassifiable or attainment effective October 18, 2000, for the 1-hour ozone standard which was revoked effective June 15, 2005.	

- (a) **Ozone Standards**  
Volatile organic compounds (VOC) and Nitrogen Oxides (NO<sub>x</sub>) are regulated under the Clean Air Act (CAA) for the purposes of attaining and maintaining the National Ambient Air Quality Standards (NAAQS) for ozone. Therefore, VOC and NO<sub>x</sub> emissions are considered when evaluating the rule applicability relating to ozone. Spencer County has been designated as attainment or unclassifiable for ozone. Therefore, VOC and NO<sub>x</sub> emissions were reviewed pursuant to the requirements for Prevention of Significant Deterioration (PSD), 326 IAC 2-2.
- (b) **PM<sub>2.5</sub>**  
Spencer County has been classified as attainment for PM<sub>2.5</sub>. Therefore, direct PM<sub>2.5</sub>, SO<sub>2</sub>, and NO<sub>x</sub> emissions were reviewed pursuant to the requirements for Prevention of Significant Deterioration (PSD), 326 IAC 2-2.
- (c) **Other Criteria Pollutants**  
Spencer County has been classified as attainment or unclassifiable in Indiana for all the other criteria pollutants. Therefore, these emissions were reviewed pursuant to the requirements for Prevention of Significant Deterioration (PSD), 326 IAC 2-2.

### Fugitive Emissions

Since this source is classified as a fuel conversion plant, it is considered one (1) of the twenty-eight (28) listed source categories, as specified in 326 IAC 2-2-1(ff)(1), 326 IAC 2-3-2(g), or 326 IAC 2-7-1(22)(B). Therefore, fugitive emissions are counted toward the determination of PSD, Emission Offset, and Part 70 Permit applicability.

### Greenhouse Gas (GHG) Emissions

On June 23, 2014, in the case of *Utility Air Regulatory Group v. EPA*, cause no. 12-1146, (available at [http://www.supremecourt.gov/opinions/13pdf/12-1146\\_4g18.pdf](http://www.supremecourt.gov/opinions/13pdf/12-1146_4g18.pdf)) the United States Supreme Court ruled that the U.S. EPA does not have the authority to treat greenhouse gases (GHGs) as an air pollutant for the purpose of determining operating permit applicability or PSD Major source status. On July 24, 2014, the U.S. EPA issued a memorandum to the Regional Administrators outlining next steps in permitting decisions in light of the Supreme Court's decision. U.S. EPA's guidance states that U.S. EPA will no longer require PSD or Title V permits for sources "previously classified as 'Major' based solely on greenhouse gas emissions."

The Indiana Environmental Rules Board adopted the GHG regulations required by U.S. EPA at 326 IAC 2-2-1(zz), pursuant to Ind. Code § 13-14-9-8(h) (Section 8 rulemaking). A rule, or part of a rule, adopted under Section 8 is automatically invalidated when the corresponding federal rule, or part of the rule, is invalidated. Due to the United States Supreme Court Ruling, IDEM, OAQ cannot consider GHG emissions to determine operating permit applicability or PSD applicability to a source or modification.

### Description of New Source Construction

The Office of Air Quality (OAQ) has reviewed an application for a PSD/new source construction and Part 70 Operating Permit, submitted by Riverview Energy Corporation on January 25, 2018, relating to construction of a direct coal hydrogenation (DCH) facility to convert coal to liquid fuels. The following is a list of the proposed emission units and pollution control devices:

- (a) Coal handling operations, identified as Block 1000, consisting of:
  - (1) One (1) shelter-type railcar dump unloading facility, identified as EU-1000, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1000, exhausting to stack EU-1000, consisting of:
    - (A) Two (2) enclosed receiving pits, identified as Receiving Pit 1 and Receiving Pit 2, discharging to Receiving Bin 1 and Receiving Bin 2, respectively.
    - (B) Two (2) enclosed receiving bins, identified as Receiving Bin 1 and Receiving Bin 2, discharging to Drag Flight Feeder 1 and Drag Flight Feeder 2, respectively, with water spray dust suppression systems.
    - (C) Two (2) enclosed drag flight feeders, identified as Drag Flight Feeder 1 and Drag Flight Feeder 2, discharging to the Unloading Conveyor, with water spray dust suppression systems.

Under the NSPS, 40 CFR 60, Subpart Y, EU-1000 is an affected facility.

- (2) One (1) enclosed rail unloading conveyor discharging to Transfer Station 1, identified as Unloading Conveyor, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, the Unloading Conveyor is an affected facility.

- (3) One (1) enclosed transfer station discharging to Conveyor 1, Conveyor 2, or Conveyor 9, identified as Transfer Station 1 (EU-1001), approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, Transfer Station 1 (EU-1001) is an affected facility.

- (4) One (1) enclosed feed conveyor discharging to Stacker 1 Boom Conveyor/Chute, identified as Conveyor 1, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 1 is an affected facility.

- (5) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #1A & #1B, identified as Stacker 1 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 1 Conveyor/Chute is an affected facility.

- (6) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #1A and Stockpile #1B, with a maximum capacity of 93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #1A and #1B are affected facilities.

- (7) One (1) enclosed feed conveyor discharging to Stacker 2 Boom Conveyor/Chute, identified as Conveyor 2, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 2 is an affected facility.

- (8) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #2A & #2B, identified as Stacker 2 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 2 Boom Conveyor/Chute is an affected facility.

- (9) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #2A and Stockpile #2B, with a maximum capacity of 93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #2A and #2B are affected facilities.

- (10) One (1) reclaimer for Stockpiles #1A & #1B, discharging to Reclaim Conveyor 6, identified as Reclaimer 1, approved in 2018 for construction, with a maximum capacity of

500 tons of coal per hour, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 1 is an affected facility.

- (11) One (1) enclosed reclaimer conveyor, identified as Conveyor 6 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 6 is an affected facility.

- (12) One (1) reclaimer for Stockpiles #2A & #2B, discharging to Reclaim Conveyor 7, identified as Reclaimer 2, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 2 is an affected facility.

- (13) One (1) enclosed reclaimer conveyor, identified as Conveyor 7 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 7 is an affected facility.

- (14) One (1) enclosed transfer station conveyor, identified as Conveyor 9 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 9 is an affected facility.

- (15) One (1) enclosed reclaim transfer station discharging to Reclaim Conveyor 8, identified as Reclaim Transfer Station (EU-1006), approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Reclaim Transfer Station is an affected facility.

- (16) One (1) enclosed conveyor, identified as Reclaim Conveyor 8 discharging to the Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 8 is an affected facility.

- (b) Coal drying loop, collectively identified as EU-1008, with emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008, consisting of the following:

- (1) One (1) enclosed coal mill and pulverizer, identified as Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Mill and Pulverizer is an affected facility.

- (2) One (1) enclosed coal dryer, identified as Coal Dryer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer Baghouse, with particulate emissions controlled by the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer is an affected facility.

- (3) One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.

Under the NSPS, 40 CFR 60, Subpart Ja, the Coal Dryer Heater (EU-1007) is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Heater (EU-1007) is part of an affected thermal dryer.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, the Coal Dryer Heater (EU-1007) is an affected source.

- (4) One (1) process baghouse, identified as Coal Dryer Baghouse, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging fines to the Block 2000 Coal Hopper, exhausting particulate and filtered nitrogen to the condenser.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Baghouse is an affected facility.

- (5) One (1) water-cooled condenser, identified as Drying Loop Condenser, approved in 2018 for construction, with a nominal capacity of 40 MMBtu/hr, with particulate emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008.

Under the NSPS, 40 CFR 60, Subpart Y, the Drying Loop Condenser is part of an affected thermal dryer.

- (c) Additives handling operations, identified as Block 1500, consisting of:

- (1) Three (3) pneumatic (nitrogen) truck unloading systems discharging to storage silos, approved in 2018 for construction, as follows:

- (A) Coarse Additive Unloading, with a maximum capacity of 20.00 tons per hour.  
(B) Fine Additive Unloading, with a maximum capacity of 20.00 tons per hour.  
(C) Sodium Sulfide (Na<sub>2</sub>S) Unloading, with a maximum capacity of 10.00 tons per hour.

- (2) Three (3) nitrogen-blanketed storage silos, as follows:

- (A) One (1) coarse additive silo, identified as T34, approved in 2018 for construction, controlled by baghouse EU-1501, exhausting to stack EU-1501.  
(B) One (1) fine additive silo, identified as T33, approved in 2018 for construction, controlled by baghouse EU-1502, exhausting to stack EU-1502.  
(C) One (1) Na<sub>2</sub>S silo, identified as T35, approved in 2018 for construction, controlled by baghouse EU-1503, exhausting to stack EU-1503.

- (3) One (1) nitrogen-blanketed fine additive production system, identified as Fine Additive Production System, approved in 2018 for construction, with a maximum capacity of 3.28 tons per hour, controlled by baghouse EU-1504, exhausting to stack EU-1504, consisting of:

- (A) One (1) coarse additive silo rotary feeder solid weigh scale.
  - (B) One (1) coarse additive screw conveyor discharging to the Fine Additive Production System.
  - (C) One (1) additive size reduction system, identified as Fine Additive Production System discharging to the T33 or the Block 2000 coarse additive transfer system.
- (d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
- (1) One (1) enclosed hopper receiving coal from Block 1000 Coal Dryer Baghouse and discharging to the Feed Prep Screw Conveyor, identified as Coal Hopper, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year.  
  
Under the NSPS, 40 CFR 60, Subpart Y, the Coal Hopper is an affected facility.
  - (2) One (1) enclosed screw conveyor, identified as Closed Screw Conveyor, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Feed Premix Drum, identified as Closed Screw Conveyor, with particulate emissions controlled by the Coal Handling System Filter, exhausting to stack EU-2005.  
  
Under the NSPS, 40 CFR 60, Subpart Y, the Closed Screw Conveyor is an affected facility.
  - (3) One (1) nitrogen-blanketed coarse additive transfer system, identified as Coarse Additive Screw Conveyor, approved in 2018 for construction, with a maximum capacity of 2.20 tons per hour, receiving material from the Block 1500 coarse additive silo and discharging to the Feed Premix Drum, with particulate emissions controlled by the Coarse Additive System Filter, exhausting to stack EU-2006.
  - (4) One (1) nitrogen-blanketed fine additive transfer system, identified as Fine Additive Handling System, approved in 2018 for construction, with a maximum capacity of 3.28 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Fine Additive System Filter, exhausting to stack EU-2007, consisting of:
    - (A) One (1) fine additive silo rotary feeder solid weigh scale.
    - (B) One (1) fine additive screw conveyor discharging to the Block 2000 feed premix drum.
  - (5) One (1) nitrogen-blanketed Na<sub>2</sub>S slurry preparation system, identified as Na<sub>2</sub>S Slurry Preparation, approved in 2018 for construction, with a maximum capacity of 0.077 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Na<sub>2</sub>S Handling System Filter, exhausting to stack EU-2008, consisting of:
    - (A) One (1) Na<sub>2</sub>S silo rotary feeder solid weigh scale.
    - (B) One (1) Na<sub>2</sub>S screw conveyor discharging to the Na<sub>2</sub>S mixing drum.
    - (C) One (1) nitrogen-blanketed mixing drum for Na<sub>2</sub>S and Block 2000 vacuum tower VGO (vacuum gas oil) discharging to the feed premix drum.  
  
Under the NSPS, 40 CFR 60, Subpart GGGa, the mixing drum is an affected facility.  
  
Under the NESHAP, 40 CFR 63, Subpart CC, the mixing drum is an affected source.
  - (6) One (1) feed premix drum, identified as Feed Premix Drum, approved in 2018 for construction, receiving coal, solid additives, and recycled vacuum gas oil (VGO) and

discharging to the feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the feed premix drum is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed premix drum is an affected source.

- (7) One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.

Under the NSPS, 40 CFR 60, Subpart Ja, the feed heater EU-2001 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the feed heater EU-2001 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed heater EU-2001 is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, feed heater EU-2001 is an affected source.

- (8) One (1) natural gas and process fuel gas-fired indirect treat gas heater, identified as EU-2002, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 52.8 MMBtu/hr (HHV), receiving hydrogen from Block 7000 and discharging to the 1st stage reactors, exhausting to stack EU-2002.

Under the NSPS, 40 CFR 60, Subpart Ja, the treat gas heater EU-2002 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, treat gas heater EU-2002 is an affected source.

- (9) One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2018 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the first stage reactor - liquid phase hydrocracking system is an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the first stage reactor - liquid phase hydrocracking system is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the first stage reactor - liquid phase hydrocracking system is an affected source.

- (10) One (1) hot separator, identified as Hot Separator, approved in 2018 for construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the hot separator is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the hot separator is an affected source.

- (11) One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub>

burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003.

Under the NSPS, 40 CFR 60, Subpart Ja, the vacuum column feed heater EU-2003 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the vacuum column feed heater EU-2003 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum column feed heater EU-2003 is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, vacuum column feed heater EU-2003 is an affected source.

- (12) One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2018 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the vacuum distillation tower is an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the vacuum distillation tower is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum distillation tower is an affected source.

- (13) One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2018 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the second stage reactor - gas phase hydrotreating system is an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the second stage reactor - gas phase hydrotreating system is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the second stage reactor - gas phase hydrotreating system is an affected source.

- (14) One (1) cold separator, identified as Cold Separator, approved in 2018 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the cold separator is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the cold separator is an affected source.

- (15) One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.

Under the NSPS, 40 CFR 60, Subpart Db, fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, the fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the fractionator heater is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator heater is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, fractionator heater EU-2004 is an affected source.

- (16) One (1) fractionator tower, identified as Fractionator Tower, approved in 2018 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the fractionator tower is an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the fractionator tower is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator tower is an affected source.

- (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:

(A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

(B) One (1) two-stage low pressure absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the HP Absorber and LP Absorber are part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the HP Absorber and LP Absorber are part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the HP Absorber and LP Absorber are affected sources.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the HP Absorber and LP Absorber is an affected source.

- (e) Sulfur recovery operations, identified as Block 3000, consisting of:

- (1) Amine Regeneration Unit, consisting of:

(A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich

amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

- (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Amine Recovery Unit is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Amine Recovery Unit part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the Amine Recovery Unit is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Amine Recovery Unit is an affected source.

(2) Sour Water Stripping System, consisting of:

- (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Sour Water Stripping System is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Sour Water Stripping System is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 61, Subpart FF, the Sour Water Stripping System is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the Sour Water Stripping System is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Sour Water Stripping System is an affected source.

(3) Sulfur Recovery System, consisting of:

- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605A Incinerator and A-605A Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit A is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, Sulfur Recovery Unit A is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit A is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit A is an affected source.

- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605B Incinerator and A-605B Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit B is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, Sulfur Recovery Unit B is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit B is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit B is an affected source.

(f) Offsites operations, identified as Block 4000, consisting of:

(1) Flares, as follows:

- (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2018 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
- (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
- (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
- (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2018 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.

Under the NSPS, 40 CFR 60, Subpart Ja, the flares are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, the flares are affected facilities.

Under the NESHAP, 40 CFR 63, Subpart CC, the flares are affected sources.

(2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T1	IFR	Naphtha product	4,629,879 (17,524)	-
T2	IFR	Naphtha product	4,629,879 (17,524)	-
T3	FR	Diesel product	4,525,796 (17,130)	-
T4	FR	Diesel product	4,525,796 (17,130)	-
T5	FR	Diesel product	4,525,796 (17,130)	-
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)	-
T7	FR	Molten sulfur	342,367 (1,296)	-

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T8	FR	Molten sulfur	342,367 (1,296)	-
T9	HPV	Ammonia product	36,720 (17,524)	-
T10	FR	Residue surge tank 1	926,980 (17,524)	-
T11	FR	Residue surge tank 2	926,980 (3,509)	-
T12	FR	Residue feed tank	926,980 (3,509)	-
T13	FR	VGO tank 1	926,980 (3,509)	-
T14	FR	VGO tank 2	926,980 (3,509)	-
T15	HPV	LPG storage	48,872 (185)	-
T16	FR	Slop tank	4,195,581 (15,880)	LP flare
T17	FR	Diesel fuel tank	23,775 (90)	-
T18	FR	Non-phenolic sour water storage tank 1	1,268,026 (4,799)	SB flare
T19	FR	Non-phenolic sour water storage tank 2	1,268,026 (4,799)	SB flare
T20	FR	Non-phenolic sour water storage tank 3	1,268,026 (4,799)	SB flare
T21	FR	Phenolic sour water storage tank	40,947 (155)	SB flare
T22	FR	Stripped non-phenolic sour water surge tank	1,268,026 (4,799)	-
T23	FR	Stripped phenolic sour water surge tank	13,737 (52)	-
T24	FR	Amine surge/deinventory tank	63,943 (242)	-
T25	FR	Fresh amine tank	63,943 (242)	-
T26	FR	Amine containment tank (sump)	793 (3)	-

1. FR - fixed roof, IFR - internal floating roof, HPV-horizontal pressure vessel

2. Tank vents to flares are part of sweep and pilot gas streams.

Under the NSPS, 40 CFR 60, Subpart Kb, T1, T2, and T6 are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, T1 - T6 and T10 - T15 are affected facilities.

Under the NSPS, 40 CFR 60, Subpart QQQ, T16 is part of an affected facility.

Under the NSPS, 40 CFR 61, Subpart FF, T16 and T18 - T21 are part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, T1 - T6, T10 - T14, T16, and T18-T23 are part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart WW, T3 - T6 and T10 - T14 are affected sources.

(3) Loading operations, as follows:

(A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Product Loading Rack is an affected facility.

Under the NESHAP, 40 CFR 61, Subpart BB, the Product Loading Rack is an affected source.

Under the NESHAP, 40 CFR 63, Subpart CC, the Product Loading Rack is an affected source.

(B) One (1) single-spot railcar loading rack for ammonia, identified as Ammonia Loading Rack, approved in 2018 for construction, with a bottlenecked capacity of 15,024,167 gallons per year, controlled by the Loading Flare.

(C) One (1) single-spot railcar loading rack for molten sulfur, identified as Sulfur Loading Rack, approved in 2018 for construction, with a bottlenecked capacity of 63,781 tons per year, controlled by the Sulfur Block Flare.

(g) Residue solidification operations, identified as Block 5000, as follows:

(1) Four (4) pastillators, identified as EU-5001A - EU5001D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5001.

(2) Four (4) pastillators, identified as EU-5002A - EU5002D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5002.

(3) Four (4) pastillators, identified as EU-5003A - EU5003D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5003.

(4) Four (4) pastillators, identified as EU-5004A - EU5004D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5004.

(5) Enclosed conveyors for residue pellets, with particulate emissions controlled by filters EU-5009, EU-5010, and EU-5011, as follows:

(A) One (1) enclosed conveyor, identified as Block 1 & 2 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5001A - EU5001D and EU-5002A - EU5002D.

(B) One (1) enclosed conveyor, identified as Block 3 & 4 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5003A - EU5003D and EU-5004A - EU5004D.

(C) One (1) enclosed loading conveyor, identified as Loading Conveyor, approved in 2018 for construction, with a maximum capacity of 51.49 tons per hour, receiving pastillators from Block 1 & 2 and Block 3 & 4 transfer conveyors, and discharging to the bulk container loading station, railcar residue silo, or swing residue silo.

- (6) One (1) residue bulk container loading station, identified as EU-5009, approved in 2018 for construction, with a maximum capacity of 8.00 tons per hour, using filter EU-5009 for particulate control and exhausting to stack EU-5009.
- (7) One (1) railcar residue storage silo, identified as EU-5010, approved in 2018 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
- (8) Two (2) residue loading hoppers, identified as EU-5005 and EU-5006, approved in 2018 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the railcar residue storage silo, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
- (9) One (1) swing residue storage silo, identified as EU-5011, approved in 2018 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
- (10) Two (2) residue loading hoppers, identified as EU-5007 and EU-5008, approved in 2018 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the swing residue storage silo, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
  - (11) Residue loadout operations using spouts and choke flow-practices, as follows:
    - (A) Two (2) railcar loadspots, approved in 2018 for construction.
    - (B) Two (2) swing loadspots, approved in 2018 for construction, accommodating either trucks or railcars.
- (h) Utilities operations, identified as Block 6000, consisting of:
  - (1) One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.

Under the NSPS, 40 CFR 60, Subpart Dc, boiler EU-6000 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, boiler EU-6000 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, boiler EU-6000 is an affected source.
  - (2) One (1) three-cell crossflow mechanical draft cooling tower, identified as EU-6001, approved in 2018 for construction, with a maximum capacity of 32,000 gallons per hour, equipped with mist eliminators and exhausting to stacks EU-6001, EU-6002, and EU-6003.
  - (3) One (1) diesel engine-driven emergency generator, identified as EU-6006, approved in 2018 for construction, with a maximum heat input capacity of 19.60 MMBtu/hr (2,800 hp) (average heating value), exhausting to stack EU-6006.

Under the NSPS, 40 CFR 60, Subpart IIII, emergency generator EU-6006 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency generator EU-6006 is an affected source.

- (4) One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2018 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), exhausting to stack EU-6008.

Under the NSPS, 40 CFR 60, Subpart IIII, emergency fire pump EU-6008 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency fire pump EU-6008 is an affected source.

- (i) Water supply and treatment operations, identified as Block 6500, consisting of:

- (1) One (1) pneumatic lime truck unloading system, identified as Lime Unloading, approved in 2018 for construction, with a maximum capacity of 20.00 tons per hour, discharging to silo EU-6501.
- (2) One (1) lime storage silo, identified as EU-6501, approved in 2018 for construction, with a maximum capacity of 20.00 tons per hour, with particulate emissions controlled by dust collector EU-6501 and exhausting to stack EU-6501.

- (j) Hydrogen unit operations, identified as Block 7000, as follows:

- (1) Hydrogen Plant 1, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:
  - (A) One (1) boiler feed water treatment system including deaerator vent EU-7003, identified as Feed Water Treatment System 1, approved in 2018 for construction, exhausting to stack EU-7003.
  - (B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2018 for construction, consisting of:
    - (i) One (1) hydrogenation reactor.
    - (ii) One (1) hydrogen sulfide adsorber.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.

Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7001, is an affected facility.
    - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
  - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2018 for construction, discharging shift gas to the pressure swing adsorber.
  - (E) One (1) pressure swing adsorber, identified as PSA 1, approved in 2018 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, Hydrogen Plant 1 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 1 is an affected source.

- (2) Hydrogen Plant 2, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:
- (A) One (1) boiler feed water treatment system including deaerator vent EU-7004, identified as Feed Water Treatment System 2, approved in 2018 for construction, exhausting to stack EU-7004.
  - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2018 for construction, consisting of:
    - (i) One (1) hydrogenation reactor.
    - (ii) One (1) hydrogen sulfide adsorber.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.

Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7002, is an affected facility.

- (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
- (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2018 for construction, discharging shift gas to the pressure swing adsorber.
- (E) One (1) pressure swing adsorber, identified as PSA 2, approved in 2018 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, Hydrogen Plant 2 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 2 is an affected source.

- (k) Wastewater treatment operations, identified as Block 8000, as follows:
- (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
  - (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
  - (3) One (1) wastewater junction box with, identified as MH1, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.

- (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
- (5) One (1) biological wastewater treatment system, approved in 2018 for construction, with emissions exhausting to vent EU-8001.

Under the NSPS, 40 CFR 60, Subpart QQQ, the process drains, junction boxes, Oily Water Separator, Oily Amine Separator, associated sewer lines, and any secondary oil-water separator in the biological wastewater treatment system are an affected aggregate facility.

Under the NESHAP, 40 CFR 61, Subpart FF, the Oily Water Separator, Oily Amine Separator, and any secondary oil-water separator in the biological wastewater treatment system are affected sources.

Under the NESHAP, 40 CFR 63, Subpart CC, the wastewater streams and treatment operations associated with petroleum refining process units are part of a new affected source..

<b>Insignificant Activities</b>
---------------------------------

The source also consists of the following insignificant activities, as defined at 326 IAC 2-7-1(21):

- (a) The following VOC and HAP storage containers:
  - (1) Storage tanks with capacity less than or equal to one thousand (1,000) gallons and annual throughputs equal to or less than twelve thousand (12,000) gallons.
  - (2) Vessels storing the following:
    - (A) Hydraulic oils.
    - (B) Lubricating oils.
- (b) Production related activities, including the following:
  - (1) Cleaners and solvents characterized as having a vapor pressure equal to or less than:
    - (A) two (2.0) kilo Pascals (fifteen (15) millimeters of mercury or three-tenths (0.3) pound per square inch) measured at thirty-eight (38) degrees Centigrade (one hundred (100) degrees Fahrenheit); or
    - (B) seven-tenths (0.7) kilo Pascal (five (5) millimeters of mercury or one-tenth (0.1) pound per square inch) measured at twenty (20) degrees Centigrade (sixty-eight (68) degrees Fahrenheit); the use of which, for all cleaners and solvents combined, does not exceed one hundred forty-five (145) gallons per twelve (12) months.
  - (2) Closed loop heating and cooling systems.
- (c) Repair activities, including the following:
  - (1) Replacement or repair of electrostatic precipitators, bags in baghouses, and filters in other air filtration equipment.
  - (2) Heat exchanger cleaning and repair.
  - (3) Process vessel degassing and cleaning to prepare for internal repairs.
- (d) Paved roads and parking lots with public access.
- (e) Conveyors as follows:

- (1) Underground conveyors.
- (f) Routine maintenance and repair of buildings, structures, or vehicles at the source where air emissions from those activities would not be associated with any production process, including the following:
  - (1) Purging of gas lines.
  - (2) Purging of vessels.
- (g) Flue gas conditioning systems and associated chemicals, such as the following:
  - (1) Ammonia.
- (h) Equipment used to collect any material that might be released during a malfunction, process upset, or spill cleanup, including the following:
  - (1) Tanks.
  - (2) Fluid handling equipment.
- (i) Blowdown for the following:
  - (1) Boiler.
  - (2) Cooling tower.
- (j) Activities associated with emergencies as follows:
  - (1) On-site fire training approved by IDEM.
- (k) Purge double block and bleed valves.
- (l) An emission unit or activity whose potential uncontrolled emissions meet the exemption levels specified in 326 IAC 2-1.1-3(e)(1) or the exemption levels specified in the following, whichever is lower:
  - For lead or lead compounds measured as elemental lead, the exemption level is six-tenths (0.6) ton per year or three and twenty-nine hundredths (3.29) pounds per day.
  - For carbon monoxide (CO), the exemption limit is twenty-five (25) pounds per day.
  - For sulfur dioxide, the exemption level is five (5) pounds per hour or twenty-five (25) pounds per day.
  - For VOC, the exemption limit is three (3) pounds per hour or fifteen (15) pounds per day.
  - For nitrogen oxides (NO<sub>x</sub>), the exemption limit is five (5) pounds per hour or twenty-five (25) pounds per day.
  - For PM<sub>10</sub> or direct PM<sub>2.5</sub>, the exemption level is either five (5) pounds per hour or twenty-five (25) pounds per day.

As follows:

- (1) Fugitive leaks of VOC and HAPs from equipment in VOC service, subject to NSPS or NESHAP, but individually less than the exemption levels listed above.
- (2) One (1) emergency generator fuel tank, identified as EU-6005, approved in 2018 for construction, with a nominal capacity of 2,000 gallons and an expected annual throughput of 69,450 gallons, using no controls and exhausting to stack EU-6005.
- (3) One (1) emergency fire pump fuel tank, identified as EU-6007, approved in 2018 for construction, with a nominal capacity of 500 gallons and an expected annual throughput of 19,950 gallons, using no controls and exhausting to stack EU-6007.

<b>Trivial Activities</b>
---------------------------

The source also consists of the following trivial activities, as defined at 326 IAC 2-7-1(42):

- (a) Water related activities, including the following:
  - (1) Water treatment activities used to provide potable and process water for the plant, excluding any activities associated with wastewater treatment.
  - (2) Steam traps, vents, leaks, and safety relief valves.
  - (3) Cooling ponds.
  - (4) Demineralized water tanks and demineralizer vents.
  - (5) Boiler water treatment operations, not including cooling towers.
  - (6) Oxygen scavenging (deaeration) of water.
  - (7) Pressure washing of equipment.
  
- (b) Combustion activities, including the following:
  - (1) Combustion emissions from propulsion of mobile sources.
  - (2) Fuel use related to food preparation for on-site consumption.
  - (3) Tobacco smoking rooms and areas.
  - (4) Indoor and outdoor kerosene heaters.
  
- (c) Activities related to ventilation, venting equipment, and refrigeration, including the following:
  - (1) Ventilation exhaust, central chiller water systems, refrigeration, and air conditioning equipment, not related to any industrial or production process, including natural draft hoods or ventilating systems that do not remove air pollutants.
  - (2) Stack and vents from plumbing traps used to prevent the discharge of sewer gases, handling domestic sewage only, excluding those at wastewater treatment plants or those handling any industrial waste.
  - (3) Vents from continuous emissions monitors and other analyzers.
  - (4) Natural gas pressure regulator vents, excluding venting at oil and gas production facilities.
  - (5) Air vents from air compressors.
  - (6) Vents for air cooling of electric motors provided the air does not commingle with regulated air pollutants.
  
- (d) Activities related to routine fabrication, maintenance, and repair of buildings, structures, equipment, or vehicles at the source where air emissions from those activities would not be associated with any commercial production process, including the following:
  - (1) Activities associated with the repair and maintenance of paved and unpaved roads, including paving or sealing, or both, of parking lots and roadways.
  - (2) Painting, including interior and exterior painting of buildings, and solvent use excluding degreasing operations utilizing halogenated organic solvents.
  - (3) Brazing, soldering, or welding operations and associated equipment.
  - (4) Batteries and battery charging stations except at battery manufacturing plants.
  - (5) Lubrication, including the following:
    - (A) Hand-held spray can lubrication.
    - (B) Dipping metal parts into lubricating oil.
    - (C) Manual or automated addition of cutting oil in machining operations.
  - (6) Nonasbestos insulation installation or removal.
  - (7) Tarring, retarring, and repair of building roofs.
  - (8) Instrument air dryer and filter maintenance.
  - (9) Manual tank gauging.

- (e) Activities performed using hand-held equipment, including the following:
  - (1) Application of hot melt adhesives with no VOC in the adhesive formulation.
  - (2) Cutting, excluding cutting torches.
  - (3) Drilling.
  - (4) Grinding.
  - (5) Machining wood, metal, or plastic.
  - (6) Polishing.
  - (7) Routing.
  - (8) Sanding.
  - (9) Sawing.
  - (10) Surface grinding.
  - (11) Turning wood, metal, or plastic.
  
- (f) Housekeeping and janitorial activities and supplies, including the following:
  - (1) Vacuum cleaning systems used exclusively for housekeeping or custodial activities, or both.
  - (2) Restrooms and associated cleanup operations and supplies.
  - (3) Alkaline or phosphate cleaners and associated equipment.
  - (4) Mobile floor sweepers and floor scrubbers.
  
- (g) Office related activities, including the following:
  - (1) Office supplies and equipment.
  - (2) Photocopying equipment and associated supplies.
  - (3) Paper shredding.
  
- (h) Storage equipment and activities, including the following:
  - (1) Pressurized storage tanks and associated piping for the following:
    - (A) Anhydrous ammonia.
    - (B) Liquid petroleum gas (LPG).
    - (C) Natural gas.
  - (2) Storage tanks, vessels, and containers holding or storing liquid substances that do not contain any VOC or HAP.
  - (3) Storage of drums containing maintenance raw materials.
  - (4) Storage of the following:
    - (A) Any non-HAP containing material in solid form stored in a sealed or covered container.
  - (5) Portable containers used for the collection, storage, or disposal of materials provided the container capacity is equal to or less than forty-six hundredths (0.46) cubic meters and the container is closed, except when the material is added or removed.
  
- (i) Emergency and standby equipment, including the following:
  - (1) Process safety relief devices installed solely for the purpose of minimizing injury to persons or damage to equipment that could result from abnormal process operating conditions, including the following:
    - (A) Explosion relief vents, diaphragms, or panels.
    - (B) Rupture discs.
    - (C) Safety relief valves.

- (j) Sampling and testing equipment and activities, including the following:
  - (1) Equipment used for quality control/assurance or inspection purposes, including sampling equipment used to withdraw materials for analysis.
  - (2) Sampling activities, including the following:
    - (A) Sampling of waste.
    - (B) Glove box sampling, charging, and packaging.
  - (3) Instrument air dryers and distribution.
- (k) Activities generating limited amounts of fugitive dust, including the following:
  - (1) Road salting and sanding.
- (l) Activities associated with production, including the following:
  - (1) Electrical resistance welding.
  - (2) Application equipment for hot melt adhesives with no VOC in the adhesive formulation.
  - (3) Air compressors and pneumatically operated equipment, including hand tools.
  - (4) Compressor or pump lubrication and seal oil systems.
- (m) Miscellaneous equipment, but not emissions associated with the process for which the equipment is used, and activities, including the following:
  - (1) Equipment used for surface coating, painting, dipping, or spraying operation, except those that will emit VOCs or HAPs.
  - (2) Manual loading and unloading operations.
  - (3) Construction and demolition operations.

<b>Enforcement Issues</b>
---------------------------

There are no pending enforcement actions.

<b>Stack Summary</b>
----------------------

Stack ID	Operation	Height (ft)	Diameter (ft)	Flow Rate (acfm)	Temperature (°F)
EU-1000	EU-1000	50	1.67	7,172	ambient

**Emission Calculations**

See Appendix A of this Technical Support Document for detailed emission calculations.

**Permit Level Determination – Part 70 New Source Construction**

Pursuant to 326 IAC 2-7-1(30), Potential to Emit is defined as “the maximum capacity of a stationary source to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or type or amount of material combusted, stored, or processed shall be treated as part of its design if the limitation is enforceable by the U.S. EPA.”

The following table is used to determine the appropriate permit level under 326 IAC 2-7. This table reflects the PTE before controls. Control equipment is not considered federally enforceable until it has been required in a federally enforceable permit. If the control equipment has been determined to be integral, the table reflects the PTE after consideration of the integral control device.

Process / Emission Unit	Part 70: Uncontrolled PTE (tons/year)								
	PM	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>	NO <sub>x</sub>	VOC	CO	Single HAP*	Combined HAPs
Total for Source	30,697	4,906	1,847	208	614	695	502	32.64	116.87
Part 70 Threshold	NA	100	100	100	100	100	100	10	25

\*Single highest source-wide HAP, n-hexane.

- (a) The potential to emit (as defined in 326 IAC 2-7-1(30)) of PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, NO<sub>x</sub>, VOC, and CO is each equal to or greater than one hundred (100) tons per year. Therefore, the source is subject to the provisions of 326 IAC 2-7 and will be issued a Part 70 Operating Permit.
- (b) The potential to emit (as defined in 326 IAC 2-7-1(30)) of any single HAP is equal to or greater than ten (10) tons per year and the potential to emit (as defined in 326 IAC 2-7-1(30)) of a combination of HAPs is equal to or greater than twenty-five (25) tons per year. Therefore, the source is subject to the provisions of 326 IAC 2-7 and will be issued a Part 70 Operating Permit.

**Prevention of Significant Deterioration (PSD)**

The table below summarizes the potential to emit, reflecting all limits, of the emission units. Any control equipment is considered federally enforceable only after issuance of this Part 70 New Source Review Permit, and only to the extent that the effect of the control equipment is made practically enforceable in the permit. If the control equipment has been determined to be integral, the table reflects the PTE after consideration of the integral control device.

Process / Emission Unit	Source-Wide Emissions after Issuance (ton/year)										
	PM	PM <sub>10</sub>	PM <sub>2.5</sub> <sup>1</sup>	SO <sub>2</sub>	NO <sub>x</sub>	VOC	CO	CO <sub>2e</sub>	Sulfuric Acid Mist <sup>2</sup>	H <sub>2</sub> S	TRS

PSD Major Source Thresholds	100	100	100	100	100	100	100	100,000	100	100	100

*Notes:*

1. PM<sub>2.5</sub> listed is direct PM<sub>2.5</sub>.

- (a) This new stationary source is major for PSD (326 IAC 2-2) because the pollutants SO<sub>2</sub>, NO<sub>x</sub>, VOC, and CO, each have emissions equal to or greater than the PSD major source threshold. Therefore, pursuant to 326 IAC 2-2, the PSD requirements apply.

**Federal Rule Applicability Determination**

Federal rule applicability for this new source has been reviewed as follows:

**New Source Performance Standards (NSPS):**

- (a) The requirements of the Emissions Guidelines and Compliance Times for Sulfuric Acid Production Units, 40 CFR 60, Subpart Cd and 326 IAC 12, are not included in the permit for the sulfur recovery units, because the units are not existing sulfuric acid production units as defined at 40 CFR 60.81(a). As defined at 40 CFR 60.81(a), *Sulfuric acid production unit* means any facility producing sulfuric acid by the contact process by burning elemental sulfur, alkylation acid, hydrogen sulfide, organic sulfides and mercaptans, or acid sludge, but does not include facilities where conversion to sulfuric acid is utilized primarily as a means of preventing emissions to the atmosphere of sulfur dioxide or other sulfur compounds.

- (b) The requirements of the Standards of Performance for Fossil-Fuel-Fired Steam Generators, 40 CFR 60, Subpart D and 326 IAC 12, are not included in the permit for the units listed in the table below for the reasons shown in the table.

Unit	Reason Not Subject
EU-1007	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-2001	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-2002	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-2003	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-2004	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
A-602A burner	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41, whether burning acid gas in normal operation or natural gas for preheating
A-602B burner	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41, whether burning acid gas in normal operation or natural gas for preheating
A-605A tail gas incinerator	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
A-605B tail gas incinerator	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
HP Flare	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
LP Flare	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
Sulfur Block Flare	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
Loading Flare	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-6000	Heat input capacity less than 250 MMBtu/hr
EU-7003	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41
EU-7004	Not a fossil-fuel-fired steam generating unit as defined at 40 CFR 60.41

As defined at 40 CFR 60.41: *Fossil-fuel-fired steam generating unit* means a furnace or boiler used in the process of burning fossil fuel for the purpose of producing steam by heat transfer.

- (c) The requirements of the Standards of Performance for Electric Utility Steam Generating Units, 40 CFR 60, Subpart Da and 326 IAC 12, are not included in the permit for the EU-3000 burners and waste heat boilers, package boiler EU-6000, and Block 7000 reformers and heat recovery boilers, because the units are not electric utility steam generating units as defined at 40 CFR 60.41Da. The units do not supply more than one-third of their potential electric output capacity and more than 25 MW net-electrical output to any utility power distribution system for sale.
- (d) 40 CFR 60, Subpart Db
- (1) The requirements of the Standards of Performance for Industrial-Commercial-Institutional Steam Generating Units, 40 CFR 60, Subpart Db and 326 IAC 12, are not included in the permit for the units listed in the table below for the reasons shown in the table.

Unit	Reason Not Subject
EU-1007	Not a steam generating unit as defined at 40 CFR 60.41b
EU-2001	Process heater as defined at 40 CFR 60.41b
EU-2002	Heat input capacity less than 100 MMBtu/hr and a process heater as defined at 40 CFR 60.41b
EU-2003	Heat input capacity less than 100 MMBtu/hr
A-602A burner	Process heater as defined at 40 CFR 60.41b in normal operation, not a steam generating unit when burning natural gas for preheat
A-602B burner	Process heater as defined at 40 CFR 60.41b in normal operation, not a steam generating unit when burning natural gas for preheat
A-605A tail gas incinerator	Heat input capacity less than 100 MMBtu/hr
A-605B tail gas incinerator	Heat input capacity less than 100 MMBtu/hr
HP Flare	Not a steam generating unit as defined at 40 CFR 60.41b
LP Flare	Not a steam generating unit as defined at 40 CFR 60.41b
Sulfur Block Flare	Not a steam generating unit as defined at 40 CFR 60.41b
Loading Flare	Not a steam generating unit as defined at 40 CFR 60.41b
EU-6000	Heat input capacity less than 100 MMBtu/hr
EU-7001	Process heater as defined at 40 CFR 60.41b
EU-7002	Process heater as defined at 40 CFR 60.41b

- (2) The fractionator heater, EU-2004, is subject to the Standards of Performance for Industrial-Commercial-Institutional Steam Generating Units, 40 CFR 60, Subpart Db and 326 IAC 12, because it is a steam generating unit as defined at 40 CFR 60.41b for which construction commenced after June 9, 1989 that has a maximum design heat input capacity of greater than 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/h)).

The following definitions from 40 CFR 60.41 b are applicable. *Heat transfer medium* means any material that is used to transfer heat from one point to another point. *Steam generating unit* means a device that combusts any fuel or byproduct/waste and produces steam or heats water or heats any heat transfer medium. This term includes any municipal-type solid waste incinerator with a heat recovery steam generating unit or any steam generating unit that combusts fuel and is part of a cogeneration system or a combined cycle system. This term does not include process heaters as they are defined in this subpart. *Process heater* means a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst.

The units subject to this rule include the following:

- One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.

EU-2004 is not a process heater as defined at 40 CFR 60.41b. The unit is not a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst. The unit heats material for an equilibrium stage-type separation process.

Fractionator heater EU-2004 is subject to the following portions of Subpart Db.

- (A) 40 CFR 60.40b(a)
- (B) 40 CFR 60.40b(c)
- (C) 40 CFR 60.40b(g)
- (D) 40 CFR 60.40b(j)
- (E) 40 CFR 60.41b
- (F) 40 CFR 60.44b(a)(1)
- (G) 40 CFR 63.44b(c)
- (H) 40 CFR 63.44b(e)
- (I) 40 CFR 60.44b(f)
- (J) 40 CFR 60.44b(h)
- (K) 40 CFR 60.44b(i)
- (L) 40 CFR 60.46b(a)
- (M) 40 CFR 60.46b(c)
- (N) 40 CFR 60.46b(e)
- (O) 40 CFR 60.48b(b)
- (P) 40 CFR 60.48b(c)
- (Q) 40 CFR 60.48b(d)
- (R) 40 CFR 60.48b(e)(2)
- (S) 40 CFR 60.48b(f)
- (T) 40 CFR 60.49b

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to fractionator heater EU-2004 except as otherwise specified in 40 CFR 60, Subpart Db.

(e) 40 CFR 60, Subpart Dc

(1) The requirements of the Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units, 40 CFR 60, Subpart Dc and 326 IAC 12, are not included in the permit for the units listed in the table below for the reasons shown in the table.

Unit	Reason Not Subject
EU-1007	Not a steam generating unit as defined at 40 CFR 60.41c
EU-2001	Heat input capacity greater than 100 MMBtu/hr and a process heater as defined at 40 CFR 60.41c
EU-2002	Process heater as defined at 40 CFR 60.41c
EU-2003	Heat input capacity less than 10 MMBtu/hr
EU-2004	Heat input capacity greater than 100 MMBtu/hr
A-602A burner	Process heater as defined at 40 CFR 60.41c in normal operation, not a steam generating unit when burning natural gas for preheat
A-602B burner	Process heater as defined at 40 CFR 60.41c in normal operation, not a steam generating unit when burning natural gas for preheat
HP Flare	Not a steam generating unit as defined at 40 CFR 60.41c
LP Flare	Not a steam generating unit as defined at 40 CFR 60.41c
Sulfur Block Flare	Not a steam generating unit as defined at 40 CFR 60.41c
Loading Flare	Not a steam generating unit as defined at 40 CFR 60.41c
EU-7001	Heat input capacity greater than 100 MMBtu/hr
EU-7002	Heat input capacity greater than 100 MMBtu/hr

(2) The tail gas incinerators (A-605A and A-605B) and package boiler, EU-6000, are subject to the Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units, 40 CFR 60, Subpart Dc and 326 IAC 12, because each is a steam generating unit as defined at 40 CFR 60.41c for which construction commenced after

June 9, 1989 that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/h)) or less, but greater than or equal to 2.9 MW (10 MMBtu/h). The units subject to this rule include the following:

- One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
- One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
- One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
- One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.
- One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.

The units are subject to the following portions of Subpart Dc.

- (A) 40 CFR 60.40c(a)
- (B) 40 CFR 60.40c(b)
- (C) 40 CFR 60.40c(h)
- (D) 40 CFR 60.41c
- (E) 40 CFR 60.48c

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to boiler EU-6000 except as otherwise specified in 40 CFR 60, Subpart Dc.

- (f) The requirements of the Standards of Performance for Sulfuric Acid Plants, 40 CFR 60, Subpart H and 326 IAC 12, are not included in the permit for the sulfur recovery units, because the units are not sulfuric acid production units as defined at 40 CFR 60.81(a).
- (g) The requirements of the Standards of Performance for Petroleum Refineries, 40 CFR 60, Subpart J and 326 IAC 12, are not included in the permit for the flares, fuel gas combustion units, and Claus sulfur recovery plant units listed in paragraph (h), because the units commenced construction after May 14, 2007
- (h) This source is subject to the Standards of Performance for Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After May 14, 2007, 40 CFR 60, Subpart Ja and 326 IAC 12, because the source is a facility engaged in producing distillate fuel oils or other products through distillation of petroleum or through redistillation, cracking or reforming of unfinished petroleum derivatives. As defined at 40 CFR 60.101a, *Petroleum* means the crude oil removed from the earth and the oils derived from tar sands, shale, and coal.

According to an applicability determination by U.S. EPA (U.S. EPA Applicability Determination Index control number J015, Mr. Edward Reich, Division of Stationary Source Enforcement, EPA to

Mr. Jim Snyder, Region 3, EPA, March 19, 1980) Subpart J was applicable to processes for converting coal to hydrocarbon liquids:

"... The SRC II process generally utilizes a more typical refining process with the final product a liquid. This product would fall under the definition of petroleum in 60.101(b). Therefore, if any of the affected facilities mentioned in section 60.100(a) are used in this process, the NSPS for petroleum refineries would be applicable. ..."

SRC II was one of a number of direct coal liquefaction processes, including the Kohleol process developed jointly by Ruhrkohle and VEBA. All are applications of the process invented by Friedrich Bergius in 1913 (ref: S. Vasireddy, et al., "Clean Liquid Fuels from Direct Coal Liquefaction: Chemistry, Catalysis, Technological Status and Challenges", Energy & Environmental Science, 2011(4), February 311-345; see also: Technology Status Report 010 - Coal Liquefaction, Department of Trade and Industry, London, October 1999).

The liquid phase hydrocracking (LPH) operation, gas phase hydrotreating (GPH) operation, and hydrogen production plant are not affected facilities under this subpart. These operations are not fluid catalytic cracking units (FCCU), fluid coking units (FCU), or delayed coking units. These operations are not described by the following definitions from 40 CFR 60.101a:

*Delayed coking unit* means a refinery process unit in which high molecular weight petroleum derivatives are thermally cracked and petroleum coke is produced in a series of closed, batch system reactors.

*Fluid catalytic cracking unit* means a refinery process unit in which petroleum derivatives are continuously charged and hydrocarbon molecules in the presence of a catalyst suspended in a fluidized bed are fractured into smaller molecules, or react with a contact material suspended in a fluidized bed to improve feedstock quality for additional processing and the catalyst or contact material is continuously regenerated by burning off coke and other deposits.

*Fluid coking unit* means a refinery process unit in which high molecular weight petroleum derivatives are thermally cracked and petroleum coke is continuously produced in a fluidized bed system.

LPH is a hydrogen cracking reaction, not thermal cracking, and the LPH process does not regenerate a catalyst. Hydrotreating stages in the GPH reactor are not cracking processes. Hydrotreating removes sulfur, nitrogen, oxygen, and halogens and to convert olefin and acetylene bonds to saturated forms. The GPH operation includes hydrocracking stages, which are, like the LPH process, not thermal cracking and do not regenerate catalysts.

The hydrogen plant reactors are not fuel combustion units as defined at 40 CFR 60.101a. Natural gas and fractionator overhead are supplied to the hydrogen plant as feed for a catalytic reaction to produce gaseous hydrogen used in other operations and carbon monoxide, with additional hydrogen produced from carbon monoxide by the water gas reaction. The reactions in the hydrogen plant are thus a process that creates a product rather than the combustion of a fuel to generate heat. As noted below, radiant heating sections of the reformer, where fuel gas and PSA tail gas are combusted, are not excluded from Subpart Ja. See the applicability determination by U.S. EPA (U.S. EPA Applicability Determination Index control number Z080005, Ms. Cynthia Reynolds, Region 8, EPA to Mr. Phillip Preston, Hyperion Energy, LLC, November 20, 2008).

The units subject to this rule include the following:

- One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a

maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.

- One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.
- One (1) natural gas and process fuel gas-fired indirect treat gas heater, identified as EU-2002, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 52.8 MMBtu/hr (HHV), receiving hydrogen from Block 7000 and discharging to the 1st stage reactors, exhausting to stack EU-2002.
- One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003.
- One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.
- One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:
  - (1) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (2) One (1) two-stage low pressure absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- Sulfur recovery operations, identified as Block 3000, consisting of:
  - (1) Amine Regeneration Unit, consisting of:
    - (A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams

vented to the Block 4000 sulfur flare.

- (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (2) Sour Water Stripping System, consisting of:
- (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
    - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
    - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
    - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
    - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
    - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.

- (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

- Flares, as follows:
  - (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2018 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
  - (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
  - (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
  - (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2018 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.
- One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.
- Hydrogen unit operations, identified as Block 7000, as follows:
  - (1) Hydrogen Plant 1, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
    - (C) One (1) reformer system, consisting of:
      - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
  - (2) Hydrogen Plant 2, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
    - (C) One (1) reformer system, consisting of:
      - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.

This source is subject to the following portions of Subpart Ja.

- (1) 40 CFR 60.100a
- (2) 40 CFR 60.101a
- (3) 40 CFR 60.102a(a)
- (4) 40 CFR 60.102a(f)(1)
- (5) 40 CFR 60.102a(g)
- (6) 40 CFR 60.103a(a)
- (7) 40 CFR 60.103a(b)
- (8) 40 CFR 60.103a(c)
- (9) 40 CFR 60.103a(d)
- (10) 40 CFR 60.103a(e)
- (11) 40 CFR 60.103a(h)
- (12) 40 CFR 60.103a(j)
- (13) 40 CFR 60.104a(a)
- (14) 40 CFR 60.104a(c)
- (15) 40 CFR 60.104a(h)
- (16) 40 CFR 60.104a(i)
- (17) 40 CFR 60.104a(j)
- (18) 40 CFR 60.106a
- (19) 40 CFR 60.107a(a)
- (20) 40 CFR 60.107a(b)
- (21) 40 CFR 60.107a(c)
- (22) 40 CFR 60.107a(d)
- (23) 40 CFR 60.107a(e)
- (24) 40 CFR 60.107a(f)
- (25) 40 CFR 60.107a(g)
- (26) 40 CFR 60.107a(i)
- (27) 40 CFR 60.108a
- (28) 40 CFR 60.109a

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the source except as otherwise specified in 40 CFR 60, Subpart Ja.

- (i) The requirements of the Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After June 11, 1973, and Prior to May 19, 1978, 40 CFR 60, Subpart K and 326 IAC 12, are not included in the permit for the storage vessels listed in paragraph (k), because the units commenced construction after May 19, 1978.
- (j) The requirements of the Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After May 18, 1978, and Prior to July 23, 1984, 40 CFR 60, Subpart Ka and 326 IAC 12, are not included in the permit for the storage vessels listed in paragraph (k), because the units commenced construction after July 23, 1984.
- (k) This source is subject to the Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984, 40 CFR 60, Subpart Kb and 326 IAC 12, because construction of the storage vessels commenced after July 23, 1984. Applicability of this subpart to each storage vessel is discussed in the table below:

ID	Contents	Capacity (gallons) (m <sup>3</sup> )	Subject	Not Subject	Reason Not Subject
T1	Naphtha product	4,629,879 (17,524)	X		
T2	Naphtha product	4,629,879 (17,524)	X		
T3	Diesel product	4,525,796 (17,130)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T4	Diesel product	4,525,796 (17,130)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T5	Diesel product	4,525,796 (17,130)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T6	Naphtha or diesel product	4,629,879 (17,524)	X		
T7	Molten sulfur	342,367 (1,296)		X	contents not volatile organic liquid (40 CFR 60.111b)
T8	Molten sulfur	342,367 (1,296)		X	contents not volatile organic liquid (40 CFR 60.111b)
T9	Ammonia product (pressurized)	36,720 (17,524)		X	pressure vessel (40 CFR 60.110b(c)(2))
T10	Residue surge tank 1	926,980 (17,524)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T11	Residue surge tank 2	926,980 (3,509)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T12	Residue feed tank	926,980 (3,509)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T13	VGO tank 1	926,980 (3,509)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T14	VGO tank 2	926,980 (3,509)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T15	LPG storage (pressurized)	48,872 (185)		X	pressure vessel (40 CFR 60.110b(c)(2))
T16	Slop tank	4,195,581 (15,880)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T17	Diesel fuel tank	23,775 (90)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T18	Non-phenolic sour water storage tank 1	1,268,026 (4,799)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T19	Non-phenolic sour water storage tank 2	1,268,026 (4,799)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T20	Non-phenolic sour water storage tank 3	1,268,026 (4,799)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))

ID	Contents	Capacity (gallons) (m <sup>3</sup> )	Subject	Not Subject	Reason Not Subject
T21	Phenolic sour water storage tank	40,947 (155)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T22	Stripped non-phenolic sour water surge tank	1,268,026 (4,799)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T23	Stripped phenolic sour water surge tank	13,737 (52)		X	Capacity less than 75 m <sup>3</sup> (40 CFR 60.110b(a))
T24	Amine surge/deinventory tank	63,943 (242)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T25	Fresh amine tank	63,943 (242)		X	maximum true vapor pressure less than 3.5 kPa (40 CFR 60.110b(b))
T26	Amine containment tank	793 (3)		X	Capacity less than 75 m <sup>3</sup> (40 CFR 60.110b(a))
EU-6005	Emergency generator diesel fuel tank	2,000 (8) (nominal)		X	Capacity less than 75 m <sup>3</sup> (40 CFR 60.110b(a))
EU-6007	Emergency fire pump diesel tank	500 (2) (nominal)		X	Capacity less than 75 m <sup>3</sup> (40 CFR 60.110b(a))

Tanks T1, T2, and T6 are subject to the following portions of Subpart Kb.

- (1) 40 CFR 60.110b(a)
- (2) 40 CFR 60.110b(e)
- (3) 40 CFR 60.111b
- (4) 40 CFR 60.112b(a)(1)
- (5) 40 CFR 60.113b(a)
- (6) 40 CFR 60.114b
- (7) 40 CFR 60.115b(a)
- (8) 40 CFR 60.116b
- (9) 40 CFR 60.117b

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to tanks T1, T2, and T6 except as otherwise specified in 40 CFR 60, Subpart Kb.

- (I) The source is subject to the Standards of Performance for Coal Preparation and Processing Plants, 40 CFR 60, Subpart Y and 326 IAC 12, because Block 1000 is a coal preparation and processing plant as defined at 40 CFR 60.251(e) that commenced construction after May 27, 2009. The units subject to this rule include the following:
- Coal handling operations, identified as Block 1000, consisting of:
    - (1) One (1) shelter-type railcar dump unloading facility, identified as EU-1000, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1000, exhausting to stack EU-1000, consisting of:
      - (A) Two (2) enclosed receiving pits, identified as Receiving Pit 1 and Receiving Pit 2, discharging to Receiving Bin 1 and Receiving Bin 2, respectively.

- (B) Two (2) enclosed receiving bins, identified as Receiving Bin 1 and Receiving Bin 2, discharging to Drag Flight Feeder 1 and Drag Flight Feeder 2, respectively, with water spray dust suppression systems.
  - (C) Two (2) enclosed drag flight feeders, identified as Drag Flight Feeder 1 and Drag Flight Feeder 2, discharging to the Unloading Conveyor, with water spray dust suppression systems.
- (2) One (1) enclosed rail unloading conveyor discharging to Transfer Station 1, identified as Unloading Conveyor, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.
  - (3) One (1) enclosed transfer station discharging to Conveyor 1, Conveyor 2, or Conveyor 9, identified as Transfer Station (EU-1001), approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.
  - (4) One (1) enclosed feed conveyor discharging to Stacker 1 Boom Conveyor/Chute, identified as Conveyor 1, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (5) One (1) enclosed stacker boom conveyor discharging to Coal Stockpiles #1A & #1B, identified as Stacker 1 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (6) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #1A and Stockpile #1B, with a maximum capacity of 93,000 tons, controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (7) One (1) enclosed feed conveyor discharging to Stacker 2 Boom Conveyor/Chute, identified as Conveyor 2, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (8) One (1) enclosed stacker boom conveyor/chute discharging to Stockpiles #2A & #2B, identified as Stacker 2 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (9) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #2A and Stockpile #2B, with a maximum capacity of 93,000 tons, controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (10) One (1) reclaimer for Stockpiles #1A & #1B, discharging to Reclaim Conveyor 6, identified as Reclaimer 1, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with emissions controlled by the coal pile total enclosure and Baghouse EU-1006.

- (11) One (1) enclosed reclaimer conveyor, identified as Conveyor 6 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.
  - (12) One (1) reclaimer for Stockpiles #2A & #2B, discharging to Reclaim Conveyor 7, identified as Reclaimer 2, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by the coal storage pile enclosure and baghouse EU-1006.
  - (13) One (1) enclosed reclaimer conveyor, identified as Conveyor 7, discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.
  - (14) One (1) enclosed transfer station conveyor, identified as Conveyor 9 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.
  - (15) One (1) enclosed reclaim transfer structure discharging to Reclaim Conveyor 8, identified as Reclaim Transfer Station (EU-1006), approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.
  - (17) One (1) enclosed coal mill conveyor, identified as Reclaim Conveyor 8, discharging to the Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with emissions controlled the Coal Dryer Baghouse.
- Coal drying loop, collectively identified as EU-1008, with emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008, consisting of the following:
    - (1) One (1) enclosed coal mill and pulverizer, identified as Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer, with particulate emissions controlled the Coal Dryer Baghouse.
    - (2) One (1) enclosed coal dryer, identified as Coal Dryer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer Baghouse, with particulate emissions controlled by the Coal Dryer Baghouse.
    - (3) One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.
    - (4) One (1) process baghouse, identified as Coal Dryer Baghouse, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging fines to the Block 2000 Coal Hopper, exhausting particulate and filtered nitrogen to the condenser.

- (5) One (1) water-cooled condenser, identified as Drying Loop Condenser, approved in 2018 for construction, with a nominal capacity of 40 MMBtu/hr, controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008.
- VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
  - (1) One (1) enclosed hopper receiving coal from Block 1000 Coal Dryer Baghouse and discharging to the Feed Prep Screw Conveyor, identified as Coal Hopper, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year.
  - (2) One (1) enclosed screw conveyor, identified as Closed Screw Conveyor, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Feed Premix Drum, identified as Closed Screw Conveyor, with particulate emissions controlled by the Coal Handling System Filter, exhausting to stack EU-2005.

The units are subject to the following portions of Subpart Y.

- (1) 40 CFR 60.250(a)
- (2) 40 CFR 60.250(d)
- (3) 40 CFR 60.251
- (4) 40 CFR 60.252(b)(1)
- (5) 40 CFR 60.252(b)(2)(iii)
- (6) 40 CFR 60.252(b)(3)
- (7) 40 CFR 60.252(c)
- (8) 40 CFR 60.254(b)
- (9) 40 CFR 60.255(b)
- (10) 40 CFR 60.255(c)
- (11) 40 CFR 60.255(d)
- (12) 40 CFR 60.255(e)
- (13) 40 CFR 60.255(f)
- (14) 40 CFR 60.255(g)
- (15) 40 CFR 60.256(b)
- (16) 40 CFR 60.256(c)
- (17) 40 CFR 60.257
- (18) 40 CFR 60.258

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the units except as otherwise specified in 40 CFR 60, Subpart Y.

- (m) The requirements of the Standards of Performance for Metallic Mineral Processing Plants, 40 CFR 60, Subpart LL and 326 IAC 12, are not included in the permit for Block 1500 additive handling and storage operations, the Block 2000 additive preparation operations, or the Block 6500 lime handling and storage operations because the operations are not a metallic mineral processing plant as defined at 40 CFR 60.381. The operations do not produce metallic mineral concentrates from ores.
- (n) The requirements of the Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for which Construction, Reconstruction, or Modification Commenced After January 5, 1981, and on or Before November 7, 2006, 40 CFR 60, Subpart VV and 326 IAC 12, are not included in the permit for the source, because the source commenced construction after November 7, 2006.
- (o) The requirements of the Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006, 40 CFR 60, Subpart VVa and 326 IAC 12, are

not included in the permit for the source, because the source is not in the synthetic organic chemical manufacturing industry as defined at 40 CFR 60.481a. The source does not produce, as an intermediate or final product, one or more of the chemicals listed in 40 CFR 60.489.

- (p) The requirements of the Standards of Performance for Bulk Gasoline Terminals, 40 CFR 60, Subpart XX and 326 IAC 12, are not included in the permit for the Product Loading Rack, because the source is not a bulk gasoline terminal as defined at 40 CFR 60.501. The source does not receive gasoline by pipeline, ship, or barge.
- (q) The requirements of the Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for which Construction, Reconstruction, or Modification Commenced After January 4, 1983, and on or Before November 7, 2006, 40 CFR 60, Subpart GGG and 326 IAC 12, are not included in the permit for this source, because the source commenced construction after November 7, 2006.
- (r) This source is subject to the Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006, 40 CFR 60, Subpart GGGa and 326 IAC 12, because the source is a facility engaged in producing distillate fuel oils or other products through distillation of petroleum or through redistillation, cracking or reforming of unfinished petroleum derivatives. As defined at 40 CFR 60.591a, *Petroleum* means the crude oil removed from the earth and the oils derived from tar sands, shale, and coal.

The treat gas heater, EU-2002, is not in VOC service. The fluid stream heated in the unit can be reasonably expected always to exceed 50 percent hydrogen by volume. Therefore Subpart GGGa is not applicable to this unit.

The facilities subject to this rule include the group of all the equipment (defined in § 60.591a) within each of the following process units:

- VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
  - (5) One (1) nitrogen-blanketed Na<sub>2</sub>S slurry preparation system, identified as Na<sub>2</sub>S Slurry Preparation, approved in 2018 for construction, with a maximum capacity of 0.077 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Na<sub>2</sub>S Handling System Filter, exhausting to stack EU-2008, consisting of:
    - (C) One (1) nitrogen-blanketed mixing drum for Na<sub>2</sub>S and Block 2000 vacuum tower VGO (vacuum gas oil) discharging to the feed premix drum.
  - (6) One (1) feed premix drum, identified as Feed Premix Drum, approved in 2018 for construction, receiving coal, solid additives, and recycled vacuum gas oil (VGO) and discharging to the feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (7) One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.
  - (9) One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2018 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (10) One (1) hot separator, identified as Hot Separator, approved in 2018 for

construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

- (11) One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003
  - (12) One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2018 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (13) One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2018 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (14) One (1) cold separator, identified as Cold Separator, approved in 2018 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (15) One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.
  - (16) One (1) fractionator tower, identified as Fractionator Tower, approved in 2018 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:
    - (A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) two-stage low pressure absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- Sulfur recovery operations, identified as Block 3000, consisting of:
    - (1) Amine Regeneration Unit, consisting of:
      - (A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat

- Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (2) Sour Water Stripping System, consisting of:
- (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.

- (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.

- (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.
- Offsites operations, identified as Block 4000, consisting of:
    - (1) Flares, as follows:
      - (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2018 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
      - (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
      - (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
      - (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2018 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.

(2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )
T1	IFR	Naphtha product	4,629,879 (17,524)
T2	IFR	Naphtha product	4,629,879 (17,524)
T3	FR	Diesel product	4,525,796 (17,130)

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )
T4	FR	Diesel product	4,525,796 (17,130)
T5	FR	Diesel product	4,525,796 (17,130)
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)
T10	FR	Residue surge tank 1	926,980 (3,509)
T11	FR	Residue surge tank 2	926,980 (3,509)
T12	FR	Residue feed tank	926,980 (3,509)
T13	FR	VGO tank 1	926,980 (3,509)
T14	FR	VGO tank 2	926,980 (3,509)
T15	FR	LPG storage (pressurized)	48,872 (185)

Notes:

1. FR - fixed roof, IFR - internal floating roof

(3) Loading operations, as follows:

(A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.

- Hydrogen unit operations, identified as Block 7000, as follows:

(1) Hydrogen Plant 1, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:

(B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2018 for construction, consisting of

- (i) One (1) hydrogenation reactor.
- (ii) One (1) hydrogen sulfide adsorber.

(C) One (1) reformer system, consisting of:

- (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
- (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.

(D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2018 for construction, using no controls and discharging

shift gas to the pressure swing adsorber.

- (2) Hydrogen Plant 2, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
  - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2018 for construction, consisting of
    - (i) One (1) hydrogenation reactor.
    - (ii) One (1) hydrogen sulfide adsorber.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
    - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
  - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2018 for construction, using no controls and discharging shift gas to the pressure swing adsorber.

Note: Pursuant to 40 CFR 60.590a(e), owners or operators are not required to comply with the definition of "process unit" in § 60.591 of this subpart until the EPA takes final action to require compliance and publishes a document in the Federal Register. While the definition of "process unit" is stayed, owners or operators should use the following definition:

*Process unit* means components assembled to produce intermediate or final products from petroleum, unfinished petroleum derivatives, or other intermediates; a process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the product.

This exclusion affects storage vessels, product transfer racks, and connected ducts and piping.

This source is subject to the following portions of Subpart GGGa.

- (1) 40 CFR 60.590a
- (2) 40 CFR 60.591a
- (3) 40 CFR 60.592a
- (4) 40 CFR 60.593a

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the source except as otherwise specified in 40 CFR 60, Subpart GGGa.

- (s) The vacuum distillation tower and fractionator tower are subject to the Standards of Performance for Volatile Organic Compound (VOC) Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Distillation Operations, 40 CFR 60, Subpart NNN and 326 IAC 12, because the units are part of a process unit that produces one or more of the chemicals listed in 40 CFR 60.667 as a product, co-product, byproduct, or intermediate. The units subject to this rule include the following:

- One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2018 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
- One (1) fractionator tower, identified as Fractionator Tower, approved in 2018 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

The vacuum distillation tower and fractionator tower are subject to the following portions of Subpart NNN.

- (1) 40 CFR 60.660(a)
- (2) 40 CFR 60.660(b)(3)
- (3) 40 CFR 60.660(c)(4)
- (4) 40 CFR 60.661
- (5) 40 CFR 60.662
- (6) 40 CFR 60.663(f)
- (7) 40 CFR 60.664
- (8) 40 CFR 60.665
- (9) 40 CFR 60.666
- (10) 40 CFR 60.667
- (11) 40 CFR 60.668

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the vacuum distillation tower and fractionator tower except as otherwise specified in 40 CFR 60, Subpart NNN.

(y) 40 CFR 60, Subpart OOO

- (1) The requirements of the Standards of Performance for Nonmetallic Mineral Processing Plants, 40 CFR 60, Subpart OOO and 326 IAC 12, are not included in the permit for the enclosed coal mill and pulverizer, because coal is not a nonmetallic mineral as defined at 40 CFR 60.671.
- (2) The requirements of the Standards of Performance for Nonmetallic Mineral Processing Plants, 40 CFR 60, Subpart OOO and 326 IAC 12, are not included in the permit for the operations listed in the table below, because the units are not nonmetallic mineral processing plants as defined at 40 CFR 60.671. The units are not equipment that is used to crush or grind any nonmetallic mineral as defined at 40 CFR 60.671.

Units Not Subject to Subpart OOO
Three (3) pneumatic (nitrogen) truck unloading systems discharging to storage silos, identified as Sodium Sulfide (Na <sub>2</sub> S) Unloading, Fine Additive Unloading, and Coarse Additive Unloading
One (1) Na <sub>2</sub> S silo, identified as T35
One (1) fine additive silo, identified as T33
One (1) coarse additive silo
One (1) enclosed screw conveyor discharging to the Feed Premix Drum, identified as Closed Screw Conveyor
One (1) nitrogen-blanketed Na <sub>2</sub> S slurry preparation system
One (1) nitrogen-blanketed fine additive transfer system discharging to the Block 2000 feed premix drum, identified as Fine Additive Transfer
One (1) feed premix drum receiving coal, solid additives, and recycled vacuum gas oil (VGO)

Units Not Subject to Subpart OOO
Block 6500 pneumatic lime truck unloading system
One (1) lime storage silo, identified as EU-6501

(3) The requirements of the Standards of Performance for Nonmetallic Mineral Processing Plants, 40 CFR 60, Subpart OOO and 326 IAC 12, are not included in the permit for the Block 1500 fine additive production system, because the unit is not a nonmetallic mineral processing plant as defined at 40 CFR 60.671. The unit does not crush or grind any nonmetallic mineral listed in 40 CFR 60.671 or a mixture of which the majority is any of the listed minerals. The solid additive is predominantly a byproduct of bauxite processing commonly known as red mud.

(u) This source is subject to the Standards of Performance for VOC Emissions From Petroleum Refinery Wastewater Systems, 40 CFR 60, Subpart QQQ and 326 IAC 12, because the source is a petroleum refinery for which construction commenced after May 4, 1987. The units subject to this rule include the following:

Pursuant to 40 CFR 63.640(o)(1), a Group 1 wastewater stream managed in a piece of equipment that is also subject to the provisions of 40 CFR 63, Subpart CC is required to comply only with that subpart.

- Offsites operations, identified as Block 4000, consisting of:

(2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T16	FR	Slop tank	4,195,581 (15,880)	LP flare

1. FR - fixed roof, IFR - internal floating roof, HPV-horizontal pressure vessel  
 2. Tank vents to flares are part of sweep and pilot gas streams.

- Wastewater treatment operations, identified as Block 8000, as follows:
  - (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
  - (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
  - (3) One (1) wastewater junction box with, identified as MH1, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.
  - (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
  - (5) One (1) biological wastewater treatment system, approved in 2018 for construction, with emissions exhausting to vent EU-8001.

This source is subject to the following portions of Subpart QQQ.

- (1) 40 CFR 60.690

- (2) 40 CFR 60.691
- (3) 40 CFR 60.692-1
- (4) 40 CFR 60.692-2
- (5) 40 CFR 60.692-3
- (6) 40 CFR 60.692-4
- (7) 40 CFR 60.692-5
- (8) 40 CFR 60.692-6
- (9) 40 CFR 60.692-7
- (10) 40 CFR 60.693-1
- (11) 40 CFR 60.693-2
- (12) 40 CFR 60.694
- (13) 40 CFR 60.695
- (14) 40 CFR 60.696
- (15) 40 CFR 60.697
- (16) 40 CFR 60.698
- (17) 40 CFR 60.699

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the source except as otherwise specified in 40 CFR 60, Subpart QQQ.

- (v) The first stage reactor - liquid phase hydrocracking system and second stage reactor - gas phase hydrotreating system are subject to the Standards of Performance for Volatile Organic Compound Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Reactor Processes, 40 CFR 60, Subpart RRR and 326 IAC 12, because the units are reactor processes that are part of a process unit that produces one or more of the chemicals listed in 40 CFR 60.707 as a product, co-product, byproduct, or intermediate. The source will produce benzene, which is listed in 40 CFR 60.707, as a byproduct of the VCC process. The units subject to this rule include the following:

- One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2018 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
- One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2018 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

The first stage reactor - liquid phase hydrocracking system and second stage reactor - gas phase hydrotreating system are subject to the following portions of Subpart RRR.

- (1) 40 CFR 60.700(a)
- (2) 40 CFR 60.700(b)(3)
- (3) 40 CFR 60.700(c)(5)
- (4) 40 CFR 60.701
- (5) 40 CFR 60.705(r)
- (6) 40 CFR 60.706
- (7) 40 CFR 60.707
- (8) 40 CFR 60.708

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the first stage reactor - liquid phase hydrocracking system and second stage reactor - gas phase hydrotreating system except as otherwise specified in 40 CFR 60, Subpart RRR.

- (w) The emergency generator and emergency fire pump are subject to the Standards of Performance for Stationary Compression Ignition Internal Combustion Engines, 40 CFR 60, Subpart IIII and 326 IAC 12, because the units are stationary compression ignition internal combustion engines that commenced construction after July 11, 2005.

Based on this evaluation, this source is subject to 40 CFR 60, Subpart IIII. On May 4, 2016, the U.S. Court of Appeals for the D.C. Circuit issued a mandate vacating paragraphs 40 CFR 60.4211(f)(2)(ii) - (iii) of NSPS Subpart IIII. Therefore, these paragraphs no longer have any legal effect and any engine that is operated for purposes specified in these paragraphs becomes a non-emergency engine and must comply with all applicable requirements for a non-emergency engine.

For additional information, please refer to the USEPA's Guidance Memo:  
<https://www.epa.gov/sites/production/files/2016-06/documents/ricevacaturguidance041516.pdf>

Since the federal rule has not been updated to remove these vacated requirements, the text below shows the vacated language as ~~strike~~through text. At this time, IDEM is not making any changes to the permit's attachment due to this vacatur. However, the permit will not reference the vacated requirements, as applicable.

40 CFR 60.4211(f)(2) You may operate your emergency stationary ICE for any combination of the purposes specified in paragraphs (f)(2)(i) ~~through (iii)~~ of this section for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by paragraph (f)(3) of this section counts as part of the 100 hours per calendar year allowed by this paragraph (f)(2).

- (i) Emergency stationary ICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by federal, state or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Administrator for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that federal, state, or local standards require maintenance and testing of emergency ICE beyond 100 hours per calendar year.
- ~~(ii) Emergency stationary ICE may be operated for emergency demand response for periods in which the Reliability Coordinator under the North American Electric Reliability Corporation (NERC) Reliability Standard EOP-002-3, Capacity and Energy Emergencies (incorporated by reference, see §60.17), or other authorized entity as determined by the Reliability Coordinator, has declared an Energy Emergency Alert Level 2 as defined in the NERC Reliability Standard EOP-002-3.~~
- ~~(iii) Emergency stationary ICE may be operated for periods where there is a deviation of voltage or frequency of 5 percent or greater below standard voltage or frequency.~~

The units subject to this rule include the following:

- One (1) diesel engine-driven emergency generator, identified as EU-6006, approved in 2018 for construction, with a maximum heat input capacity of 19.60 MMBtu/hr (2,800 hp) (average heating value), using no add-on controls and exhausting to stack EU-6006.
- One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2018 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), using no add-on controls and exhausting to stack EU-6008.

The units are subject to the following portions of Subpart IIII.

- (1) 40 CFR 60.4200(a)(2)
- (2) 40 CFR 60.4200(a)(4)
- (3) 40 CFR 60.4205(b)
- (4) 40 CFR 60.4205(c)
- (5) 40 CFR 60.4206

- (6) 40 CFR 60.4207(b)
- (7) 40 CFR 60.4208(a)
- (8) 40 CFR 60.4209(a)
- (9) 40 CFR 60.4211(a)
- (10) 40 CFR 60.4211(c)
- (11) 40 CFR 60.4211(f)(1)
- (12) 40 CFR 60.4211(f)(2)(i)
- (13) 40 CFR 60.4211(f)(3)
- (14) 40 CFR 60.4211(g)(2)
- (15) 40 CFR 60.4211(g)(3)
- (16) 40 CFR 60.4214(b)
- (17) 40 CFR 60.4218
- (18) 40 CFR 60.4219
- (19) Table 4 to Subpart IIII of Part 60
- (20) Table 5 to Subpart IIII of Part 60
- (21) Table 8 to Subpart IIII of Part 60

The requirements of 40 CFR Part 60, Subpart A – General Provisions, which are incorporated as 326 IAC 12-1, apply to the emergency generator and emergency fire pump except as otherwise specified in 40 CFR 60, Subpart IIII.

- (x) There are no other New Source Performance Standards (40 CFR Part 60) and 326 IAC 12 included in the permit for this proposed new source.

**National Emission Standards for Hazardous Air Pollutants (NESHAP):**

- (a) The requirements of the National Emission Standard for Equipment Leaks (Fugitive Emission Sources) of Benzene, 40 CFR 61, Subpart J, 326 IAC 14-7 are not included in the permit. The source has no equipment in benzene service as defined at 40 CFR 61.111. *In benzene service* means that a piece of equipment either contains or contacts a fluid (Liquid or gas) that is at least 10 percent benzene by weight as determined according to the provisions of §61.245(d). The provisions of §61.245(d) also specify how to determine that a piece of equipment is not in benzene service. Based on information provided by the licensor, the benzene content of products is expected to be less than 2% by weight
- (b) The requirements of the National Emission Standard for Equipment Leaks (Fugitive Emission Sources), 40 CFR 61, Subpart V, 326 IAC 14-8-1 are not included in the permit. The source is not subject to provisions of 40 CFR 61 that reference this subpart.
- (c) The loading rack, is subject to the National Emission Standard for Benzene Emissions From Benzene Transfer Operations, 40 CFR 61, Subpart BB, when loading naphtha because the unit is a loading rack at which naphtha product containing benzene is loaded into railcars. Based on information provided by the licensor, the benzene content of products is expected to be less than 2% by weight. The units subject to this rule include the following:
- One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.

The Product Loading Rack is subject to the following portions of Subpart BB:

- (1) 40 CFR 61.300(a)
  - (2) 40 CFR 61.300(b)
  - (3) 40 CFR 61.305(i)
- (d) This source is subject to the National Emission Standards for Benzene Waste Operations, 40 CFR 61, Subpart FF, because the source is a petroleum refinery as defined in 40 CFR 61.341. The units subject to this rule include the following:

- Sulfur recovery operations, identified as Block 3000, consisting of:
  - (1) Sour Water Stripping System, consisting of:
    - (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  
- Offsites operations, identified as Block 4000, consisting of:
  - (1) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T16	FR	Slop tank	4,195,581 (15,880)	LP flare
T18	FR	Non-phenolic sour water storage tank 1	1,268,026 (4,799)	SB flare
T19	FR	Non-phenolic sour water storage tank 2	1,268,026 (4,799)	SB flare
T20	FR	Non-phenolic sour water storage tank 3	1,268,026 (4,799)	SB flare
T21	FR	Phenolic sour water storage tank	40,947 (155)	SB flare

- Wastewater treatment operations, identified as Block 8000, as follows:
  - (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
  - (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
  - (3) One (1) wastewater junction box with, identified as MH1, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.
  - (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
  - (5) One (1) biological wastewater treatment system, approved in 2018 for construction, with emissions exhausting to vent EU-8001.

This source is subject to the following portions of Subpart FF:

- (1) 40 CFR 61.340
- (2) 40 CFR 61.341
- (3) 40 CFR 61.342
- (4) 40 CFR 61.343
- (5) 40 CFR 61.346
- (6) 40 CFR 61.347
- (7) 40 CFR 61.348
- (8) 40 CFR 61.349
- (9) 40 CFR 61.350
- (10) 40 CFR 61.351
- (11) 40 CFR 61.352
- (12) 40 CFR 61.353
- (13) 40 CFR 61.354
- (14) 40 CFR 61.355
- (15) 40 CFR 61.356
- (16) 40 CFR 61.357
- (17) 40 CFR 61.358

The requirements of 40 CFR Part 61, Subpart A – General Provisions, which are incorporated as 326 IAC 14-1, apply to the source except as otherwise specified in 40 CFR 61, Subpart FF.

- (e) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry, 40 CFR 63, Subpart F and 326 IAC 20-11 are not included in the permit for this source, since the source does not manufacture as a primary product one or more of the chemicals listed in 40 CFR 63.100(b)(1)(i) or(ii).
- (f) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry for Process Vents, Storage Vessels, Transfer Operations, and Wastewater, 40 CFR 63, Subpart G and 326 IAC 20-11 are not included in the permit for this source, since the source is not subject to 40 CFR 63, Subpart F.
- (g) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From the Synthetic Organic Chemical Manufacturing Industry for Equipment Leaks, 40 CFR 63, Subpart H, 326 IAC 20-11, and 326 IAC 20-12 are not included in the permit. The source is not subject to provisions of 40 CFR 63, Subpart CC that reference this subpart. Pursuant to 40 CFR 63.640(p)(2), equipment leaks subject to 40 CFR 63, Subpart CC that are also subject to 40 CFR 60, Subpart GGGa are required to comply only with the provisions specified in 40 CFR 60, Subpart GGGa.
- (h) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) for Industrial Process Cooling Towers, 40 CFR 63, Subpart Q and 326 IAC 20-4 are not included in the permit for the cooling tower (EU-6001, EU-6002, and EU-6003), since the cooling towers are not operated with chromium-based water treatment chemicals.
- (i) The requirements of the National Emission Standards for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations), 40 CFR 63, Subpart R and 326 IAC 20-10 are not included in the permit for the source, since the source is not a bulk gasoline terminal or a pipeline breakout station. The source does not receive gasoline by pipeline, ship or barge. The source is not a facility along a pipeline containing storage vessels used to relieve surges or receive and store gasoline from the pipeline for reinjection and continued transportation by pipeline or to other facilities.
- (j) The requirements of the National Emission Standards for Marine Tank Vessel Loading Operations, 40 CFR 63, Subpart Y and 326 IAC 20-17 are not included in the permit for the source, since the source is not a marine tank vessel loading operation as defined at 40 CFR 63.561.

- (k) This source is subject to the National Emission Standards for Hazardous Air Pollutants From Petroleum Refineries, 40 CFR 63, Subpart CC and 326 IAC 20-16, because the units are petroleum refining process units as defined at 40 CFR 63.641.

This subpart includes a definition of "petroleum refining process units" at 40 CFR 63.641:

*Petroleum refining process unit* means a process unit used in an establishment primarily engaged in petroleum refining as defined in the Standard Industrial Classification code for petroleum refining (2911), and used primarily for the following:

- (1) Producing transportation fuels (such as gasoline, diesel fuels, and jet fuels), heating fuels (such as kerosene, fuel gas distillate, and fuel oils), or lubricants;
- (2) Separating petroleum; or
- (3) Separating, cracking, reacting, or reforming intermediate petroleum streams.
- (4) Examples of such units include, but are not limited to, petroleum-based solvent units, alkylation units, catalytic hydrotreating, catalytic hydrorefining, catalytic hydrocracking, catalytic reforming, catalytic cracking, crude distillation, lube oil processing, hydrogen production, isomerization, polymerization, thermal processes, and blending, sweetening, and treating processes. Petroleum refining process units also include sulfur plants.

The source self-selected an SIC code other than 2911. IDEM considers that the source conforms to all three of the uses specified in paragraphs (1) through (3) and that the source includes several of the processes named in paragraph (4). The definition of SIC code 2911, petroleum refining, from the 1987 SIC Manual is: "Establishments primarily engaged in producing gasoline, kerosene, distillate fuel oils, residual fuel oils, and lubricants, through fractionation or straight distillation of crude oil, redistillation of unfinished petroleum derivatives, cracking or other processes." IDEM recognizes that the source will not distill crude oil, if the term is limited to naturally occurring crude oil extracted from wells. However, the application of "cracking" in the SIC code definition is not qualified with modifying phrases like "of crude oil" or "of unfinished petroleum derivatives." It follows then that vacuum distillation of the liquid phase hydrocracking reactor product is redistillation of unfinished petroleum derivatives because the liquid supplied to the LPH reactor is recycled vacuum gas oil from the fractionator tower. The fractionation tower is itself a redistillation operation because the feed to gas phase hydrotreating reactor consists of unfinished petroleum derivatives that are hydrocracked in the LPH process.

IDEM finds that the direct coal hydrogenation process is an example of cracking or other processes in petroleum refining and that the definition of "petroleum refining process units" in 40 CFR 63.641 is clearly applicable to the source. This determination is consistent with the definitions of "petroleum" and "petroleum refining" in 40 CFR 60.101a, and the EPA determination regarding applicability of the NSPS, 40 CFR 60, Subpart J, to the production of liquid transportation fuels from coal cited in the discussion of the applicability of 40 CFR 60, Subpart Ja to the source.

The treat gas heater, EU-2002, is part of a petroleum refining process unit. However the unit is not considered to emit or have equipment containing or contacting one or more of the hazardous air pollutants listed in table 1 of this Subpart CC. Therefore Subpart CC is not applicable to this unit.

The units subject to this rule include the following:

- VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
  - (5) One (1) nitrogen-blanketed Na<sub>2</sub>S slurry preparation system, identified as Na<sub>2</sub>S Slurry Preparation, approved in 2018 for construction, with a maximum capacity of 0.077 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Na<sub>2</sub>S Handling System Filter, exhausting to stack EU-2008, consisting of:
    - (C) One (1) nitrogen-blanketed mixing drum for Na<sub>2</sub>S and Block 2000 vacuum tower VGO (vacuum gas oil) discharging to the feed premix drum.
  - (6) One (1) feed premix drum, identified as Feed Premix Drum, approved in 2018 for construction, receiving coal, solid additives, and recycled vacuum gas oil (VGO) and discharging to the feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (7) One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.
  - (9) One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2018 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (10) One (1) hot separator, identified as Hot Separator, approved in 2018 for construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (11) One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003
  - (12) One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2018 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (13) One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2018 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (14) One (1) cold separator, identified as Cold Separator, approved in 2018 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
  - (15) One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.

- (16) One (1) fractionator tower, identified as Fractionator Tower, approved in 2018 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.
- (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:
  - (A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) two-stage low pressure absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- Sulfur recovery operations, identified as Block 3000, consisting of:
  - (1) Amine Regeneration Unit, consisting of:
    - (A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (2) Sour Water Stripping System, consisting of:

- (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
    - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
    - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
    - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
    - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
    - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
    - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
    - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
    - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
    - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
  - (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B,

approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.

- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.
- Offsites operations, identified as Block 4000, consisting of:
    - (1) Flares, as follows:
      - (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2018 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
      - (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the

atmosphere.

- (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
- (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2018 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.

(2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )
T1	IFR	Naphtha product	4,629,879 (17,524)
T2	IFR	Naphtha product	4,629,879 (17,524)
T3	FR	Diesel product	4,525,796 (17,130)
T4	FR	Diesel product	4,525,796 (17,130)
T5	FR	Diesel product	4,525,796 (17,130)
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)
T10	FR	Residue surge tank 1	926,980 (3,509)
T11	FR	Residue surge tank 2	926,980 (3,509)
T12	FR	Residue feed tank	926,980 (3,509)
T13	FR	VGO tank 1	926,980 (3,509)
T14	FR	VGO tank 2	926,980 (3,509)
T16	FR	Slop tank	4,195,581 (15,880)
T18	FR	Non-phenolic sour water storage tank 1	1,268,026 (4,799)
T19	FR	Non-phenolic sour water storage tank 2	1,268,026 (4,799)
T20	FR	Non-phenolic sour water storage tank 3	1,268,026 (4,799)
T21	FR	Phenolic sour water storage tank	40,947 (155)
T22	FR	Stripped non-phenolic sour water surge tank	1,268,026 (4,799)
T23	FR	Stripped phenolic sour water surge tank	13,737 (52)

Notes:

1. FR - fixed roof, IFR - internal floating roof

- (3) Loading operations, as follows:
  - (A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.
- Hydrogen unit operations, identified as Block 7000, as follows:
  - (1) Hydrogen Plant 1, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
    - (B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2018 for construction, consisting of
      - (i) One (1) hydrogenation reactor.
      - (ii) One (1) hydrogen sulfide adsorber.
    - (C) One (1) reformer system, consisting of:
      - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
      - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
    - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2018 for construction, using no controls and discharging shift gas to the pressure swing adsorber.
  - (2) Hydrogen Plant 2, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
    - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2018 for construction, consisting of
      - (i) One (1) hydrogenation reactor.
      - (ii) One (1) hydrogen sulfide adsorber.
    - (C) One (1) reformer system, consisting of:
      - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
      - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.

- (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2018 for construction, using no controls and discharging shift gas to the pressure swing adsorber.
- Wastewater treatment operations, identified as Block 8000, as follows:
  - (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
  - (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
  - (3) One (1) wastewater junction box with, identified as MH1, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.
  - (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
  - (5) One (1) biological wastewater treatment system, approved in 2018 for construction, with emissions exhausting to vent EU-8001.

The units are subject to the following portions of Subpart CC:

- (1) 40 CFR 63.640(a)
- (2) 40 CFR 63.640(c)
- (3) 40 CFR 63.640(d)
- (4) 40 CFR 63.640(e)
- (5) 40 CFR 63.640(f)
- (6) 40 CFR 63.640(h)
- (7) 40 CFR 63.640(k)
- (8) 40 CFR 63.640(m)
- (9) 40 CFR 63.640(n)(2)
- (10) 40 CFR 63.640(n)(8)
- (11) 40 CFR 63.640(o)(1)
- (12) 40 CFR 63.640(p)(2)
- (13) 40 CFR 63.641
- (14) 40 CFR 63.642
- (15) 40 CFR 63.643
- (16) 40 CFR 63.644
- (17) 40 CFR 63.645
- (18) 40 CFR 63.647
- (19) 40 CFR 63.654
- (20) 40 CFR 63.655
- (21) 40 CFR 63.656
- (22) 40 CFR 63.658
- (23) 40 CFR 63.670
- (24) 40 CFR 63.671
- (24) Table 11 to Subpart CC of Part 63

The requirements of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated as 326 IAC 20-1, apply to the units except as otherwise specified in 40 CFR 63, Subpart CC.

- (l) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) From Oil and Natural Gas Production Facilities, 40 CFR 63, Subpart HH and 326 IAC 20-30 are not included in the permit for this source, since the source does not process, upgrade, or store natural gas and does not process, upgrade, or store hydrocarbon liquids as defined at 40 CFR 63.761. The liquids processed and stored at the source are not naturally occurring, unrefined petroleum liquids.
- (m) The requirements of the National Emission Standards for Tanks—Level 1, 40 CFR 63, Subpart OO and 326 IAC 20-35 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (n) The requirements of the National Emission Standards for Containers, 40 CFR 63, Subpart PP and 326 IAC 20-36 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (o) The requirements of the National Emission Standards for Surface Impoundments, 40 CFR 63, Subpart QQ and 326 IAC 20-37 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (p) The requirements of the National Emission Standards for Individual Drain Systems, 40 CFR 63, Subpart RR and 326 IAC 20-38 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (q) The requirements of the National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process, 40 CFR 63, Subpart SS and 326 IAC 20-39 are not included in the permit for this source. Pursuant to 40 CFR 63.640(n)(2), Group 1 storage vessels subject to 40 CFR 63, Subpart CC that are also subject to 40 CFR 60, Subpart Kb are required to comply with either 40 CFR part 60, subpart Kb, except as provided in 40 CFR 63.640(n)(8) or with 40 CFR 63, Subpart CC. This source will comply with 40 CFR 60, Subpart Kb, therefore the source is not subject to provisions of 40 CFR 63, Subpart CC that reference this subpart.
- (r) The requirements of the National Emission Standards for Equipment Leaks - Control Level 1, 40 CFR 63, Subpart TT and 326 IAC 20-40 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (s) The requirements of the National Emission Standards for Equipment Leaks - Control Level 2 Standards, 40 CFR 63, Subpart UU and 326 IAC 20-41 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (t) The requirements of the National Emission Standards for Oil-Water Separators and Organic-Water Separators, 40 CFR 63, Subpart VV and 326 IAC 20-42 are not included in the permit for this source, since the source is not subject to another subpart of parts 60, 61, or 63 that references this subpart.
- (u) This source is subject to the National Emission Standards for Storage Vessels (Tanks) - Control Level 2, 40 CFR 63, Subpart WW and 326 IAC 20-43, because the source is subject to Subpart CC, which references this subpart. The units subject to this rule include the following:

- Offsites operations, identified as Block 4000, consisting of:

- (2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )
T3	FR	Diesel product	4,525,796 (17,130)
T4	FR	Diesel product	4,525,796 (17,130)
T5	FR	Diesel product	4,525,796 (17,130)
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)
T10	FR	Residue surge tank 1	926,980 (3,509)
T11	FR	Residue surge tank 2	926,980 (3,509)
T12	FR	Residue feed tank	926,980 (3,509)
T13	FR	VGO tank 1	926,980 (3,509)
T14	FR	VGO tank 2	926,980 (3,509)

These units are subject to the following portions of Subpart WW:

- (1) 40 CFR 63.1060
- (2) 40 CFR 63.1061
- (3) 40 CFR 63.1065(a)
- (4) 40 CFR 63.1067

Note: Tank T6 is subject to these requirements of Subpart WW when containing diesel fuel. When containing naphtha, tank T6 is subject to 40 CFR 60, subpart Kb and is not subject to provisions of 40 CFR 63, Subpart CC that reference this Subpart WW.

The requirements of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated as 326 IAC 20-1, do not apply to this subpart except as specified in a referencing subpart.

- (v) The requirements of the National Emission Standards for Ethylene Manufacturing Process Units: Heat Exchange Systems and Waste Operations, 40 CFR 63, Subpart XX are not included in the permit for this source, since the source does not operate an ethylene production unit or an ethylene production facility referenced to this subpart by subpart YY.
- (w) The requirements of the National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards, 40 CFR 63, Subpart YY and 326 IAC 20-44 are not included in the permit for this source, since the source does not operate an ethylene production unit as defined at 40 CFR 63.1103(e)(2).
- (x) This source is subject to the National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units, 40 CFR 63, Subpart UUU and 326 IAC 20-50, because the source is a petroleum refinery located at a major source of HAP emissions.

Pursuant to 40 CFR 63.1561(a)(1), a petroleum refinery is an establishment engaged primarily in petroleum refining as defined in the Standard Industrial Classification (SIC) code 2911 and the North American Industry Classification (NAIC) code 32411, and used mainly for::

- (i) Producing transportation fuels (such as gasoline, diesel fuels, and jet fuels), heating fuels (such as kerosene, fuel gas distillate, and fuel oils), or lubricants;

- (ii) Separating petroleum; or
- (iii) Separating, cracking, reacting, or reforming an intermediate petroleum stream, or recovering a by-product(s) from the intermediate petroleum stream (e.g., sulfur recovery).

The source self-selected an SIC code other than 2911. IDEM considers that the source conforms to all three of the uses specified in paragraphs (i) through (iii) of 40 CFR 63.1561(a)(1). The definition of SIC code 2911, petroleum refining, from the 1987 SIC Manual is: "Establishments primarily engaged in producing gasoline, kerosene, distillate fuel oils, residual fuel oils, and lubricants, through fractionation or straight distillation of crude oil, redistillation of unfinished petroleum derivatives, cracking or other processes." IDEM recognizes that the source will not distill crude oil, if the term is limited to naturally occurring crude oil extracted from wells. However, the application of "cracking" in the SIC code definition is not qualified with modifying phrases like "of crude oil" or "of unfinished petroleum derivatives." It follows then that vacuum distillation of the liquid phase hydrocracking reactor product is redistillation of unfinished petroleum derivatives because the liquid supplied to the LPH reactor is recycled vacuum gas oil from the fractionator tower. The fractionation tower is itself a redistillation operation because the feed to gas phase hydrotreating reactor consists of unfinished petroleum derivatives that are hydrocracked in the LPH process.

The process vents and bypass lines serving the liquid phase hydrocracking (LPH) operation, gas phase hydrotreating (GPH) operation, and hydrogen production plant are not affected facilities under this subpart. These operations are not fluidized catalytic crack units, catalytic reforming units, or sulfur recovery units as defined at 40 CFR 63.1579. These operations are not described by the following definitions from 40 CFR 63.1579:

*Catalytic cracking unit* means a refinery process unit in which petroleum derivatives are continuously charged; hydrocarbon molecules in the presence of a catalyst suspended in a fluidized bed are fractured into smaller molecules, or react with a contact material suspended in a fluidized bed to improve feedstock quality for additional processing; and the catalyst or contact material is continuously regenerated by burning off coke and other deposits.

*Catalytic reforming unit* means a refinery process unit that reforms or changes the chemical structure of naphtha into higher octane aromatics through the use of a metal catalyst and chemical reactions that include dehydrogenation, isomerization, and hydrogenolysis.

*Sulfur recovery unit* means a process unit that recovers elemental sulfur from gases that contain reduced sulfur compounds and other pollutants, usually by a vapor-phase catalytic reaction of sulfur dioxide and hydrogen sulfide.

The units subject to this rule include the following:

- VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:
  - (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:
    - (A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) two-stage low pressure absorber, approved in 2018 for

construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

- Sulfur recovery operations, identified as Block 3000, consisting of:
  - (1) Amine Regeneration Unit, consisting of:
    - (A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (2) Sour Water Stripping System, consisting of:
    - (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
  - (3) Sulfur Recovery System, consisting of:
    - (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A,

approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.

- (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.

- (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
- (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
- (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
- (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
- (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
- (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
- (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

This source is subject to the following portions of Subpart UUU:

- (1) 40 CFR 63.1560
- (2) 40 CFR 63.1561
- (3) 40 CFR 63.1562(a)
- (4) 40 CFR 63.1562(b)(3)
- (5) 40 CFR 63.1562(b)(4)
- (6) 40 CFR 63.1562(c)
- (7) 40 CFR 63.1563(a)(2)

- (41) Table 44 to Subpart UUU of Part 63

The requirements of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated as 326 IAC 20-1, apply to the units except as otherwise specified in 40 CFR 63, Subpart UUU.

- (y) The requirements of the National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline), 40 CFR 63, Subpart EEEE and 326 IAC 20-83, are not included in the permit for this source, because, pursuant to 40 CFR 63.2338(c)(1), the storage tanks and product loading racks subject to this subpart are part of an affected source under 40 CFR 63, Subpart CC.
- (z) The emergency generator and emergency fire pump are subject to the National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines, 40 CFR 63, Subpart ZZZZ and 326 IAC 20-82, because the units are stationary reciprocating internal combustion engines constructed after December 19, 2002. The units subject to this rule include the following:
  - One (1) diesel engine-driven emergency generator, identified as EU-6006, approved in 2018 for construction, with a maximum heat input capacity of 19.60 MMBtu/hr (2,800 hp) (average heating value), using no add-on controls and exhausting to stack EU-6006.
  - One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2018 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), using no add-on controls and exhausting to stack EU-6008.

Based on this evaluation, this source is subject to 40 CFR 63, Subpart ZZZZ. On May 4, 2016, the U.S. Court of Appeals for the D.C. Circuit issued a mandate vacating paragraphs 40 CFR 63.6640(f)(2)(ii) - (iii) of NESHAP Subpart ZZZZ. Therefore, these paragraphs no longer have any legal effect and any engine that is operated for purposes specified in these paragraphs becomes a non-emergency engine and must comply with all applicable requirements for a non-emergency engine.

For additional information, please refer to the USEPA's Guidance Memo:  
<https://www.epa.gov/sites/production/files/2016-06/documents/ricevacaturguidance041516.pdf>

Since the federal rule has not been updated to remove these vacated requirements, the text below shows the vacated language as ~~struck through~~ text. At this time, IDEM is not making any changes to the permit's attachment due to this vacatur. However, the permit will not reference the vacated requirements, as applicable.

40 CFR 63.6640(f)(2) You may operate your emergency stationary RICE for any combination of the purposes specified in paragraphs (f)(2)(i) ~~through (iii)~~ of this section for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by paragraphs (f)(3) and (4) of this section counts as part of the 100 hours per calendar year allowed by this paragraph (f)(2).

- (i) Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by federal, state or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Administrator for approval of

additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that federal, state, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

~~(ii) Emergency stationary RICE may be operated for emergency demand response for periods in which the Reliability Coordinator under the North American Electric Reliability Corporation (NERC) Reliability Standard EOP-002-3, Capacity and Energy Emergencies (incorporated by reference, see §63.14), or other authorized entity as determined by the Reliability Coordinator, has declared an Energy Emergency Alert Level 2 as defined in the NERC Reliability Standard EOP-002-3.~~

~~(iii) Emergency stationary RICE may be operated for periods where there is a deviation of voltage or frequency of 5 percent or greater below standard voltage or frequency.~~

EU-6006 and EU-6008 are subject to the following portions of Subpart ZZZZ:

- (1) 40 CFR 63.6580
- (2) 40 CFR 63.6585
- (3) 40 CFR 63.6590(a)(2)(i)
- (4) 40 CFR 63.6590(b)(1)(i)
- (5) 40 CFR 63.6640(f)(1)
- (6) 40 CFR 63.6640(f)(2)(i)
- (7) 40 CFR 63.6640(f)(3)
- (8) 40 CFR 63.6645(f)
- (9) 40 CFR 63.6665
- (10) 40 CFR 63.6670
- (11) 40 CFR 63.6675
- (12) Table 8 to Subpart ZZZZ of Part 63

The requirements of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated as 326 IAC 20-1, apply to EU-6006 and EU-6008 except as otherwise specified in 40 CFR 63, Subpart ZZZZ.

- (aa) This source is subject to the National Emission Standards for Hazardous Air Pollutants for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63, Subpart DDDDD and 326 IAC 20-95, because the source owns or operates industrial, commercial, or institutional boilers or process heaters as defined in §63.7575 that are located at, or are part of, a major source of HAP.

The components of Sulfur Recovery Units A and B listed below are not boilers as defined at 40 CFR 63.7575. The units do not have a primary purpose of recovering thermal energy in the form of steam or hot water. Waste heat boilers are excluded from the definition of "boiler" at 40 CFR 63.7575. The components of Sulfur Recovery Units A and B are not process heaters as defined at 40 CFR 63.7575. The units do not transfer heat indirectly to a process material (liquid, gas, or solid) or to a heat transfer material (e.g., glycol or a mixture of glycol and water) for use in a process unit, instead of generating steam. Except for the waste heat boilers, the units either heat process materials directly or are reactors that use or release thermal energy.

- One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
  - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.

- (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A heat exchanger and molten sulfur to the sulfur product pit.
  - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
  - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.
- One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, discharging emergency and pressure relief streams to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
    - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
    - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
    - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
    - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
    - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

The components of Hydrogen Plants 1 and 2 listed below are not boilers as defined at 40 CFR 63.7575. The units do not have a primary purpose of recovering thermal energy in the form of steam or hot water. Waste heat boilers are excluded from the definition of "boiler" at 40 CFR 63.7575. The components of Hydrogen Plants 1 and 2 are not process heaters as defined at 40 CFR 63.7575. The units do not transfer heat indirectly to a process material (liquid, gas, or solid) or to a heat transfer material (e.g., glycol or a mixture of glycol and water) for use in a process unit, instead of generating steam. Except for the waste heat boilers, the units either heat process materials directly or are reactors that use or release thermal energy.

- Hydrogen Plant 1, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:

- (B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2018 for construction, consisting of
    - (i) One (1) hydrogenation reactor.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
    - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
  - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2018 for construction, using no controls and discharging shift gas to the pressure swing adsorber.
- Hydrogen Plant 2, with a maximum capacity of 557.4 tons of hydrogen per day, consisting of:
    - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2018 for construction, consisting of
      - (i) One (1) hydrogenation reactor.
    - (C) One (1) reformer system, consisting of:
      - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.
      - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
    - (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2018 for construction, using no controls and discharging shift gas to the pressure swing adsorber.

The units subject to this rule include the following:

- One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.
- One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage

reactors, exhausting to stack EU-2001.

- One (1) natural gas and process fuel gas-fired indirect treat gas heater, identified as EU-2002, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 52.8 MMBtu/hr (HHV), receiving hydrogen from Block 7000 and discharging to the 1st stage reactors, exhausting to stack EU-2002.
- One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003.
- One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.
- One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.

This source is subject to the following portions of Subpart DDDDD:

- (1) 40 CFR 63.7480
- (2) 40 CFR 63.7485
- (3) 40 CFR 63.7490(a)(2)
- (4) 40 CFR 63.7490(b)
- (5) 40 CFR 63.7495(a)
- (6) 40 CFR 63.7495(d)
- (7) 40 CFR 63.7495(i)
- (8) 40 CFR 63.7499(l)
- (9) 40 CFR 63.7500(a)(1)
- (10) 40 CFR 63.7500(a)(3)
- (11) 40 CFR 63.7500(b)
- (12) 40 CFR 63.7500(e)
- (13) 40 CFR 63.7500(f)
- (14) 40 CFR 63.7505(a)
- (15) 40 CFR 63.7510(g)
- (16) 40 CFR 63.7510(k)
- (17) 40 CFR 63.7515(d)

- (31) 40 CFR 63.7550(a)
- (32) 40 CFR 63.7550(b)
- (33) 40 CFR 63.7550(c)(1)
- (34) 40 CFR 63.7550(h)(3)
- (35) 40 CFR 63.7555(a)

- (36) 40 CFR 63.7555(h)
- (37) 40 CFR 63.7560
- (38) 40 CFR 63.7565
- (39) 40 CFR 63.7570
- (40) 40 CFR 63.7575
- (41) Table 3 to Subpart DDDDD of Part 63 (item 1 (contin oxy trim), 2 (no trim, vac col feed) 3 (no trim all others))
- (42) Table 9 to Subpart DDDDD of Part 63
- (43) Table 10 to Subpart DDDDD of Part 63

The requirements of 40 CFR Part 63, Subpart A – General Provisions, which are incorporated as 326 IAC 20-1, apply to the units except as otherwise specified in 40 CFR 63, Subpart DDDDD.

- (bb) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) for Source Category: Gasoline Distribution Bulk Terminals, Bulk Plants, and Pipeline Facilities, 40 CFR 63, Subpart BBBB are not included in the permit for this source, since because the source is a major source of HAP emissions
- (cc) The requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAPs) for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63, Subpart JJJJJ are not included in the permit for this source, since because the source is a major source of HAP emissions
- (dd) There are no other National Emission Standards for Hazardous Air Pollutants Under the NESHAP, 40 CFR 63, 326 IAC 14 and 326 IAC 20 included for this proposed new source.

**Compliance Assurance Monitoring (CAM):**

- (a) Pursuant to 40 CFR 64.2, Compliance Assurance Monitoring (CAM) is applicable to each new pollutant-specific emission unit that meets the following criteria:
  - (1) has a potential to emit before controls equal to or greater than the Part 70 major source threshold for the pollutant involved;
  - (2) is subject to an emission limitation or standard for that pollutant (or a surrogate thereof); and
  - (3) uses a control device, as defined in 40 CFR 64.1, to comply with that emission limitation or standard.
- (b) Pursuant to 40 CFR 64.2(b)(1)(i), emission limitations or standards proposed after November 15, 1990 pursuant to a NSPS or NESHAP under Section 111 or 112 of the Clean Air Act are exempt from the requirements of CAM. Therefore, an evaluation was not conducted for any emission limitations or standards proposed after November 15, 1990 pursuant to a NSPS or NESHAP under Section 111 or 112 of the Clean Air Act.
- (c) Pursuant to 40 CFR 64.3(d), if a continuous emission monitoring system (CEMS) is required pursuant to other federal or state authority, the owner or operator shall use the CEMS to satisfy the requirements of CAM according to the criteria contained in 40 CFR 64.3(d).

The following table is used to identify the applicability of CAM to each emission unit and each emission limitation or standard for a specified pollutant based on the criteria specified under 40 CFR 64.2:

Emission Unit/Pollutant	Control Device	Applicable Emission Limitation	Uncontrolled PTE (tons/year)	Controlled PTE (tons/year)	CAM Applicable (Y/N)	Large Unit (Y/N)
Railcar unloading (EU-1000)/PM	BH	326 IAC 2-2	<100	<100	N <sup>1</sup>	N

Emission Unit/Pollutant	Control Device	Applicable Emission Limitation	Uncontrolled PTE (tons/year)	Controlled PTE (tons/year)	CAM Applicable (Y/N)	Large Unit (Y/N)

Wastewater treatment/combined HAPs	CC	none	<25	<25	N <sup>5</sup>	N
<p>Uncontrolled PTE (tpy) and controlled PTE (tpy) are evaluated against the Major Source Threshold for each pollutant. Major Source Threshold for criteria pollutants (PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, NO<sub>x</sub>, VOC and CO) is 100 tpy, for a single HAP ten (10) tpy, and for total HAPs twenty-five (25) tpy.</p> <p>Under the Part 70 Permit program (40 CFR 70), PM is not a regulated pollutant.</p>						
<p>N <sup>1</sup> Under 326 IAC 2-2, PM is not a surrogate for a regulated air pollutant. Therefore, CAM does not apply to these emission units for the 326 IAC 2-2 PM limitation.</p>						
<p>N <sup>2</sup> CAM does not apply for PM<sub>10</sub> because the uncontrolled PTE of PM<sub>10</sub> is less than the major source threshold.</p>						
<p>N <sup>3</sup> CAM does not apply for PM<sub>2.5</sub> because the uncontrolled PTE of PM<sub>2.5</sub> is less than the major source threshold.</p>						
<p>N <sup>4</sup> CAM does not apply for any single HAP because the unit is not subject to a limitation.</p>						
<p>N <sup>5</sup> CAM does not apply for combined HAPs because the unit is not subject to a limitation.</p>						
<p>N <sup>6</sup> A continuous compliance determination method, which provides data either in units of the standard or correlated directly to the compliance limit, is already specified in the Part 70 permit. Therefore, the emission limitation or standard is exempt from the requirements of 40 CFR Part 64, CAM.</p>						
<p>N <sup>7</sup> CAM does not apply for VOC because the uncontrolled PTE of VOC is less than the major source threshold.</p>						
<p>Controls: BH = Baghouse, SCR=selective catalytic reduction, TGTU=Tail Gas Treatment Unit, DE=drift eliminator, CC=carbon cannister</p>						
<p>Emission units without air pollution controls are not subject to CAM. Therefore, they are not listed.</p>						

Based on this evaluation, the requirements of 40 CFR Part 64, CAM, are applicable to the coal dryer loop (EU-1008), fine additive production system (EU-1504), and pulverized coal conveying (EU-2005), which are each not considered a "large unit," for PM<sub>10</sub> and PM<sub>2.5</sub>, and for the product loading rack, which is not considered a "large unit," for VOC upon issuance of the Part 70 Permit Renewal. A CAM plan must be submitted as part of the Part 70 Operating Permit Renewal application.

**State Rule Applicability Determination**

State rule applicability for this new source has been reviewed as follows:

**326 IAC 2-2 (PSD)**

PSD applicability is discussed under the Permit Level Determination – PSD section.

**326 IAC 2-2-3 (PSD Rule: Control Technology Review Requirements)**

Pursuant to 326 IAC 2-2-3 (Control Technology Review Requirements), the Permittee shall comply with the following BACT limits:

(a) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> BACT for the coal handling operations shall be as follows:

(1) Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Railcar unloading, including: Receiving Pits 1 & 2 Receiving Bins 1 & 2 Drag Flight Feeders 1 & 2 (EU-1000)	Baghouse EU-1000 (stack EU-1000) Water spray dust suppression (bins & feeders only)	PM	0.0022	0.12
		PM <sub>10</sub>	0.0022	0.12
		PM <sub>2.5</sub>	0.0022	0.12
Transfer station, including: Unloading Conveyor (EU-1001)	Baghouse EU-1001 (stack EU-1001)	PM	0.002	0.16
		PM <sub>10</sub>	0.002	0.16
		PM <sub>2.5</sub>	0.002	0.16
Coal storage enclosure 1, including Conveyor 1 Stacker 1 Boom/Chute Stockpiles #1A & #1B Reclaimer 1  Coal storage enclosure 2, including: Conveyor 2 Stacker 2 Boom/Chute Stockpiles #2A & #2B Reclaimer 2  Reclaim transfer station, including: Conveyor 6 Conveyor 7 Conveyor 9	Baghouse EU-1006 (stack EU-1006)	PM	0.002	0.11
		PM <sub>10</sub>	0.002	0.11
		PM <sub>2.5</sub>	0.002	0.11
Coal drying loop purge, including: Conveyor 8 Coal mill & pulverizer Coal Dryer	Loop Purge Baghouse (stack EU-1008)	PM	0.002	0.26
		PM <sub>10</sub>	0.002	0.26

(1) Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Enclosed screw conveyor to Block 2000 feed premix drum	Coal Handling System Filter (stack EU-2005)	PM <sub>2.5</sub>	0.002	0.26
		PM	0.002	0.003
		PM <sub>10</sub>	0.002	0.003
		PM <sub>2.5</sub>	0.002	0.003

*PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable PM.*

(2) There shall be no (0%) visible emissions from the entrance and exit doors of the unloading enclosure at any time.

(b) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> BACT for the additive handling operations shall be as follows:

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Coarse additive silo, T34 (EU-1501)	Baghouse EU-1501 (stack EU-1501)	PM	0.002	0.016
		PM <sub>10</sub>	0.002	0.016
		PM <sub>2.5</sub>	0.002	0.016
Fine additive silo, T33 (EU-1502)	Baghouse EU-1502 (stack EU-1502)	PM	0.002	0.018
		PM <sub>10</sub>	0.002	0.018
		PM <sub>2.5</sub>	0.002	0.018
Na <sub>2</sub> S silo, T35 (EU-1503)	Baghouse EU-1503 (stack EU-1503)	PM	0.002	0.013
		PM <sub>10</sub>	0.002	0.013
		PM <sub>2.5</sub>	0.002	0.013
Fine additive production system	Baghouse EU-1504 (stack EU-1504)	PM	0.002	0.004
		PM <sub>10</sub>	0.002	0.004
		PM <sub>2.5</sub>	0.002	0.004
Coarse additive screw conveyor	Coarse additive system filter (stack EU-2006)	PM	0.002	0.004
		PM <sub>10</sub>	0.002	0.004
		PM <sub>2.5</sub>	0.002	0.004
Fine additive transfer system	Fine additive system filter (stack EU-2007)	PM	0.002	0.004
		PM <sub>10</sub>	0.002	0.004
		PM <sub>2.5</sub>	0.002	0.004
Na <sub>2</sub> S slurry preparation system	Na <sub>2</sub> S handling system filter (stack EU-2008)	PM	0.002	0.001
		PM <sub>10</sub>	0.002	0.001
		PM <sub>2.5</sub>	0.002	0.001

*PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable PM.*

(c) BACT for the fuel combustion units shall be as follows:

(1) PM, PM<sub>10</sub>, and PM<sub>2.5</sub>:

(A) The units shall burn only natural gas and process off-gas.

(B) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel

consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.

(C) Particulate matter emissions shall not exceed:

<b>Emission Limitations</b>			
<b>Unit ID</b>	<b>Pollutant</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
EU-1007	PM (filterable)	0.0019	0.11
	PM <sub>10</sub>	0.0075	0.42
	PM <sub>2.5</sub>	0.0075	0.42
EU-2001	PM (filterable)	0.0019	0.24
	PM <sub>10</sub>	0.0075	0.96
	PM <sub>2.5</sub>	0.0075	0.96
EU-2002	PM	0.0075	0.10
	PM <sub>10</sub>	0.0075	0.40
	PM <sub>2.5</sub>	0.0075	0.40
EU-2003	PM (filterable)	0.0019	1.71E-02
	PM <sub>10</sub>	0.0075	6.75E-02
	PM <sub>2.5</sub>	0.0075	6.75E-02
EU-2004	PM (filterable)	0.0019	0.30
	PM <sub>10</sub>	0.0075	1.17
	PM <sub>2.5</sub>	0.0075	1.17
EU-6000	PM (filterable)	0.0019	0.13
	PM <sub>10</sub>	0.0075	0.51
	PM <sub>2.5</sub>	0.0075	0.51

*PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable PM.*

(2) SO<sub>2</sub>:

- (A) The units shall burn only natural gas and process off-gas.
- (B) The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month.
- (C) SO<sub>2</sub> emissions shall not exceed:

<b>SO<sub>2</sub> Emission Limitations</b>	
<b>Unit ID</b>	<b>tpy</b>
EU-1007	0.35
EU-2001	0.80
EU-2002	0.33
EU-2003	0.06
EU-2004	0.97
EU-6000	0.42

(3) NOx:

- (A) The units shall burn only natural gas and process off-gas.
- (B) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (C) The units shall use ultra-low-NOx burners.
- (D) NOx emissions shall not exceed:

<b>Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
EU-1007	0.030	1.67
EU-2001	0.030	3.85
EU-2002	0.030	1.58
EU-2003	0.030	0.27
EU-2004	0.030	4.68
EU-6000	0.030	2.06

(4) VOC:

- (A) The units shall burn only natural gas and process off-gas.
- (B) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (C) VOC emissions shall not exceed:

<b>Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
EU-1007	0.0054	0.30
EU-2001	0.0054	0.69
EU-2002	0.0054	0.29
EU-2003	0.0054	0.05
EU-2004	0.0054	0.84
EU-6000	0.0054	0.37

(5) CO:

- (A) The units shall burn only natural gas and process off-gas.
- (B) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.

(C) CO emissions shall not exceed:

Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
EU-1007	0.0365	2.04
EU-2001	0.0365	4.69
EU-2002	0.0365	1.93
EU-2003	0.0365	0.33
EU-2004	0.0365	5.69
EU-6000	0.0365	2.50

(6) Carbon dioxide equivalent (CO<sub>2</sub>e), as defined at 40 CFR 98.6:

- (A) The units shall burn only natural gas and process off-gas.
- (B) The units shall be designed and operated to achieve the highest practical energy efficiency.
- (C) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (D) CO<sub>2</sub>e emissions shall not exceed the value of tons per twelve (12) consecutive month period shown in the table below:

Emission Limitations	
Unit ID	CO <sub>2</sub> e Limit
EU-1007	29,127
EU-2001	67,023
EU-2002	27,561
EU-2003	4,698
EU-2004	81,430
EU-6000	35,756

(d) BACT for the sulfur recovery units shall be as follows:

- (1) PM (filterable) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0019 lb/MMBtu and 0.10 lb/hr, each.
- (2) PM<sub>10</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (3) PM<sub>2.5</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (4) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).
- (5) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 26.30 lb/hr, each.

- (6) The tail gas treatment units (TGTUA and TGTUB) shall each use low-NOx burners.
  - (7) NOx emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.10 lb/MMBtu and 5.28 lb/hr, each.
  - (8) VOC emissions from the tail gas treatment unit stacks (EU-3001 and EU-3002) shall not exceed 0.0054 lb/MMBtu and 0.28 lb/hr, each.
  - (9) CO emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 65 ppmv @ 0% O<sub>2</sub>, shall not exceed 0.082 lb/MMBtu and 4.33 lb/hr, each.
  - (10) Sulfuric Acid Mist (H<sub>2</sub>SO<sub>4</sub> mist) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0244 lb/MMBtu and 1.29 lb/hr, each.
  - (11) Opacity shall not exceed ten percent (10%) on a six-minute average.
  - (12) Incinerators A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
  - (13) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.
- (e) BACT for the SB, LP, and HP flares shall be as follows:
- (1) The units shall burn only natural gas and process off-gas as supplemental and pilot fuel.
  - (2) PM, PM<sub>10</sub>, and PM<sub>2.5</sub>:
    - (A) Particulate matter emissions while operating in sweep and pilot mode shall not exceed:

Emission Limitations			
Unit ID	Pollutant	lb/MMBtu	lb/hr
HP Flare	PM <sub>FILTRABLE</sub>	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
LP Flare	PM <sub>FILTRABLE</sub>	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
SB Flare	PM <sub>FILTRABLE</sub>	0.0019	1.62E-03
	PM <sub>10</sub>	0.0074	6.32E-03
	PM <sub>2.5</sub>	0.0074	6.32E-03

- (B) The HP Flare and LP Flare shall operate with no visible emissions, except for periods not to exceed a total of five (5) minutes during any two (2) consecutive hours when flaring a process stream.

(3) SO<sub>2</sub>:

(A) The Permittee shall burn only natural gas and process off-gas in any flare as supplemental or pilot fuel gas.

(B) SO<sub>2</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>SO<sub>2</sub> Emission Limitations</b>	
<b>Unit ID</b>	<b>lb/hr</b>
HP Flare	0.013
LP Flare	0.013

(C) SO<sub>2</sub> emissions from the SB Flare shall not exceed 0.069 lb/ hr when operating in sweep and pilot mode.

(4) NO<sub>x</sub>:

(A) NO<sub>x</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>NO<sub>x</sub> Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.099	0.71
LP Flare	0.099	0.71
SB Flare	0.099	8.46E-02

(B) NO<sub>x</sub> emissions shall not exceed 0.068 lb/MMBtu (LHV) when flaring a process stream.

(5) VOC:

(A) VOC emissions while operating in sweep and pilot mode shall not exceed:

<b>VOC Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.0054	0.039
LP Flare	0.0054	0.039
SB Flare	0.0054	4.62E-03

(B) VOC destruction and removal efficiency shall not be less than 98% when flaring a process stream.

(6) The Best Available Control Technology (PSD BACT) for CO for the flares shall be as follows:

(A) CO emissions while operating in sweep and pilot mode shall not exceed:

<b>CO Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
HP Flare	0.083	0.60
LP Flare	0.083	0.60
SB Flare	0.083	7.09E-02

- (B) CO emissions shall not exceed 0.31 lb/MMBtu (LHV) when flaring a process stream.
- (7) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the flares listed in the table below when operating in sweep and pilot mode shall not exceed the values shown per twelve (12) consecutive month period, with compliance determined at the end of each month.

Emission Limitations	
Unit ID	CO <sub>2</sub> e Limit
Sulfur Block Flare	448
LP Flare	3,781
HP Flare	3,781

(f) BACT for the tanks shall be as follows:

- (1) VOL (as defined at 40 CFR 60.111b) tanks, T1, T2, and T6, shall use internal floating roofs.
- (2) Emissions from the slop tank, T16, shall be controlled by the LP Flare at all times and the slop tank throughput shall not exceed the value shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.
- (3) Emissions from the sour water tanks, T18 - T21, shall be controlled by the Sulfur Block Flare at all times and the sour water tank throughputs shall each not exceed the values shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.
- (4) All tanks shall use white tank shells.
- (5) All tanks shall use submerged filling.
- (6) All tanks shall use good maintenance practices based on generally-accepted industry standards, including but not limited to API 650 Welded Steel Tanks for Oil Storage and API 653 Tank Inspection, Repair, Alteration, and Reconstruction.
- (7) Tanks shall comply with the following limitations:

Tank ID	Product Stored	Storage Temperature (°F)	VOC Emissions Limit (tons/yr)	Throughput Limit (kgal/yr)
T1	Naphtha Product	ambient	1.15	-
T2	Naphtha Product	ambient	1.15	-
T3	Diesel Product	ambient	2.29	-
T4	Diesel Product	ambient	2.29	-
T5	Diesel Product	ambient	2.29	-
T6	Naphtha Product	ambient	1.15	-
	Diesel Product	ambient	0.17	-
T10	Residue	505	1E-04	-
T11	Residue	505	1E-04	-
T12	Residue	505	1E-04	-
T13	VGO	505	0.175	-
T14	VGO	505	0.175	-
T16	Slop tank	ambient	-	305,467
T17	Diesel Fuel	ambient	1.14E-02	-
T18	Non-Phenolic Sour Water	ambient	-	462,829
T19	Non-Phenolic Sour Water	ambient	-	462,829
T20	Non-Phenolic Sour Water	ambient	-	462,829
T21	Phenolic Sour Water	ambient	-	4,628
T22	Stripped Non-Phenolic Sour Water	ambient	0.48	-
T23	Stripped Phenolic Sour Water	ambient	0.48	-
T24	Amine Surge/Deinventory	ambient	0.48	-

Tank ID	Product Stored	Storage Temperature (°F)	VOC Emissions Limit (tons/yr)	Throughput Limit (kgal/yr)
T25	Fresh Amine	ambient	0.48	-
T26	Amine Containment	ambient	0.48	-
EU-6005	Emergency generator diesel fuel	ambient	1.14E-02	-
EU-6008	Emergency fire pump diesel fuel	ambient	1.14E-02	-

(g) BACT for the product loading operations shall be as follows:

- (1) The Loading Flare shall burn only natural gas and process off-gas as supplemental and pilot fuel.
- (2) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the Loading Flare shall be as follows:

(A) Particulate matter emissions while operating pilot mode shall not exceed:

Emission Limitations			
Unit ID	Pollutant	Ib/MMBtu	Ib/hr
Loading Flare	PM <sub>FILTRABLE</sub>	0.0019	4.22E-04
	PM <sub>10</sub>	0.0074	1.64E-03
	PM <sub>2.5</sub>	0.0074	1.64E-03

(3) The Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the Loading Flare shall be as follows:

- (A) The Permittee shall burn only natural gas and process off-gas in any flare as supplemental or pilot fuel gas
- (B) SO<sub>2</sub> emissions from the Loading Flare shall not exceed 0.069 lb/ hr when operating in pilot mode.

(4) The Best Available Control Technology (PSD BACT) for NO<sub>x</sub> for the Loading Flare shall be as follows:

(A) NO<sub>x</sub> emissions while operating in pilot mode shall not exceed:

NO <sub>x</sub> Emission Limitations		
Unit ID	Ib/MMBtu	Ib/hr
Loading Flare	0.099	2.20E-02

(B) NO<sub>x</sub> emissions shall not exceed 0.068 lb/MMBtu (LHV) when controlling emissions from naphtha or diesel loading operations.

(5) The Best Available Control Technology (PSD BACT) for VOC for the Loading Flare shall be as follows:

(A) VOC emissions while operating in pilot mode shall not exceed:

VOC Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
Loading Flare	0.0054	1.20E-03

- (B) The Product Loading Rack shall use only submerged loading.
- (C) The overall VOC control efficiency, including capture efficiency and destruction efficiency, for the product Loading Flare shall be 98% or greater.
- (D) VOC emissions shall not exceed:

Emission Limitations	
Product	lb/kgal <sup>1</sup>
naphtha	0.049
diesel	1.02E-03

1. kgal = 1,000 gallons

- (6) The Best Available Control Technology (PSD BACT) for CO for the Loading Flare shall be as follows:

- (A) CO emissions while operating in pilot mode shall not exceed:

CO Emission Limitations		
Unit ID	lb/MMBtu	lb/hr
Loading Flare	0.083	1.84E-02

- (B) CO emissions shall not exceed 0.31 lb/MMBtu (LHV) when flaring a process stream.
- (7) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the Loading Flare shall not exceed 559 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.
- (h) BACT for the residue solidification and handling operations shall be as follows:
  - (1) VOC emissions from residue solidification unit EU-5001a-5001d (stack EU-5001) shall not exceed 1.40 lb/hr.
  - (2) VOC emissions from residue solidification unit EU-5002a-5002d (stack EU-5002) shall not exceed 1.40 lb/hr.
  - (3) VOC emissions from residue solidification unit EU-5003a-5003d (stack EU-5003) shall not exceed 1.40 lb/hr.
  - (4) VOC emissions from residue solidification unit EU-5004a-5004d (stack EU-5004) shall not exceed 1.40 lb/hr.
  - (5) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the solid residue handling operations shall be as follows:

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Residue bulk container loading and residue	Filter EU-5009 (stack EU-5009)	PM	0.002	0.001
		PM <sub>10</sub>	0.002	0.001

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
transfer conveyors (EU-5009)		PM <sub>2.5</sub>	0.002	0.001
Residue rail storage silo (EU-5010), loading hoppers (EU-5005, EU-5006), and residue transfer conveyors	Filter EU-5010 (stack EU-5010)	PM	0.002	0.003
		PM <sub>10</sub>	0.002	0.003
		PM <sub>2.5</sub>	0.002	0.003
Residue swing storage silo (EU-5011), loading hoppers (EU-5007, EU-5008), and residue transfer conveyors	Filter EU-5011 (stack EU-5011)	PM	0.002	0.003
		PM <sub>10</sub>	0.002	0.003
		PM <sub>2.5</sub>	0.002	0.003

*PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable PM.*

- (6) Transfers from the loading hoppers to transports shall employ choke flow-practices
  - (7) There shall be no visible emissions from transfers from the loading hoppers and from hoppers to transports.
- (i) BACT for the utilities shall be as follows:
- (1) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions from the cooling tower (EU-6001, EU-6002 and EU-6003) shall be controlled by the use of drift eliminators with a maximum drift rate of no more than 0.0005%.
  - (2) Total dissolved solids (TDS) in the circulating cooling water shall not exceed 2,395 mg/l.
  - (3) VOC emissions from the cooling towers (EU-6001, EU-6002 and EU-6003) shall not exceed 1.34 lb/hr.

(4) Emissions from the emergency engines shall not exceed the following:

Emission Unit	Unit ID	Pollutant	Limitation
Emergency Diesel Generator	EU-6006	PM	0.20 g/kW-hr
		PM <sub>10</sub>	0.20 g/kW-hr
		PM <sub>2.5</sub>	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	6.40 g/kW-hr
		CO	3.50 g/kW-hr
		Opacity	Acceleration: 20% Lugging: 15% Peak: 50%
	CO <sub>2e</sub>	811 tons per twelve (12) consecutive month period with compliance determined at the end of each month	
Emergency Diesel Fire Pump	EU-6008	PM	0.20 g/kW-hr
		PM <sub>10</sub>	0.20 g/kW-hr
		PM <sub>2.5</sub>	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	4.00 g/kW-hr
		CO	3.50 g/kW-hr
		CO <sub>2e</sub>	217 tons per twelve (12) consecutive month period with compliance determined at the end of each month

(5) Emergency generator (EU-6006) and emergency fire pump (EU-6008) shall use good combustion practices and shall use energy efficiency.

(j) BACT for the hydrogen production units shall be as follows:

(1) The units shall burn only natural gas and process off-gas.

(2) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	Ib/MMBtu
PM	0.006
PM <sub>10</sub>	0.006
PM <sub>2.5</sub>	0.0048

*PM<sub>10</sub> and PM<sub>2.5</sub> shall include filterable and condensable PM.*

(3) Sulfur content of the fuel gas delivered to each reformer shall not exceed 0.005 gr/scf.

(4) The units shall use selective catalytic reduction (SCR) with low-NO<sub>x</sub> burners for NO<sub>x</sub> control.

(5) NO<sub>x</sub> emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu
NOx	0.0065

- (6) VOC emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu <sup>1</sup>
VOC	0.0015

- (7) CO emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu
CO	0.020

- (8) The CO<sub>2e</sub> emissions from Block 7000 hydrogen production operations shall not exceed the values shown in the table below per twelve (12) consecutive month period, with compliance determined at the end of each month.

Emission Limitations	
Unit ID	CO <sub>2e</sub> Limit (tons)
EU-7001	986,271
EU-7002	986,271
EU-7003	1,080
EU-7004	1,080

- (9) VOC emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 3.20 lb/hr, each.
- (10) CO emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 1.06 lb/hr, each.

- (k) BACT for the water operations shall be as follows:

- (1) Lime handling operations PM, PM<sub>10</sub>, and PM<sub>2.5</sub>:

Emission Unit Description (ID)	Control Device (Stack ID)	Emission Limitations		
		Pollutant	gr/dscf	lb/hr
Lime silo (EU-6501)	Filter EU-6501 (stack EU-6501)	PM	0.002	0.01
		PM <sub>10</sub>	0.002	0.01
		PM <sub>2.5</sub>	0.002	0.01

*PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable.*

- (2) VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and manhole no. 1 (EU-8003) shall not exceed 20 parts per million by volume (dry) (ppmvd), each.

- (l) BACT for the refinery process fugitive emissions shall be as follows:

- (1) Fugitive VOC emissions shall be controlled by a Leak Detection and Repair (LDAR) program. The leak detection and repair program specified in 40 CFR 60, Subpart GGGa shall serve as BACT for VOC fugitive emissions.

- (A) Fugitive VOC emissions from Block 2000 VEBA Combi Cracker operations shall not exceed 151.18 tons per twelve (12) consecutive month period, with compliance determined monthly.
  - (B) Fugitive VOC emissions from Block 4000 offsites operations shall not exceed 25.04 tons per twelve (12) consecutive month period.
- (m) BACT for paved roads shall be as follows:
- (a) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the paved roads shall be the development, maintenance, and implementation of a fugitive dust control plan, which shall include but not be limited to vacuum sweeping and water flushing as necessary and the implementation of a speed reduction plan
  - (b) Visible emissions from truck traffic on plant roads shall not exceed one (1) minute in any one (1) hour period.

**326 IAC 2-2-5 (Air Quality Impact Requirements)**

- (a) Pursuant to 326 IAC 2-2-5(e)(1) the Permittee shall conduct an air quality impact analysis in accordance with the following provisions:
- (1) Any estimates of ambient air concentrations used in the demonstration process shall be based upon the applicable air quality models, data bases, and other requirements specified in 40 CFR Part 51, Appendix W (Requirements for Preparation, Adoption, and Submittal of Implementation Plans, Guideline on Air Quality Models).
  - (2) Where an air quality impact model specified in the guidelines in subdivision (1) is inappropriate, a model may be modified or another model substituted provided that all applicable guidelines are satisfied.
  - (3) Modifications or substitution of any model may only be done in accordance with guideline documents and with written approval from U.S. EPA and shall be subject to the public comment procedures set forth in 326 IAC 2-1.1-6.
- (b) Pursuant to 326 IAC 2-2-5 (Air Quality Impact; Requirements), the source shall comply with the following:
- (1) Emergency generator (EU-6006) shall not exceed 100 hours of operation, per twelve (12) consecutive month period with compliance determined at the end of each month.
  - (2) Emergency fire pump (EU-6008) shall not exceed 200 hours of operation, per twelve (12) consecutive month period with compliance determined at the end of each month.
- (c) Pursuant to 326 IAC 2-2-5 (Air Quality Impact; Requirements), sulfur content of the fuel gas and SO<sub>2</sub> emissions of the fuel gas combustion units listed in the table below shall not exceed the following:

Unit ID	Sulfur Content (gr/scf)	SO <sub>2</sub> Emission Limitations (lb/hr)
EU-1007	0.0063	0.10
EU-2001	0.0065	0.24
EU-2002	0.0064	0.10
EU-2003	0.0062	0.02
EU-2004	0.0063	0.28
EU-6000	0.0063	0.12

See Appendix C to this Technical Support Document (TSD) for the PSD air quality analysis.

**326 IAC 2-2-6 (Increment Consumption Requirements)**

Pursuant to 326 IAC 2-2-6(a) any demonstration under 326 IAC 2-2-5 shall demonstrate that increased emissions caused by the proposed stationary source will not exceed eighty percent (80%) of the available maximum allowable increases (MAI) over the baseline concentrations of PM, PM<sub>10</sub>, PM<sub>2.5</sub>, VOC, CO, NO<sub>x</sub> and Greenhouse Gases, indicated in 326 IAC 2-2-6(b)(1). PM, PM<sub>10</sub>, PM<sub>2.5</sub>, VOC, CO, NO<sub>x</sub> and Greenhouse Gases are emitted and subject to PSD in this proposed permit, T147-39554-00065.

**326 IAC 2-2-7 (Additional Analysis, Requirements)**

Pursuant to 326 IAC 2-2-7(a) the Permittee shall conduct an analysis of the impairment to visibility, soils and vegetation. An analysis of the air quality impact projected for the area as a result of general commercial, residential, industrial, and other growth associated with the source was performed. The results of the additional impact analysis concluded the modification will have no adverse impact on economic growth, soils, vegetation, and endangered or threatened species.

See Appendix C to this Technical Support Document (TSD) for the PSD air quality analysis.

**326 IAC 2-2-8 (Source Obligation)**

- (a) Pursuant to 326 IAC 2-2-8(1), approval to construct shall become invalid if construction is not commenced within eighteen (18) months after receipt of the approval, if construction is discontinued for a period of eighteen (18) months or more, or if construction is not completed within a reasonable time.
- (b) Approval for construction shall not relieve the Permittee of the responsibility to comply fully with applicable provisions of the state implementation plan and any other requirements under local, state, or federal law.

**326 IAC 2-2-9 (Innovative Control Technology)**

Pursuant to 326 IAC 2-2-9 the Permittee may request the commissioner in writing to approve a system of innovative control technologies as part of the PSD application for T147-39554-00065.

**326 IAC 2-2-10 (Source Information)**

Pursuant to 326 IAC 2-1-10, the Permittee has submitted all information necessary to perform an analysis or make the determination required under 326 IAC 2-2.

**326 IAC 2-2-12 (Permit Rescission)**

Pursuant to 326 IAC 2-2-12, the permit issued under 326 IAC 2-2 shall remain in effect unless and until it is rescinded, modified, revoked, or it expires in accordance with 326 IAC 2-1.1-9.5 or 326 IAC 2-2-8.

**326 IAC 2-4.1 (Major Sources of Hazardous Air Pollutants (HAP))**

- (a) The operation of the units listed in the table below will each emit equal to or greater than ten (10) tons per year for a single HAP and equal to or greater than twenty-five (25) tons per year for a combination of HAPs. Therefore, 326 IAC 2-4.1 would apply to units. However, pursuant to 326 IAC 2-4.1-1(b)(2), because these units are specifically regulated by NESHAP 40 CFR 63, Subpart CC, which was issued pursuant to Section 112(d), 112(h), or 112(j) of the Clean Air Act, the units are exempt from the requirements of 326 IAC 2-4.1.

Unit
Product Loading Rack
Hydrogen Plant Deaeration Vents
VCC fugitive emissions

- (b) The operation of all other facilities at the source will each emit less than ten (10) tons per year for a single HAP and less than twenty-five (25) tons per year for a combination of HAPs. Therefore, 326 IAC 2-4.1 does not apply to other facilities at the source.

**326 IAC 2-6 (Emission Reporting)**

This source is subject to 326 IAC 2-6 (Emission Reporting) because it is required to have an operating permit pursuant to 326 IAC 2-7 (Part 70). The potential to emit of VOC is greater than 250 tons per year. Therefore, pursuant to 326 IAC 2-6-3(a)(1), annual reporting is required. An emission statement shall be submitted in accordance with the compliance schedule in 326 IAC 2-6-3 and every year thereafter. The emission statement shall contain, at a minimum, the information specified in 326 IAC 2-6-4.

**326 IAC 2-7-6(5) (Annual Compliance Certification)**

The U.S. EPA Federal Register 79 FR 54978 notice does not exempt Title V Permittees from the requirements of 40 CFR 70.6(c)(5)(iv) or 326 IAC 2-7-6(5)(D), but the submittal of the Title V annual compliance certification to IDEM satisfies the requirement to submit the Title V annual compliance certifications to EPA. IDEM does not intend to revise any permits since the requirements of 40 CFR 70.6(c)(5)(iv) or 326 IAC 2-7-6(5)(D) still apply, but Permittees can note on their Title V annual compliance certifications that submission to IDEM has satisfied reporting to EPA per Federal Register 79 FR 54978. This only applies to Title V Permittees and Title V compliance certifications.

**326 IAC 3-5 (Continuous Monitoring of Emissions)**

- (a) Pursuant to 326 IAC 3-5-1(a), 326 IAC 3-5 applies to the emissions units listed in the table below, which are required to perform continuous monitoring under 326 IAC 12, incorporating 40 CFR 60 by reference.

Unit	ID	Applicable NSPS
Coal dryer heater	EU-1007	40 CFR 60, Subpart Ja
Feed heater	EU-2001	40 CFR 60, Subpart Ja
Treat gas heater	EU-2002	40 CFR 60, Subpart Ja
Fractionator heater	EU-2004	40 CFR 60, Subparts Db and Ja
TGTU A	EU-3001	40 CFR 60, Subpart Ja
TGTU B	EU-3002	40 CFR 60, Subpart Ja
Boiler	EU-6000	40 CFR 60, Subpart Ja

- (b) Pursuant to 326 IAC 3-5-1(d), IDEM requires, as a condition of a construction or operating permit issued under 326 IAC 2-2 and 326 IAC 2-7 that the source monitor emissions of the units listed in the table below to ensure compliance with an emission limitation or standard established in one (1) of the permits listed in 326 IAC 3-5-1(d).

Unit	ID
Reformer furnace 1	EU-7001
Reformer furnace 2	EU-7002

- (c) Pursuant to 326 IAC 3-5-1(b) and (d), emissions units described in (a) and (b) are subject to the following requirements:

- (1) Any emissions unit subject to 326 IAC 12, shall comply with the monitoring and reporting requirements as specified for the applicable rule.
- (2) All requirements of 326 IAC 3-5.

**326 IAC 5-1 (Opacity Limitations)**

This source is subject to the opacity limitations specified in 326 IAC 5-1-2(1).

**326 IAC 6-2 (Particulate Emission Limitations for Sources of Indirect Heating)**

Pursuant to 326 IAC 6-2-1(h), the units listed in the table below are not subject to the requirements of 326 IAC 6-2, since the limitations established in 326 IAC 6-2 are inconsistent with limitations required by 326 IAC 2. The operations are subject to prevention of significant deterioration (PSD) best available control technology (BACT) requirements under 326 IAC 2-2-3.

Unit	ID
Coal dryer heater	EU-1007
Feed heater	EU-2001
Treat gas heater	EU-2002
Vacuum column feed heater	EU-2003
Fractionator heater	EU-2004
Boiler	EU-6000

**326 IAC 6-3 (Particulate Emission Limitations for Manufacturing Processes)**

Pursuant to 326 IAC 6-3-1(c)(1), the units listed in the table below are not subject to the requirements of 326 IAC 6-3, since the operations are subject to particulate matter limitations that are as stringent as or more stringent than the particulate emission limitations established in 326 IAC 6-3. The operations are subject to prevention of significant deterioration (PSD) best available control technology (BACT) requirements under 326 IAC 2-2-3.

Process Unit
Block 1000
Block 1500
Block 2000
Block 3000
Block 4000
Block 5000
Block 6000
Block 6500
Block 7000
Block 8000

**326 IAC 6-4 (Fugitive Dust Emissions)**

The source is subject to the requirements of 326 IAC 6-4, because vehicle traffic on paved and unpaved roads has the potential to emit fugitive particulate emissions. Pursuant to 326 IAC 6-4 (Fugitive Dust Emissions Limitations), the source shall not allow fugitive dust to escape beyond the property line or boundaries of the property, right-of-way, or easement on which the source is located, in a manner that would violate 326 IAC 6-4.

**326 IAC 6-5 (Fugitive Particulate Matter Emission Limitations)**

The source is not subject to the requirements of 326 IAC 6-5, because vehicle traffic on paved and unpaved roads does not have potential fugitive particulate emissions greater than 25 tons per year.

**326 IAC 7-1.1 (Sulfur Dioxide Emission Limitations)**

The sulfur recovery units, SRU A and SRU B, are subject to 326 IAC 326 IAC 7-1.1 because the SO<sub>2</sub> PTE of each unit is equal to or greater than 25 tons/year or 10 pounds/hour.

- (a) The sulfure dioxide emission limitations in 326 IAC 7-1.1-2 are not applicable to SRU A and SRU B because the units are not fuel combustion units.
- (b) The compliance test methods in 326 IAC 7-2 are not applicable to SRU A and SRU B because the units are not subject to limitations in 326 IAC 7-1.1, 326 IAC 7-4, or 326 IAC 7-4.1.
- (c) Pursuant to 326 IAC 7-1.1-1(3), SRU A ans SRU B shall comply with sulfur dioxide emission limitations and other requirements under 326 IAC 2 and 326 IAC 12.

**326 IAC 8-1-6 (New Facilities: General Reduction Requirements)**

- (a) Each new unit listed in the table below is not subject to the requirements of 326 IAC 8-1-6, since the unlimited VOC potential emissions from each new unit is less than twenty-five (25) tons per year.

Description	Unit ID	Description	Unit ID
Coal unloading	EU-1001	Product loading rack (when loading diesel)	-
Coal conveying and storage	EU-1006	Storage tanks	T1 - T26
Coal dryer heater	EU-1007	Residue processing	EU-50nn
Coal milling and drying	EU-1008	Boiler	EU-6000
Additive unloading, storage, and processing	EU-15nn	Cooling tower (each of 3 cells)	EU-6001 EU-6002 EU-6003
Veba Combi Cracker (VCC) operations	EU-20nn	Emergency engine fuel tanks	EU-6005 EU-6007
Feed heater	EU-2001	Emergency generator	EU-6006
Treat gas heater	EU-2002	Emergency fire pump	EU-6008
Vacuum column feed heater	EU-2003	Lime handling and storage	EU-65nn
Fractionator heater	EU-2004	Hydrogen plant reformer 1	EU-7001
Sulfur recovery operations	EU-30nn	Hydrogen plant reformer 2	EU-7002
Flare pilots	EU-4001 EU-4002 EU-4003 EU-4004	Hydrogen plant deaeration vent 1	EU-7003
HP flare operations	-	Hydrogen plant deaeration vent 2	EU-7004
LP flare operations	-		
SB flare operations	-		

- (b) Vacuum producing systems, wastewater separators, and process turnarounds in petroleum refineries are not subject to 326 IAC 8-1-6 because these operations are subject to other rules in 326 IAC 8. These operations are subject to 326 IAC 8-4-2.
- (c) Pursuant to 326 IAC 8-1-6 (New Facilities; General Reduction Requirements), the Permittee shall control VOC emissions from the units listed in the table below using the Best Available Control Technology (BACT), which has been determined to be the following:

Description	Unit ID
HP Flare	-
Product loading rack (when loading naphtha)	-
Wastewater collection and treatment	-

BACT for these units has been determined to be the following:

- (1) BACT for the HP Flare operations shall be as follows:
  - (A) The overall VOC control efficiency, including capture efficiency and destruction efficiency, for the HP Flare shall be 98% or greater when flaring a process stream.
- (2) BACT for the Product Loading Rack when loading naphtha shall be as follows:
  - (A) The Product Loading Rack shall use only submerged loading.

- (B) The overall VOC control efficiency, including capture efficiency and destruction efficiency, for the Product Loading Flare shall be 98% or greater.
- (C) VOC emissions shall not exceed:

Emission Limitations	
Product	lb/kgal <sup>1</sup>
naphtha	0.049

1. *kgal = 1,000 gallons*

- (3) VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and manhole no. 1 (EU-8003) shall not exceed 20 parts per million by volume (dry) (ppmvd), each.

### 326 IAC 8-4 (Petroleum Sources)

Pursuant to 326 IAC 8-4-1(c), sections 2 through 5 and 7 through 9 of apply to all new sources of the types described in this rule as of January 1, 1980.

- (a) Pursuant to 326 IAC 8-4-2 (Petroleum Refineries):

- (1) Vacuum Systems: No owner or operator of any vacuum producing systems at a petroleum refinery may cause, allow or permit the emission of any noncondensable volatile organic compounds from the condensers, hot wells or accumulators of the system.
- (2) Wastewater Separators: The owner or operator of any wastewater (oil/water) separators at a petroleum refinery shall equip all separators, forebay, and openings in covers with lids or seals such that the lids or seals are in the closed position at all times except when in actual use.
- (3) Process Turnaround: The owner or operator of a petroleum refinery shall notify the commissioner thirty (30) days prior to a process unit turnaround. In addition, the owner or operator shall minimize volatile organic compound emissions during turnaround, by providing for:
  - (A) Depressurization venting of the process unit or vessel to a vapor recovery system, flare or firebox; and
  - (B) No emission of volatile organic compounds from a process unit or vessel until its internal pressure is 136 kPa (19.7 psi) or less.

- (b) Storage vessels at the source with capacities greater than one hundred fifty thousand (150,000) liters (thirty nine thousand (39,000) gallons) contain volatile organic compounds whose true vapor pressure at the highest monthly average daily temperature of 78.3°F is less than or equal to 10.5 kPa (1.52 psia). The true vapor pressure of product naphtha, the highest of the liquids stored, is 8.07 kPa (1.17 psia) at 78.3°F. Therefore, the requirements of 326 IAC 8-4-3 are not applicable to storage vessels at the source.
- (c) 326 IAC 8-4-4 (Bulk Gasoline Terminals) is not applicable to the source. The source is not a bulk gasoline terminal as defined at 326 IAC 1-2-8. The source is not a gasoline storage facility which receives gasoline from refineries primarily by pipeline, ship, barge or rail, and delivers gasoline to bulk gasoline plants or to commercial or retail accounts primarily by transport.
- (d) 326 IAC 8-4-5 (Bulk Gasoline Plants) is not applicable to the source. The source is not a bulk gasoline plant as defined at 326 IAC 1-2-7. The source is not a gasoline storage and distribution facility which receives gasoline from bulk terminals by transport, stores it in tanks, and subsequently dispenses it via account trucks to local farms, businesses, and service stations.

- (e) 326 IAC 8-4-7 (Gasoline Transports) is not applicable to the source. The source is not an owner or operator of gasoline transports as defined at 326 IAC 1-2-84. The definition of "transport" is: a tractor semi-trailer capable of hauling a maximum load permissible by law of liquid petroleum products with various sized compartment and typically a total capacity of approximately eight thousand (8,000) gallons.
- (f) The requirements of 326 IAC 8-4-8 (Leaks from Leaks from Petroleum Refineries; Monitoring; Reports) is not applicable to the source. The source is a petroleum refinery as defined in 40 CFR 60 and 40 CFR 63. However, because the dates for initial submissions and reports under this rule are past, IDEM, OAQ considers that leak detection and repair provisions of other rules applicable to this source, including but not limited to 40 CFR 60, Subpart GGGa, comply with the intent of this rule.
- (g) 326 IAC 8-4-9 (Leaks from Transports and Vapor Collection Systems; Records) is not applicable to the source. The source is not an owner or operator of a vapor balance system or vapor control system at a source subject to 326 IAC 8-4-4, 326 IAC 8-4-5, or 326 IAC 8-4-6 or of gasoline transports subject to 326 IAC 8-4-7.

**326 IAC 8-5 (Miscellaneous Operations)**

The source is not subject to 326 IAC 8-5 because it is not one of the types of sources listed in 326 IAC 8-5-2 through 326 IAC 8-5-6.

**326 IAC 8-6 (Organic Solvent Emission Limitations)**

The source is not subject to 326 IAC 8-6 because it is not one of the categories of sources listed in 326 IAC 8-6-1. The source is not an existing source (as of January 1, 1980), located in Lake and Marion Counties, or a source commencing operation after October 7, 1974, and prior to January 1, 1980, located anywhere in the state, with potential emissions of 90.7 megagrams (100 tons) or greater per year of VOC, not limited by other rules in 326 IAC 8.

**326 IAC 8-7 (Specific VOC Reduction Requirements for Lake/Porter/Clark/Floyd Counties)**

The source is not subject to 326 IAC 8-7 because it is not located in Lake, Porter, Clark, or Floyd Counties.

**326 IAC 8-9 (Volatile Organic Liquid Storage Vessels)**

The source is not subject to 326 IAC 8-9 because it is not located in Lake, Porter, Clark, or Floyd Counties.

**326 IAC 8-18 (Synthetic Organic Chemical Manufacturing Industry Air Oxidation, Distillation, and Reactor Processes)**

The source is not subject to 326 IAC 8-18 because it is not located in Lake or Porter Counties.

**326 IAC 8-19 (Control of Volatile Organic Compound Emissions from Process Vents in Batch Operations)**

The source is not subject to 326 IAC 8-19 because it is not located in Lake or Porter Counties.

**326 IAC 8-20 (Industrial Wastewater)**

The source is not subject to 326 IAC 8-20 because it is not located in Lake or Porter Counties.

**326 IAC 9 (Carbon Monoxide Emission Limits)**

The source is a stationary source of carbon monoxide emissions commencing operation after March 21, 1972. However, the source is not a source for which an emission limit has been established in 326 IAC 9-1-2. The VCC operations (Block 2000) are not a catalyst regeneration petroleum cracking system or a petroleum fluid coker as described at 326 IAC 9-1-2(a)(1). Operations at the source are not ferrous metal smelters or refuse incineration and refuse burning equipment as described at 326 IAC 9-1-2(a)(2) or (3). Therefore, the source is not subject to the requirements of 326 IAC 9-1.

**Compliance Determination and Monitoring Requirements**

Permits issued under 326 IAC 2-7 are required to assure that sources can demonstrate compliance with all applicable state and federal rules on a continuous basis. All state and federal rules contain compliance provisions; however, these provisions do not always fulfill the requirement for a continuous demonstration. When this occurs, IDEM, OAQ, in conjunction with the source, must develop specific conditions to satisfy 326 IAC 2-7-5. As a result, Compliance Determination Requirements are included in the permit. The Compliance Determination Requirements in Section D of the permit are those conditions that are found directly within state and federal rules and the violation of which serves as grounds for enforcement action.

If the Compliance Determination Requirements are not sufficient to demonstrate continuous compliance, they will be supplemented with Compliance Monitoring Requirements, also in Section D of the permit. Unlike Compliance Determination Requirements, failure to meet Compliance Monitoring conditions would serve as a trigger for corrective actions and not grounds for enforcement action. However, a violation in relation to a compliance monitoring condition will arise through a source's failure to take the appropriate corrective actions within a specific time period.

(a) The Compliance Determination Requirements applicable to this proposed Part 70 permit are as follows:

(1) The following control devices for particulate control shall be in operation and control particulate emissions from the associated coal handling emission units at all times those emission units are in operation:

Emission Unit Description	Unit ID	Control Device
Railcar unloading	EU-1000	Baghouse EU-1000 Water spray dust suppression (hoppers & feeders only)
Transfer station	EU-1001	Baghouse EU-1001
Coal storage enclosure 1 Coal storage enclosure 2 Reclaim transfer station	EU-1006	Baghouse EU-1006
Coal drying loop	EU-1008	Baghouse EU-1008
Enclosed screw conveyor to Block 2000 feed premix drum	EU-2005	Coal Handling System Filter EU-2005

(2) The following control devices for particulate control shall be in operation and control particulate emissions from the associated solids handling emission units at all times those emission units are in operation:

Emission Unit Description	Unit ID	Control Device ID
Coarse additive unloading	silos T34	Baghouse EU-1501
Fine additive unloading	silos T33	Baghouse EU-1502
Na <sub>2</sub> S unloading	silos T35	Baghouse EU-1503
Fine additive production system	-	Baghouse EU-1504
Coarse additive transfer system	Coarse Additive Screw Conveyor	Filter EU-2006
Fine additive transfer system	Fine Additive Transfer	Filter EU-2007
Na <sub>2</sub> S slurry preparation system	Na <sub>2</sub> S Slurry Preparation	Filter EU-2008

(3) The following equation shall be used to determine the CO<sub>2</sub>e emissions from EU-1007, EU-2001, EU-2002, EU-2003, EU-2004, and EU-6000:

$$E_{GHG_i} = F_i \times 60.12 \text{ tons/MMCF}$$

Where:

$$\begin{aligned} E_{GHGi} &= \text{CO}_2\text{e emissions for unit } i, \text{ tons/month} \\ F_i &= \text{fuel gas usage in unit } i, \text{ MMCF/month} \\ i &= \text{fuel combustion unit ID} \end{aligned}$$

- (4) The following equation shall be used to determine the CO<sub>2</sub>e emissions from EU-3001 and EU-3002:

$$E_{GHGSB} = \text{Sulfur production (tons/month)} \times 0.641 \text{ (ton CO}_2\text{e/ton S)}$$

Where:

$$E_{GHGSB} = \text{CO}_2\text{e emissions (ton/month) for the sulfur recovery systems (TGTUA and TGTUB)}$$

- (5) The following equation shall be used to determine the CO<sub>2</sub>e emissions from the HP Flare, LP Flare, and Sulfur Block Flare:

$$E_{FLAi} = F_i \text{ (MMCF/month)} \times 60.36 \text{ (ton CO}_2\text{e/MMCF fuel gas)}$$

Where:

$$\begin{aligned} E_{FLAi} &= \text{CO}_2\text{e emissions for flare } i, \text{ (ton/month)} \\ F_i &= \text{Monthly sweep and pilot fuel gas usage in flare } i, \text{ (MMCF/month)} \\ i &= \text{flare identifier} \end{aligned}$$

- (6) The LP Flare for VOC control shall be in operation and control VOC emissions from the slop tank at all times the slop tank is in operation.
- (7) The Sulfur Block Flare for hydrogen sulfide control shall be in operation and control hydrogen sulfide emissions from sour water tanks T18 - T21 at all times sour water tanks T18 - T21 are in operation.
- (8) Swing tank product changes
- (A) In any twelve (12) consecutive month period during which tank T6 does not change between naphtha and diesel service, tank T6 shall be determined to be in compliance with the VOC emission limit in the table in Condition D.6.1 for the product in service.
- (B) In any twelve (12) consecutive month period during which tank T6 changes between naphtha and diesel service, tank T6 shall be determined to in compliance with the VOC emission limit in Condition D.6.1 if the result, C, of the calculation below is less than or equal to 1.

$$C = \frac{D_N \times 6.29}{2,295} + \frac{(365 - D_N) \times 0.95}{345}$$

Where C = compliance determination coefficient  
D<sub>N</sub> = actual number of days in naphtha service during the twelve (12) consecutive month period

- (9) Loading Flare
- (A) The Loading Flare shall be determined to be in compliance with Conditions D.7.1(b)(1), (d)(1), (e)(1), and (f)(1) at all times that the flares burn only gaseous fuel that complies with Condition D.7.1(c).
- (B) Prior to such time as the source shall conduct the testing required in Condition D.7.4, the Loading Flare shall be determined to be in compliance with Condition D.7.1(b)(2), (d)(2), (e)(2), and (f)(2) at all times that the source can demonstrate that the flares were designed to comply with 40 CFR 60.18.
- (10) The Loading Flare for VOC control shall be in operation and control emissions from the Product Loading Rack facility at all times the Product Loading Rack facility is in operation.
- (11) The following equation shall be used to determine the CO<sub>2</sub>e emissions from the Loading Flare

$$E_{LDG} = F_{LDG} \times 60.36 \frac{\text{tons}}{\text{MMCF}} + L_N \times 3.77E-03 \frac{\text{tons}}{\text{kgal}} + L_D \times 2.06E-04 \frac{\text{tons}}{\text{kgal}}$$

Where:

- E<sub>FLA</sub> = CO<sub>2</sub>e emissions (ton/month) for the Loading Flare  
 F<sub>LDG</sub> = Fuel gas usage in the Loading Flare (MMCF/month)  
 L<sub>N</sub> = Monthly naphtha loadout (kgal/month)  
 L<sub>D</sub> = Monthly diesel loadout (kgal/month)  
 kgal = 1,000 gallons

- (12) The following control devices for particulate control shall be in operation and control particulate emissions from the associated residue handling emission units at all times those emission units are in operation:

Emission Unit Description	Unit ID	Control Device ID
Residue container loading and residue transfer conveyors	EU-5009	Filter EU-5009
Residue rail storage silo, loading hoppers, and residue transfer conveyors	EU-5005, EU-5006, EU-5010	Filter EU-5010
Residue swing storage silo, loading hoppers, and residue transfer conveyors	EU-5007, EU-5008, EU-5011	Filter EU-5011

- (13) The drift eliminators for particulate control shall be in operation and control emissions from the cooling tower at all times the cooling tower is in operation.
- (14) The following equation shall be used to determine the CO<sub>2</sub>e emissions from the Emergency Generator (EU-6006) and Emergency Fire Pump (EU-6008):

(A)

$$E_{6006} = H_{6006} \times 1.62 \frac{\text{tons}}{\text{hr}}$$

Where:

- E<sub>RICE</sub> = CO<sub>2</sub>e emissions for non-emergency operation of the Emergency Generator (EU-6006), (ton/month)

$H_{6008}$  = Monthly hours of non-emergency operation of the Emergency Generator (EU-6006), (hr/month)

(B)

$$E_{6008} = H_{6008} \times 0.43 \frac{\text{tons}}{\text{hr}}$$

Where:

$E_{6008}$  = CO<sub>2</sub>e emissions for operation of the Emergency Fire Pump (EU-6008), (ton/month)

$H_{6008}$  = Monthly hours of operation of the Emergency Fire Pump (EU-6008), (hr/month)

(15) The selective catalytic reduction (SCR) systems for NO<sub>x</sub> control shall be in operation and control emissions from the hydrogen plant reformers (EU-7001 and/or EU-7002) facility at all times the EU-7001 and/or EU-7002 facility are in operation.

(16) The following equation shall be used to determine the CO<sub>2</sub>e emissions from hydrogen production operations:

(A)

$$E_{HYi} = H_{HYi} \times 112.59 \text{ (tons CO}_2\text{e/hr)}$$

Where:

$E_{HYi}$  = CO<sub>2</sub>e emissions for hydrogen plant *i*, (ton/month)

$H_{HYi}$  = Monthly hours of operation of hydrogen plant *i*, (hr/month)

*i* = indicator for hydrogen plant 1 or 2

(B)

$$E_{DAi} = H_{DAi} \times 0.12 \text{ (tons CO}_2\text{e/hr)}$$

Where:

$E_{DAi}$  = CO<sub>2</sub>e emissions for DA vent *i*, (ton/month)

$H_{DAi}$  = Monthly hours of operation of DA vent, *i* (hr/month)

*i* = indicator for hydrogen plant 1 or 2

(17) The following control devices for particulate control shall be in operation and control particulate emissions from the associated lime unloading emission units at all times those emission units are in operation:

Emission Unit Description	Unit ID	Control Device ID
Lime unloading	EU-6501	Filter EU-6501

Summary of Testing Requirements					
Emission Unit	Control Device	Timeframe for Testing	Pollutant	Frequency of Testing	Authority
Railcar unloading	Baghouse EU-1000	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
		60/180 <sup>2</sup>	Opacity	Every 90 days <sup>3</sup>	40 CFR 60, Subpart Y
Transfer station	Baghouse EU-1001	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2

Summary of Testing Requirements					
Emission Unit	Control Device	Timeframe for Testing	Pollutant	Frequency of Testing	Authority
		60/180 <sup>2</sup>	Opacity	Every 90 days <sup>3</sup>	40 CFR 60, Subpart Y
Coal storage enclosure 1	Baghouse EU-1006	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Coal storage enclosure 2 Reclaim transfer station		60/180 <sup>2</sup>	Opacity	Every 90 days <sup>3</sup>	40 CFR 60, Subpart Y
Coal dryer heater, EU-1007	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NOx, VOC, CO	Every 5 years	326 IAC 2-2
		60/180 <sup>2</sup>	NOx	Every 2 years	40 CFR 60, Subpart Ja
Coal drying loop purge	Baghouse EU-1008	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Coarse additive unloading	Baghouse EU-1501	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Fine additive unloading	Baghouse EU-1502	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Na <sub>2</sub> S unloading	Baghouse EU-1503	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Fine additive production system	Baghouse EU-1504	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Feed heater, EU-2001	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , VOC, CO	Every 5 years	326 IAC 2-2
Treat gas heater, EU-2002	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NOx, VOC, CO	Every 5 years	326 IAC 2-2
		60/180 <sup>2</sup>	NOx	Every 2 years	40 CFR 60, Subpart Ja
Vacuum column feed heater, EU-2003	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NOx, VOC, CO	Every 5 years	326 IAC 2-2
Fractionator heater, EU-2004	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , VOC, CO	Every 5 years	326 IAC 2-2
Enclosed screw conveyor to Block 2000 feed premix drum	Filter EU-2005	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
		60/180 <sup>2</sup>	Opacity	Every 90 days <sup>3</sup>	40 CFR 60, Subpart Y
Coarse additive transfer system	Filter EU-2006	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Fine additive transfer system	Filter EU-2007	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Na <sub>2</sub> S slurry preparation system	Filter EU-2008	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2

Summary of Testing Requirements					
Emission Unit	Control Device	Timeframe for Testing	Pollutant	Frequency of Testing	Authority
Tail gas treatment unit A, EU-3001	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NO <sub>x</sub> , VOC, CO, H <sub>2</sub> SO <sub>4</sub> mist	Every 5 years	326 IAC 2-2
Tail gas treatment unit B, EU-3002	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NO <sub>x</sub> , VOC, CO, H <sub>2</sub> SO <sub>4</sub> mist	Every 5 years	326 IAC 2-2
HP flare	-	first planned event	net heating value, actual exit velocity, visible emissions	Every 5 years	326 IAC 2-2
LP flare	-	first planned event	net heating value, actual exit velocity, visible emissions	Every 5 years	326 IAC 2-2
SB flare	-	first planned event	net heating value, actual exit velocity, visible emissions	Every 5 years	326 IAC 2-2
Loading flare while loading naphtha	-	180 <sup>1</sup>	net heating value, actual exit velocity, visible emissions	Every 5 years	326 IAC 2-2
Loading flare while loading diesel	-	180 <sup>1</sup>	net heating value, actual exit velocity, visible emissions	Every 5 years	326 IAC 2-2
Product loading rack while loading naphtha	Loading flare	180 <sup>1</sup>	VOC input to flare	Every 5 years	326 IAC 2-2
Product loading rack while loading diesel	Loading flare	180 <sup>1</sup>	VOC input to flare	Every 5 years	326 IAC 2-2
Residue pastillator line, EU-5001a-d	-	180 <sup>1</sup>	VOC	Every 5 years	326 IAC 2-2
Residue pastillator line, EU-5002a-d	-	180 <sup>1</sup>	VOC	Every 5 years	326 IAC 2-2
Residue pastillator line, EU-5003a-d	-	180 <sup>1</sup>	VOC	Every 5 years	326 IAC 2-2

Summary of Testing Requirements					
Emission Unit	Control Device	Timeframe for Testing	Pollutant	Frequency of Testing	Authority
Residue pastillator line, EU-5004a-d	-	180 <sup>1</sup>	VOC	Every 5 years	326 IAC 2-2
Residue container loading and transfer conveyors	Filter EU-5009	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Residue rail storage silo, loading hoppers, and transfer conveyors	Filter EU-5010	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Residue swing storage silo, loading hoppers, and transfer conveyors	Filter EU-5011	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Boiler, EU-6000	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , NO <sub>x</sub> , VOC, CO	Every 5 years	326 IAC 2-2
		60/180 <sup>2</sup>	NO <sub>x</sub>	Every 2 years	40 CFR 60, Subpart Ja
Lime unloading	Filter EU-6501	180 <sup>1</sup>	PM, PM <sub>10</sub> , PM <sub>2.5</sub>	Every 5 years	326 IAC 2-2
Hydrogen plant reformer 1, EU-7001	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , VOC, CO	Every 5 years	326 IAC 2-2
Hydrogen plant reformer 2, EU-7002	-	180 <sup>1</sup>	PM <sub>FILTERABLE</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> , VOC, CO	Every 5 years	326 IAC 2-2
Hydrogen plant 1 DA vent, EU-7003	-	180 <sup>1</sup>	VOC, CO	Every 5 years	326 IAC 2-2
Hydrogen plant 2 DA vent, EU-7004	-	180 <sup>1</sup>	VOC, CO	Every 5 years	326 IAC 2-2
Wastewater treatment system vent, EU-8001	-	180 <sup>1</sup>	VOC	Every 5 years	326 IAC 2-2

Notes:

1. 180 days after startup
2. Within 60 days of achieving maximum capacity but not later than 180 days after startup
3. If the any 6-minute average opacity reading in the most recent performance test is less than or equal to 50% of the applicable standard, a new opacity test must be conducted within 12 months of the date of the previous test.

(b) The Compliance Monitoring Requirements applicable to this proposed Part 70 permit are as follows:

- (1) Coal handling:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Baghouse EU-1000	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1001	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1006	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1008	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Filter EU-2005	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Coal unloading enclosure	Negative pressure, or	Daily	greater than 0.013 mm Hg	Response Steps
	Air flow	Daily	200 ft/min	
	Enclosure inspection	Monthly	Satisfactory/unsatisfactory	
Coal storage enclosure 1	Negative pressure, or	Daily	greater than 0.013 mm Hg	Response Steps
	Air flow	Daily	200 ft/min	
	Enclosure inspection	Monthly	Satisfactory/unsatisfactory	
Coal storage enclosure 2	Negative pressure	Daily	greater than 0.013 mm Hg	Response Steps
	Air flow	Daily	200 ft/min	
	Enclosure inspection	Monthly	Satisfactory/unsatisfactory	

These monitoring conditions are necessary because the baghouses, filter, and enclosures for the coal handling operations must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

(2) Solids handling:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Baghouse EU-1501	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1502	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1503	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Baghouse EU-1504	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Filter EU-2006	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps

Control	Parameter	Frequency	Range	Excursions and Exceedances
Filter EU-2007	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Filter EU-2008	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps

These monitoring conditions are necessary because the baghouses and filters for the solids handling operations must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

(3) Fuel gas combustion:

(A) Continuous emissions monitoring systems (CEMS):

Unit	Parameter	Frequency	Excursions and Exceedances	Authority	Reporting
EU-1007	O <sub>2</sub> CEMS	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas				
EU-2001	NO <sub>x</sub> CEMS	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas				
EU-2002	O <sub>2</sub> CEMS	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas				
EU-2003	Total sulfur in fuel gas	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
EU-2004	NO <sub>x</sub> CEMS	Continuous	Response Steps	40 CFR 60, Subpart Db	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas			40 CFR 60, Subpart Ja	
EU-6000	O <sub>2</sub> CEMS	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas				

(B) CEMS downtime monitoring:

Control	Parameter	Frequency	Range	Excursions and Exceedances
O <sub>2</sub> CEMS: EU-1007 EU-2001 EU-2002 EU-6000	stack percent oxygen	once per day	as determined by CEMS	Response steps
NO <sub>x</sub> CEMS: EU-2001	stack percent oxygen	once per day	as determined by CEMS	Response steps
Total Sulfur Continuous Analyzer: EU-1007 EU-2001 EU-2002 EU-2003 EU-2004 EU-6000	fuel gas sulfur	once per hour	≤ 0.005 gr/dscf	Response steps

These monitoring conditions are necessary because the fuel gas combustion units must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements) and 40 CFR 60.

(4) Sulfur recovery units:

(A) Continuous emissions monitoring systems (CEMS):

Unit	Parameter	Frequency	Excursions and Exceedances	Authority	Reporting
Tail gas incinerator A-605A	SO <sub>2</sub> CEMS	Continuous	Response Steps	326 IAC 2-2 (PSD)	Quarterly for calibration gas audits and RATA, and CEMS downtime
Tail gas incinerator A-605B	SO <sub>2</sub> CEMS	Continuous	Response Steps	326 IAC 2-2 (PSD)	Quarterly for calibration gas audits and RATA, and CEMS downtime

(B) CEMS downtime monitoring:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Tail gas incinerator A-605A	H <sub>2</sub> S in T-602A offgas	Drager tube, once per hour	TBD	Response steps
Tail gas incinerator A-605B	H <sub>2</sub> S in T-602A offgas	Drager tube, once per hour	TBD	Response steps

These monitoring conditions are necessary because the sulfur recovery units must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements) and 40 CFR 60.

(5) Flares:

(A) Continuous emissions monitoring systems (CEMS):

Unit	Parameter	Frequency	Excursions and Exceedances	Authority	Reporting
HP flare	Total sulfur in fuel gas	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Flare pilot	Continuous	Response Steps	326 IAC 2-2 (PSD)	Records of the presence of a pilot
LP flare	Total sulfur in fuel gas	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Flare pilot	Continuous	Response Steps	326 IAC 2-2 (PSD)	Records of the presence of a pilot
SB flare	Total sulfur in fuel gas	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Flare pilot	Continuous	Response Steps	326 IAC 2-2 (PSD)	Records of the presence of a pilot
Loading flare	Total sulfur in fuel gas	Continuous	Response Steps	40 CFR 60, Subpart Ja	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Flare pilot	Continuous	Response Steps	326 IAC 2-2 (PSD)	Records of the presence of a pilot

These monitoring conditions are necessary because the flares must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements) and 40 CFR 60.

(6) Residue handling:

(A) Filters

Control	Parameter	Frequency	Range	Excursions and Exceedances
Filter EU-5009	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Filter EU-5010	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps
Filter EU-5011	Water Pressure Drop	Daily	3.0 - 6.0 inches of water	Response Steps

These monitoring conditions are necessary because the filters for the residue handling operations must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

(B) Loading

Control	Parameter	Frequency	Range	Excursions and Exceedances
Railcar loading choke flow-practices	Visible Emissions	Daily	Normal/ abnormal	Response Steps
Swing loading choke flow-practices	Visible Emissions	Daily	Normal/ abnormal	Response Steps

(7) Cooling tower:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Cell EU-6001	TDS	once per week	≤2,395 mg/l	Response Steps
	Presence of liquid VOC in return	once per week	none visible	
Cell EU-6002	TDS	once per week	≤2,395 mg/l	Response Steps
	Presence of liquid VOC in return	once per week	none visible	
Cell EU-6003	TDS	once per week	≤2,395 mg/l	Response Steps
	Presence of liquid VOC in return	once per week	none visible	

These monitoring conditions are necessary because the cooling tower must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

(8) Hydrogen production plants:

(A) Continuous emissions monitoring systems (CEMS):

Unit	Parameter	Frequency	Excursions and Exceedances	Authority	Reporting
EU-7001	NOx CEMS	Continuous	Response Steps	40 CFR 60, Subpart Db	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas			40 CFR 60, Subpart Ja	
EU-7002	NOx CEMS	Continuous	Response Steps	40 CFR 60, Subpart Db	Quarterly for calibration gas audits and RATA, and CEMS downtime
	Total sulfur in fuel gas			40 CFR 60, Subpart Ja	

(B) CEMS downtime monitoring:

Control	Parameter	Frequency	Range	Excursions and Exceedances
EU-7001 SCR	ammonia flow rate	four (4) times per hour	TBD	Response steps
	inlet duct temperature		TBD	
EU-7002 SCR	ammonia flow rate	four (4) times per hour	TBD	Response steps
	inlet duct temperature		TBD	

These monitoring conditions are necessary because the hydrogen production plants must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements) and 40 CFR 60.

(9) Lime unloading:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Filter EU-6501	Inspection	twice per year	manufacturer's specifications	Response Steps

These monitoring conditions are necessary because the lime unloading filter must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

(10) Wastewater:

Control	Parameter	Frequency	Range	Excursions and Exceedances
Oily water sump carbon canister (EU-8002)	Exhaust VOC concentration	Daily <sup>1</sup>	<20 ppmvd	Response Steps
	or Exhaust benzene concentration	Daily <sup>1</sup>	1 ppmvd	

Control	Parameter	Frequency	Range	Excursions and Exceedances
Manhole No. 1 carbon canister (EU-8003)	Exhaust VOC concentration	Daily <sup>1</sup>	<20 ppmvd	Response Steps
	Exhaust benzene concentration	Daily <sup>1</sup>	1 ppmvd	

1. Monitoring shall be conducted each day or at intervals no greater than 20 percent of the design carbon replacement interval, whichever is greater.

These monitoring conditions are necessary because the carbon canisters for VOC control must operate properly to assure compliance with 326 IAC 2-2 (Prevention of Significant Deterioration (PSD) Requirements).

**Conclusion and Recommendation**

Unless otherwise stated, information used in this review was derived from the application and additional information submitted by the applicant. An application for the purposes of this review was received on January 25, 2018.

The staff recommends to the Commissioner that the proposed Part 70 permit be approved.

**IDEM Contact**

- (a) Questions regarding this proposed permit can be directed to Doug Logan at the Indiana Department Environmental Management, Office of Air Quality, Permits Branch, 100 North Senate Avenue, MC 61-53 IGCN 1003, Indianapolis, Indiana 46204-2251 or by telephone at (317) 234-5328 or toll free at 1-800-451-6027, extension 4-5328.
- (b) A copy of the findings is available on the Internet at: <http://www.in.gov/ai/appfiles/idem-caats/>
- (c) For additional information about air permits and how the public and interested parties can participate, refer to the IDEM Air Permits page on the Internet at: <http://www.in.gov/idem/airquality/2356.htm>; and the Citizens' Guide to IDEM on the Internet at: <http://www.in.gov/idem/6900.htm>.

- Notes:*
1. PM emission factor is filterable PM only. PM10 emission factor is filterable and condensable PM10 combined. PM2.5 emission factor is filterable and condensable PM2.5 combined.
  2. Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.
  3. Emission factors provided by the burner manufacturer, subject to testing.

**Methodology**

MMBtu = 1,000,000 Btu  
 MMCF = 1,000,000 Cubic Feet of Gas  
 Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
 Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					Total - Organics
	Benzene	Dichlorobenzene	Formaldehyde	n-Hexane	Toluene	
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	
Potential Emission in tons/yr	5.09E-04	2.91E-04	1.82E-02	0.44	8.24E-04	<b>0.46</b>

	HAPs - Metals					Total - Metals
	Lead	Cadmium	Chromium	Manganese	Nickel	
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	
Potential Emission in tons/yr	1.21E-04	2.66E-04	3.39E-04	9.20E-05	5.09E-04	<b>1.33E-03</b>

Methodology is the same as above.  
 The five highest organic and metal HAPs emission factors are provided above.  
 Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO2	CH4	N2O
Emission Factor in lb/MMcf	120,000	2.3	0.64
Potential Emission in tons/yr	29,067	0.56	0.16
Summed Potential Emissions in tons/yr	29,068		
CO2e Total in tons/yr	29,127		

**Methodology**

The N2O Emission Factor for uncontrolled is 2.2. The N2O Emission Factor for low Nox burner is 0.64.  
 Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
 Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
 CO2e (tons/yr) = CO2 Potential Emission ton/yr x CO2 GWP (1) + CH4 Potential Emission ton/yr x CH4 GWP (25) + N2O Potential Emission ton/yr x N2O GWP (298).

**2. Potential to Emit After Issuance**

	Pollutant

**1. Silo Loading**

**A. Unrestricted Potential to Emit**

Description	Unit ID	Control Device ID	Silo Throughput <sup>1</sup> (tons/hr)	Uncontrolled					
				Emission Factor <sup>2</sup>		Potential to Emit			
				PM (lb/ton)	PM10 = PM2.5 (lb/ton)	PM (lb/hr)	PM10 = PM2.5 (lb/hr)	PM (tons/yr)	PM10 = PM2.5 (tons/yr)
Coarse additive silo	T33	EU-1501	20.00	0.73	0.46	14.60	9.20	63.95	40.30
Fine additive silo	T34	EU-1502	20.00	0.73	0.46	14.60	9.20	63.95	40.30
Sodium sulfide silo	T35	EU-1503	10.00	0.73	0.46	7.30	4.60	31.97	20.15

**Methodology**

Potential to Emit (lb/hr) = Silo Throughput (tons/hr) x Emission Factor (lb/ton)  
Potential to Emit (tons/yr) = Potential to Emit (lb/hr) x 8,760 (hrs/yr) / 2,000 (lb/ton)

**B. Bottlenecked Potential to Emit**

Description	Unit ID	Control Device ID	Bottlenecked Additive Throughput <sup>3</sup> (tons/yr)	Uncontrolled			
				Emission Factor <sup>2</sup>		Potential to Emit	
				PM (lb/ton)	PM10 = PM2.5 (lb/ton)	PM (tons/yr)	PM10 = PM2.5 (tons/yr)
Coarse additive silo	T33	EU-1501	28776.60	0.73	0.46	10.50	6.62
Fine additive silo	T34	EU-1502	28776.60	0.73	0.46	10.50	6.62
Sodium sulfide silo	T35	EU-1503	674.52	0.73	0.46	0.25	0.16
<b>Total</b>						<b>21.25</b>	<b>13.39</b>

Notes to section 1A & B:

- Silo Throughput is the rate of unloading delivery trucks or railcars.
- Emission factors from AP-42, Chapter 11.12 Concrete Batching, Table 11.12-2 (updated June 2006) SCC 3-05-011-07 (cement unloading to elevated storage silo) Emission factor unit is pounds per ton of material loaded. PM2.5 assumed equal to PM10 because AP-42 does not have emission factors for PM2.5.
- Bottlenecked throughput based on bottlenecked production capacity.

**Methodology**

Bottlenecked Throughput (tons/yr) = Bottlenecked mixer capacity (tons/hr) x 8,760 hr/yr x weight fraction of cement in mix  
Potential to Emit (tons/yr) = Bottlenecked Throughput (tons/yr) x Emission Factor (lb/ton) / 2,000 (lb/ton)

**C. Hazardous Air Pollutants**

**Part 70 Permit No.:** 147-39554-00065  
**Reviewer:** Doug Logan  
**Date:** 10/19/2018

**Process Specifications**

Coal usage: 258 tph at 8.00% moisture and 6.67% ash = 220.46 tph, moisture and ash free  
 sulfur content: 3.30% by weight (moisture and ash free)  
 from S. Lang, KBR, by email 3/29/2018, 11:39AM

Potential sulfur producti 220.46 tons coal/hr x 3.30% sulfur x 8760 hr/yr = 63,731 tons of sulfur/year

	Heat Input Capacity (MMBtu/hr)		Sulfur Production Rate (tons/yr)	
	Maximum	Bottlenecked	Maximum	Bottlenecked
TGTUA (EU-3001)	52.75	75.35	44,611	63,731
TGTUB (EU-3002)	52.75		44,611	

Exhaust flow rate (each 25,169 acfm @ 549.3 K = 989 °R *Bottlenecked case, each SRU handling a nominal 50% of VCC capacity*  
 35,956 acfm *Maximum for each SRU, 70% of VCC capacity*  
 (based on modeling parameters provided by the source, 70% of VCC capacity, including excess oxygen, nitrogen, and trace gases)

Site elevation (ASL): 148 m, thus nominal site atmospheric pressure = 0.983 atm  
 Interpolated from Table 3-214, *Perry's Chemical Engineers' Handbook, 6th ed.*

**Exhaust moisture correction:**

4.69 (lb mole H<sub>2</sub>O/min), each SRU, bottlenecked, 50% of VCC capacity

6.57 (lb mole H<sub>2</sub>O/min), SRU maximum, 70% of VCC capacity

determined by the source from design material balance, includes moisture from combustion of H<sub>2</sub>S and saturation of inlet streams after amine and caustic scrubbers

and the exhaust molar flow rate (dry) is:

*Bottlenecked condition, 50% of VCC capacity.*

25,169 (acfm) x 0.983 (atm) / [ 989 (°R) x 0.7302 (atm ft<sup>3</sup>/lb mole °R) ] - 4.69 (lb mole H<sub>2</sub>O/min) = 29.59 (lb mole/min)  
 correcting to 0% O<sub>2</sub> based on design oxygen content in the exhaust: 3.29% O<sub>2</sub> 28.62 (lb mole/min @ 0% O<sub>2</sub>)

*SRU (each) maximum, 70% of VCC capacity*

35,956 (acfm) x 0.983 (atm) / [ 989 (°R) x 0.7302 (atm ft<sup>3</sup>/lb mole °R) ] - 6.57 (lb mole H<sub>2</sub>O/min) = 42.40 (lb mole/min)  
 correcting to 0% O<sub>2</sub> based on design oxygen content in the exhaust: 3.29% O<sub>2</sub> 41.01 (lb mole/min @ 0% O<sub>2</sub>)

**Methodology**

Exhaust molar flow rate (lb-mole/min @ 0% O<sub>2</sub>) = Exhaust molar flow rate (lb-mole/min) x [1 - %O<sub>2</sub>/100]

**2. Hazardous Air Pollutants**

	Pollutant					
	Benzene	Formaldehyde	n-Hexane	Toluene	Nickel	Total HAPs
Emission Factor <sup>1</sup> (lb/MMBtu)	1.47E-06	5.25E-05	1.26E-03	2.38E-06	1.47E-06	-
Bottlenecked PTE (tons/yr)	4.86E-04	1.73E-02	0.42	7.86E-04	4.86E-04	0.43

Notes:

1. Emission factors from PTE calculations provided by the source.

	Pollutant		
	Sulfuric Acid Mist	H <sub>2</sub> S	Total Reduced Sulfur
Emission Factor (lb/MMBtu)	0.0244	-	0.0125
BACT limit (ppmv)	-	10	-
Bottlenecked PTE (tons/yr)	8.05	5.11	4.13
Emission rate (lb/long ton S)	0.28	0.18	0.14

for comparison to RBLC entries

**Methodology**

Bottlenecked PTE (tons/yr) = Exhaust Molar Flow Rate (bottlenecked) (dry) (lb mole/min @ 0% O<sub>2</sub>) x BACT Limit (ppmv) / 1,000,000 (ppmv/mole fraction) x 60 (min/hr) x 8,760 (hr/yr) / 2,000 (lb/ton) x 2 x 34 (lb H<sub>2</sub>S/lb mole) H<sub>2</sub>S

Bottlenecked PTE (tons/yr) = Bottlenecked Heat Input Capacity (MMBtu/hr) x Emission Factor (lb/MMBtu) x 8,760 (hr/yr) / 2,000 (lb/ton) *all others*

Total HAPs (tons/yr) = sum of named HAPs

Emission rate (lb/long ton S) = Bottlenecked PTE (tons/yr) x 2,000 (lb/ton) / [Bottlenecked Throughput (tons S/yr) / 1.1 (ton/long ton)]

**3. Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Emission Factor in lb/MMBtu	123.2	0	2.16E-03
Potential Emission in tons/yr	40,660	0	0.71
Summed Potential Emissions in tons/yr	40,661		
CO <sub>2</sub> e Total in tons/yr	40,872		

**Methodology**

CO<sub>2</sub> emission factor provided by the source, includes CO<sub>2</sub> in the ARU acid gas stream

CH<sub>4</sub> emissions considered negligible because the SRU's are fueled with hydrogen sulfide

N<sub>2</sub>O emission factor scaled from AP 42, Table 1.4-2 using natural gas HHV of 1,020 MMBtu/MMCF

Emission (tons/yr) = Throughput (MMBtu/hr) x Emission Factor (lb/MMBtu) x 8760 hr/yr x 1 ton/2,000 lb

Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.

CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).

**Notes:**

- PM emission factor is filterable PM only. PM10 emission factor is filterable and condensable PM10 combined. PM2.5 emission factor is filterable and condensable PM2.5 combined.
- Emission Factors for NOx: Uncontrolled = 100, Low NOx Burner = 50, Low NOx Burners/Flue gas recirculation = 32
- Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.

**Methodology**

All emission factors are based on normal firing.

MMBtu = 1,000,000 Btu

MMCF = 1,000,000 Cubic Feet of Gas

Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03

Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu

Unit SO<sub>2</sub> PTE (lb/hr) = Emission Limit (gr/dscf) x Heat Input Capacity (HHV) (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) / 7,000 (gr/lb) / 2,000 (lb/ton) x 64 lb SO<sub>2</sub>/lb mole / 32 lb S/lb mole SO<sub>2</sub>

Unit PTE (lb/hr) = Heat Input Capacity (HHV) (MMBtu/hr) x Emission Factor (lb/MMBtu) all others

PTE (tons/yr) = Potential Throughput (MMCF/yr) x Emission Limit (gr/scf) x 1,000,000 (scf/MMCF) / 7,000 (gr/lb) / 2,000 lb/ton x 64 lb SO<sub>2</sub>/lb mole / 32 lb S/lb mole SO<sub>2</sub>

PTE (tons/yr) = Total Heat Input Capacity (HHV) (MMBtu/hr) x Emission Limit (lb/MMBtu) x 8,760 (hr/yr) / 2,000 lb/ton all others

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					Total - Organics
	Benzene	Dichlorobenzen e	Formaldehyde	n-Hexane	Toluene	
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	
Potential Emission in tons/yr	7.79E-06	4.45E-06	2.78E-04	6.68E-03	1.26E-05	<b>6.98E-03</b>

	HAPs - Metals					Total - Metals
	Lead	Cadmium	Chromium	Manganese	Nickel	
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	
Potential Emission in tons/yr	1.86E-06	4.08E-06	5.19E-06	1.41E-06	7.79E-06	<b>2.03E-05</b>

Methodology is the same as above.

The five highest organic and metal HAPs emission factors are provided above.

Additional HAPs emission factors are available in AP-42, Chapter 1.4.

<b>Total HAPs</b>	<b>7.00E-03</b>
<b>Worst HAP</b>	<b>6.68E-03</b>

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO2	CH4	N2O
Emission Factor in lb/MMcf	120,000	2.3	2.2
Potential Emission in tons/yr	SB Flare	445	0.01
	LP Flare	3,758	0.07
	HP Flare	3,758	0.07
Summed Potential Emissions in tons/yr		7,962	
CO2e Total in tons/yr	SB Flare	448	
	LP Flare	3,781	
	HP Flare	3,781	
	<b>Total</b>	<b>8,009</b>	

GHG compliance determination factor = 1079.36 (tons CO<sub>2</sub>e/MMCF fuel gas)

**Methodology**

The N2O Emission Factor for uncontrolled is 2.2. The N2O Emission Factor for low Nox burner is 0.64.

Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.

Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.

Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton

CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).

GHG compliance determination factor (tons CO<sub>2</sub>e/MMCF fuel gas) = CO<sub>2</sub>e Total (tons/yr) / Potential Throughput (MMCF/yr)

<b>Total</b>			<b>332,998</b>	<b>287,636</b>		<b>5793.11</b>

**Notes:**

- Vapor molecular weights calculated in "Product Vapor HAP" tab.
- Loading loss calculated in "Block 4000 Racks" tab.
- Product heat content provided by the source, 7/26/2018.

**Methodology**

VOC Input (lb/yr) = Loading Loss (lb/kgal) x Annual Throughput (kgal/yr)  
Heat Input (MMBtu/yr) = VOC Input (lb/yr) x Heat Content (MMBtu/lb)

**A. Criteria Pollutants**

	Pollutant						
	PM	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>	NO <sub>x</sub>	VOC	CO
Emission Factor <sup>1</sup> (lb/MMBtu)	- <sup>2</sup>	- <sup>2</sup>	- <sup>2</sup>	- <sup>3</sup>	0.068	- <sup>4</sup>	0.31
Potential to Emit (tons/yr)					0.20		0.90

**Notes:**

- Emission factor source, Tables 13.5-1 and 13.5-2, AP-42 (2/18) except as noted.
- Particulate matter (soot) emissions negligible for nonsmoking flare, ref. note d, AP-42 Table 13.5-1 (2/18).
- Sulfur content of hydrotreated products considered negligible.
- VOC emissions are accounted for in the loading rack PTE.

**Methodology**

Potential to Emit (tons/yr) = Emission Factor (lb/MMBtu) x Total Heat Input (MMBtu/yr) / 2,000 (lb/ton)

**B. Hazardous Air Pollutants**

HAP Emissions are accounted for in the loading rack PTE.

**C. Greenhouse Gases (GHGs)**

Given that alkanes have the nominal formula C<sub>n</sub>H<sub>2n+2</sub> and the atomic weights of C = 12 and H = 1, then the molecular weight is M = 12n + 2n + 2, and n = (M-2)/14

	VOC Input <sup>1</sup> (lb/yr)	Molecular Weight <sup>1</sup> , M (lb/lb mole)	VOC Input (lb mole/yr)	n (lb mole CO <sub>2</sub> / lb mole VOC)	Molar CO <sub>2</sub> Emissions (lb mole/yr)	Molar CO Emissions (lb mole/yr)	CO <sub>2</sub> Emissions (tons/yr)

Potential Emission (lb/hr)	4.22E-04	1.64E-03	1.64E-03	1.87E-04	2.20E-02	1.20E-03	1.84E-02
Potential Emission (tons/yr)	1.85E-03	7.20E-03	7.20E-03	8.19E-04	0.10	5.25E-03	8.07E-02

**Notes:**

- BACT specifications
- PM<sub>2.5</sub> emission factor is filterable and condensable PM<sub>2.5</sub> combined.

**Methodology**

All emission factors are based on normal firing.  
MMBtu = 1,000,000 Btu  
MMCF = 1,000,000 Cubic Feet of Gas  
Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
Potential Throughput (MMCF) = Heat Input Capacity (MMBtu/hr) x 8,760 hrs/yr x 1 MMCF/1,020 MMBtu  
SO<sub>2</sub> Emission Limit (lb/MMBtu) = Emission Limit (ppmv) / 1,000,000 / 359 (lb mole/ft<sup>3</sup>) x 1,000,000 (scf/MMCF) / HHV (MMBtu/MMCF) x 64 lb SO<sub>2</sub>/lb mole / 34 lb H<sub>2</sub>S/lb mole  
note: Volume fractions equal mole fraction, so ppmv/1,000,000=mole fraction, molar volume standard conditions (1 atm, 273.15 K), molar volume V = RT/P = 359 ft<sup>3</sup>/lb-mole from the  
PTE (tons/yr) = Potential Throughput (MMCF/yr) x HHV (MMBtu/MMCF) x Emission Limit (lb/MMBtu) x 8,760 (hr/yr) / 2,000 lb/ton

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					Total - Organics
	Benzene	Dichlorobenzene	Formaldehyde	n-Hexane	Toluene	
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	
Potential Emission in tons/yr	2.02E-06	1.16E-06	7.23E-05	1.73E-03	3.28E-06	<b>1.81E-03</b>

	HAPs - Metals					Total - Metals
	Lead	Cadmium	Chromium	Manganese	Nickel	
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	
Potential Emission in tons/yr	4.82E-07	1.06E-06	1.35E-06	3.66E-07	2.02E-06	<b>5.28E-06</b>
						<b>Total HAPs 1.82E-03</b>
						<b>Worst HAP 1.73E-03</b>

Methodology is the same as above.  
The five highest organic and metal HAPs emission factors are provided above.  
Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Emission Factor in lb/MMcf	120,000	2.3	2.2
Potential Emission in tons/yr	116	2.22E-03	2.12E-03
Summed Potential Emissions in tons/yr	116		
CO <sub>2</sub> e Total in tons/yr	116		

GHG compliance determination factor = 60.36

**Methodology**

The N<sub>2</sub>O Emission Factor for uncontrolled is 2.2. The N<sub>2</sub>O Emission Factor for low Nox burner is 0.64.  
Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
CO<sub>2</sub>e (tons/yr) = CO<sub>2</sub> Potential Emission ton/yr x CO<sub>2</sub> GWP (1) + CH<sub>4</sub> Potential Emission ton/yr x CH<sub>4</sub> GWP (25) + N<sub>2</sub>O Potential Emission ton/yr x N<sub>2</sub>O GWP (298).  
GHG Compliance Determination Factor (tons CO<sub>2</sub>e/MMCF fuel gas) = CO<sub>2</sub>e Total (tons/yr) / Potential Throughput (MMCF/yr)

**3. Potential to Emit After Issuance**

### 1. VOC

Uncontrolled loading loss from AP-42 Chapter 5.2, Eqn. 1.

$$L_L = 12.46 \text{ (SPM / T)}$$

Where  $L_L$  = Loading Loss (lb/kgal)

S = a saturation factor, AP-42 Table 5.2-1 (dimensionless)

P = true vapor pressure of liquid loaded, (psia) (AP-42 Table 7.1-2 or other standard engineering sources)

M = vapor molecular weight (lb/lb mole) (AP-42 Table 7.1-2 or other standard engineering sources)

T = temperature of bulk liquid loaded, (°R)

Fuel Type <sup>1</sup>	Saturation Factor <sup>2</sup>	True Vapor Pressure <sup>3</sup> (psia)	Molecular Weight <sup>4</sup> (lb/lb-mole)	Temperature <sup>5</sup> (°R)	$L_L$ Loading Loss (lb/kgal)	Annual Throughput <sup>6</sup> (kgal/yr)	Uncontrolled VOC PTE (ton/yr)	Emission Control Efficiency (%)	Controlled VOC Emissions (ton/yr)	Emissions Limit (lb/kgal)
Naphtha loading	1.0	1.17	90.55	537.97	2.45	112,721	138.20	98%	2.76	0.049
Distillate loading	1.0	1.14E-02	192.39	537.97	0.051	220,277	5.61	98%	0.11	1.02E-03
<b>Total</b>							<b>143.8</b>		<b>2.88</b>	

**Notes:**

- The source has stated there are no emissions from sulfur loading or ammonia loading.
- Vapor balance service, submerged loading
- Vapor pressure determined using August Equation (Eqn 1-24, AP-42 Chapter 7) with coefficients for naphtha and diesel from "Product Vapor HAP" tab.
- Vapor molecular weights calculated in "Product Vapor HAP" tab.
- Temperature is maximum monthly average temperature from meteorological data in TANKS 4.0.9d for Evansville, Indiana
- Annual product throughput from "Block 4000 Tanks" tab.

### Methodology

1 kgal = 1,000 gal

Vapor recovery collection efficiency is from AP-42 Chapter 5.2.

Uncontrolled VOC PTE (ton/yr) = Annual throughput (kgal/yr) x loading loss (lb/kgal) x 1 ton / 2000 lb

Controlled VOC PTE (ton/yr) = Uncontrolled VOC PTE (ton/yr) x [1 - (Control Eff x Collection Eff.)]

Emissions Limit (lb/kgal) =  $L_L$  (lb/kgal) x (1-Control Efficiency (%)/100)

### 2. Hazardous Air Pollutants

Residue Solidification Unit	EU-5003a-d	S-5003	17.16	8.15E-02	1.40	6.12
Residue Solidification Unit	EU-5004a-d	S-5004	17.16	8.15E-02	1.40	6.12
<b>Total</b>					<b>5.59</b>	<b>24.50</b>

Notes:

- Each unit has the capacity to process 1/3 of the total hourly residue production, 51.49 tons.
- Emission factor derived by the source from mass transfer model.

**Methodology**

VOC Emission factor provided by source.  
VOC PTE (ton/yr) = Solidification Rate (ton/hr) x VOC Emission Factor (lb/ton) x 8760 hr/yr x 1 ton / 2000 lb  
VCC residue is the bottoms product of VCC Vacuum Distillation Tower where vacuum gas oil (VGO) is extracted for recycle. This residue is solidified (into pastilles) and cooled along a conveyor.

**B. Pastille handling**

	Number of Transfers	Throughput per transfer (tons/hr)	Emission Factor (lb/ton)			Uncontrolled PTE					
			PM	PM <sub>10</sub>	PM <sub>2.5</sub>	(lb/hr)			(tons/yr)		
						PM	PM <sub>10</sub>	PM <sub>2.5</sub>	PM	PM <sub>10</sub>	PM <sub>2.5</sub>
Pastille line discharge to transfer conveyor <sup>1</sup> (EU-5001a-d, EU-5002a-d, EU-5003a-d, EU-5004a-d)	16	4.29	0.0030	0.0011	0.0011	0.21	0.08	0.08	0.90	0.33	0.33

loading conveyor discharge to packaging or storage silo, silo transfer to loading hopper <sup>1,3</sup> (EU-5005, EU-5006, EU-5007, EU-5008, EU-5009, EU-5010, EU-5011)	-	51.49	0.0030	0.0011	0.0011	0.15	0.06	0.06	0.68	0.25	0.25
hopper discharge to transport <sup>4</sup>	-	-	-	-	-	-	-	-	-	-	-
<b>Total</b>									<b>2.48</b>	<b>0.91</b>	<b>0.91</b>

Notes:

- Emission factor: conveyor transfer point, uncontrolled (SCC 3-05-020-06), Table 11.19.2-2, AP-42, 5th ed., August 2004
- Residue cooling forms a glassy coat on material with some characteristics of bitumen.
- Loading conveyor discharges to only one point at a time (EU-5009, EU-5010, or EU-5011). Transfer to loading hoppers EU-5005 and EU-5006 controlled by baghouse EU-5010. Transfer to loading hoppers EU-5007 and EU-5008 controlled by baghouse EU-5011.
- Based on the bituminous (i.e., tarry) characteristics of the residue, IDEM considers that the emissions from loadout operations will be negligible. Use of control devices for silos and hoppers is considered mainly to retain the material in the vessel rather than as an emission control.

**Methodology**

Uncontrolled PTE (lb/hr) = Number of transfers x Throughput per transfer (tons/hr) x Emission Factor (lb/ton)  
PTE (tons/yr) = PTE (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton)

**2. Bottlenecked Potential to Emit<sup>1</sup>**

**A. Pastillators**

Unit	Solidification Rate tons/yr	VOC Emission Factor lb/ton	Potential to Emit VOC
			ton/yr
Block 5000	451,052	8.15E-02	18.37
<b>Total</b>			<b>18.37</b>

Notes:

- Solidification process is bottlenecked by the amount of residue generated by the Block 2000 process, emission factor from section 1

**B. Pastille handling**

	Annual Throughput (tons/yr)	Emission Factor (lb/ton)			Bottlenecked PTE (tons/yr) (Uncontrolled)		
		PM	PM <sub>10</sub>	PM <sub>2.5</sub>	PM	PM <sub>10</sub>	PM <sub>2.5</sub>

Emission Factor in lb/MMBtu <sup>3</sup>	-	-	-	-	0.04	-	0.036
Potential Emission in tons/yr	0.56	2.26	2.26	0.53	12.00	1.64	10.80

*Notes:*  
 1. PM emission factor is filterable PM only. PM10 emission factor is filterable and condensable PM10 combined.  
 PM2.5 emission factor is filterable and condensable PM2.5 combined.  
 2. Worst-case factor provided by the source based on local natural gas composition and use of fractionator tower overhead in fuel gas supply, subject to testing.  
 3. Emission factors provided by the burner manufacturer, subject to testing.

**Methodology**

Emission Factors are from AP 42, Chapter 1.4, Tables 1.4-1, 1.4-2, 1.4-3, SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03  
 MMBtu = 1,000,000 Btu  
 MMCF = 1,000,000 Cubic Feet of Gas  
 Emission (tons/yr) = Throughput (MMBtu/hr) x Emission Factor (lb/MMBtu) x 8760 hr/yr x 1 ton/2,000 lb

**Hazardous Air Pollutants (HAPs)**

	HAPs - Organics					
	Benzene	Dichlorobenzene	Formaldehyde	n-Hexane	Toluene	Total - Organics
Emission Factor in lb/MMcf	2.1E-03	1.2E-03	7.5E-02	1.8E+00	3.4E-03	-
Potential Emission in tons/yr	6.24E-04	3.57E-04	2.23E-02	0.54	1.01E-03	0.56

	HAPs - Metals					
	Lead	Cadmium	Chromium	Manganese	Nickel	Total - Metals
Emission Factor in lb/MMcf	5.0E-04	1.1E-03	1.4E-03	3.8E-04	2.1E-03	-
Potential Emission in tons/yr	1.49E-04	3.27E-04	4.16E-04	1.13E-04	6.24E-04	1.63E-03
<b>Total HAPs</b>						<b>0.56</b>
<b>Worst HAP</b>						<b>0.54</b>

HAPs emission factors from AP-42, Chapter 1.4.  
 The five highest organic and metal HAPs emission factors are provided above.  
 Additional HAPs emission factors are available in AP-42, Chapter 1.4.

**Greenhouse Gases (GHGs)**

	Greenhouse Gas		
	CO2	CH4	N2O
Emission Factor in lb/MMcf	120,000	2.3	0.64
Potential Emission in tons/yr	35,682	0.68	0.19
Summed Potential Emissions in tons/yr	35,683		
CO2e Total in tons/yr	35,756		

**Methodology**

The N2O Emission Factor for uncontrolled is 2.2. The N2O Emission Factor for low Nox burner is 0.64.  
 Emission Factors are from AP 42, Table 1.4-2 SCC #1-02-006-02, 1-01-006-02, 1-03-006-02, and 1-03-006-03.  
 Global Warming Potentials (GWP) from Table A-1 of 40 CFR Part 98 Subpart A.  
 Emission (tons/yr) = Throughput (MMCF/yr) x Emission Factor (lb/MMCF)/2,000 lb/ton  
 CO2e (tons/yr) = CO2 Potential Emission ton/yr x CO2 GWP (1) + CH4 Potential Emission ton/yr x CH4 GWP (25) + N2O Potential Emission ton/yr x N2O GWP (298).

**2. Potential to Emit After Issuance**

	Pollutant							
	PM	PM <sub>10</sub>	direct PM <sub>2.5</sub>	SO <sub>2</sub>	NOx	VOC	CO	CO <sub>2e</sub>
Emission Limit <sup>1</sup> in lb/MMBtu	0.0019	0.0075	0.0075	-	0.030	0.0054	0.0365	-
Maximum Emission Limit <sup>2</sup> in gr S/scf	-	-	-	0.0062	-	-	-	-
Annual Emission Limit <sup>3</sup> in gr S/scf	-	-	-	0.005	-	-	-	-
Compliance determination coefficient (ton CO2e/MMCF)								60.12
Potential to Emit After Issuance in lb/hr	0.13	0.51	0.51	0.12	2.06	0.37	2.50	-
Potential to Emit After Issuance in tons/yr	0.57	2.25	2.25	0.42	9.00	1.62	10.95	35,756

*Notes:*  
 1. BACT specifications  
 2. Maximum  
 3. Twelve (12) month average

**Methodology**

Compliance determination coefficient (ton CO2e/MMCF) = CO2e Total (tons/yr) / Potential Throughput (MMCF/yr)  
 PTE After Issuance (lb/hr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Maximum Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO2/lb-mole) / 32 (lb S/lb-mole) SO2  
 PTE After Issuance (lb/hr) = Emission Limit (lb/MMBtu) x Heat Input Capacity (MMBtu/hr) all others  
 PTE After Issuance (tons/yr) = Heat Input Capacity (MMBtu/hr) / HHV (MMBtu/MMCF) x 1,000,000 (SCF/MMCF) x Annual Emission Limit (gr/scf) / 7,000 (gr/lb) x 64 (lb SO2/lb-mole) / 32 (lb S/lb-mole) x 8,760 (hr/yr) / 2,000 (lb/ton) SO2  
 PTE After Issuance (tons/yr) = PTE After Issuance (lb/hr) x 8,760 (hr/yr) / 2,000 (lb/ton) all others

Horizontal tank, dimensions of commercially available tank (www.dultmeier.com, model HST2000-64)

$V$  = 2000 gal       $L$  = 12.0 ft       $D$  = 5.33 ft

Storage Losses (breathing losses)

Daily average ambient temperature,  $T_{AA}$  = 515.7 °R, Eqn 1-27,  $T_{AA} = (T_{AX} + T_{AN})/2$   
 Liquid bulk temperature,  $T_B$  = 515.7 °R, Eqn 1-28,  $T_B = T_{AA} + 6\alpha - 1$   
 Daily average liquid surface temperature,  $T_{LA}$  = 517.5 °R, Eqn 1-26,  $T_{LA} = 0.44 T_{AA} + 0.56 T_B + 0.0079 \alpha I$

Vapor molecular weight,  $M$  = 130 lb/lb-mole, Table 7.1-2  
 Throughput,  $Q$  = 69450 gal/yr = 1653.6 bbl/yr (note 1 bbl = 42 gal)

$A$  = 12.31 vapor pressure equation (Eqn 1-24) coefficients,  
 $B$  = 9029.5 regression of data in Table 7.1-2

Vapor pressure at daily average liquid surface temperature,  $P_{VA}$  = 0.01 psia, Eqn 1-24, Ch 7

Effective diameter,  $D_E$  = 9.03 ft      Eqn 1-13,  $D_E = ((LD)/(\pi/4))^{1/2}$   
 Effective height,  $H_E$  = 4.19 ft      Eqn 1-14,  $H_E = \pi D/4$   
 Vapor space outage,  $H_{VO}$  = 2.09 ft       $H_E/2$ , explanation of terms, Eqn 1-15

Maximum and minimum liquid surface temperature and vapor pressure  
 $T_{LX}$  = 528.1 °R       $T_{LN}$  = 507.0 °R      Eqn 1-26 applied at  $T_{AX}$  and  $T_{AN}$ , note 5 to Eqn 1-7  
 $P_{VX}$  = 0.01 psia       $P_{VN}$  = 0.00 psia      Eqn 1-24 applied at  $T_{AX}$  and  $T_{AN}$ , note 5 to Eqn 1-7

Daily vapor pressure range,  $\Delta P_V$  = 0.00 psia, Eqn 1-9,  $\Delta P_V = P_{VX} - P_{VN}$   
 Daily vapor temperature range,  $\Delta T_V$  = 21.5 °R, eqn 1-8,  $\Delta T_V = 0.72 (T_{AX} - T_{AN}) + 0.028 \alpha I$   
 Breather vent pressure setting range,  $\Delta P_B$  = 0.06 psia, assumed, see note 3 to Eqn 1-7

Vapor space expansion factor,  $K_E$  = 0.04 Eqn 1-7,  $K_E = (\Delta T_V/T_{LA}) + (\Delta P_V - \Delta P_B)/(P_A - P_{VA})$   
 Vented vapor saturation factor,  $K_S$  = 1.00 Eqn 1-20,  $K_S = 1 / (1 + 0.053 P_{VA} H_{VO})$   
 Stock vapor density,  $W_V$  = 0.0001 lb/ft<sup>3</sup>, Eqn 1-21,  $W_V = (M_V P_{VA}) / (R T_{LA})$

$R$  = ideal gas law constant, 10.73 (psia ft<sup>3</sup>)/(lb-mole °R), Table 1-9, Perry's Chemical Engineers' Handbook, 6th ed.

Storage loss,  $L_S = 365 K_E (\pi D_E^2/4) H_{VO} K_S W_V$ , Eqn 1-4

$L_S$  = 0.25 lb/yr

Working Losses

turnovers = 35 per year,  $N = Q$  (gal/yr) /  $V$  (gal) (note Eqn 1-30 gives  $N$  in terms of  $Q$  (bbl/yr) and  $V_{LX}$  (ft<sup>3</sup>), presumed the same as this equation)

Working loss turnover (saturation) factor,  $K_N$  = 1 Fig 7.1-18, explanation of terms, Eqn 1-29

Working loss product factor,  $K_P$  = 1 organic liquids other than crude oil, explanation of terms, Eqn 1-29

Working loss,  $L_W = 0.0010 M_V P_{VA} Q K_N K_P$ , Eqn 1-29

$L_W$  = 1.27 lb/yr, Eqn 1-29, AP-42 Ch 7

Notes:

- HAP fractions from licensor historical data, provided by the source
- Coefficients determined by regression of data in Tbl 3-8, Perry's Chemical Engineers' Handbook, 6th ed., except as noted.
- Vapor mole fraction in air at standard pressure.
- Vapor weight fraction as the fraction of total VOC.
- Product naphtha liquid molecular weight provided by the source from process modeling, 7/26/2018. Vapor pressure coefficients determined by regression of model values provided by the source, 7/27/2018.
- Molecular weight determined by solving iteratively for  $\Sigma xM = \text{product naphtha value above}$ . Fraction partial pressure taken as mixture vapor pressure minus the sum of HAP partial pressures.
- Worst-case (highest) vapor pressure (m-cresol)
- Diesel molecular weight provided by the source from process modeling, 7/26/2018. Vapor pressure coefficients determined by regression of data in AP-42, Table 7.1-2 for No 2 distillate fuel oil.
- Molecular weight determined by solving iteratively for  $\Sigma xM = \text{product diesel value above}$ . Fraction partial pressure taken as mixture vapor pressure minus the sum of HAP partial pressures.

**Methodology**

$x = (m/M) / \Sigma (m/M)$   
 $P^{sat} = \exp(A-B/T)$ , T taken to be 517.7°R  
 $p = x P^{sat}$ , derived from Raoult's Law  
 $y = p / P_{tot}$  (Dalton's Law,  $P_{tot} = 14.7$  psia)  
 $v = (yM) / \Sigma (yM)$ , expressed as weight fraction of VOC  
 average vapor molecular weight =  $\Sigma (yM) / \Sigma y$

**Background Information**

On January 25, 2018, the Office of Air Quality (OAQ) received an application from Riverview Energy Corporation related to the construction and operation of a new stationary direct coal hydrogenation plant.

This proposed plant will use a Veba Combi Cracker (VCC) process to produce premium distillate products, such as ultra-low sulfur diesel fuel. The VCC technology is a thermal hydrocracking/hydrogenation process for converting raw coal at very high conversion rates and liquid yields into directly marketable distillates. The feedstock is slurried with finely ground coal, additive and catalyst and then is injected into the high pressure section of the process. After adding makeup hydrogen, the feed stream is preheated by heat recovery from the reactor effluents and fired heater. This feed mixture is converted in a cascade of three slurry phase reactors.

The converted coal, the additive and catalyst are separated from the vaporized reaction products and the recycle gas in a hot separator. The hot separator bottom product is fed to a vacuum flasher for additional distillate recovery. The hydrotreating stage is a single reactor vessel with three beds for hydrotreating, followed by two beds for hydrocracking to maximize diesel production. After leaving the hydrotreating stage the effluent is cooled, condensed and separated from the non-condensable gas fraction and the liquids are processed in a fractionator to produce high quality naphtha, ultra-low sulfur diesel fuel and fractionator bottoms. The bottoms are recycled back to the hydrotreating stage and converted to diesel.

**Requirement for Best Available Control Technology (BACT)**

326 IAC 2-2 requires a best available control technology (BACT) review to be performed on the proposed new emission units because the potential to emit of at least one pollutant is greater than the PSD major thresholds. The potential to emit of PM, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, NO<sub>x</sub>, VOC, CO, H<sub>2</sub>SO<sub>4</sub>, and GHGs is greater than PSD thresholds for these pollutants, therefore a BACT evaluation for these pollutants will be conducted.

**Proposed New Emission Units**

326 IAC 2-2 (Prevention of Significant Deterioration) requires a BACT analysis for the following emission units:

- (a) Coal handling operations, identified as Block 1000, consisting of:

- (1) One (1) shelter-type railcar dump unloading facility, identified as EU-1000, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1000, exhausting to stack EU-1000, consisting of:
  - (A) Two (2) enclosed receiving pits, identified as Receiving Pit 1 and Receiving Pit 2, discharging to Receiving Bin 1 and Receiving Bin 2, respectively.
  - (B) Two (2) enclosed receiving bins, identified as Receiving Bin 1 and Receiving Bin 2, discharging to Drag Flight Feeder 1 and Drag Flight Feeder 2, respectively, with water spray dust suppression systems.
  - (C) Two (2) enclosed drag flight feeders, identified as Drag Flight Feeder 1 and Drag Flight Feeder 2, discharging to the Unloading Conveyor, with water spray dust suppression systems.

Under the NSPS, 40 CFR 60, Subpart Y, EU-1000 is an affected facility.

- (2) One (1) enclosed rail unloading conveyor discharging to Transfer Station 1, identified as Unloading Conveyor, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, the Unloading Conveyor is an affected facility.

- (3) One (1) enclosed transfer station discharging to Conveyor 1, Conveyor 2, or Conveyor 9, identified as Transfer Station 1 (EU-1001), approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1001, exhausting to stack EU-1001.

Under the NSPS, 40 CFR 60, Subpart Y, Transfer Station 1 (EU-1001) is an affected facility.

- (4) One (1) enclosed feed conveyor discharging to Stacker 1 Boom Conveyor/Chute, identified as Conveyor 1, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 1 is an affected facility.

- (5) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #1A & #1B, identified as Stacker 1 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 1 Conveyor/Chute is an affected facility.

- (6) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #1A and Stockpile #1B, with a maximum capacity of 93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #1A and #1B are affected facilities.

- (7) One (1) enclosed feed conveyor discharging to Stacker 2 Boom Conveyor/Chute, identified as Conveyor 2, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 2 is an affected facility.

- (8) One (1) enclosed stacker boom conveyor/chute discharging to Coal Stockpiles #2A & #2B, identified as Stacker 2 Boom Conveyor/Chute, approved in 2018 for construction, with a maximum capacity of 5,000 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Stacker 2 Boom Conveyor/Chute is an affected facility.

- (9) Two (2) radial conical ring coal storage piles, approved in 2018 for construction, identified as Stockpile #2A and Stockpile #2B, with a maximum capacity of 93,000 tons, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Stockpiles #2A and #2B are affected facilities.

- (10) One (1) reclaimer for Stockpiles #1A & #1B, discharging to Reclaim Conveyor 6, identified as Reclaimer 1, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 1 is an affected facility.

- (11) One (1) enclosed reclaimer conveyor, identified as Conveyor 6 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 6 is an affected facility.

- (12) One (1) reclaimer for Stockpiles #2A & #2B, discharging to Reclaim Conveyor 7, identified as Reclaimer 2, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by the coal storage pile enclosure and baghouse EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Reclaimer 2 is an affected facility.

- (13) One (1) enclosed reclaimer conveyor, identified as Conveyor 7 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 7 is an affected facility.

- (14) One (1) enclosed transfer station conveyor, identified as Conveyor 9 discharging to the Reclaim Transfer Station, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 9 is an affected facility.

- (15) One (1) enclosed reclaim transfer station discharging to Reclaim Conveyor 8, identified as Reclaim Transfer Station (EU-1006), approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, with particulate emissions controlled by baghouse EU-1006, exhausting to stack EU-1006.

Under the NSPS, 40 CFR 60, Subpart Y, the Reclaim Transfer Station is an affected facility.

- (16) One (1) enclosed conveyor, identified as Reclaim Conveyor 8 discharging to the Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, Conveyor 8 is an affected facility.

- (b) Coal drying loop, collectively identified as EU-1008, with emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008, consisting of the following:

- (1) One (1) enclosed coal mill and pulverizer, identified as Coal Mill and Pulverizer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer, with particulate emissions controlled the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Mill and Pulverizer is an affected facility.

- (2) One (1) enclosed coal dryer, identified as Coal Dryer, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging to the Coal Dryer Baghouse, with particulate emissions controlled by the Coal Dryer Baghouse.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer is an affected facility.

- (3) One (1) natural gas and process fuel gas-fired heater, identified as Coal Dryer Heater EU-1007, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 55.8 MMBtu/hr (HHV), with emissions exhausting to Stack EU-1007.

Under the NSPS, 40 CFR 60, Subpart Ja, the Coal Dryer Heater (EU-1007) is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Heater (EU-1007) is part of an affected thermal dryer.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, the Coal Dryer Heater (EU-1007) is an affected source.

- (4) One (1) process baghouse, identified as Coal Dryer Baghouse, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year, discharging fines to the Block 2000 Coal Hopper, exhausting particulate and filtered nitrogen to the condenser.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Dryer Baghouse is an affected facility.

- (5) One (1) water-cooled condenser, identified as Drying Loop Condenser, approved in 2018 for construction, with a nominal capacity of 40 MMBtu/hr, with particulate emissions controlled by Loop Purge Baghouse EU-1008 exhausting to stack EU-1008.

Under the NSPS, 40 CFR 60, Subpart Y, the Drying Loop Condenser is part of an affected thermal dryer.

- (c) Additives handling operations, identified as Block 1500, consisting of:

- (1) Three (3) pneumatic (nitrogen) truck unloading systems discharging to storage silos, approved in 2018 for construction, as follows:

- (A) Coarse Additive Unloading, with a maximum capacity of 20.00 tons per hour.
- (B) Fine Additive Unloading, with a maximum capacity of 20.00 tons per hour.
- (C) Sodium Sulfide ( $\text{Na}_2\text{S}$ ) Unloading, with a maximum capacity of 10.00 tons per hour.

- (2) Three (3) nitrogen-blanketed storage silos, as follows:

- (A) One (1) coarse additive silo, identified as T34, approved in 2018 for construction, controlled by baghouse EU-1501, exhausting to stack EU-1501.
- (B) One (1) fine additive silo, identified as T33, approved in 2018 for construction, controlled by baghouse EU-1502, exhausting to stack EU-1502.
- (C) One (1)  $\text{Na}_2\text{S}$  silo, identified as T35, approved in 2018 for construction, controlled by baghouse EU-1503, exhausting to stack EU-1503.

- (3) One (1) nitrogen-blanketed fine additive production system, identified as Fine Additive Production System, approved in 2018 for construction, with a maximum capacity of 3.28 tons per hour, controlled by baghouse EU-1504, exhausting to stack EU-1504, consisting of:

- (A) One (1) coarse additive silo rotary feeder solid weigh scale.
- (B) One (1) coarse additive screw conveyor discharging to the Fine Additive Production System.
- (C) One (1) additive size reduction system, identified as Fine Additive Production System discharging to the T33 or the Block 2000 coarse additive transfer system.

- (d) VEBA Combi Cracker (VCC) unit operations, identified as Block 2000, consisting of:

- (1) One (1) enclosed hopper receiving coal from Block 1000 Coal Dryer Baghouse and discharging to the Feed Prep Screw Conveyor, identified as Coal Hopper, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a bottlenecked capacity of 2,263,248 tons per year.

Under the NSPS, 40 CFR 60, Subpart Y, the Coal Hopper is an affected facility.

- (2) One (1) enclosed screw conveyor, identified as Closed Screw Conveyor, approved in 2018 for construction, with a maximum capacity of 500 tons of coal per hour and a

bottlenecked capacity of 2,263,248 tons per year, discharging to the Feed Premix Drum, identified as Closed Screw Conveyor, with particulate emissions controlled by the Coal Handling System Filter, exhausting to stack EU-2005.

Under the NSPS, 40 CFR 60, Subpart Y, the Closed Screw Conveyor is an affected facility.

- (3) One (1) nitrogen-blanketed coarse additive transfer system, identified as Coarse Additive Screw Conveyor, approved in 2018 for construction, with a maximum capacity of 2.20 tons per hour, receiving material from the Block 1500 coarse additive silo and discharging to the Feed Premix Drum, with particulate emissions controlled by the Coarse Additive System Filter, exhausting to stack EU-2006.
- (4) One (1) nitrogen-blanketed fine additive transfer system, identified as Fine Additive Handling System, approved in 2018 for construction, with a maximum capacity of 3.28 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Fine Additive System Filter, exhausting to stack EU-2007, consisting of:
  - (A) One (1) fine additive silo rotary feeder solid weigh scale.
  - (B) One (1) fine additive screw conveyor discharging to the Block 2000 feed premix drum.
- (5) One (1) nitrogen-blanketed Na<sub>2</sub>S slurry preparation system, identified as Na<sub>2</sub>S Slurry Preparation, approved in 2018 for construction, with a maximum capacity of 0.077 tons per hour, discharging to the Block 2000 feed premix drum, with particulate emissions controlled by the Na<sub>2</sub>S Handling System Filter, exhausting to stack EU-2008, consisting of:
  - (A) One (1) Na<sub>2</sub>S silo rotary feeder solid weigh scale.
  - (B) One (1) Na<sub>2</sub>S screw conveyor discharging to the Na<sub>2</sub>S mixing drum.
  - (C) One (1) nitrogen-blanketed mixing drum for Na<sub>2</sub>S and Block 2000 vacuum tower VGO (vacuum gas oil) discharging to the feed premix drum.

Under the NSPS, 40 CFR 60, Subpart GGGa, the mixing drum is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the mixing drum is an affected source.

- (6) One (1) feed premix drum, identified as Feed Premix Drum, approved in 2018 for construction, receiving coal, solid additives, and recycled vacuum gas oil (VGO) and discharging to the feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the feed premix drum is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed premix drum is an affected source.

- (7) One (1) natural gas and process fuel gas-fired indirect feed heater, identified as EU-2001, approved in 2018 for construction, equipped with Low-NOX burners, with a maximum heat input capacity of 128.4 MMBtu/hr (HHV), discharging to the 1st stage reactors, exhausting to stack EU-2001.

Under the NSPS, 40 CFR 60, Subpart Ja, the feed heater EU-2001 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the feed heater EU-2001 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the feed heater EU-2001 is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, feed heater EU-2001 is an affected source.

- (8) One (1) natural gas and process fuel gas-fired indirect treat gas heater, identified as EU-2002, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 52.8 MMBtu/hr (HHV), receiving hydrogen from Block 7000 and discharging to the 1st stage reactors, exhausting to stack EU-2002.

Under the NSPS, 40 CFR 60, Subpart Ja, the treat gas heater EU-2002 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, treat gas heater EU-2002 is an affected source.

- (9) One (1) first stage reactor - liquid phase hydrocracking system, identified as LPH, approved in 2018 for construction, discharging to the hot separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the first stage reactor - liquid phase hydrocracking system is an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the first stage reactor - liquid phase hydrocracking system is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the first stage reactor - liquid phase hydrocracking system is an affected source.

- (10) One (1) hot separator, identified as Hot Separator, approved in 2018 for construction, discharging vapor to the 2nd stage reactors and liquids to the vacuum column feed heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the hot separator is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the hot separator is an affected source.

- (11) One (1) natural gas and process fuel gas-fired indirect vacuum column feed heater, identified as EU-2003, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 9 MMBtu/hr (HHV), discharging to the vacuum distillation tower, exhausting to stack EU-2003.

Under the NSPS, 40 CFR 60, Subpart Ja, the vacuum column feed heater EU-2003 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the vacuum column feed heater EU-2003 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum column feed heater EU-2003 is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, vacuum column feed heater EU-2003 is an affected source.

- (12) One (1) vacuum distillation tower, identified as Vacuum Distillation Column, approved in 2018 for construction, discharging sour LPG to the amine absorber, vapor to the 2nd stage reactors, slop oil to Block 4000, phenolic sour water to Block 3000, and hydrogenated residue to Block 5000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the vacuum distillation tower is an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the vacuum distillation tower is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the vacuum distillation tower is an affected source.

- (13) One (1) second stage reactor - gas phase hydrotreating system, identified as GPH, approved in 2018 for construction, discharging to the cold separator, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the second stage reactor - gas phase hydrotreating system is an affected facility.

Under the NSPS, 40 CFR 60, Subpart RRR, the second stage reactor - gas phase hydrotreating system is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the second stage reactor - gas phase hydrotreating system is an affected source.

- (14) One (1) cold separator, identified as Cold Separator, approved in 2018 for construction, discharging non-phenolic sour water to Block 3000 and hydrocarbons to the fractionator heater, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the cold separator is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the cold separator is an affected source.

- (15) One (1) natural gas and process fuel gas-fired indirect fractionator heater, identified as EU-2004, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, discharging to the fractionator tower, with a maximum heat input capacity of 156 MMBtu/hr (HHV), exhausting to stack EU-2004.

Under the NSPS, 40 CFR 60, Subpart Db, fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, the fractionator heater EU-2004 is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the fractionator heater is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator heater is an affected source.

Under the NESHAP, 40 CFR 63, Subpart DDDDD, fractionator heater EU-2004 is an affected source.

- (16) One (1) fractionator tower, identified as Fractionator Tower, approved in 2018 for construction, discharging sour LPG to the amine absorber, naphtha and diesel fuel to Block 4000, vacuum gas oil (VGO) to Block 4000 or the Feed Premix Drum, and non-phenolic sour water to Block 3000, with emergency and pressure relief streams vented to the Block 4000 high pressure flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the fractionator tower is an affected facility.

Under the NSPS, 40 CFR 60, Subpart NNN, the fractionator tower is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the fractionator tower is an affected source.

- (17) One (1) amine absorber system discharging sweet LPG to Block 4000 and rich amine to Block 3000, consisting of:

(A) One (1) two-stage high pressure absorber, identified as HP Absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to the low pressure absorber and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

(B) One (1) two-stage low pressure absorber, approved in 2018 for construction, where acid gas from Block 2000 contacts amine solution followed by water wash discharging treated gas to Block 4000 and rich amine to the amine recovery unit or rich amine surge tank, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the HP Absorber and LP Absorber are part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the HP Absorber and LP Absorber are part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the HP Absorber and LP Absorber are affected sources.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the HP Absorber and LP Absorber is an affected source.

- (e) Sulfur recovery operations, identified as Block 3000, consisting of:

- (1) Amine Regeneration Unit, consisting of:

(A) One (1) heat exchanger, identified as Rich Amine-Lean Amine Heat Exchanger, approved in 2018 for construction, where rich amine from Block 2000 or the rich

amine surge tank is heated by lean amine discharging rich amine to the stripper and lean amine to storage or the Block 2000 absorbers, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

- (B) One (1) stripper column, identified as Stripper, approved in 2018 for construction, discharging lean amine to the Rich Amine-Lean Amine Heat Exchanger and the reboiler and vapor to the overheads condenser, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (C) One (1) water-cooled condenser, identified as Overheads Condenser, approved in 2018 for construction, discharging condensate to the stripper condenser accumulator, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (D) One (1) accumulator drum, identified as Stripper Condenser Accumulator, approved in 2018 for construction, discharging condensate to stripper reflux and the sour water stripping system and hydrogen sulfide gas to the Sulfur Recovery System, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (E) One (1) steam-heated reboiler, identified as Stripper Reboiler, approved in 2018 for construction, discharging lean amine to the stripper reflux, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Amine Recovery Unit is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Amine Recovery Unit part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the Amine Recovery Unit is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Amine Recovery Unit is an affected source.

(2) Sour Water Stripping System, consisting of:

- (A) One (1) sour water stripping system, identified as Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery system, receiving sour water from the Block 2000 vacuum distillation column, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (B) One (1) sour water stripping system, identified as Non-Phenolic Sour Water Stripping System, approved in 2018 for construction, discharging acid gas to the sulfur recovery, receiving sour water from the Block 2000 cold separator, condensate from the amine regeneration unit stripper condensate accumulator, and sour water from the sulfur recovery system, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.

Under the NSPS, 40 CFR 60, Subpart Ja, the Sour Water Stripping System is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Sour Water Stripping System is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 61, Subpart FF, the Sour Water Stripping System is part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, the Sour Water Stripping System is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each bypass line serving the Sour Water Stripping System is an affected source.

- (3) Sulfur Recovery System, consisting of:
- (A) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit A, approved in 2018 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
    - (i) One (1) burner, identified as A-602A burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
    - (ii) One (1) acid gas furnace, identified as A-602A Furnace, discharging to the waste heat boiler.
    - (iii) One (1) waste heat boiler identified as A-602A Waste Heat Boiler, using heat from A-602A Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
    - (iv) One (1) three-stage Claus reactor train, identified as SRU A reactors, discharging treated gas to the TGTU A Heat Exchanger and molten sulfur to the sulfur product pit.
    - (v) One (1) sulfur product pit, identified as Sulfur Product Pit A, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
    - (vi) One (1) heat exchanger, identified as TGTU A Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
    - (vii) One (1) hydrogenation reactor, identified as R-604A, discharging tail gas to the quench contactor.
    - (viii) One (1) quench contactor, identified as T-601A, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
    - (ix) One (1) amine absorber, identified as T-602A, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
    - (x) One (1) incinerator, identified as A-605A Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
    - (xi) One (1) waste heat boiler identified as A-605A Waste Heat Boiler, using heat from A-605A Incinerator to create high pressure steam, exhausting to stack TGTUA.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605A Incinerator and A-605A Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit A is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, Sulfur Recovery Unit A is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit A is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit A is an affected source.

- (B) One (1) sulfur recovery unit, identified as Sulfur Recovery Unit B, approved in 2018 for construction, with emergency and pressure relief streams vented to the Block 4000 sulfur flare.
- (i) One (1) burner, identified as A-602B burner, combusting acid gas from the amine regeneration unit and the phenolic and non-phenolic sour water strippers and using natural gas and process fuel gas for start-up, equipped with Low-NOX burners, with a heat input capacity of 40.00 MMBtu/hr (HHV), discharging to the acid gas furnace.
  - (ii) One (1) acid gas furnace, identified as A-602B Furnace, discharging to the waste heat boiler.
  - (iii) One (1) waste heat boiler identified as A-602B Waste Heat Boiler, using heat from A-602B Furnace to create high pressure steam and discharging cooled gas to the Claus reactors.
  - (iv) One (1) three-stage Claus reactor train, identified as SRU B reactors, discharging treated gas to the TGTU B Heat Exchanger and molten sulfur to the sulfur product pit.
  - (v) One (1) sulfur product pit, identified as Sulfur Product Pit B, with a maximum throughput capacity of 44,611 tons of sulfur per year (70% of VCC capacity) and a nominal capacity 31,865 tons per year (50% of VCC capacity), discharging purge air to the TGTU incinerator and molten sulfur to Block 4000.
  - (vi) One (1) heat exchanger, identified as TGTU B Heat Exchanger, discharging tail gas and hydrogen to the hydrogenation reactor.
  - (vii) One (1) hydrogenation reactor, identified as R-604B, discharging tail gas to the quench contactor.
  - (viii) One (1) quench contactor, identified as T-601B, discharging tail gas to the amine absorber and sour water to the non-phenolic sour water stripping system.
  - (ix) One (1) amine absorber, identified as T-602B, discharging tail gas to the incinerator and rich amine to the amine recovery unit.
  - (x) One (1) incinerator, identified as A-605B Incinerator, combusting tail gas and natural gas and process fuel gas, with a maximum heat input capacity of 52.75 MMBtu/hr (0.60 MMBtu/hr from tail gas) (HHV) and a normal heat input capacity of 37.68 MMBtu/hr (0.43 MMBtu/hr from tail gas) (HHV), exhausting to a waste heat boiler.
  - (xi) One (1) waste heat boiler identified as A-605B Waste Heat Boiler, using heat from A-605B Incinerator to create high pressure steam, exhausting to stack TGTUB.

Under the NSPS, 40 CFR 60, Subpart Dc, the A-605B Incinerator and A-605B Waste Heat Boiler is an affected facility.

Under the NSPS, 40 CFR 60, Subpart Ja, Sulfur Recovery Unit B is part of a sulfur recovery plant that is an affected facility.

Under the NSPS, 40 CFR 60, Subpart GGGa, Sulfur Recovery Unit B is part of a sulfur recovery plant that is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Sulfur Recovery Unit B is an affected source.

Under the NESHAP, 40 CFR 63, Subpart UUU, each process vent or group of process vents and each bypass line serving Sulfur Recovery Unit B is an affected source.

(f) Offsites operations, identified as Block 4000, consisting of:

(1) Flares, as follows:

- (A) One (1) natural gas and process fuel gas-fired flare identified as High Pressure (HP) Flare, approved in 2018 for construction, servicing overpressure and emergency reliefs from Block 2000 VEBA Combi Cracker operations, controlling emissions from Block 2000 depressurization system, with pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
- (B) One (1) natural gas and process fuel gas-fired flare, identified as Low Pressure (LP) Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 7000 Hydrogen Unit operations, controlling emissions Block 7000 start-up and shut-down vents, and a continuous sweep stream from the Block 2000 slop tank, with a sweep and pilot heat input capacity of 6.50 MMBtu/hr (LHV), exhausting to the atmosphere.
- (C) One (1) natural gas and process fuel gas-fired flare, identified as Sulfur Block Flare, approved in 2018 for construction, servicing overpressure reliefs from Block 3000 Sulfur Recovery operations and sulfur loading, controlling emergency streams from Sulfur Recovery Units A and B, and a continuous sweep stream from the sour water storage tanks, with a sweep and pilot heat input capacity of 0.77 MMBtu/hr (LHV), exhausting to the atmosphere.
- (D) One (1) natural gas and process fuel gas-fired flare, identified as Loading Flare, approved in 2018 for construction, servicing Block 4000 naphtha, diesel, and ammonia loading operations, with a pilot heat input capacity of 0.20 MMBtu/hr (LHV), exhausting to the atmosphere.

Under the NSPS, 40 CFR 60, Subpart Ja, the flares are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, the flares are affected facilities.

Under the NESHAP, 40 CFR 63, Subpart CC, the flares are affected sources.

(2) Product storage tanks, approved in 2018 for construction, as follows:

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T1	IFR	Naphtha product	4,629,879 (17,524)	-
T2	IFR	Naphtha product	4,629,879 (17,524)	-
T3	FR	Diesel product	4,525,796 (17,130)	-
T4	FR	Diesel product	4,525,796 (17,130)	-
T5	FR	Diesel product	4,525,796 (17,130)	-
T6	IFR	Naphtha or diesel product	4,629,879 (17,524)	-
T7	FR	Molten sulfur	342,367 (1,296)	-
T8	FR	Molten sulfur	342,367 (1,296)	-
T9	HPV	Ammonia product	36,720 (17,524)	-
T10	FR	Residue surge tank 1	926,980 (17,524)	-
T11	FR	Residue surge tank 2	926,980 (3,509)	-
T12	FR	Residue feed tank	926,980 (3,509)	-
T13	FR	VGO tank 1	926,980 (3,509)	-
T14	FR	VGO tank 2	926,980 (3,509)	-
T15	HPV	LPG storage	48,872 (185)	-
T16	FR	Slop tank	4,195,581 (15,880)	LP flare
T17	FR	Diesel fuel tank	23,775 (90)	-
T18	FR	Non-phenolic sour water storage tank 1	1,268,026 (4,799)	SB flare
T19	FR	Non-phenolic sour water storage tank 2	1,268,026 (4,799)	SB flare
T20	FR	Non-phenolic sour water storage tank 3	1,268,026 (4,799)	SB flare
T21	FR	Phenolic sour water storage tank	40,947 (155)	SB flare
T22	FR	Stripped non-phenolic sour water surge tank	1,268,026 (4,799)	-
T23	FR	Stripped phenolic sour water surge tank	13,737 (52)	-
T24	FR	Amine surge/deinventory tank	63,943 (242)	-
T25	FR	Fresh amine tank	63,943 (242)	-

ID	Construction <sup>1</sup>	Contents	Capacity (gallons) (m <sup>3</sup> )	Control <sup>2</sup>
T26	FR	Amine containment tank (sump)	793 (3)	-

1. FR - fixed roof, IFR - internal floating roof, HPV-horizontal pressure vessel

2. Tank vents to flares are part of sweep and pilot gas streams.

Under the NSPS, 40 CFR 60, Subpart Kb, T1, T2, and T6 are affected facilities.

Under the NSPS, 40 CFR 60, Subpart GGGa, T1 - T6 and T10 - T15 are affected facilities.

Under the NSPS, 40 CFR 60, Subpart QQQ, T16 is part of an affected facility.

Under the NSPS, 40 CFR 61, Subpart FF, T16 and T18 - T21 are part of an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, T1 - T6, T10 - T14, T16, and T18-T23 are part of an affected source.

Under the NESHAP, 40 CFR 63, Subpart WW, T3 - T6 and T10 - T14 are affected sources.

(3) Loading operations, as follows:

(A) One (1) 8-spot railcar loading rack for naphtha and diesel, identified as Product Loading Rack, approved in 2018 for construction, with a maximum capacity of 2,500 gallons per minute at each spot, controlled by the Loading Flare.

Under the NSPS, 40 CFR 60, Subpart GGGa, the Product Loading Rack is an affected facility.

Under the NESHAP, 40 CFR 61, Subpart BB, the Product Loading Rack is an affected source.

Under the NESHAP, 40 CFR 63, Subpart CC, the Product Loading Rack is an affected source.

(B) One (1) single-spot railcar loading rack for ammonia, identified as Ammonia Loading Rack, approved in 2018 for construction, with a bottlenecked capacity of 15,024,167 gallons per year, controlled by the Loading Flare.

(C) One (1) single-spot railcar loading rack for molten sulfur, identified as Sulfur Loading Rack, approved in 2018 for construction, with a bottlenecked capacity of 63,781 tons per year, controlled by the Sulfur Block Flare.

(g) Residue solidification operations, identified as Block 5000, as follows:

(1) Four (4) pastillators, identified as EU-5001A - EU5001D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5001.

- (2) Four (4) pastillators, identified as EU-5002A - EU5002D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5002.
- (3) Four (4) pastillators, identified as EU-5003A - EU5003D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5003.
- (4) Four (4) pastillators, identified as EU-5004A - EU5004D, approved in 2018 for construction, with a maximum capacity of 4.29 tons per hour, each, exhausting to stack EU-5004.
- (5) Enclosed conveyors for residue pellets, with particulate emissions controlled by filters EU-5009, EU-5010, and EU-5011, as follows:
  - (A) One (1) enclosed conveyor, identified as Block 1 & 2 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5001A - EU5001D and EU-5002A - EU5002D.
  - (B) One (1) enclosed conveyor, identified as Block 3 & 4 transfer conveyors, with a maximum capacity of 34.33 tons per hour, receiving pastillators from the eight (8) pastillators, identified as EU-5003A - EU5003D and EU-5004A - EU5004D.
  - (C) One (1) enclosed loading conveyor, identified as Loading Conveyor, approved in 2018 for construction, with a maximum capacity of 51.49 tons per hour, receiving pastillators from Block 1 & 2 and Block 3 & 4 transfer conveyors, and discharging to the bulk container loading station, railcar residue silo, or swing residue silo.
- (6) One (1) residue bulk container loading station, identified as EU-5009, approved in 2018 for construction, with a maximum capacity of 8.00 tons per hour, using filter EU-5009 for particulate control and exhausting to stack EU-5009.
- (7) One (1) railcar residue storage silo, identified as EU-5010, approved in 2018 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
- (8) Two (2) residue loading hoppers, identified as EU-5005 and EU-5006, approved in 2018 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the railcar residue storage silo, using baghouse EU-5010 for particulate control and exhausting to stack EU-5010.
- (9) One (1) swing residue storage silo, identified as EU-5011, approved in 2018 for construction, with a maximum capacity of 1,236 tons per day, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
- (10) Two (2) residue loading hoppers, identified as EU-5007 and EU-5008, approved in 2018 for construction, with a combined maximum capacity of 1,236 tons per day, receiving residue from the swing residue storage silo, using baghouse EU-5011 for particulate control and exhausting to stack EU-5011.
  - (11) Residue loadout operations using spouts and choke flow-practices, as follows:
    - (A) Two (2) railcar loadspots, approved in 2018 for construction.

- (B) Two (2) swing loadspots, approved in 2018 for construction, accommodating either trucks or railcars.
  
- (h) Utilities operations, identified as Block 6000, consisting of:
  - (1) One (1) natural gas and process fuel gas-fired package boiler, identified as EU-6000, approved in 2018 for construction, equipped with Low-NO<sub>x</sub> burners, with a maximum heat input capacity of 68.50 MMBtu/hr (HHV), exhausting to stack EU-6000.  
  
Under the NSPS, 40 CFR 60, Subpart Dc, boiler EU-6000 is an affected facility.  
  
Under the NSPS, 40 CFR 60, Subpart Ja, boiler EU-6000 is an affected facility.  
  
Under the NESHAP, 40 CFR 63, Subpart DDDDD, boiler EU-6000 is an affected source.
  - (2) One (1) three-cell crossflow mechanical draft cooling tower, identified as EU-6001, approved in 2018 for construction, with a maximum capacity of 32,000 gallons per hour, equipped with mist eliminators and exhausting to stacks EU-6001, EU-6002, and EU-6003.
  - (3) One (1) diesel engine-driven emergency generator, identified as EU-6006, approved in 2018 for construction, with a maximum heat input capacity of 19.60 MMBtu/hr (2,800 hp) (average heating value), exhausting to stack EU-6006.  
  
Under the NSPS, 40 CFR 60, Subpart IIII, emergency generator EU-6006 is an affected facility.  
  
Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency generator EU-6006 is an affected source.
  - (4) One (1) diesel engine-driven emergency fire pump, identified as EU-6008, approved in 2018 for construction, with a maximum heat input capacity of 5.25 MMBtu/hr (750 hp) (average heating value), exhausting to stack EU-6008.  
  
Under the NSPS, 40 CFR 60, Subpart IIII, emergency fire pump EU-6008 is an affected facility.  
  
Under the NESHAP, 40 CFR 63, Subpart ZZZZ, emergency fire pump EU-6008 is an affected source.
  
- (i) Water supply and treatment operations, identified as Block 6500, consisting of:
  - (1) One (1) pneumatic lime truck unloading system, identified as Lime Unloading, approved in 2018 for construction, with a maximum capacity of 20.00 tons per hour, discharging to silo EU-6501.
  - (2) One (1) lime storage silo, identified as EU-6501, approved in 2018 for construction, with a maximum capacity of 20.00 tons per hour, with particulate emissions controlled by dust collector EU-6501 and exhausting to stack EU-6501.
  
- (j) Hydrogen unit operations, identified as Block 7000, as follows:
  - (1) Hydrogen Plant 1, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:

- (A) One (1) boiler feed water treatment system including deaerator vent EU-7003, identified as Feed Water Treatment System 1, approved in 2018 for construction, exhausting to stack EU-7003.
- (B) One (1) feed preparation train, identified as Feed Prep 1, approved in 2018 for construction, consisting of:
  - (i) One (1) hydrogenation reactor.
  - (ii) One (1) hydrogen sulfide adsorber.
- (C) One (1) reformer system, consisting of:
  - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7001, approved in 2018 for construction, with a maximum heat input capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NOx control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.  
  
Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7001, is an affected facility.
  - (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
- (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 1, approved in 2018 for construction, discharging shift gas to the pressure swing adsorber.
- (E) One (1) pressure swing adsorber, identified as PSA 1, approved in 2018 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, Hydrogen Plant 1 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 1 is an affected source.

- (2) Hydrogen Plant 2, with a maximum capacity of 105 million standard cubic feet (scf) (279 tons) of hydrogen per day, consisting of:
  - (A) One (1) boiler feed water treatment system including deaerator vent EU-7004, identified as Feed Water Treatment System 2, approved in 2018 for construction, exhausting to stack EU-7004.
  - (B) One (1) feed preparation train, identified as Feed Prep 2, approved in 2018 for construction, consisting of:
    - (i) One (1) hydrogenation reactor.
    - (ii) One (1) hydrogen sulfide adsorber.
  - (C) One (1) reformer system, consisting of:
    - (i) One (1) steam-hydrocarbon reformer furnace fired with process fuel gas and PSA tail gas supplemented by pipeline natural gas, identified as EU-7002, approved in 2018 for construction, with a maximum heat input

capacity of 838.6 MMBtu/hr (HHV), using selective catalytic reduction for NO<sub>x</sub> control, discharging water gas to the CO-shift converter, exhausting combustion products to the waste heat recovery system.

Under the NSPS, 40 CFR 60, Subpart Ja, steam-hydrogen reformer, EU-7002, is an affected facility.

- (ii) One (1) heat recovery system generating high pressure steam, incorporated in the reformer furnace convection section via heat recovery coils, approved in 2018 for construction.
- (D) One (1) catalytic CO-shift converter, identified as CO-shift Converter 2, approved in 2018 for construction, discharging shift gas to the pressure swing adsorber.
- (E) One (1) pressure swing adsorber, identified as PSA 2, approved in 2018 for construction, discharging hydrogen to feed preparation and Block 2000 and tail gas to the reformer as fuel.

Under the NSPS, 40 CFR 60, Subpart GGGa, Hydrogen Plant 2 is an affected facility.

Under the NESHAP, 40 CFR 63, Subpart CC, Hydrogen Plant 2 is an affected source.

(k) Wastewater treatment operations, identified as Block 8000, as follows:

- (1) One (1) wastewater junction box with associated process drains, identified as Oily Water Sump, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8002.
- (2) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Water Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and water to MH1.
- (3) One (1) wastewater junction box with, identified as MH1, approved in 2018 for constructions, with emissions controlled by a carbon canister, exhausting to stack EU-8003.
- (4) One (1) totally enclosed oil-water separator with associated process drains, identified as Oily Amine Separator, approved in 2018 for construction, discharging oil to the Slop Tank (T16) and amine solution to the Rich Amine Return Header.
- (5) One (1) biological wastewater treatment system, approved in 2018 for construction, with emissions exhausting to vent EU-8001.

Under the NSPS, 40 CFR 60, Subpart QQQ, the process drains, junction boxes, Oily Water Separator, Oily Amine Separator, associated sewer lines, and any secondary oil-water separator in the biological wastewater treatment system are an affected aggregate facility.

Under the NESHAP, 40 CFR 61, Subpart FF, the Oily Water Separator, Oily Amine Separator, and any secondary oil-water separator in the biological wastewater treatment system are affected sources.

Under the NESHAP, 40 CFR 63, Subpart CC, the wastewater streams and treatment operations associated with petroleum refining process units are part of a new affected source..

### Summary of the Best Available Control Technology (BACT) Process

IDEM, OAQ conducts BACT analyses in accordance with the *“Top-Down” Best Available Control Technology Guidance Document* outlined in the 1990 draft U.S. EPA *New Source Review Workshop Manual*, which outlines the steps for conducting a top-down BACT analysis. Those steps are listed below:

- (1) Identify all potentially available control options;
- (2) Eliminate technically infeasible control options;
- (3) Rank remaining control technologies;
- (4) Evaluate the most effective controls and document the results; and
- (5) Select BACT.

Also in accordance with the *“Top-Down” Best Available Control Technology Guidance Document* outlined in the 1990 draft U.S. EPA *New Source Review Workshop Manual*, BACT analyses take into account the energy, environmental, and economic impacts of the control options. Emission reductions may be determined through the application of available control techniques, process design, and/or operational limitations. Such reductions are necessary to demonstrate that the emissions remaining after application of BACT will not cause adverse environmental effects to public health and the environment. The Office of Air Quality (OAQ) makes BACT determinations by following the five steps identified above.

This BACT determination is based on the following information:

- (1) The EPA RACT/BACT/LAER (RBLCL) Clearinghouse;
- (2) EPA and State air quality permits;
- (3) Communications with control device equipment manufacturers;
- (4) Technical books and articles; and
- (5) Guidance documents from state and federal agencies.

### Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis Material Handling

#### **Step 1: Identify Potential Control Technologies**

Particulate matter (PM) is a complex mixture of small particles and liquid droplets. PM can be made up of a variety of components, including acids, organic chemicals, metals, and soil or dust particles. PM includes any size of filterable particulate. Filterable particulate is the particulate that is emitted directly as a solid or liquid at the stack.

Emissions of particulate matter (PM) are generally controlled with add-on control equipment designed to capture the emissions prior to the time they are exhausted to the atmosphere. In cases where the material being emitted is organic, particulate matter may be controlled through a combustion process. Generally, PM emissions are controlled through one of the following mechanisms:

- (1) Mechanical collectors (such as cyclones or multiclones).
- (2) Wet scrubbers.
- (3) Electrostatic precipitators (ESP).
- (4) Fabric filter dust collectors (baghouses).
- (5) Wet suppression

Fugitive PM emissions from paved roads are typically controlled through the use of work practices which include a site-specific Fugitive Dust Control Plan.

The choice of which technology is most appropriate for a specific application depends upon several factors, including particle size to be collected, particle loading, stack gas flow rate, stack gas physical

characteristics (e.g., temperature, moisture content, presence of reactive materials), and desired collection efficiency.

### ***Mechanical Collectors (such as Cyclones or Multiclones)***

Mechanical collectors use the inertia of the particles for collection. The particulate-laden gas stream enters the control device and is forced to move in a cyclonic manner, which causes the particles to move toward the outside of the vortex. Most of the large-diameter particles enter a hopper below the cyclonic tubes while the gas stream turns and exits the device.

Cyclones are typically used to remove relatively large particles from gas streams. Conventional single cyclones are estimated to control PM at 70-90%, PM<sub>10</sub> at 30-90%, and PM<sub>2.5</sub> at 0-40%. High efficiency single cyclones are designed to achieve higher control of smaller particles and multiclones may also achieve higher control of smaller particles. Collection efficiency generally increases with particle size and/or density, inlet duct velocity, cyclone body length, number of gas revolutions in the cyclone, ratio of cyclone body diameter to gas exit diameter, dust loading, and smoothness of the cyclone inner wall. Cyclone efficiency will decrease with increases in gas viscosity, body diameter, gas exit diameter, gas inlet duct area, and gas density.

Cyclones are often used for recovery and recycling of material or as precleaners for more expensive final control devices such as fabric filters or electrostatic precipitators. Cyclones are used for applications such as after spray drying operations in the food and chemical industries; after crushing/grinding/calcining operations in the mineral and chemical industries to collect salable or useful material; for first stage control of PM from sinter plants, roasters, kilns, and furnaces in the metallurgical industries; for catalyst recycling in the fluid-cracking process; and for precleaning fossil-fuel and wood-waste fired industrial and commercial fuel combustion units.

The typical gas flow rates for a single cyclone are 1,060 to 25,400 scfm. Flows that are higher use multiple cyclones in parallel. Inlet gas temperatures are only limited by the material of construction of the cyclone. Cyclones perform more efficiently with higher pollutant loadings, with loadings typically ranging from 1.0 to 100 gr/scf. Cyclones are unable to handle sticky or tacky materials.

### ***Wet Scrubbers***

A wet scrubber is an air pollution control device that removes PM from waste gas streams primarily through the impaction, diffusion, interception and/or absorption of the pollutant onto droplets of liquid. The liquid containing the pollutant is then collected for disposal. There are numerous types of wet scrubbers that remove PM, including venturi, impingement and sieve plate, spray towers, mechanically aided, condensation growth, packed beds, ejector, mobile bed, catenary grid, froth tower, oriented fiber pad, and wetted mist eliminators. Collection efficiencies for wet scrubbers vary with the particle size distribution of the waste gas stream. In general, collection efficiency decreases as the PM size decreases. Collection efficiencies also vary with scrubber type. Collection efficiencies range from greater than 99% for venturi scrubbers to 40-60% (or lower) for simple spray towers. Wet scrubbers are smaller and more compact than baghouses or ESPs. They have lower capital costs and comparable operation and maintenance (O&M) costs. Wet scrubbers are particularly useful in the removal of PM with the following characteristics:

- (1) Sticky and/or hygroscopic materials (materials that readily absorb water);
- (2) Combustible, corrosive and explosive materials;
- (3) Particles which are difficult to remove in their dry form;
- (4) PM in the presence of soluble gases; and
- (5) PM in waste gas streams with high moisture content.

Some applications of wet scrubbers include the following:

- Condensation scrubbers: for controlling fine PM-containing waste-gas streams.
- Fiber-bed scrubbers (wetted-fiber scrubbers or mist eliminators): for controlling aerosol emissions from chemical, plastics, asphalt, sulfuric acid, and surface coating industries; for controlling lubricant mist emission from rotating machinery and storage tanks; and for eliminating visible plume downstream of other control devices.
- Impingement-plate/tray-tower scrubbers: for the food and agriculture industry and at gray and iron foundries. These types of scrubbers may be used to control other pollutants such as SO<sub>2</sub>, VOC, and HAPs in other settings.
- Mechanically-aided scrubbers: for food processing paper, pharmaceuticals, chemicals, plastics, tobacco, fiberglass, ceramics, and fertilizer. Processes controlled include dryers, cookers, crushing and grinding operations, spraying, ventilation, and material handling.
- Orifice scrubbers: for food processing and packaging; pharmaceutical processing and packaging; manufacture of chemicals, rubber and plastics, ceramics, and fertilizer. Processes controlled include dryers, cookers, crushing and grinding operations, spraying, ventilation, and material handling.
- Packed-bed/packed-tower wet scrubbers: for the chemical, aluminum, coke and ferroalloy, food and agriculture, and chromium electroplating industries.
- Spray-chamber/spray-tower wet scrubbers: often used as part of a flue gas desulfurization systems, where they are used to control emissions from coal and oil combustion from electric utilities and industrial sources.
- Venturi scrubbers: for controlling PM emissions from utility, industrial, commercial, and institutional boilers fired with coal, oil, wood, and liquid waste; for sources in the chemical, mineral products, wood, pulp and paper, rock products, and asphalt manufacturing industries; for lead, aluminum, iron and steel, and gray iron production industries; for municipal solid waste incinerators. They are typically used where it is necessary to obtain high collection efficiencies for fine PM.

The primary disadvantage of wet scrubbers is that increased collection efficiency comes at the cost of increased pressure drop across the control system. Another disadvantage is that they generate waste in the form of a sludge which requires treatment and/or disposal. Lastly, downstream plume visibility problems can result unless the added moisture is removed from the gas stream.

### ***Electrostatic Precipitators***

An electrostatic precipitator (ESP) is a particle control device that uses electrical forces to move the particles out of the flowing gas stream and onto collector plates. The particles are given an electrical charge by forcing them to pass through a corona, a region in which gaseous ions flow. The electrical field that forces the charged particles to the walls comes from electrodes maintained at high voltage in the center of the flow lane.

Once the particles are collected on the plates, they must be removed from the plates without re-entraining them into the gas stream. This is usually accomplished by knocking them loose from the plates, allowing the collected layer of particles to slide down into a hopper from which they are evacuated. Some precipitators remove the particles by intermittent or continuous washing with water.

Dry-type ESPs are primarily used in the electric utility industry and may also be used by the textile industry, pulp and paper facilities, the metallurgical industry, cement and mineral industry, sulfuric acid manufacturing plants, as well as for coke ovens and hazardous waste incinerators. Dust characteristics are a limiting factor for dry-type ESPs. Sticky, moist, high resistivity, flammable, or explosive dusts and particles are not well-suited for dry-type ESPs. Wet ESPs are used in situations for which dry ESPs are

not suited, such as when the material to be collected is wet, sticky, flammable, explosive, or has a high resistivity. Wet ESPs are commonly used by the textile industry, pulp and paper facilities, the metallurgical industry, and sulfuric acid manufacturing plants. The limiting factor for wet ESPs is temperature; typically wet ESPs cannot handle operating temperatures exceeding 170°F.

ESP control efficiencies are very high and can range from 95% to 99.9% due to the strong electrical forces applied to small particles and can handle high temperatures (dry ESPs), pressures, and gas flow rates. The composition of the particulate matter is very important because it influences the conductivity within the dust layers on the collection plate. Wet ESPs are effective at collecting sticky particles and mist, help to cool and condition gas streams, and may provide for control of other aerosolized pollutants in the gas stream. ESPs in general are not suited for use in processes which are highly variable because they are very sensitive to fluctuations in gas stream conditions (flow rates, temperatures, particulate and gas composition, and particulate loadings). They have high capital costs and require large installation space. Dry ESPs are not recommended for removing sticky or moist particles. Wet ESPs can have potential problems with corrosion and they generate a wastewater slurry that must be handled.

### ***Fabric Filtration***

A fabric filter unit consists of one or more isolated compartments containing rows of fabric bags in the form of round, flat, or shaped tubes, or pleated cartridges. Particle laden gas passes up (usually) along the surface of the bags then radially through the fabric. Particles are retained on the upstream face of the bags, and the cleaned gas stream is vented to the atmosphere. The filter is operated cyclically, alternating between relatively long periods of filtering and short periods of cleaning. During cleaning, dust that has accumulated on the bags is removed from the fabric surface and deposited in a hopper for subsequent disposal.

Fabric filters collect particles with sizes ranging from submicron to several hundred microns in diameter at efficiencies generally in excess of 99 or 99.9%. The layer of dust, or dust cake, collected on the fabric is primarily responsible for such high efficiency. The cake is a barrier with tortuous pores that trap particles as they travel through the cake. Gas temperatures up to about 500°F, with surges to about 550°F, can be accommodated routinely in some configurations. Most of the energy used to operate the system appears as pressure drop across the bags and associated hardware and ducting.

Fabric filters are used where high efficiency particle collection is required and can be used in most any process where dust is generated and can be collected and ducted to a central location. Limitations are imposed by gas characteristics (temperature and corrosivity) and particle characteristics (primarily stickiness) that affect the fabric or its operation and that cannot be economically accommodated. Important process variables include particle characteristics, gas characteristics, and fabric properties. The most important design parameter is the air- or gas-to-cloth ratio (the amount of gas in ft<sup>3</sup>/min that penetrates one ft<sup>2</sup> of fabric) and the usual operating parameter of interest is pressure drop across the filter system. Fabric filters are usually made of woven or (more commonly) needle-punched felts sewn to the desired shape, mounted in a plenum with special hardware, and used across a wide range of dust concentrations.

Fabric filters provide high collection efficiency for both coarse and fine particles and are relatively insensitive to fluctuations in gas stream conditions. Operation is simple and fabric filters are useful for collecting particles with resistivities either too low or too high for collection with ESPs. Fabric filters have limited application for high temperatures and corrosive or moist exhaust.

### ***Wet Suppression***

Wet suppression systems use liquid sprays or foam to suppress the formation of airborne dust. The primary control mechanisms are those that prevent emissions through agglomerate formation by combining small dust particles with larger aggregate or with liquid droplets. The key factors that affect the degree of agglomeration and, hence, the performance of the system are the coverage of the material by

the liquid and the ability of the liquid to wet small particles. There are two types of wet suppression systems: liquid sprays which use water or water/surfactant mixtures as the wetting agent and systems which supply foams as the wetting agent. Wet suppression systems typically achieve PM control efficiencies of greater than 85%.

**Step 2: Eliminate Technically Infeasible Options:**

For material handling, all of the control technologies are considered technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
Fabric filter dust collectors (baghouses)	99+%
Electrostatic precipitators (ESP)	95-99%
Mechanical collectors (such as cyclones or multiclones)	70% - 90%
Wet scrubbers	70% - 90%
Wet suppression	50% - 90%

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Rail Unloading - coal

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (Emission unit)	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	railcar dump unloading facility, consisting of: Receiving Pits 1 & 2 Receiving Bins 1 & 2 Drag Flight Feeders 1 & 2 (EU-1000)	Shelter-type enclosure and baghouse EU-1000 Water spray dust suppression (hoppers and feeder only)	PM/PM10/PM2.5: 0.0022 gr/dscf 0.12 lb/hr 5% opacity (6-min avg.)	5,000 ton/hr
New Steel International	OH-0315 07-00587 (5/6/2008)	Scrap barge unloading to truck and Coal and Iron Ore barge unloading	baghouses 1A and 1B	PM/PM10: 0.0022 gr/dscf, 0.93 lb/hr and 4.07 tpy Fugitive PM: 6.15 tpy and fugitive PM10: 2.84 tpy	
0.0022 gr/dscf is the most stringent grain loading. Therefore, this has been determined to be BACT.					
Southeast Idaho Energy, LLC	ID-0017 P-2008.0066 (2/10/2009)	railcar unloading & storage	baghouses	PM: 0.0009 gr/dscf 0.09 lb/hr 99% CE 5% opacity PM10: 0.0004 gr/dscf 0.04 lb/hr 99% control efficiency	5,000 tons/hr
5% opacity is most stringent limit. Therefore this has been determined to be BACT.					
Permit cited in ID-0017, and later revision P-2009.0127, do not incorporate gr/dscf limits, only lb/hr and opacity. Value of gr/dscf calculated from lb/hr limit and air flow rate provided in the permit conflicts with the gr/dscf value in RBLC. Therefore the gr/dscf value from OH-0315 is considered in determining BACT.					
Indiana Gasification - IN	IN-0166 T147-30464-00060 (6/27/2012)	Rail Unloading	Baghouse or dust extraction system	PM/PM10: 0.003 gr/dscf PM2.5: 0.0015 gr/dscf 99.0% CE	-

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (Emission unit)	Control	BACT	Throughput (ton/yr)
This includes the most stringent limit (PM2.5), however, this plant was not built and the permit was revoked. Therefore these emission limits cannot be verified and are not considered as BACT.					
East Kentucky Power Cooperative, Inc - J.K. Smith Generating Station	KY-0100 V-05-070 R3 (4/09/2010)	storage piles, railcar unloading, egress to underground conveyor	wet suppression	10% opacity	3000 tph
Ohio River Clean Fuels	OH-0317 02-22896 (11/20/2008)	coal handling and storage	-	PM: 0.09 lb/hr PM10: 0.04 lb/hr	-
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Homeland Energy Solutions	IA-0089 07-A-955P to 07-A-982P (8/8/2007)	Coal Unloading/storage	Baghouse and water fogging	PM/PM10: 0.005 gr/dscf	200 tons/hr
Tri-State Generation and Transmission Assoc	CO-0072 12MF322-1 (5/16/2007)	coal handling and storage (train unloading, crushers, transfer, silo and storage piles)	water spray bars	PM: 1.7 tpy PM10: 0.7 tpy	4500000 ton/yr
NRG Coal Handling Plant	TX-0507 8579, PSD-TX-371M4 (4/13/2006)	Rail Unloading	None	PM: 1.15 lb/hr PM10: 0.54 lb/hr	-
Public Service Company Of Colorado Comanche Station	CO-0057 04UNITPB10 15 (07/05/2005)	coal handling and storage (includes open storage pile, rail unloading, transfer to pile and transfer to bunkers)	Water Sprays, lower well, dust suppressant, Enclosures and baghouses where feasible	PM/PM10: 0.01 gr/dscf	-
Mesabi Nugget	MN-0061 13700318-001 (6/26/2005)	coal unloading	baghouse	0.005 gr/dscf 10% opacity	
Auburn Nugget	IN-0119 033-19475-00092 (5/31/2005)	coal car unloading	Baghouse	PM: 0.0052 gr/dscf 3% opacity	165 tph

Conveyor transfer - coal

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Unloading Conveyor, Transfer Station (EU-1001)	baghouse	PM/PM10/PM2.5: 0.002 gr/dscf 0.16 lb/hr (EU-1001) 5% opacity (6-min avg.)	5,000 tons/hr
		Closed Screw Conveyor	coal handling system filter (EU-2005)	PM/PM10/PM2.5: 0.002 gr/dscf 0.003 lb/hr 5% opacity (6-min avg.)	500 tons/hr (max) 258 tons/hr (bottlenecked)
US Steel	MN-0084 13700063-004 (12/6/2011)	Reclaim conveyor	Baghouse	PM/PM10/PM2.5: 0.002 gr/dscf 0.31 lb/hr, 5% opacity (6-min avg.), 95% CE	
0.002 gr/dscf is the most stringent limitation for conveyor transfer, therefore this has been determined to be BACT.					

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Great River Energy-Spiritwood	ND-0024 PTC07026 (9/14/2007)	coal handling	baghouse	PM: 0.005 gr/dscf 5% opacity 99.9% CE	85.3 tph
5% opacity is the most stringent opacity. Therefore, this has been determined to be BACT.					
Indiana Gasification - IN	IN-0166 / T147-30464-00060 (6/27/2012)	Conveyor Transfer	Baghouse	PM/PM10: 0.003 gr/dscf *PM2.5: 0.0015 gr/dscf 99.0% CE	750 tph
This plant was not built and the permit was revoked. Therefore these emission limits cannot be verified and are not considered as BACT.					
Holland Board Of Public Works-James Deyoung Plant	MI-0403 25-07 (2/11/2011)	Barge unloading system; all coal fuel conveyors and transfer points; reclaim hopper and vibrating feeders; coal drop points; transfer / crusher house; active storage pile; and inactive storage pile	Fabric filter controls emissions from the transfer/crusher house. conveyors are equipped with three sided enclosures	PM: 0.004 gr/dscf PM10: 0.34 lb/hr 10% opacity	-

		PM <sub>10</sub> <sup>1</sup>	0.002	0.001
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.001
Residue bulk container loading and residue transfer conveyors (EU-5009)	Filter EU-5009 (stack EU-5009)	PM	0.002	0.001
		PM <sub>10</sub> <sup>1</sup>	0.002	0.001
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.001
Residue rail storage silo (EU-5010), loading hoppers (EU-5005, EU-5006), and residue transfer conveyors	Filter EU-5010 (stack EU-5010)	PM	0.002	0.003
		PM <sub>10</sub> <sup>1</sup>	0.002	0.003
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.003
Residue swing storage silo (EU-5011), loading hoppers (EU-5007, EU-5008), and residue transfer conveyors	Filter EU-5011 (stack EU-5011)	PM	0.002	0.003
		PM <sub>10</sub> <sup>1</sup>	0.002	0.003
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.003
Lime silo (EU-6501)	Filter EU-6501 (stack EU-6501)	PM	0.002	0.01
		PM <sub>10</sub> <sup>1</sup>	0.002	0.01
		PM <sub>2.5</sub> <sup>1</sup>	0.002	0.01

Notes:

1. PM<sub>10</sub> and PM<sub>2.5</sub> include both filterable and condensable.
- (2) Transfers from the loading hoppers to transports shall employ choke flow-practices
- (3) There shall be no visible emissions from transfers from the loading hoppers and from hoppers to transports.

<b>BACT Analysis</b> <b>Process fuel gas-fired heaters and boiler</b>
--

**PM/PM10/PM2.5**

**Step 1: Identify Potential Control Technologies**

PM/PM10/PM2.5 emissions can be controlled with the following control technologies:

- (1) Good Combustion Practices

**Step 2: Eliminate Technically Infeasible Options**

A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice for gas-fired combustion units is the best control for PM/PM10/PM2.5 emissions. Natural gas combustion is already efficient. It is possible to achieve PM/PM10/PM2.5 reductions from an add-on control device; however, any add-on control technology would not be cost effective since the PM/PM10/PM2.5 concentration in these units is relatively low. Good Combustion Practices are a technically feasible option.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units (<100 MMBtu/hr) - PM/PM10/PM2.5

This source is in SIC code 2821, not 2911 like the proposed source. RBLC process code is 12.390, for "other gaseous fuels and gaseous fuel mixtures" but entries specify that the units burn natural gas. Therefore these entries may not represent BACT for the proposed source and have not been considered.					

Notes:

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3, the Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the fuel combustion units listed in the table below shall be as follows:

Description	Unit ID
Coal dryer heater	EU-1007
Feed heater	EU-2001
Treat gas heater	EU-2002
Vacuum column feed heater	EU-2003
Fractionator heater	EU-2004
Package boiler	EU-6000

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (c) Particulate matter emissions shall not exceed:

Emission Limitations			
Unit ID	Pollutant	lb/MMBtu	lb/hr
EU-1007	PM <sub>FILTERABLE</sub>	0.0019	0.11
	PM <sub>10</sub>	0.0075	0.42
	PM <sub>2.5</sub>	0.0075	0.42

	PM <sub>2.5</sub>	0.0075	0.51

Notes:

1. tons/yr = tons per twelve (12) consecutive month period

## SO<sub>2</sub>

### **Step 1: Identify Potential Control Technologies**

Sulfur Dioxide (SO<sub>2</sub>) emissions result from the oxidation of fuel-bound sulfur, with emissions dependent upon the sulfur content of the fuel. Sulfur Dioxide (SO<sub>2</sub>) emissions are generally controlled with add-on control equipment designed to capture the emissions prior to the time they are exhausted to the atmosphere.

- (a) Flue Gas Desulfurization (FGD) System);
  - (1) Wet Scrubbing
  - (2) Spray Dryer Absorption (SDA)
  - (3) Dry Sorbent Injection (DSI)
- (b) Fuel Specification.
- (c) Good Combustion Practices

The choice of which technology is most appropriate for a specific application depends upon several factors, including particle size to be collected, particle loading, stack gas flow rate, stack gas physical characteristics (e.g., temperature, moisture content, presence of reactive materials), and desired collection efficiency.

### **Flue Gas Desulfurization (FGD) System (Dry and Wet Scrubbers)**

A flue gas desulfurization system (FGD) is comprised of a spray dryer that uses lime as a reagent followed by particulate control or wet scrubber that uses limestone as a reagent. FGD is an established technology. FGD typically operates at a temperature of approximately 300°F to 700°F (wet) and 300°F to 1830°F (dry). The FGD has a waste stream inlet pollutant concentration of 2,000 ppmv. Absorption of SO<sub>2</sub> is accomplished by the contact between the exhaust and an alkaline reagent, which results in the formation of neutral salts. Wet systems employ reagents using packed or spray towers and generate wastewater streams, while dry systems inject slurry reagent into the exhaust stream to react, dry and be removed downstream by particulate control equipment. Chlorine emissions can result in salt deposition within the absorber and in downstream equipment. Wet systems may require flue gas re-heating downstream of the absorber to prevent corrosive condensation. Inlet streams for dry systems must be cooled as appropriate, and dry systems require use of particulate controls to collect the solid neutral salts.

- (1) Wet Scrubbing Wet scrubbers are regenerative processes which are designed to maximize contact between the exhaust gas and an absorbing liquid. The exhaust gas is scrubbed with a 5 - 15 percent slurry, comprised of lime (CaO) or limestone (CaCO<sub>3</sub>) in suspension. The SO<sub>2</sub> in the exhaust gas reacts with the CaO or CaCO<sub>3</sub> to form calcium sulfite (CaSO<sub>3</sub>.2H<sub>2</sub>O) and calcium

sulfate ( $\text{CaSO}_4$ ). The scrubbing liquor is continuously recycled to the scrubbing tower after fresh lime or limestone has been added.

The types of scrubbers which can adequately disperse the scrubbing liquid include packed towers, plate or tray towers, spray chambers, and venturi scrubbers. In addition to calcium sulfite/sulfate, numerous other absorbents are available including sodium solutions and ammonia-based solutions.

- (2) Spray Dryer Absorption (SDA) - An alternative to wet scrubbing is a process known as dry scrubbing, or spray-dryer absorption (SDA). As in wet scrubbing, the gas-phase  $\text{SO}_2$  is removed by intimate contact with a suitable absorbing solution. Typically, this may be a solution of sodium carbonate ( $\text{Na}_2\text{CO}_3$ ) or slaked lime [ $\text{Ca}(\text{OH})_2$ ]. In SDA systems the solution is pumped to rotary atomizers, which create a spray of very fine droplets. The droplets mix with the incoming  $\text{SO}_2$ -laden exhaust gas in a very large chamber and subsequent absorption leads to the formation of sulfites and sulfates within the droplets. Almost simultaneously, the sensible heat of the exhaust gas which enters the chamber evaporates the water in the droplets, forming a dry powder before the gas leaves the spray dryer. The temperature of the desulfurized gas stream leaving the spray dryer is now approximately 30 - 50°F above its dew point.

The exhaust gas from the SDA system contains a particulate mixture which includes reacted products. Typically, baghouses employing teflon-coated fiberglass bags (to minimize bag corrosion) are utilized to collect the precipitated particulates.

- (3) Dry Sorbent Injection (DSI) - This control option typically involves the injection of dry powders into either the furnace or post-furnace region of utility-sized boilers. This process was developed as a lower cost option to conventional FGD technology. Since the sorbent is injected directly into the exhaust gas stream, the mixing offered by the dry scrubber tower is not realized. The maximum efficiency realized for this  $\text{SO}_2$  control technology is estimated to be fairly nominal. It is felt that if sufficient amounts of reactants are introduced into the flue gas, there is a possibility of some degree of mixing and reaction. The science is inexact and the coupling of reactant dosage and in-flue mixing which impacts the  $\text{SO}_2$  control efficiency is susceptible to variability in  $\text{SO}_2$  concentrations.

### **Dry Sorbent Injection**

A post-combustion technology in which a calcium or sodium-based sorbent reacts with  $\text{SO}_2$  and  $\text{SO}_3$  and is removed downstream by particulate control equipment. The system requires use of particulate controls to collect the reaction solids. Dry sorbent injection is not listed in the RBLC as BACT for the control of  $\text{SO}_2$  emissions for auxiliary boilers. Technology has not been applied to natural gas combustion turbines due to very low  $\text{SO}_2$  emissions. Controls would not provide any measurable emission reduction.

### **Fuel Specifications**

Combusting only clean natural gas, which has an inherently low sulfur content, rather than higher sulfur content fuels alone or in combination with natural gas has a very low potential for generating  $\text{SO}_2$  emissions.

### **Step 2: Eliminate Technically Infeasible Options:**

FGD systems are not listed in the RBLC as BACT for the control of  $\text{SO}_2$  emissions for process heaters and/or boilers. Technology has not been applied to natural gas units due to very low  $\text{SO}_2$  emissions. Controls would not provide any measurable emission reduction and would not be economically feasible.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Good Combustion Practices and use of low-sulfur fuel gas are the only feasible option.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLCL):

Combustion Units - SO<sub>2</sub>

Facility - County, State	RBLCL ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month.	0.35 tpy	55.80
		EU-2001 Feed heater		0.80 tpy	128.40
		EU-2002 Treat gas heater		0.33 tpy	52.80
		EU-2003 Vacuum column feed heater		0.06 tpy	9.00
		EU-2004 Fractionator heater		0.97 tpy	156.00
		EU-6000 Boiler		0.42 tpy	68.50
The source has proposed a more restrictive limit for fuel gas sulfur content than entries in the RBLCL database. Therefore, this is determined to be BACT.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3, the Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the fuel combustion units listed in the table below shall be as follows:

Description	Unit ID
Coal dryer heater	EU-1007
Feed heater	EU-2001
Treat gas heater	EU-2002
Vacuum column feed heater	EU-2003
Fractionator heater	EU-2004
Package boiler	EU-6000

- (a) The units shall burn only natural gas and process off-gas.
- (b) The average sulfur content of the fuel gas combusted shall not exceed 0.005 gr/scf per twelve (12) consecutive month period with compliance determined at the end of each month.
- (c) SO<sub>2</sub> emissions shall not exceed:

SO <sub>2</sub> Emission Limitations	
Unit ID	tpy
EU-1007	0.35
EU-2001	0.80
EU-2002	0.33
EU-2003	0.06
EU-2004	0.97
EU-6000	0.42

## **NO<sub>x</sub>**

### **Step 1: Identify Potential Control Technologies**

NO<sub>x</sub> emissions can be controlled with the following control technologies:

Post-combustion controls:

- (1) Selective Catalytic Reduction (SCR)
- (2) Selective Non-Catalytic Reduction (SNCR)

Combustion controls:

- (3) Low NO<sub>x</sub> Burner (LNB)/Ultra low-Nox burner (ULNB)
- (4) Flue Gas Recirculation (FGR)
- (5) Good Combustion Practices

#### **Selective Catalytic Reduction (SCR)**

Selective Catalytic Reduction (SCR) process involves the mixing of anhydrous or aqueous ammonia vapor with flue gas and passing the mixture through a catalytic reactor to reduce NO<sub>x</sub> to water and N<sub>2</sub>. Under optimal conditions, SCR has a removal efficiency up to 90% when used on steady state processes. The efficiency of removal will be reduced for processes that are not stable or require frequent changes in the mode of operation.

The most important factor affecting SCR efficiency is temperature. SCR can operate in a flue gas window ranging from 480°F to 800°F, although the optimum temperature range depends on the type of catalyst and the flue gas composition. In this particular service, the minimum target temperature is approximately 750°F. Temperatures below the optimum decrease catalyst activity and allow NH<sub>3</sub> to slip through; above the optimum range, ammonia will oxidize to form additional NO<sub>x</sub>. SCR efficiency is also largely dependent on the stoichiometric molar ratio of NH<sub>3</sub>:NO<sub>x</sub>; variation of the ideal 1:1 ratio to 0.5:1 ratio can reduce the removal efficiency to 50%.

#### **Selective Non-Catalytic Reduction (SNCR)**

With selective non-catalytic reduction (SNCR), NO<sub>x</sub> is selectively removed by the injection of ammonia or urea into the flue gas at an appropriate temperature window of 1600°F to 2000°F, without employing a catalyst. Similar to SCR without a catalyst bed, the injected chemicals selectively reduce the NO<sub>x</sub> to molecular nitrogen and water. This approach avoids the problem related to catalyst fouling but the temperature window and reagent mixing residence time is critical for conducting the necessary chemical reaction.

At the proper temperature, urea decomposes to produce ammonia which is responsible for NO<sub>x</sub> reduction. At a higher temperature, the rate of competing reactions for the direct oxidation of ammonia that forms NO<sub>x</sub> becomes significant. At a lower temperature, the rates of NO<sub>x</sub> reduction reactions become too slow resulting in urea slip (i.e. emissions of unreacted urea).

Optimal implementation of SNCR requires the employment of an injection system that can accomplish thorough reagent/gas mixing within the temperature window while accommodating spatial and production rate temperature variability in the gas stream. The attainment of maximum NO<sub>x</sub> control performance requires that the furnace exhibit a favorable opportunity for the application of this technology relative to the location of the reaction temperature range and steady operation within that temperature window.

#### **Low NO<sub>x</sub> Burners (LNB)**

Using LNB can reduce formation of NO<sub>x</sub> through careful control of the fuel-air mixture during combustion. Control techniques used in LNBs includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NOx emissions can be realized using LNBs. The U.S. EPA reports that LNBs have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

**Flue Gas Recirculation (FGR)**

Recirculating a portion of the flue gas to the combustion zone can lower the peak flame temperature and result in reduced thermal NOx production. The flue gas recirculation (FGR) can be highly effective technique for lowering NOx emissions from burners and it's relatively inexpensive to apply. FGR lowers NOx emissions in two ways; the cooler, relatively inert, recirculated flue gases act as heat sink, absorbing heat from the flame and lowering peak flame temperatures and when mixed with the combustion air, recirculated flue gases lower the average oxygen content of the air, starving the NOx-forming reactions for one of the needed ingredients.

**Step 2: Eliminate Technically Infeasible Options:**

Technology	BACT Evaluation
Selective Catalytic Reduction (SCR) Technically Feasible – <b>Yes</b>	Selective Catalytic Reduction (SCR) is technically feasible.
Selective Non-Catalytic Reduction (SNCR) Technically Feasible – <b>No</b>	Riverview will operate at a wide range of load levels, with lower levels potentially unable to provide a temperature profile that maintains the range needed for effective control for sufficient residence time to achieve proper control.  Some ammonia will be emitted.  The combustion units used at Riverview combust a combination of gaseous fuels that are proportionally variable over relatively short time periods and results in short term NOx loading variations. This variability works against the limited temperature flexibility and difficulty of SNCR in adjusting to short term changes maintaining consistent NOx control during operation of these units. For these reasons, the SNCR is technically infeasible.
Low NOx Burner (LNB) Technically Feasible - <b>Yes</b>	LNB/ULNB is technically feasible.
Flue Gas Recirculation (FGR) Technically Feasible – <b>Yes</b>	Flue Gas Recirculation (FGR) is technically feasible.
Good Combustion Practices Technically Feasible – <b>Yes</b>	Good Combustion Practices are technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
LNB/ULNB	40-85%
SCR	70%-90%
SNCR	30%-50%
FGR	15%-50%

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units (<100 MMBtu/hr) - NOx

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)

## **VOC**

### **Step 1: Identify Potential Control Technologies**

VOC emissions can be controlled with the following control technologies:

- (1) Thermal Oxidation
- (2) Catalytic Oxidation
- (3) Flares
- (4) Good Combustion Practices

### **Step 2: Eliminate Technically Infeasible Options**

VOC emissions from boilers/heaters are the result of incomplete fuel combustion. A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice for gas-fired combustion units is the best control for VOC emissions. Natural gas combustion is already efficient. It is possible to achieve VOC reductions from an add-on control device; however, any add-on oxidation control technology would not be cost effective since the VOC concentration in these units is relatively low.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units (<100 MMBtu/hr) - VOC

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)

### **Step 5: Select BACT**

Pursuant to 326 IAC 2-2 (PSD BACT), IDEM has established the following BACT:

BACT shall be the following:

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (c) VOC emissions shall not exceed:

<b>Emission Limitations</b>		
<b>Unit ID</b>	<b>lb/MMBtu</b>	<b>lb/hr</b>
EU-1007	0.0054	0.30
EU-2001	0.0054	0.69
EU-2002	0.0054	0.29
EU-2003	0.0054	0.05
EU-2004	0.0054	0.84
EU-6000	0.0054	0.37

## **CO**

### **Step 1: Identify Potential Control Technologies**

Emissions of carbon monoxide (CO) are generally controlled by oxidation. CO control technologies include:

Post-combustion controls:

- (a) Regenerative thermal oxidation;
- (b) Catalytic oxidation;
- (c) Flares

Combustion controls:

- (d) Good Combustion Practices

### **Step 2: Eliminate Technically Infeasible Options**

Carbon monoxide emissions from boilers/heaters are the result of incomplete fuel combustion. A search of the USEPA's RACT/BACT/LAER Clearinghouse indicates the use of good combustion practice and engineering design for gas-fired combustion units is the best control for CO emissions. Natural gas combustion is already efficient. It is possible to achieve CO reductions from an add-on control device;

however, any add-on oxidation control technology has been consistently shown as not cost effective since the CO concentration in these units is relatively low.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary. Good Combustion Practices are a feasible option.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

**Combustion Units (<100 MMBtu/hr) - CO**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	GCP	2.04 lb/hr 0.0365 lb/MMBtu	55.80
		EU-2002 Treat gas heater		1.93 lb/hr 0.0365 lb/MMBtu	52.80
		EU-2003 Vacuum column feed heater		0.33 lb/hr 0.0365 lb/MMBtu	9.00
		EU-6000 Boiler		2.50 lb/hr 0.0365 lb/MMBtu	68.50
The source has proposed a limit of 0.0365 lb CO/MMBtu, which is more restrictive than the limits established for other sources in SIC code 2911. Therefore, this has been determined to be BACT.					
Holly Refinery & Marketing-Tulsa LLC	OK-0167 2012-1062-C(M-1)PSD (4/20/2015)	Process heaters	0.040 lb/MMBtu	-	10.00

## **GHGs**

### **Step 1: Identify Potential Control Technologies**

- (1) Energy efficiency measures
- (2) Post-combustion CO<sub>2</sub> capture and sequestration (CCS).

### **Step 2: Eliminate Technically Infeasible Options**

#### **Energy efficiency measures**

An opportunity for reducing GHG emissions is to increase the energy efficiency. Because CO<sub>2</sub> emissions are a direct result of the amount of fuel fired (for a given fuel), the more efficient the process, the less fuel that is required and the less greenhouse gas emissions that result. Some energy efficiency measures that may be applied include the following:

##### Coal Moisture Control

The VCC process requires coal with specific properties in order to operate efficiently. Maintaining tight coal specifications to keep moisture to low levels would reduce energy requirements, and therefore reduce emissions.

##### General Measures

Systems to monitor and track performance of critical equipment and processes can help optimize operation. Using this information, research on machinery and equipment can be conducted, as could energy efficiency studies and other measures such as predictive maintenance. Scheduled preventive maintenance and roaction of redundant equipment helps minimize equipment downtime and optimize operation. Training programs asnd good housekeeping programs hlep decrease energy consumption.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of energy efficiency is a technically feasible option for the heaters and boiler at this source.

##### Post-combustion CO<sub>2</sub> Capture

Post-combustion CO<sub>2</sub> capture is a relatively new concept. In EPA's recent GHG BACT guidance, EPA takes the position that, "for the purpose of a BACT analysis for GHGs, EPA classifies CCS as an add-on pollution control technology that is "available" for large CO<sub>2</sub>-emitting facilities including fossil fuel-fired power plants and industrial facilities with high-purity CO<sub>2</sub> streams". However, the heaters and boiler at Riverview do not fit into either of these categories. The EPA guidance document provides little specific guidance on whether or how to consider CCS in situations outside of the above quoted examples. However, some guidance specific to medium-sized natural gas boilers appears in its guidance document which presents an example GHG BACT analysis for a 250 MMBtu/hr natural gas fired boiler. In this EPA boiler example, carbon capture isn't listed or considered in the BACT analysis as a potentially available option.

#### **Post-combustion CO<sub>2</sub> capture and sequestration (CCS)**

Natural gas combustion heater/boiler exhaust streams have relatively low CO<sub>2</sub> concentrations (6-9% versus 12-15% for coal-boilers and >30% for high concentration industrial gas streams). This means that for a natural gas heater/boiler, a very large volume of gas needs to be treated to recover the CO<sub>2</sub>. Additionally, the low concentration and low pressure complicate the absorption and desorption of the CO<sub>2</sub>, which increases the energy required. Also, a low pressure absorption system creates a low pressure CO<sub>2</sub> stream which requires a very high energy demand for compression prior to transport. All these factors make the application of CO<sub>2</sub> capture on any natural gas combustion exhaust extremely difficult and expensive. Additionally, the cost of capturing CO<sub>2</sub> for smaller sources is more expensive due to the lack of economy-of-scale.

The CO<sub>2</sub> must be reused or liquefied, transported and stored. Pipelines are the most common. The Co<sub>2</sub>

must be compressed to high pressures, which requires considerable energy consumption. At this time, existing infrastructure to support the transportation of CO<sub>2</sub> does not exist. Therefore, transportation of the CO<sub>2</sub> stream would require the construction of a pipeline to the nearest sequestration site.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of post-combustion CO<sub>2</sub> capture is not a technically or economically feasible option for the operations at this source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Combustion Units - CO<sub>2</sub>e

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	EU-1007 Coal milling and drying heater	energy efficiency, good combustion practices, and gaseous fuel	29,127 tons/yr	55.80
		EU-2001 Feed heater		67,023 tons/yr	128.40
		EU-2002 Treat gas heater		27,561 tons/yr	52.80
		EU-2003 Vacuum column feed heater		4,698 tons/yr	9.00
		EU-2004 Fractionator heater		81,430 tons/yr	156.00
		EU-6000 Boiler		35,756 tons/yr	68.50
Production-based limits, e.g., lb/MMBtu or lb/1000 lb steams, cannot be considered as establishing BACT for the proposed source because of differences in fuel heating values and unit efficiencies, and because not all units are steam-generating equipment.					
Exxon Mobil Oil Corp.	TX-0832 PSDTX768M 1, PSDTX799, PSDTX802 (1/9/2018)	F-2001 kero HDT charge heater & F-2002 kero HDT stripper reboilers	stack temp 600°F, GCP <sup>3</sup>	-	85.50
		F-3001 diesel DHDT charge heater and F-3002 diesel DHDT stripper reboiler			66.50
This RBLC entry is labeled as draft, therefore it is not considered as establishing BACT for the proposed source because the limits have not been tested.					
Indorama Ventures Olefins LLC	LA-0314 PSD-LA-813 (8/3/2016)	Dryer regenerator heater-005	gas fuel, GCP	-	29.00
Holly Refinery & Marketing-Tulsa LLC	OK-0167 2012-1062-C(M-1)PSD (4/20/2015)	Process heaters	gas fuel, energy efficiency	146 lb/MMBtu	10.00
					25.00
		CDU atmospheric tower heater (refinery fuel gas)			42.00
					50.00
					248.00

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process (All natural gas-fired unless otherwise noted)	Control	BACT	Rating (MMBtu/hr)	
	OK-0166 2010-599-C(M-3) (4/20/2015)	Process heater (refinery fuel gas)			76.00

LA-0302 PSD-LA-779 (5/23/2014)		Process heat boilers (EQT 1008 & 1009)		69173 tpy (comb)	78.00	
The Sasol complex is in SIC code 2869, therefore these entries are not considered as establishing BACT for the proposed source, which is in SIC code 2911						
Lima Refining Co.	OH-0362 P0114527 (12/23/2013)	Vacuum unit II heater	low carbon gaseous fuel, GCP <sup>4</sup>	-	102.30	

Notes:

1. tpy - tons per twelve (12) consecutive months
2. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
3. TX-0832 GCP: performing preventative maintenance as necessary, and inspecting and tuning burners and conducting a visual inspection of the heater components annually.

4. *OH-362 GCP: Heat recovery through use of a convection section and boiler feed water preheating; and excess oxygen monitoring and annual burner tuning and heater inspection.*

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 the Best Available Control Technology (PSD BACT), shall be the following:

- (a) The units shall burn only natural gas and process off-gas.
- (b) The units shall be designed and operated to achieve the highest practical energy efficiency.
- (c) The units shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (d) CO<sub>2e</sub> emissions shall not exceed the value of tons per twelve (12) consecutive month period shown in the table below:

Emission Limitations	
Unit ID	CO <sub>2e</sub> Limit
EU-1007	29,127
EU-2001	67,023
EU-2002	27,561
EU-2003	4,698
EU-2004	81,430
EU-6000	35,756

**BACT Analysis**  
**Sulfur Recovery/Tail Gas Treatment Unit (TGTU)**

**Step 1: Identify Potential Control Technologies**

The sulfur recovery process converts H<sub>2</sub>S (from the amine regeneration process and sour water stripping process) to elemental sulfur. In this case, the Claus process is used. Feed gases are burned with sufficient air to combust some of the H<sub>2</sub>S to promote the Claus reactions. This process creates emissions.

NOx emissions can be controlled with the following control technologies:

- (1) Low NOx Burner (LNB)/Ultra low-Nox burner (ULNB)

**Low NOx Burners (LNB)**

Using LNB can reduce formation of NOx through careful control of the fuel-air mixture during combustion. Control techniques used in LNBs includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NOx emissions can be realized using LNBs. The U.S. EPA reports that LNBs have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

**Step 2: Eliminate Technically Infeasible Options**

Low Nox burners are technically feasible.  
Thermal oxidizers are not economically feasible for this sulfur recovery unit.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Low Nox burners are technically feasible.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - PM/PM<sub>10</sub>/PM<sub>2.5</sub>

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners Good Combustion Practices	PM (filterable): 0.0019 lb/MMBtu 0.10 lb/hr, each PM10/PM2.5: 0.0074 lb/MMBtu 0.39 lb/hr (each) 10% opacity	111 (max, ea) 159 (comb, bottle-necked)
BP Products, North America	OH-0357 P0111667 (9/20/2013)	Claus SRU	None	PM10: 0.6 lb/hr 1.74 tpy based on AP-42, 7.6 lb/MMscf (equivalent to 0.0074 lb/MMBtu)	120 (32.15 MMBtu/hr)
This is the most stringent limit for PM10. Therefore, it has been determined to be BACT for PM10 and PM2.5.					
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-nox burners	PM10: 1.36 lb/hr and 5.96 tpy (12-month rolling avg.) and 0.08 lb/MMBtu 10% opacity (6-min avg.)	17 MMBtu/hr
This is the most stringent limit for opacity, therefore it has been included in BACT.					
Conoco Phillips Co.	MT-0030 2619-24 (11/19/2008)	Claus SRU TGTU	Proper equipment design, good combustion practices and use gaseous fuels	PM/PM10/PM2.5: none	235
This is the most stringent limitation on design and operating practice, therefore it has been included in BACT.					
CHS McPherson Refinery Inc	KS-0032 C-13055 (12/12/2015)	Sulfur Recovery Plant	ATS units	PM: 3.67 lb/hr PM10: 7.76 lb/hr	-
Not considered a representative comparison. PM/PM10 emissions from the sulfur recovery plant at this source are controlled by a mist eliminator, indicating that the ATS process is fundamentally different from the Claus sulfur recovery process with tail gas treatment. Permit cited does not appear to be available on line.					
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	VE: 20% Opacity PM10: 0.2 lb/hr (0.85 tpy) (AP-42)	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - SO<sub>2</sub>

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners Good Combustion Practices	150 ppmv @ 0% O <sub>2</sub> (annual) 167 ppmv @ 0% O <sub>2</sub> (12-hour avg) 26.30 lb/hr (ea)	111 (max, ea) 159 (comb, bottle-necked)
Conoco Phillips Co.	MT-0030 2619-24 (11/19/2008)	Claus SRU TGTU	TGTUf	150 ppmv @ 0% O <sub>2</sub> (annual) 167 ppmv @ 0% O <sub>2</sub> (12-hour avg)	235
This is the most stringent limit for SO <sub>2</sub> - considered more restrictive than higher ppmv limits with specified control efficiencies. Therefore, this has been determined to be BACT.					
CHS McPherson Refinery Inc	KS-0032 C-13055 (12/12/2015)	Sulfur Recovery Plant	ATS units	90 ppmvd @ 0% O <sub>2</sub> (24 hr avg) SO <sub>2</sub> CEMS	-
Not considered a representative comparison. PM/PM10 emissions from the sulfur recovery plant at this source are controlled by a mist eliminator, indicating that the ATS process is fundamentally different from the Claus sulfur recovery process with tail gas treatment. Permit cited does not appear to be available on line.

Conoco Phillips	IL-0103 06050052 (8/5/2008)	Sulfur Recovery Units E and F	Good combustion practices for thermal oxidizers on tail gas treating unit	0.082 lb/MMBtu	
These are the most stringent limits for CO. Therefore, these have been determined to be BACT.					
Chevron Products	MS-0089 1280-00058 (4/14/2009)	Sulfur Recovery Units II and III	Two low-NOx thermal oxidizers	16.92 lb/hr (3-hr rolling avg.) 49.42 tpy (12-month rolling avg.) 100 ppmvd @ 0% O2 (30-day rolling avg.) CO CEMS	290

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Sunoco	OH-0308 04-01447 (2/23/2009)	Sulfur Recovery Unit (new)	Tail gas treatment units and SRU incinerator thermal oxidizer low-nox burners	2.59 lb/hr 11.34 tpy (12-month rolling avg.) 0.15 lb/MMBtu incinerator	17 MMBtu/hr
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	52.5 lb/hr (incineration of tail gas, each unit) 0.32 tpy 3 startup/shutdown events per year for each unit	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Texstar	TX-0501 6051, PSD-TX-55M3 (7/11/2006)	Tail gas incinerator stack	-	3.69 lb/hr 15.9 tpy	
The source is a natural gas liquids facility in SIC code 132 (also provides NAICS code of 221210), therefore this entry should not be considered as establishing BACT for the proposed source.					

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - CO<sub>2</sub>e

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners Good Combustion Practices	40,872 tpy (combined)	111 (max, ea) 159 (comb, bottle-necked)
BACT proposed by the source. Tons per year limits at other sources are not considered applicable because unit capacities are not available for comparison.					
Dakota Prairie Refining	ND-0031 PTC12090 (2/21/2013)	Sulfur recovery unit	none	1137 tpy	

Sulfur Recovery/Tail Gas Treatment Unit (TGTU) - H<sub>2</sub>SO<sub>4</sub> mist

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (Long tons/day)
Riverview Energy	Proposed	Claus SRU TGTU (EU-3001 and EU-3002)	SRU Tail gas unit with incinerator burner and low-NOx burners Good Combustion Practices	H <sub>2</sub> SO <sub>4</sub> : 0.0244 lb/MMBtu and 1.29 lb/hr, each (equivalent to 0.28 lb/long ton S)	111 (max, ea) 159 (comb, bottle-necked)
Limits proposed by the source for sulfuric acid mist are more restrictive than any found in RBLC, therefore these are selected as BACT.					
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Sulfur recovery process units	thermal oxidizer low NOx burners	H <sub>2</sub> SO <sub>4</sub> : 2.37 lb/hr (10.4 tpy) (equivalent to 0.10 lb/long ton)	23.5 ton/hr
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					

**Step 5: Select BACT**

IDEM, OAQ has established BACT for TGTUA and TGTUB as:

- (a) PM (filterable) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0019 lb/MMBtu and 0.10 lb/hr, each.
- (b) PM<sub>10</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (c) PM<sub>2.5</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0074 lb/MMBtu and 0.39 lb/hr, each.
- (d) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 150 ppmv @ 0% excess air (on a twelve month rolling average) and shall be less than 167 ppmv @ 0% excess air (on a twelve hour average).
- (e) The SO<sub>2</sub> emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 26.30 lb/hr, each.
- (f) The tail gas treatment units (TGTUA and TGTUB) shall each use low-NOx burners.
- (g) NOx emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.10 lb/MMBtu and 5.28 lb/hr, each.
- (h) VOC emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0054 lb/MMBtu and 0.28 lb/hr, each.
- (i) CO emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 65 ppmv @ 0% O<sub>2</sub>, shall not exceed 0.082 lb/MMBtu and 4.33 lb/hr, each.
- (j) Sulfuric Acid Mist (H<sub>2</sub>SO<sub>4</sub> mist) emissions from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 0.0244 lb/MMBtu and 1.29 lb/hr, each.
- (k) Opacity shall not exceed ten percent (10%) on a six-minute average.
- (l) Incinerators (A-605A and A-605B) shall use good combustion practices. Good combustion practices shall include monitoring of the flue gas oxygen content, combustion air flow, fuel consumption, and flue gas temperature. These parameters shall be maintained within the manufacturer's recommended operating guidelines or within a range that is otherwise indicative of proper operation of the emissions unit.
- (m) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the tail gas treatment unit stacks (TGTUA and TGTUB) shall not exceed 40,872 tons per twelve (12) consecutive month period, combined, with compliance determined at the end of each month.

<b>BACT Analysis Flares</b>
---------------------------------

**Step 1: Identify Potential Control Technologies**

The following control technologies have been identified to control emissions from the flare:

- (1) Flare design and good combustion practices;
- (2) Process flaring minimization practices; and

(3) Flare Gas Recovery.

Add-on controls typically have not been utilized on flares.

**Step 2: Eliminate Technically Infeasible Options**

Flare design and good combustion practices

Flare design, good combustion practices and monitoring are key elements in emissions performance of flares. The flare must be properly operated and maintained in order to achieve the anticipated emission rates guaranteed by the flare manufacturer.

The use of proper flare design and good combustion practices is a technically feasible control option.

Process flaring minimization practices

To the extent actions can be taken to minimize the volume of gas going to the flare, emissions of CO will be less. Flaring minimization practices are feasible and are evaluated in the analysis of BACT.

The use of process flaring minimization practices is a technically feasible control option.

Flare Gas Recovery

Flare gas recovery is not a feasible option. These flares do not operate constantly; only the pilot flame does. There would not be anything to recover except in the rare case of a process upset – which would preclude the use of any heat recovered.

Flare - PM/PM<sub>10</sub>/PM<sub>2.5</sub>

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (MMBtu/hr)
Riverview Energy	Proposed	Loading flare	Operate in accordance with 40 CFR 60.18 Implement a Flare Management Plan as required by 40 CFR 60, Subpart Ja	sweep & pilot operation: use gaseous fuel PM (filterable): 0.0019 lb/MMBtu SB: 1.62E-03 lb/hr LP: 0.014 lb/hr HP: 0.014 lb/hr loading: 4.22E-04 lb/hr PM10/PM2.5: 0.0074 lb/MMBtu SB: 6.32E-03 lb/hr LP: 0.053 lb/hr HP: 0.053 lb/hr loading: 1.64E-03 lb/hr Flare stream operations: VE: 0% except for 5 min during 2 cons. hrs	0.20

IDEM is aware that that the above control technologies may be able to periodically achieve control efficiencies that exceed 98% under certain operating conditions. However, BACT must be achievable on a consistent basis under normal operational conditions. BACT limitations do not necessarily reflect the highest possible control efficiency achievable by the technology on which the emission limitation is based. The permitting authority has the discretion to base the emission limitation on a control efficiency that is somewhat lower than the optimal level. There are several reasons why the permitting authority might choose to do this. One reason is that the control efficiency achievable through the use of the technology may fluctuate, so that it would not always achieve its optimal control efficiency. In that case, setting the emission limitation to reflect the highest control efficiency would make violations of the permit unavoidable. To account for this possibility, a permitting authority must be allowed a certain degree of discretion to set the emission limitation at a level that does not necessarily reflect the highest possible control efficiency, but will allow the Permittee to achieve compliance consistently. While we recognize that greater than 98% may be achievable as an average during testing, IDEM allows for sources to include a safety factor, or margin of error, to allow for minor variations in the operation of the emission units and the control device.

Therefore, the proposed VOC control of 98% is considered the top BACT for this operation.

Flare - CO

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (MMBtu/hr)
Riverview Energy	Proposed	Loading flare	Operate in accordance with 40 CFR 60.18	sweep & pilot operation: use gaseous fuel CO: 0.083 lb/MMBtu SB: 7.09E-02 lb/hr LP: 0.60 lb/hr HP: 0.60 lb/hr loading: 1.84E-02 lb/hr Flare stream operations: CO: 0.31 lb/MMBtu	0.20
		Sulfur block flare			0.77
		Hydrogen plant flare			6.50
		High pressure flare			6.50
0.31 lb CO/MMBtu, considered as while actively flaring in conformance with 40 CFR 60.18 because that is how the emission factor is defined in AP-42, Chapter 13.5 is most stringent for CO. Therefore this is considered BACT for CO.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The units shall burn only natural gas and process off-gas as supplemental and pilot fuel.
- (b) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the flares shall be as follows:
  - (1) Particulate matter emissions while operating in sweep and pilot mode shall not exceed:

Emission Limitations			
Unit ID	Pollutant	lb/MMBtu	lb/hr
HP Flare	PM (filterable)	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
LP Flare	PM (filterable)	0.0019	0.014
	PM <sub>10</sub>	0.0074	0.053
	PM <sub>2.5</sub>	0.0074	0.053
SB Flare	PM (filterable)	0.0019	1.62E-03
	PM <sub>10</sub>	0.0074	6.32E-03

<b>Emission Limitations</b>			
<b>Unit ID</b>	<b>Pollutant</b>	<b>Ib/MMBtu</b>	<b>Ib/hr</b>
	PM <sub>2.5</sub>	0.0074	6.32E-03
Loading Flare	PM (filterable)	0.0019	4.22E-04
	PM10	0.0074	1.64E-03
	PM2.5	0.0074	1.64E-03

(2) The HP Flare and LP Flare shall operate with no visible emissions, except for periods not to exceed a total of five (5) minutes during any two (2) consecutive hours when flaring a process stream.

(c) The Best Available Control Technology (PSD BACT) for SO<sub>2</sub> for the flares shall be as follows:

(1) The Permittee shall burn only natural gas and process off-gas in any flare as supplemental or pilot fuel gas.

(2) SO<sub>2</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>SO<sub>2</sub> Emission Limitations</b>	
<b>Unit ID</b>	<b>Ib/hr</b>
HP Flare	0.013
LP Flare	0.013

(3) SO<sub>2</sub> emissions from the SB Flare shall not exceed 0.069 Ib/hr when operating in sweep and pilot mode.

(4) SO<sub>2</sub> emissions from the Loading Flare shall not exceed 0.069 Ib/hr when operating in pilot mode.

(d) The Best Available Control Technology (PSD BACT) for NO<sub>x</sub> for the flares shall be as follows:

(1) NO<sub>x</sub> emissions while operating in sweep and pilot mode shall not exceed:

<b>NO<sub>x</sub> Emission Limitations</b>		
<b>Unit ID</b>	<b>Ib/MMBtu</b>	<b>Ib/hr</b>
HP Flare	0.099	0.71
LP Flare	0.099	0.71
SB Flare	0.099	8.46E-02
Loading Flare	0.099	2.20E-02

(2) NO<sub>x</sub> emissions shall not exceed 0.068 Ib/MMBtu (LHV) when flaring a process stream.

(e) The Best Available Control Technology (PSD BACT) for VOC for the flares shall be as follows:

(1) VOC emissions while operating in sweep and pilot mode shall not exceed:

VOC Emission Limitations		
Unit ID	Ib/MMBtu	Ib/hr
HP Flare	0.0054	0.039
LP Flare	0.0054	0.039
SB Flare	0.0054	4.62E-03

- (2) VOC destruction and removal efficiency shall not be less than 98% when flaring a process stream.
- (3) VOC emissions while operating in pilot mode shall not exceed:

VOC Emission Limitations		
Unit ID	Ib/MMBtu	Ib/hr
Loading Flare	0.0054	1.20E-03

- (f) The Best Available Control Technology (PSD BACT) for CO for the flares shall be as follows:

- (1) CO emissions while operating in purge and pilot mode shall not exceed:

CO Emission Limitations		
Unit ID	Ib/MMBtu	Ib/hr
HP Flare	0.083	0.60
LP Flare	0.083	0.60
SB Flare	0.083	7.09E-02
Loading Flare (pilot only)	0.083	1.84E-02

- (2) CO emissions shall not exceed 0.31 Ib/MMBtu (LHV) when flaring a process stream.
- (g) Carbon dioxide equivalent (CO<sub>2</sub>e) emissions, as defined at 40 CFR 98.6, from the flares listed in the table below when operating in purge and pilot mode shall not exceed the values shown per twelve (12) consecutive month period, with compliance determined at the end of each month.

Emission Limitations	
Unit ID	CO <sub>2</sub> e Limit
Sulfur Block Flare	448
LP Flare	3,781
HP Flare	3,781
Loading Flare	559

## VOC BACT Analysis Tanks

### **Step 1: Identify Potential Control Technologies**

#### Add-on controls:

There are two general categories of control methods for volatile organic compounds (VOCs): destruction methods and reclamation methods. Destruction control methods reduce the VOC concentration by high temperature oxidation into carbon dioxide and water vapor. Reclamation control methods consist of capturing VOCs for reuse or disposal. These are discussed in more detail below.

#### *Destruction Control Methods*

The destruction of organic compounds usually requires temperatures ranging from 1200°F to 2200°F for direct thermal oxidizers or 600°F to 1200°F for catalytic systems. Combustion temperature depends on the chemical composition and the desired destruction efficiency. Carbon dioxide and water vapor are the typical products of complete combustion. Turbulent mixing and combustion chamber retention times of 0.5 to 1.0 seconds are needed to obtain high destruction efficiencies.

Fume oxidizers typically need supplemental fuel. Concentrated VOC streams with high heat contents obviously require less supplementary fuel than more dilute streams. VOC streams sometimes have a heat content high enough to be self-sustaining, but a supplemental fuel-firing rate equal to about 5% of the total oxidizer heat input is usually needed to stabilize the burner flame. Natural gas is the most common fuel for VOC oxidizers, but fuel oil is an option in some circumstances.

Destruction control methods include:

(a) Thermal Oxidizer:

Thermal oxidation is the process of oxidizing VOC in a waste gas stream by raising the temperature above the VOC's auto-ignition point in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The residence time, temperature, flow velocity and mixing, and the oxygen concentration in the combustion chamber affect the oxidation rate and destruction efficiency. Thermal oxidizers operating costs are relatively high, since they typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. In general, thermal oxidizers are less efficient at treating waste gas streams with highly variable flowrates, since the variable flowrate results in varying residence times, combustion chamber temperature, and poor mixing. In addition, thermal oxidizers are also not generally cost-effective for low-concentration, high-flow organic vapor streams.

Thermal oxidizers can achieve 95-99.99+% VOC control efficiency and can be used over a wide range of organic vapor concentrations, but perform best at inlet concentrations of around 1,500-3,000 ppmv. Thermal oxidizers are typically designed to have a residence time of 0.3 to 1.0 second and combustion chamber temperatures between 1,200 and 2,000°F. In order to meet 98% or greater control or a 20 parts per million by volume (ppmv) compound exit concentration of non-halogenated organics, thermal oxidizers should typically be operated at a residence time of at least 0.75 seconds, a combustion chamber temperature of at least 1600°F, and with proper mixing. While thermal oxidation provides efficient VOC control, other pollutants such as nitrogen oxides and carbon monoxide are formed from the combustion process.

Thermal oxidizers are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases. It may be necessary to install a post-

oxidation acid gas treatment system in such cases, depending on the outlet concentration. This would likely make incineration an uneconomical option. For halogenated VOC streams, a combustion temperature of 2000°F, a residence time of 1.0 second, and use of an acid gas scrubber on the outlet is recommended.

The three types of thermal oxidation systems include direct flame, recuperative, and regenerative thermal oxidizers, which are differentiated by the type of heat recovery equipment used.

(1) Direct Flame Thermal Oxidizer

A direct flame thermal oxidizer is comprised of a combustion chamber and does not include any heat recovery of exhaust air by a heat exchanger.

(2) Recuperative Thermal Oxidizer

A recuperative thermal oxidizer is comprised of the combustion chamber, a heat exchanger for preheating the untreated VOC gas stream, and, if cost-effective, a secondary energy recovery heat exchanger. In a recuperative thermal oxidizer, the untreated VOC gas stream entering the oxidizer is preheated using the heat content of the treated gas stream exiting the oxidizer using a heat exchanger, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. Recuperative thermal oxidizers usually are more economical than direct flame thermal oxidizers because they typically recover 40 to 70% of the waste heat from the exhaust gases.

(3) Regenerative Thermal Oxidizer

A regenerative thermal oxidizer typically consists of a set of 2 or 3 packed ceramic beds that are used to recover heat from hot combustion gases that are generated during combustion of the VOC gas stream and auxiliary fuel, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. An "inlet" bed is used to pre-heat the untreated VOC gas stream, an "outlet" bed is used to recover heat from the treated gas stream, and one bed is in a purge cycle. The purge cycle is needed to prevent emission spikes each time the gas flow is redirected. The oxidizer is operated on a rotating schedule, where the gas flow through the ceramic beds is redirected periodically using a set of gas flow dampers. Once the heat energy of the "inlet" ceramic bed has been depleted, the flow through the system is redirected so that the untreated VOC gas stream entering the oxidizer is directed through the previously heated "outlet" ceramic bed. Regenerative thermal oxidizers have much higher heat recovery efficiencies than recuperative thermal oxidizers, recovering 85 to 95% of the heat from the treated gas stream, and therefore have lower auxiliary fuel requirements. However, compared to direct flame and recuperative thermal oxidizers, regenerative thermal oxidizers typically have higher capital (equipment and installation) costs, are larger and heavier, and have higher maintenance costs.

(b) Catalytic Oxidizer:

Catalytic oxidation is the process of oxidizing organic contaminants in a waste gas stream within a heated chamber containing a catalyst bed in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The catalyst is used to lower the activation energy of the oxidation reaction, enabling the oxidation to occur at lower reaction temperatures compared to thermal oxidizers. The residence time, temperature, flow velocity and mixing, the oxygen concentration, and type of catalyst used in the combustion chamber affect the oxidation rate and destruction efficiency. Catalytic oxidizers typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. Catalytic oxidizers operate at lower

temperatures and require less fuel than thermal oxidizers, they have a smaller footprint, and they need little or no insulation. The catalyst bed is usually composed of the following: (1) the substrate, typically ceramic or metal honeycombs, grids, mesh pads, or beads; (2) the carrier, a high surface area inorganic material such as alumina that is bonded to the substrate that contains a complex pore structure; and (3) the catalyst, a thin layer of material deposited onto the carrier. The most widely used catalysts for VOC oxidation are noble metals, such as platinum, palladium and rhodium or mixtures thereof. Base metal catalysts, such as oxides of chromium, cobalt, copper, manganese, titanium, and vanadium may also be used for VOC oxidation. Similar to thermal oxidizers, catalytic oxidizers may use regenerative or recuperative heat recovery to reduce auxiliary fuel requirements, where the untreated VOC gas stream entering the catalytic oxidizer is preheated using the heat content of the treated gas stream exiting the catalytic oxidizer.

Catalytic oxidizers can achieve 90-99% VOC control efficiency, depending on the oxidizer design and waste stream characteristics. Catalytic oxidizers are typically designed to have a residence time of 0.5 seconds or less and combustion chamber temperatures between 600 and 1,200°F. Catalytic oxidation is most suited to waste gas streams with little variation in the flow rate and type and concentration of VOC to be treated. In addition, catalytic oxidizers should not be used for waste gas streams that have a high concentration of particles, silicone, sulfur, halogen compounds, and/or heavy hydrocarbons that can cause fouling or masking of the catalyst, and for waste gas streams that contain metals such as mercury, phosphorus, arsenic, antimony, bismuth, lead, zinc, and/or tin that can cause catalyst poisoning.

(c) Flare:

Flaring is the process of oxidizing VOC in a waste gas stream by piping the waste gas to a remote, usually elevated location and burning it in a flame using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing. Flares are generally categorized in two ways: (1) by the height of the flare tip (i.e., ground or elevated), and (2) by the method of enhancing mixing at the flare tip (i.e., steam-assisted, air-assisted, pressure-assisted, or non-assisted). Flares can be used to control almost any VOC stream, and can typically handle large fluctuations in VOC concentration, flow rate, heating value, and inert species content. Flaring is appropriate for continuous, batch, and variable flow vent stream applications, but the primary use is that of a safety device used to control a large volume of pollutant resulting from upset conditions. Flares have primarily been used in petroleum production, petroleum refineries, and chemical plants to control waste gas streams containing low molecular weight VOC with high heating values.

A properly operated flare can achieve 98+% VOC control efficiency when controlling emission streams with heat contents greater than 300 British thermal units per standard cubic foot (Btu/scf). If the waste gas stream has a heat content less than 300 Btu/scf, auxiliary fuel must be introduced in sufficient quantity to make up the difference. The VOC destruction efficiency of a flare depends upon the waste gas characteristics (density, flammability, heating value, and VOC component autoignition temperatures) and the combustion zone conditions (temperature, residence time, mixing, and available oxygen). While flares can provide efficient VOC control, other pollutants such as nitrogen oxides (NO<sub>x</sub>) and carbon monoxide (CO) are formed from the combustion process. Flares are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases.

*Reclamation Control Methods*

Organic compounds may be reclaimed by one of three possible methods: adsorption, absorption (scrubbing), or condensation. In general, the organic compounds are separated from the emission stream and reclaimed for reuse or disposal. Depending on the nature of the contaminant and the inlet concentration of the emission stream, recovery technologies can reach efficiencies of 98%.

(d) Carbon Adsorption Unit:

Carbon adsorption is a process where VOCs are removed from a waste gas stream when it is passed through a bed containing activated carbon particles, which have a highly porous structure with a large surface-to-volume ratio. Carbon adsorption systems usually operate in two phases: adsorption and desorption. During adsorption, the majority of the VOC molecules migrate from the gas stream to the surface of the activated carbon (through the activated carbon pores) where it is lightly held to the surface by weak intermolecular forces known as van der Waals' forces. As the activated carbon bed approaches saturation with VOC, its control efficiency drops, and the bed must be taken offline to be replaced or regenerated. Typically, two activated carbon beds are utilized on a rotating schedule, where a second bed (containing fresh or previously regenerated activated carbon) is brought online to continue controlling the VOC gas stream while the first bed is being replaced or regenerated. In regenerative systems, most VOC gases can be desorbed and removed from the activated carbon bed by heating the bed to a sufficiently high temperature, usually via steam or hot air, or by reducing the pressure within the bed to a sufficiently low value (vacuum desorption). The regenerated activated carbon can be reused and the VOCs that are removed from the bed can be reclaimed or destroyed.

Carbon adsorber size and purchase cost depend primarily on the gas stream volumetric flow rate, temperature, pressure, VOC composition, VOC mass loading, and moisture and particulate contents. The adsorptive capacity of an activated carbon bed for a VOC gas tends to increase with the VOC gas phase concentration, molecular weight, diffusivity, polarity, and boiling point. Carbon adsorption systems can be used for VOC gas concentrations from less than 10 ppm to approximately 10,000 ppm. Carbon adsorption systems (in general) are usually limited to waste gas streams with VOC compounds having a molecular weight of more than 50 and less than approximately 200 lb/lb-mole, since low molecular weight organics usually do not adsorb sufficiently and high molecular weight compounds are difficult to desorb and remove during the desorption cycle. Industrial applications of adsorption systems include control for dry cleaning, degreasing, paint spraying, solvent extraction, metal foil coating, paper coating, plastic film coating, printing, pharmaceuticals, rubber, linoleum, and transparent wrapping.

Carbon adsorption systems can achieve 95-99% VOC control efficiency. Carbon adsorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the activated carbon bed. Particulate matter and high moisture concentrations present in the gas stream compete with the VOC for pore space within the activated carbon and thereby reduce the VOC adsorptive capacity and control efficiency of the carbon adsorption systems. In addition, particulate matter and moisture can become entrained within the carbon bed, causing operating problems such as increased pressure drop across the bed.

(e) Gas Absorption (wet scrubber):

A wet scrubber is an absorption system in which a waste gas stream is interacted with a scrubbing fluid inside a contact chamber in order to strip particulate or gaseous pollutants from the waste gas stream through the processes of diffusion and dissolution. In many cases, an additive such as an acid, a base, or a VOC oxidizing agent is dissolved in the scrubbing fluid so that the dissolved gaseous pollutant chemically reacts with the scrubbing fluid to form a non-volatile or soluble product, thereby allowing additional gaseous pollutant to be absorbed by the scrubbing fluid. The four types of wet scrubber systems include packed towers, plate (or tray) columns, venturi scrubbers, and spray chambers. Gas and liquid flow through an absorber may be countercurrent, crosscurrent, or cocurrent. When used as an emission control technique, wet scrubbers are typically used for controlling particulate, acid gases, halogen gases, and highly soluble gases such as sulfur dioxide and ammonia.

If a wet scrubber is used for VOC control, the scrubbing fluid chosen should have a high solubility for the VOC gas, a low vapor pressure, a low viscosity, and should be relatively inexpensive. Water is the most commonly used scrubbing fluid for absorbing highly water-soluble (hydrophilic) VOC compounds such as methanol, ethanol, isopropanol, butanol, acetone, and formaldehyde. Other scrubbing fluid such as mineral oils, nonvolatile hydrocarbon oils, and aqueous solutions containing surfactants or amphiphilic block copolymers may be used for absorbing water-insoluble (hydrophobic) VOC compounds. Physical absorption is typically enhanced by lower temperatures, greater scrubbing fluid contacting time and surface area, higher scrubbing fluid to VOC ratio, and higher VOC concentrations in the gas stream.

Wet scrubber systems can achieve 70-99% VOC control efficiency, depending on the VOC solubility in the scrubbing fluid, the VOC-scrubbing fluid temperature, the scrubbing fluid contacting time and surface area, the scrubbing fluid to VOC ratio, the VOC concentration in the gas stream, and whether the scrubbing fluid contains a VOC oxidizing agent. Wet scrubber absorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the wet scrubber. When used to control VOC, the spent scrubbing fluid must be regenerated, treated, or shipped offsite for proper disposal.

(f) Condensation Unit:

Condensation is the separation of VOCs from an emission stream through a phase change, by either increasing the system pressure or, more commonly, lowering the system temperature below the dew point of the VOC vapor. Three types of condensers are used for air pollution Controls: (1) conventional non-refrigeration systems (such as cold-water direct contact condensers similar to wet scrubbers and cold-water indirect heat exchangers); (2) refrigeration systems (including mechanical compression refrigeration using chlorofluorocarbons (CFCs) and hydrofluorocarbons (HFCs) and Reverse Brayton Cycle refrigeration); and (3) cryogenic systems that utilize liquid nitrogen (including direct contact condensers and indirect heat exchangers).

Condensation units control VOC more efficiently when they are used for gas streams containing high concentrations of VOC and with low exhaust volumes. Condensation units are typically utilized at sources where there is a significant cost benefit to recovering the organic liquid for reuse, where the recovered organic liquids do not contain multiple organic compounds or water that require separation, and where the heat content of gas stream will not overload the refrigeration system. In addition, condensation units are typically used only on gas streams that have little or no particulate contamination, which can cause fouling within the condensation equipment and reduced heat transfer efficiency. Some industrial applications where refrigerated condensers are used include the dry cleaning industry, degreasers using VOC or halogenated solvents, transfer of volatile organic liquid or petroleum products, and vapors from storage vessels.

Cold-water (non-refrigeration) condensation systems can achieve 90-99% VOC control efficiency, depending on the vapor pressures of the specific compounds. Condensation units using mechanical compression refrigeration (using CFC or HFC) can achieve 90+% VOC control efficiency, condensation units using Reverse Brayton Cycle refrigeration can achieve 98% VOC control efficiency, and condensation units using cryogenic (liquid nitrogen) cooling can achieve 99+% VOC control efficiency.

*Other Control Methods*

- (g) Bio-filtration is a process in which a waste gas stream is passed through a bed of peat, compost, bark, soil, gravel, or other inorganic media in order to strip organic contaminant gases from the waste gas stream through the process of dissolution in the bed moisture and adsorption to the bed media. Under aerobic conditions, microorganisms naturally present in the bed oxidize the

organic contaminant gases within the bed to carbon dioxide, water, and additional biomass through metabolic processes. If the temperature of the waste gas stream is too high, the gas stream must be cooled to an optimum temperature before it can be treated in the biofilter in order to maintain the viability of the microorganisms. In addition, the bed must be monitored and maintained at an optimum moisture content and pH in order to prevent cracking of the bed media and to maintain the viability of the microorganisms.

Bio-filtration systems are designed to follow three basic steps. First, a pollutant in the gas phase is passed through a biologically active packed bed. The pollutant then diffuses into the biofilm immobilized on the packing medium. Finally, microorganisms growing in the biofilm oxidize the pollutant as a primary substrate or co-metabolite and in the process convert contaminants into the benign end products of carbon dioxide, water and additional biomass.

Three primary bioreactor configurations are available to treat stationary sources of air pollution: bio-filters, bio-trickling filters, and bio-scrubbers.

(1) Bio-Filters

Bio-filters are the simplest and oldest of the three vapor-phase bioreactors and involve passing a contaminated air stream through a reactor containing biologically-active packing material. The contaminants are transferred from the air stream into a bio-film immobilized on the support media and are converted by the microorganisms into CO<sub>2</sub>, water, and additional biomass. Moisture is typically supplied to the bio-film in a humid inlet waste gas stream. Packing media used in bio-filter beds can be broadly categorized as either "natural" or "synthetic". Natural media include wood chips, peat, and compost, with compost by far the most widely used. Synthetic media include activated carbon, ceramic pellets, polystyrene beads, ground tires, plastic media, and polyurethane foam. Natural organic packing media generally contain a supply of nutrients as a naturally occurring component of the packing itself. When a synthetic support medium is used, nutrients must be added for microbial growth.

(2) Bio-Trickling Filters

Bio-trickling filters are similar to bio-filters with the exception that there is a liquid nutrient medium continuously recirculating through the column. To facilitate the recirculation of the liquid phase, rigid synthetic media is used as the packing medium. Microorganisms grow primarily as a fixed film on inert packing media but may also be present in the liquid phase because they can both grow suspended in the liquid phase and because the flowing liquid imparts sufficient force to detach biomass from the solid support media. Contaminants are transferred from the air stream into the liquid phase and bio-film for subsequent degradation.

Potential disadvantages of bio-trickling filter operations include: clogging of the pore space if the filter is treating high VOC loads or if the filter is provided excess nutrients, and the need to manage the liquid stream. An additional disadvantage is that bio-trickling filters may have more difficulty treating poorly soluble compounds since the specific surface area in bio-trickling filters is generally lower.

(3) Bio-Scrubbers

Bio-scrubbers combine physical and chemical treatment with a biological treatment in two separate reactors. In the first reactor, the contaminated air stream is contacted with water in a reactor packed with inert media, resulting in contaminant transfer from the air phase to the liquid phase. The liquid is then directed into an activated sludge reactor where the contaminants are biologically degraded. The separated activated sludge tank

allows the reactor to treat higher concentrations of compounds than bio-filters can handle. In addition since compound transfer and degradation occur in separate reactors, optimization of each reactor can take place separately. As with bio-trickling filters, bio-scrubbers offer greater operator control over nutrient supply, acidity, and the build-up of toxic by-products.

A potential disadvantage of bio-scrubbers is that slower growing microorganisms may be washed out of the system and disposal of excess sludge is required.

#### *Other control options*

(a) Submerged Fill

Loading losses occur in cargo carrier loading as the organic vapors are displaced as the liquid product is loaded. The organic vapors can contain residual vapors from the last product loaded, vapors transferred to the tank in a vapor balance system and vapors generated in the tank as new product is loaded. The amount of vapors generated can be controlled by the type of loading method used. In splash loading, the fill pipe is only lowered part way into the tank. This results in large amounts of turbulence in the liquid and results in close contact of the VOC with the vapor which increase emissions. The submerged fill method is an alternate filling method used to reduce the amount of vapor/liquid contact. In the submerged fill method, the fill pipe extends below the liquid surface. As the liquid is transferred to the tank, the submerged fill pipe significantly reduces turbulence, air/liquid contact and results in lower overall VOC emissions.

(b) Tank Color

Color selection can contribute to elevated emissions of VOC. Black or darker colored tanks absorb more frequencies of light. This energy is transferred to the contents of the tank as heat through conduction in the tank wall. As the liquid heats, the vapor pressure rises and potential VOC emissions increase. The reverse is true for light colored or reflective tanks.

(c) Floating Roof Tanks

VOC emissions from storage tanks may be controlled through the use of floating roof tanks. Floating tanks control VOC emissions by reducing the amount of organic vapor that is in the tank at any one time. This is accomplished by having a roof that floats on top of the liquid in the tank and is sealed in a manner that does not allow vapor loss around the edges of the floating roof. By floating the roof, no vapor zone above the liquid can form.

### **Step 2: Eliminate Technically Infeasible Options**

There are some add-on control devices that are considered technically feasible, however, due to the relatively low PTE of VOC for each tank, there are no add-on control devices that are considered economically feasible.

Submerged fill and tank color are considered feasible control options.

### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Since floating roof tanks, submerged fill and tank color are considered the only feasible control options, a ranking is not necessary.

### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

*Riverview Energy Corporation  
Proposed Organic Liquid Tanks BACT*

- (a) *VOL (as defined at 40 CFR 60.111b) tanks, T1, T2, and T6, shall use internal floating roofs.*
- (b) *Emissions from the slop tank, T16, shall be controlled by the LP Flare at all times and the slop tank throughput shall not exceed the value shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.*
- (c) *Emissions from the sour water tanks, T18 - T21, shall be controlled by the Sulfur Block Flare at all times and the sour water tank throughputs shall each not exceed the values shown in the table below per twelve (12) consecutive month period with compliance determined at the end of each month.*
- (d) *All tanks shall use white tank shells.*
- (e) *All tanks shall use submerged filling.*
- (f) *All tanks shall use good maintenance practices based on generally-accepted industry standards, including but not limited to API 650 Welded Steel Tanks for Oil Storage and API 653 Tank Inspection, Repair, Alteration, and Reconstruction.*
- (g) *Tanks shall comply with the following limitations:*

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Capacity (gallons)
Magellan Pipeline Terminals, LP	TX-0613 94433, N134 (4/23/2012)	tanks - misc	Internal floating roof	9.0 lb/hr (8.0 ton/yr)	various from 1.68 to 14.7 million gal
An internal floating roof is the most stringent control for tanks containing Volatile Organic Liquids as defined at 40 CFR 60.111b. Therefore, this has been determined to be BACT for tanks T1, T2, and T6.					
ENI US Operating Co., Inc.	FL-0328 OCS-EPA- R4007 (10/27/2011)	Various diesel storage tanks ranging from 50 gal to 610,000 gal	Use of good maintenance practices based on the current manufacturer's specifications for each tank	0.27 ton/yr	-
This has been determined BACT for all tanks.					
Union Co. Lumber Co.	AR-0124 2348-AOP- R0 (8/3/2015)	diesel oil tanks	light color tanks	0.4 lb/hr	
This has been determined BACT for all tanks.					
Agrium	AK-0083 AQ0083CPT 06 (1/6/2015)	Two Methyl-diethanol Amine (MDEA) Storage Tanks	Submerged fill	0.002 tpy	
Submerged fill has been determined BACT for all tanks.					
In addition, the source has proposed the use of a flare for tanks T16, and T18-T21. Therefore, this has been determined to be BACT for tanks T16, and T18-T21.					
CF Industries Nitrogen	IA-0106 PN 13-037 (7/12/2013)	Diesel Belly Tanks	None	VOC: 0.1 ton/yr	various
		Methyl-diethanol Amine (MDEA) Storage Tank	Nitrogen blanket	0.1 tpy	
A nitrogen blanket is not considered BACT for the MDEA tanks, T24-T26. A nitrogen blanket is not a control technology for VOC emissions from a tank because the blanket does not affect the partial pressure of the stored liquid or the vapor phase concentration exhausted from the tank.					
LBC Houston	TX-0783 123325, N206 (2/6/2016)	tanks (24) vapor pressure <0.52 psia	submerged fill pipes and are painted white	0.01 tpy	
		tanks (16)	internal floating roofs with welded seams, mechanical shoe primary seals, rim-mounted secondary seals and welded deck seams and vapor combustor	0.26 tpy for (6) and 0.15 tpy for (10) NSPS Kb 99.9% CE	
Ticona Polymers	TX-0774 123216, PSDTX1438 and GHGPSDTX (11/12/2015)	crude and methanol tanks	Submerged fill, white tanks with internal floating roofs	NSPS Kb & MACT G 6.86 tpy	
Union County Lumber Company	AR-0124 2348-AQP- R0 (8/3/2015)	diesel storage tanks	None	VOC: 0.4 lb/hr	various
		oil storage tanks	None	VOC: 0.3 lb/hr	various
Florida Power and Light Co.	FL-0346 0110037- 011-AC (4/22/2014)	Three ULSD fuel oil storage tanks	Pressure relieve valves/vapor condensers, or tanks with internal floating roofs or equivalent		-
Old Dominion Electric Corp.	MD-0042 CPCN Case No. 9327 (4/8/2014)	fuel oil tanks	LAER: periodic maintenance to minimize fugitive emissions	0.001 ton/yr	80000, 150000, 75000 bbl
Indiana Gasification, LLC	IN-0166 T147-30464- 00060 (6/27/2012)	Sulfuric acid tanks	fixed roof and submerged fill	none	866500 gal each
This source was never constructed and the permit was revoked. Therefore the reference is not considered in determining BACT					

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Capacity (gallons)
Valero Refining	LA-0213 PSD-LA-619(M5) (11/17/2009)	tanks - for light materials, sour water, naphtha, raffinate	Floating roofs	Comply with 40 CFR 60, Subpart Kb or 40 CFR 63, Subpart CC	various
This reference is not considered BACT for the sour water tanks. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Ohio River Clean Fuels, LLC	OH-0317 02-22896 (11/20/2008)	Diesel Tank (Fixed Roof)	Submerged fill	VOC: 0.8 ton/yr	262,500 gal/day
		Naphtha Tank (Internal floating roof)	Submerged fill and floating roof	VOC: 0.88 ton/yr 99% CE	
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Conoco Phillips	IL-0103 06050052 (8/5/2008)	sour water tank	Internal floating roof	none	3,360,000 gal
This reference is not considered BACT for the sour water tanks at the proposed source. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Navajo Refining Co., LLC	NM-0050 PSD-NM-195-M25 (12/14/2007)	tanks - naphtha, or vol liq up to 11.0 psi	External floating roof	none	100,000 bbl thrpt (4.2 million gal)
		Sour Water Tank and Naphtha tank	External floating roof	none	20000 BBL
BACT for the proposed source includes internal floating roofs for VOL tanks. External floating roofs are not considered a more restrictive control. This reference is not considered BACT for the sour water tanks at the proposed source. IFR control requirements in 40 CFR 60, Subpart Kb are not applicable because the sour water stream does not contain volatile organic liquids as defined at 40 CFR 60.111b, the sour water will not emit VOC as defined at 40 CFR 51.100. Requirements of 40 CFR 63, Subpart 63 are not applicable to the sour water tanks because the sour water does not contain hazardous air pollutants listed in Table 1, Appendix to Subpart CC of Part 63.					
Progress Energy Florida	FL-0285 PSD-FL-381, 1030011-010-AC (1/26/2007)	tanks - Distillate	None	keep records establishing vapor pressure is below 3.5KPa	3.5 million gal. (ea.)
Florida Power and Light Co.	FL-0286 PSD-FL-354, 0990646-001-AC (1/10/2007)	tanks - Distillate (ULSD)	None	keep records establishing vapor pressure is below 3.5KPa; MSDS is acceptable	6.3 million gal. (ea.)

Citgo Refining and Chemicals Co.	TX-0478 PSD-TX-408M3 (4/20/2015)	tanks - petroleum products	None	1.6 lb/hr (3.9 tpy)	various
		tanks - petroleum products	None	4.4 lb/hr (3.3 tpy)	various
		tanks - petroleum products	None	0.8 lb/hr (1.4 tpy)	various
Continental Carbon Co.	TX-0464 P1014 (3/18/2005)	tanks - low vapor pressure oil	Fixed roof	0.01 lb/hr	NA

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (Control Technology Review; Requirements), IDEM has established the following BACT:

- (a) All tanks shall use white tank shells.
- (b) All tanks shall use submerged filling.
- (c) All tanks shall use good maintenance practices based on generally-accepted industry standards, including but not limited to API 650 Welded Steel Tanks for Oil Storage and API 653 Tank Inspection, Repair, Alteration, and Reconstruction.
- (d) Tanks shall comply with the following controls and limitations:

Tank ID	Product Stored	Storage Temperature (°F)	Vapor Pressure <sup>1</sup> (psia)	Throughput Limit <sup>2</sup> (kgal/yr)
T1	Naphtha Product	ambient	1.15	-
T2	Naphtha Product	ambient	1.15	-
T3	Diesel Product	ambient	2.29	-
T4	Diesel Product	ambient	2.29	-
T5	Diesel Product	ambient	2.29	-
T6	Naphtha Product	ambient	1.15	-
	Diesel Product	ambient	0.17	-
T10	Residue <sup>3</sup>	505	1E-04	-
T11	Residue	505	1E-04	-
T12	Residue	505	1E-04	-
T13	VGO	505	0.175	-
T14	VGO	505	0.175	-
T16	Slop tank <sup>4</sup>	ambient	-	305,467
T17	Diesel Fuel	ambient	1.14E-02	-
T18	Non-Phenolic Sour Water <sup>5</sup>	ambient	-	462,829
T19	Non-Phenolic Sour Water	ambient	-	462,829
T20	Non-Phenolic Sour Water	ambient	-	462,829
T21	Phenolic Sour Water	ambient	-	4,628
T22	Stripped Non-Phenolic Sour Water	ambient	0.48	-
T23	Stripped Phenolic Sour Water	ambient	0.48	-
T24	Amine Surge/Deinventory	ambient	0.48	-
T25	Fresh Amine	ambient	0.48	-
T26	Amine Containment	ambient	0.48	-
EU-6005 <sup>6</sup>	Emergency generator diesel fuel	ambient	1.14E-02	-
EU-6008	Emergency fire pump diesel fuel	ambient	1.14E-02	-

Notes:

1. Vapor pressure for products stored at ambient temperature taken at the highest monthly average daily temperature for Evansville, IN from meteorological data in TANKS 4.0.9d, 78.3°F.
2. kgal/yr = kgal per twelve (12) consecutive month period, with compliance determined at the end of each month. kgal = 1,000 gallons
3. Vapor pressure at elevated storage temperature from process modeling provided by the source.
4. Diesel fuel taken as representative of slop oil
5. Vapor pressure of wastewater streams and 40% MDEA solution ("amine") taken as water at 78.3°F, Table 3-5, *Perry's Chemical Engineers' Handbook, 6th Ed.*, because of the low partial pressures of the organic compounds.
6. Throughput for emergency engine fuel tanks does not include operation during emergencies.

**VOC BACT Analysis  
 Loading Racks**

**Step 1: Identify Potential Control Technologies**

**Cooling and Condensing System**

Refrigerated condensers, also sometimes known as Vapor Recovery Units (VRUs) are used as air pollution control devices for treating emission streams with high VOC concentrations (e.g., gasoline bulk terminals, storage, etc.). Condensation is a separation technique in which one or more volatile

compounds of vapor mixture are separated from remaining vapors through saturation followed by a phase change.

The reported efficiency is around 80%. Refrigerated condensers are used as air pollution control devices for treating emission streams with high VOC concentrations (usually > 5,000 ppmv). Removal efficiencies above 90% can be achieved with coolants such as chilled water, brine solutions, ammonia, special filter media, etc. depending upon the emission stream characteristics.

### **Thermal Oxidizer**

Thermal oxidation systems operate in three (3) stages: a burner generates hot combustion gases, combustion products mix with the exhaust from the process lines, and the mixture is oxidized. Thermal incineration is performed at much higher temperatures than catalytic incineration, typically between 1200°F and 2000°F. Thermal incinerators operate at peak efficiency when oxidizing concentrated organic exhaust streams just above or below the upper and lower explosive limits. This is because the oxidation rate is directly proportional to the organic concentration, the local heat of reaction during oxidation, and the increased concentration of free radicals which participate in the oxidation reaction. Thermal oxidation destruction efficiency ranges from 95% to 99%.

### **Catalytic Thermal Oxidizer**

This type of thermal oxidizer is a better system than the straight-shot thermal oxidizer. It uses a heated catalytic (platinum coated ceramic beads) system to destroy VOCs at a much lower temperature (around 650°F) and consumes less natural gas. A catalyst is an element or compound that speeds up a reaction at lower temperatures compared to thermal oxidation without undergoing change itself. Catalytic oxidizers require approximately 1.5 to 2.0 ft<sup>3</sup> of catalyst per 1000 standard ft<sup>3</sup> per gas flow rate. Even though this type of control system can normally reach over 98% destruction efficiency, its catalytic media is very expensive to upkeep and has to be replaced every 5 years or so. It also has an odor problem due to the lower combustion temperature.

### **Carbon Adsorbers**

Carbon adsorbers use activated carbon to remove VOC from low to medium concentration gas stream by adsorption. Adsorption itself is a phenomenon where gas molecules passing through a bed of solid particles (e.g., activated carbon) are selectively held there by attractive forces which are weaker and less specific than those of chemical bonds. During adsorption, a gas molecule migrates from the gas stream to the surface of the solid when it is held by physical attraction releases energy which typically equals or exceeds the heat of condensation. Most adsorbers can be cleaned by heating to a sufficiently high temperature, usually using steam or hot combustion gases or by lowering the pressure to a low value (vacuum). This cleaning process created a waste product, which will have to be properly disposed.

VOC and acid gases can be controlled with control efficiencies greater than 90%. Common problems with carbon adsorbers can be plugging and fouling of the activated carbon exposed to wet or heavily concentrated particulate gas streams. Sources may experience significant issues with maintenance and repair that result in unacceptable downtime for the control units.

### **Flare**

Flaring is a combustion control process for VOC's in which the waste gas stream is piped to remote, usually elevated, location (for safety reasons) and burned in an open flame in the open air using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing for nearly complete (>98%) VOC destruction. Complete combustion in VCU is governed by flame temperature, residence time in the combustion zone, turbulent mixing of the components to complete the oxidation reaction, and available oxygen for free radical formation.

**Step 2: Eliminate Technically Infeasible Options**

The test for technical feasibility of any control option is whether it is both available and applicable in reducing VOC emissions. All the control technologies listed in the step 1 are considered technically feasible options.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
Flare	98%
Thermal Oxidation	98%
Condenser	98%
Carbon Adsorber	95%
Cooling and Condensing Systems	80%

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Naphtha loading operation and diesel loading operation	Loading flare (EU-4002)	98% CE naphtha: 0.049 lb/kgal diesel: 1.02E-03 lb/kgal Submerged loading	
Countrymark	IN-0244 T103-35351-00011 (12/3//2015)	Truck Loading Rack	Flare vapor combustion unit, relief stack and vapor knockout box	35 mg/liter gasoline/ethanol loaded (equivalent to 0.292 lb VOC/kgal) 0.014 lb/kgal diesel loaded 0.016 lb/kgal kerosene loaded Leak Prevention measures (including submerged loading)	
Marathon	IN-0243 T129-34987-00005 (8/14/2015)	Truck Loading Rack	vapor recovery unit (VRU)	0.159 lb/kgal gasoline/ethanol loaded 0.014 lb/kgal diesel loaded Leak Prevention measures	
Countrymark	IN-0231 T055-35558-00003 (6/30/2015)	Truck loading rack	Flare vapor combustion unit, relief stack and vapor knockout box	VOC: 0.014 lb/kgal diesel loaded Leak prevention measures	
VOC limits for gasoline loading are not comparable to naphtha, which has a lower vapor pressure. Therefore the BACT for naphtha loading is established as the lb/kgal emission factor after control by a flare with DRE equal to 98% which is consistent with a flare operating in conformance with 40 CFR 60.18. VOC limit of 0.014 lb/kgal is the most stringent for diesel loading. Therefore, it is chosen as BACT.					

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Castleton Commodities (CCI)	TX-0756 116072, PSDTX1388 (6/22/2015)	Truck loading diesel	None	VOC: 1.99 lb/hr (4.53 tpy)

Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.					
Chelsea Sandwich LLC	MA-0040 MBR-08-IND-007 (8/20/2008)	Loading rack - residual oil	RTO	VOC: 1.77 ton/mo (3.54 tpy) 90 % capture eff. and 99% destruction eff.	
Marathon Pipeline - Zachary Station	LA-0212 PSD-LA-721 (2/1/2007)	Loading Rack	Vapor combustor (products > 1.5 psia)	VOC: 10 mg/L	

Riverview has proposed the use of a flare as BACT. A search of the RBLC shows that in addition to a flare, there are other types of control. A flare is considered top BACT for this type of operation. IDEM is aware that that the above control technologies may be able to periodically achieve control efficiencies that exceed 98% under certain operating conditions (such as 99.8%). However, BACT must be achievable on a consistent basis under normal operational conditions. BACT limitations do not necessarily reflect the highest possible control efficiency achievable by the technology on which the emission limitation is based. The permitting authority has the discretion to base the emission limitation on a control efficiency that is somewhat lower than the optimal level. There are several reasons why the permitting authority might choose to do this. One reason is that the control efficiency achievable through the use of the technology may fluctuate, so that it would not always achieve its optimal control efficiency. In that case, setting the emission limitation to reflect the highest control efficiency would make violations of the permit unavoidable. To account for this possibility, a permitting authority must be allowed a certain degree of discretion to set the emission limitation at a level that does not necessarily reflect the highest possible control efficiency, but will allow the Permittee to achieve compliance consistently. While we recognize that greater than 98% may be achievable as an average during testing, IDEM allows for sources to include a safety factor, or margin of error, to allow for minor variations in the operation of the emission units and the control device.

Therefore, the proposed use of a flare with control of 98% is considered the top BACT for this operation.

### **Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The Product Loading Flare shall be designed and operated in accordance with 40 CFR 60.18.
- (b) The Best Available Control Technology (PSD BACT) for VOC for the product loading rack shall be as follows:
  - (1) The Product Loading Rack shall use only submerged loading.
  - (2) The overall VOC control efficiency, including capture efficiency and destruction efficiency, for the Product Loading Flare shall be 98% or greater.
  - (3) VOC emissions shall not exceed:

<b>Emission Limitations</b>	
<b>Product</b>	<b>lb/kgal<sup>1</sup></b>
naphtha	0.049
Diesel	1.02E-03

Notes:

- 1. kgal = 1,000 gallons

<b>VOC BACT Analysis Residue Solidification Units</b>
---

VCC Residue is the bottoms product of the VCC Vacuum Distillation Tower wherein Vacuum Gas Oil (VGO) is extracted for recycle. The residue is a heavy bitumen type flowable liquid at ~ 500 degree F with limited volatile organic content, i.e, sufficient only to enable pumping. A small amount of hydrocarbon is initially released. The potential VGO emissions are limited due to: 1) incorporation of VGO in the residue matrix, 2) initial quick cooling of the pastille bottom surface and hemi-spherical top surface, forming an initial hard coating and 3) reduction of VGO vapor pressure in the pastille and coating with travel along the cooling line. A limited volume of exhaust air flow is extracted from the front one-third portion of the enclosures to aid cooling.

### **Step 1: Identify Potential Control Technologies**

#### Add-on controls:

There are two general categories of control methods for volatile organic compounds (VOCs): destruction methods and reclamation methods. Destruction control methods reduce the VOC concentration by high temperature oxidation into carbon dioxide and water vapor. Reclamation control methods consist of capturing VOCs for reuse or disposal. These are discussed in more detail below.

#### *Destruction Control Methods*

The destruction of organic compounds usually requires temperatures ranging from 1200°F to 2200°F for direct thermal oxidizers or 600°F to 1200°F for catalytic systems. Combustion temperature depends on the chemical composition and the desired destruction efficiency. Carbon dioxide and water vapor are the typical products of complete combustion. Turbulent mixing and combustion chamber retention times of 0.5 to 1.0 seconds are needed to obtain high destruction efficiencies.

Fume oxidizers typically need supplemental fuel. Concentrated VOC streams with high heat contents obviously require less supplementary fuel than more dilute streams. VOC streams sometimes have a heat content high enough to be self-sustaining, but a supplemental fuel-firing rate equal to about 5% of the total oxidizer heat input is usually needed to stabilize the burner flame. Natural gas is the most common fuel for VOC oxidizers, but fuel oil is an option in some circumstances.

Destruction control methods include:

(a) Thermal Oxidizer:

Thermal oxidation is the process of oxidizing VOC in a waste gas stream by raising the temperature above the VOC's auto-ignition point in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The residence time, temperature, flow velocity and mixing, and the oxygen concentration in the combustion chamber affect the oxidation rate and destruction efficiency. Thermal oxidizers operating costs are relatively high, since they typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. In general, thermal oxidizers are less efficient at treating waste gas streams with highly variable flowrates, since the variable flowrate results in varying residence times, combustion chamber temperature, and poor mixing. In addition, thermal oxidizers are also not generally cost-effective for low-concentration, high-flow organic vapor streams.

Thermal oxidizers can achieve 95-99.99+% VOC control efficiency and can be used over a wide range of organic vapor concentrations, but perform best at inlet concentrations of around 1,500-3,000 ppmv. Thermal oxidizers are typically designed to have a residence time of 0.3 to 1.0 second and combustion chamber temperatures between 1,200 and 2,000°F. In order to meet 98% or greater control or a 20 parts per million by volume (ppmv) compound exit concentration of non-halogenated organics, thermal oxidizers should typically be operated at a residence time of at least 0.75 seconds, a combustion chamber temperature of at least 1600°F, and with proper mixing. While thermal oxidation provides efficient VOC control, other pollutants such as nitrogen oxides and carbon monoxide are formed from the combustion process.

Thermal oxidizers are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases. It may be necessary to install a post-oxidation acid gas treatment system in such cases, depending on the outlet concentration. This would likely make incineration an uneconomical option. For halogenated VOC streams, a combustion temperature of 2000°F, a residence time of 1.0 second, and use of an acid gas scrubber on the outlet is recommended.

The three types of thermal oxidation systems include direct flame, recuperative, and regenerative thermal oxidizers, which are differentiated by the type of heat recovery equipment used.

(1) Direct Flame Thermal Oxidizer

A direct flame thermal oxidizer is comprised of a combustion chamber and does not include any heat recovery of exhaust air by a heat exchanger.

(2) Recuperative Thermal Oxidizer

A recuperative thermal oxidizer is comprised of the combustion chamber, a heat exchanger for preheating the untreated VOC gas stream, and, if cost-effective, a secondary energy recovery heat exchanger. In a recuperative thermal oxidizer, the untreated VOC gas stream entering the oxidizer is preheated using the heat content of the treated gas stream exiting the oxidizer using a heat exchanger, resulting in improved

oxidizer efficiency and reduced auxiliary fuel usage. Recuperative thermal oxidizers usually are more economical than direct flame thermal oxidizers because they typically recover 40 to 70% of the waste heat from the exhaust gases.

(3) Regenerative Thermal Oxidizer

A regenerative thermal oxidizer typically consists of a set of 2 or 3 packed ceramic beds that are used to recover heat from hot combustion gases that are generated during combustion of the VOC gas stream and auxiliary fuel, resulting in improved oxidizer efficiency and reduced auxiliary fuel usage. An "inlet" bed is used to pre-heat the untreated VOC gas stream, an "outlet" bed is used to recover heat from the treated gas stream, and one bed is in a purge cycle. The purge cycle is needed to prevent emission spikes each time the gas flow is redirected. The oxidizer is operated on a rotating schedule, where the gas flow through the ceramic beds is redirected periodically using a set of gas flow dampers. Once the heat energy of the "inlet" ceramic bed has been depleted, the flow through the system is redirected so that the untreated VOC gas stream entering the oxidizer is directed through the previously heated "outlet" ceramic bed. Regenerative thermal oxidizers have much higher heat recovery efficiencies than recuperative thermal oxidizers, recovering 85 to 95% of the heat from the treated gas stream, and therefore have lower auxiliary fuel requirements. However, compared to direct flame and recuperative thermal oxidizers, regenerative thermal oxidizers typically have higher capital (equipment and installation) costs, are larger and heavier, and have higher maintenance costs.

(b) Catalytic Oxidizer:

Catalytic oxidation is the process of oxidizing organic contaminants in a waste gas stream within a heated chamber containing a catalyst bed in the presence of oxygen for sufficient time to completely oxidize the organic contaminants to carbon dioxide and water. The catalyst is used to lower the activation energy of the oxidation reaction, enabling the oxidation to occur at lower reaction temperatures compared to thermal oxidizers. The residence time, temperature, flow velocity and mixing, the oxygen concentration, and type of catalyst used in the combustion chamber affect the oxidation rate and destruction efficiency. Catalytic oxidizers typically require combustion of an auxiliary fuel (e.g., natural gas) to maintain combustion chamber temperature high enough to completely oxidize the contaminant gases. Catalytic oxidizers operate at lower temperatures and require less fuel than thermal oxidizers, they have a smaller footprint, and they need little or no insulation. The catalyst bed is usually composed of the following: (1) the substrate, typically ceramic or metal honeycombs, grids, mesh pads, or beads; (2) the carrier, a high surface area inorganic material such as alumina that is bonded to the substrate that contains a complex pore structure; and (3) the catalyst, a thin layer of material deposited onto the carrier. The most widely used catalysts for VOC oxidation are noble metals, such as platinum, palladium and rhodium or mixtures thereof. Base metal catalysts, such as oxides of chromium, cobalt, copper, manganese, titanium, and vanadium may also be used for VOC oxidation. Similar to thermal oxidizers, catalytic oxidizers may use regenerative or recuperative heat recovery to reduce auxiliary fuel requirements, where the untreated VOC gas stream entering the catalytic oxidizer is preheated using the heat content of the treated gas stream exiting the catalytic oxidizer.

Catalytic oxidizers can achieve 90-99% VOC control efficiency, depending on the oxidizer design and waste stream characteristics. Catalytic oxidizers are typically designed to have a residence time of 0.5 seconds or less and combustion chamber temperatures between 600 and 1,200°F. Catalytic oxidation is most suited to waste gas streams with little variation in the flow rate and type and concentration of VOC to be treated. In addition, catalytic oxidizers should not be used for waste gas streams that have a high concentration of particles, silicone, sulfur, halogen compounds, and/or heavy hydrocarbons that can cause fouling or masking of the catalyst, and for

waste gas streams that contain metals such as mercury, phosphorus, arsenic, antimony, bismuth, lead, zinc, and/or tin that can cause catalyst poisoning.

(c) Flare:

Flaring is the process of oxidizing VOC in a waste gas stream by piping the waste gas to a remote, usually elevated location and burning it in a flame using a specially designed burner tip, auxiliary fuel, and steam or air to promote mixing. Flares are generally categorized in two ways: (1) by the height of the flare tip (i.e., ground or elevated), and (2) by the method of enhancing mixing at the flare tip (i.e., steam-assisted, air-assisted, pressure-assisted, or non-assisted). Flares can be used to control almost any VOC stream, and can typically handle large fluctuations in VOC concentration, flow rate, heating value, and inert species content. Flaring is appropriate for continuous, batch, and variable flow vent stream applications, but the primary use is that of a safety device used to control a large volume of pollutant resulting from upset conditions. Flares have primarily been used in petroleum production, petroleum refineries, and chemical plants to control waste gas streams containing low molecular weight VOC with high heating values.

A properly operated flare can achieve 98+% VOC control efficiency when controlling emission streams with heat contents greater than 300 British thermal units per standard cubic foot (Btu/scf). If the waste gas stream has a heat content less than 300 Btu/scf, auxiliary fuel must be introduced in sufficient quantity to make up the difference. The VOC destruction efficiency of a flare depends upon the waste gas characteristics (density, flammability, heating value, and VOC component autoignition temperatures) and the combustion zone conditions (temperature, residence time, mixing, and available oxygen). While flares can provide efficient VOC control, other pollutants such as nitrogen oxides (NO<sub>x</sub>) and carbon monoxide (CO) are formed from the combustion process. Flares are not generally recommended for controlling gases containing halogen- or sulfur-containing compounds, because of the formation of hydrogen chloride, hydrogen fluoride gas, sulfur dioxide, and other highly corrosive acid gases.

*Reclamation Control Methods*

Organic compounds may be reclaimed by one of three possible methods: adsorption, absorption (scrubbing), or condensation. In general, the organic compounds are separated from the emission stream and reclaimed for reuse or disposal. Depending on the nature of the contaminant and the inlet concentration of the emission stream, recovery technologies can reach efficiencies of 98%.

(d) Carbon Adsorption Unit:

Carbon adsorption is a process where VOCs are removed from a waste gas stream when it is passed through a bed containing activated carbon particles, which have a highly porous structure with a large surface-to-volume ratio. Carbon adsorption systems usually operate in two phases: adsorption and desorption. During adsorption, the majority of the VOC molecules migrate from the gas stream to the surface of the activated carbon (through the activated carbon pores) where it is lightly held to the surface by weak intermolecular forces known as van der Waals' forces. As the activated carbon bed approaches saturation with VOC, its control efficiency drops, and the bed must be taken offline to be replaced or regenerated. Typically, two activated carbon beds are utilized on a rotating schedule, where a second bed (containing fresh or previously regenerated activated carbon) is brought online to continue controlling the VOC gas stream while the first bed is being replaced or regenerated. In regenerative systems, most VOC gases can be desorbed and removed from the activated carbon bed by heating the bed to a sufficiently high temperature, usually via steam or hot air, or by reducing the pressure within the bed to a sufficiently low value (vacuum desorption). The regenerated activated carbon can be reused and the VOCs that are removed from the bed can be reclaimed or destroyed.

Carbon adsorber size and purchase cost depend primarily on the gas stream volumetric flow rate, temperature, pressure, VOC composition, VOC mass loading, and moisture and particulate

contents. The adsorptive capacity of an activated carbon bed for a VOC gas tends to increase with the VOC gas phase concentration, molecular weight, diffusivity, polarity, and boiling point. Carbon adsorption systems can be used for VOC gas concentrations from less than 10 ppm to approximately 10,000 ppm. Carbon adsorption systems (in general) are usually limited to waste gas streams with VOC compounds having a molecular weight of more than 50 and less than approximately 200 lb/lb-mole, since low molecular weight organics usually do not adsorb sufficiently and high molecular weight compounds are difficult to desorb and remove during the desorption cycle. Industrial applications of adsorption systems include control for dry cleaning, degreasing, paint spraying, solvent extraction, metal foil coating, paper coating, plastic film coating, printing, pharmaceuticals, rubber, linoleum, and transparent wrapping.

Carbon adsorption systems can achieve 95-99% VOC control efficiency. Carbon adsorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the activated carbon bed. Particulate matter and high moisture concentrations present in the gas stream compete with the VOC for pore space within the activated carbon and thereby reduce the VOC adsorptive capacity and control efficiency of the carbon adsorption systems. In addition, particulate matter and moisture can become entrained within the carbon bed, causing operating problems such as increased pressure drop across the bed.

(e) Gas Absorption (wet scrubber):

A wet scrubber is an absorption system in which a waste gas stream is interacted with a scrubbing fluid inside a contact chamber in order to strip particulate or gaseous pollutants from the waste gas stream through the processes of diffusion and dissolution. In many cases, an additive such as an acid, a base, or a VOC oxidizing agent is dissolved in the scrubbing fluid so that the dissolved gaseous pollutant chemically reacts with the scrubbing fluid to form a non-volatile or soluble product, thereby allowing additional gaseous pollutant to be absorbed by the scrubbing fluid. The four types of wet scrubber systems include packed towers, plate (or tray) columns, venturi scrubbers, and spray chambers. Gas and liquid flow through an absorber may be countercurrent, crosscurrent, or cocurrent. When used as an emission control technique, wet scrubbers are typically used for controlling particulate, acid gases, halogen gases, and highly soluble gases such as sulfur dioxide and ammonia.

If a wet scrubber is used for VOC control, the scrubbing fluid chosen should have a high solubility for the VOC gas, a low vapor pressure, a low viscosity, and should be relatively inexpensive. Water is the most commonly used scrubbing fluid for absorbing highly water-soluble (hydrophilic) VOC compounds such as methanol, ethanol, isopropanol, butanol, acetone, and formaldehyde. Other scrubbing fluid such as mineral oils, nonvolatile hydrocarbon oils, and aqueous solutions containing surfactants or amphiphilic block copolymers may be used for absorbing water-insoluble (hydrophobic) VOC compounds. Physical absorption is typically enhanced by lower temperatures, greater scrubbing fluid contacting time and surface area, higher scrubbing fluid to VOC ratio, and higher VOC concentrations in the gas stream.

Wet scrubber systems can achieve 70-99% VOC control efficiency, depending on the VOC solubility in the scrubbing fluid, the VOC-scrubbing fluid temperature, the scrubbing fluid contacting time and surface area, the scrubbing fluid to VOC ratio, the VOC concentration in the gas stream, and whether the scrubbing fluid contains a VOC oxidizing agent. Wet scrubber absorption system control efficiency increases with reduced VOC gas stream temperatures. Therefore, high temperature VOC gas streams are typically cooled prior to entry into the wet scrubber. When used to control VOC, the spent scrubbing fluid must be regenerated, treated, or shipped offsite for proper disposal.

(f) Condensation Unit:

Condensation is the separation of VOCs from an emission stream through a phase change, by either increasing the system pressure or, more commonly, lowering the system temperature below the dew point of the VOC vapor. Three types of condensers are used for air pollution Controls: (1) conventional non-refrigeration systems (such as cold-water direct contact condensers similar to wet scrubbers and cold-water indirect heat exchangers); (2) refrigeration systems (including mechanical compression refrigeration using chlorofluorocarbons (CFCs) and hydrofluorocarbons (HFCs) and Reverse Brayton Cycle refrigeration); and (3) cryogenic systems that utilize liquid nitrogen (including direct contact condensers and indirect heat exchangers).

Condensation units control VOC more efficiently when they are used for gas streams containing high concentrations of VOC and with low exhaust volumes. Condensation units are typically utilized at sources where there is a significant cost benefit to recovering the organic liquid for reuse, where the recovered organic liquids do not contain multiple organic compounds or water that require separation, and where the heat content of gas stream will not overload the refrigeration system. In addition, condensation units are typically used only on gas streams that have little or no particulate contamination, which can cause fouling within the condensation equipment and reduced heat transfer efficiency. Some industrial applications where refrigerated condensers are used include the dry cleaning industry, degreasers using VOC or halogenated solvents, transfer of volatile organic liquid or petroleum products, and vapors from storage vessels.

Cold-water (non-refrigeration) condensation systems can achieve 90-99% VOC control efficiency, depending on the vapor pressures of the specific compounds. Condensation units using mechanical compression refrigeration (using CFC or HFC) can achieve 90+% VOC control efficiency, condensation units using Reverse Brayton Cycle refrigeration can achieve 98% VOC control efficiency, and condensation units using cryogenic (liquid nitrogen) cooling can achieve 99+% VOC control efficiency.

*Other Control Methods*

- (g) Bio-filtration is a process in which a waste gas stream is passed through a bed of peat, compost, bark, soil, gravel, or other inorganic media in order to strip organic contaminant gases from the waste gas stream through the process of dissolution in the bed moisture and adsorption to the bed media. Under aerobic conditions, microorganisms naturally present in the bed oxidize the organic contaminant gases within the bed to carbon dioxide, water, and additional biomass through metabolic processes. If the temperature of the waste gas stream is too high, the gas stream must be cooled to an optimum temperature before it can be treated in the biofilter in order to maintain the viability of the microorganisms. In addition, the bed must be monitored and maintained at an optimum moisture content and pH in order to prevent cracking of the bed media and to maintain the viability of the microorganisms.

Bio-filtration systems are designed to follow three basic steps. First, a pollutant in the gas phase is passed through a biologically active packed bed. The pollutant then diffuses into the biofilm immobilized on the packing medium. Finally, microorganisms growing in the biofilm oxidize the pollutant as a primary substrate or co-metabolite and in the process convert contaminants into the benign end products of carbon dioxide, water and additional biomass.

Three primary bioreactor configurations are available to treat stationary sources of air pollution: bio-filters, bio-trickling filters, and bio-scrubbers.

- (1) Bio-Filters

Bio-filters are the simplest and oldest of the three vapor-phase bioreactors and involve passing a contaminated air stream through a reactor containing biologically-active packing material. The contaminants are transferred from the air stream into a bio-film immobilized on the support media and are converted by the microorganisms into CO<sub>2</sub>, water, and additional biomass. Moisture is typically supplied to the bio-film in a humid inlet waste gas stream. Packing media used in bio-filter beds can be broadly categorized as either "natural" or "synthetic". Natural media include wood chips, peat, and compost, with compost by far the most widely used. Synthetic media include activated carbon, ceramic pellets, polystyrene beads, ground tires, plastic media, and polyurethane foam. Natural organic packing media generally contain a supply of nutrients as a naturally occurring component of the packing itself. When a synthetic support medium is used, nutrients must be added for microbial growth.

(2) Bio-Trickling Filters

Bio-trickling filters are similar to bio-filters with the exception that there is a liquid nutrient medium continuously recirculating through the column. To facilitate the recirculation of the liquid phase, rigid synthetic media is used as the packing medium. Microorganisms grow primarily as a fixed film on inert packing media but may also be present in the liquid phase because they can both grow suspended in the liquid phase and because the flowing liquid imparts sufficient force to detach biomass from the solid support media. Contaminants are transferred from the air stream into the liquid phase and bio-film for subsequent degradation.

Potential disadvantages of bio-trickling filter operations include: clogging of the pore space if the filter is treating high VOC loads or if the filter is provided excess nutrients, and the need to manage the liquid stream. An additional disadvantage is that bio-trickling filters may have more difficulty treating poorly soluble compounds since the specific surface area in bio-trickling filters is generally lower.

(3) Bio-Scrubbers

Bio-scrubbers combine physical and chemical treatment with a biological treatment in two separate reactors. In the first reactor, the contaminated air stream is contacted with water in a reactor packed with inert media, resulting in contaminant transfer from the air phase to the liquid phase. The liquid is then directed into an activated sludge reactor where the contaminants are biologically degraded. The separated activated sludge tank allows the reactor to treat higher concentrations of compounds than bio-filters can handle. In addition since compound transfer and degradation occur in separate reactors, optimization of each reactor can take place separately. As with bio-trickling filters, bio-scrubbers offer greater operator control over nutrient supply, acidity, and the build-up of toxic by-products.

A potential disadvantage of bio-scrubbers is that slower growing microorganisms may be washed out of the system and disposal of excess sludge is required.

## **Step 2: Eliminate Technically Infeasible Options**

There are some add-on control devices that are considered technically feasible, however, due to the relatively low PTE of VOC for each unit, there are no add-on control devices that are considered economically feasible.

## **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no technically feasible control options.

#### **Step 4: Evaluate the Most Effective Controls and Document the Results**

A search in the EPA's RACT/BACT/LAER Clearinghouse (RBLC) did not produce any results for this type of unit.

#### **Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

BACT shall be the following:

- (a) VOC emissions from residue solidification unit EU-5001a-5001d (stack S-5001) shall not exceed 1.40 lb/hr.
- (b) VOC emissions from residue solidification unit EU-5002a-5002d (stack S-5002) shall not exceed 1.40 lb/hr.
- (c) VOC emissions from residue solidification unit EU-5003a-5003d (stack S-5003) shall not exceed 1.40 lb/hr.
- (d) VOC emissions from residue solidification unit EU-5004a-5004d (stack S-5004) shall not exceed 1.40 lb/hr.

<b>Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis Cooling Tower</b>
---

#### **Step 1: Identify Potential Control Technologies**

PM emissions from cooling towers are typically controlled through one of the following mechanisms:

- (1) Drift eliminators.
- (2) Minimizing total dissolved solids (TDS).

#### **Step 2: Eliminate Technically Infeasible Options:**

For the cooling tower, the above listed control technologies are considered technically feasible.

#### **Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

The control technologies for cooling towers are ranked as follows:

- (1) Drift eliminators.
- (2) Minimization of total dissolved solids (TDS).

#### **Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

#### **Cooling Tower**

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	3 Cell Cooling Tower	Drift Eliminator	PM/PM10/PM2.5: 0.0005% drift 2,395 mg/l TDS VOC: 1.34 lb/hr	10,667 GPM, each

**Step 5: Select BACT**

IDEM, OAQ has established BACT for the cooling towers as:

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) PM, PM10, and PM2.5 emissions from the cooling tower (EU-6001, EU-6002 and EU-6003) shall be controlled by the use of drift eliminators with a maximum drift rate of no more than 0.0005%.
- (b) Total dissolved solids (TDS) in the circulating cooling water shall not exceed 2,395 mg/l.
- (c) VOC emissions from the cooling towers (EU-6001, EU-6002 and EU-6003) shall not exceed 1.34 lb/hr.

**BACT Analysis**  
**Emergency Generators - PM/PM10/PM2.5, NOx, SO2, VOC, CO and CO2e**

**Step 1: Identify Potential Control Technologies**

PM/PM10/PM2.5, NOx, SO2, VOC, CO and CO2e emissions can be controlled with the following control technologies:

- (1) Good Combustion Practices
- (2) Low sulfur diesel

**Step 2: Eliminate Technically Infeasible Options**

Good Combustion Practices is the only technically feasible option.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

There are no add-on control devices that are considered feasible; therefore no ranking is necessary.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Emergency Generators

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (hp)
Riverview Energy	Proposed	Emergency Diesel Generator	Good combustion practices	PM/PM10/PM2.5: 0.20 g/kW-hr SO2: 15 ppm S in fuel NOx + NMHC: 6.40 g/kW-hr CO: 3.50 g/kW-hr CO2e: 811 tons per 12-month consecutive period	2,800
		Emergency Diesel Fire Pump	Good combustion practices	PM/PM10/PM2.5: 0.20 g/kW-hr SO2: 15 ppm S in fuel NOx+NMHC: 4.00 g/kW-hr CO: 3.50 g/kW-hr CO2e: 217 tons per 12-month consecutive period	750
Standards applicable to stationary RICE are highly variable, depending on model year, power output, and service category. In general, the requirements of the NSPS, 40 CFR 60, Subpart IIII are recognized as the most restrictive limitations for new compression ignition stationary RICE.

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

(a)

Emission Unit	ID	Pollutant	Limitation
Emergency Diesel Generator	EU-6006	PM	0.20 g/kW-hr
		PM10	0.20 g/kW-hr
		PM2.5	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	6.40 g/kW-hr
		CO	3.50 g/kW-hr
		Opacity	Acceleration: 20% Lugging: 15% Peak: 50%
	CO <sub>2</sub> e	811 tons per twelve (12) consecutive month period with compliance determined at the end of each month	
Emergency Diesel Firewater pump	EU-6009	PM	0.20 g/kW-hr
		PM10	0.20 g/kW-hr
		PM2.5	0.20 g/kW-hr
		SO <sub>2</sub>	15 ppm in fuel
		NO <sub>x</sub> + NMHC	4.00 g/kW-hr
		CO	3.50 g/kW-hr
		CO <sub>2</sub> e	217 tons per twelve (12) consecutive month period with compliance determined at the end of each month

(c) Emergency generator (EU-6006) and emergency fire pump (EU-6009) shall use good combustion practices and shall use energy efficiency.

**BACT Analysis  
Hydrogen Plant**

**NO<sub>x</sub>**

**Step 1: Identify Potential Control Technologies**

NO<sub>x</sub> emissions can be controlled with the following control technologies:

Post-combustion controls:

- (1) Selective Catalytic Reduction (SCR)
- (2) Selective Non-Catalytic Reduction (SNCR)

Combustion controls:

- (3) Low NO<sub>x</sub> Burner (LNB)/Ultra low-Nox burner (ULNB)
- (4) Flue Gas Recirculation (FGR)

**Selective Catalytic Reduction (SCR)**

Selective Catalytic Reduction (SCR) process involves the mixing of anhydrous or aqueous ammonia vapor with flue gas and passing the mixture through a catalytic reactor to reduce NO<sub>x</sub> to water and N<sub>2</sub>. Under optimal conditions, SCR has a removal efficiency up to 90% when used on steady state processes. The efficiency of removal will be reduced for processes that are not stable or require frequent changes in the mode of operation.

The most important factor affecting SCR efficiency is temperature. SCR can operate in a flue gas window ranging from 480°F to 800°F, although the optimum temperature range depends on the type of catalyst and the flue gas composition. In this particular service, the minimum target temperature is approximately 750°F. Temperatures below the optimum decrease catalyst activity and allow NH<sub>3</sub> to slip through; above the optimum range, ammonia will oxidize to form additional NO<sub>x</sub>. SCR efficiency is also largely dependent on the stoichiometric molar ratio of NH<sub>3</sub>:NO<sub>x</sub>; variation of the ideal 1:1 ratio to 0.5:1 ratio can reduce the removal efficiency to 50%.

**Selective Non-Catalytic Reduction (SNCR)**

With selective non-catalytic reduction (SNCR), NO<sub>x</sub> is selectively removed by the injection of ammonia or urea into the flue gas at an appropriate temperature window of 1600°F to 2000°F, without employing a catalyst. Similar to SCR without a catalyst bed, the injected chemicals selectively reduce the NO<sub>x</sub> to molecular nitrogen and water. This approach avoids the problem related to catalyst fouling but the temperature window and reagent mixing residence time is critical for conducting the necessary chemical reaction.

At the proper temperature, urea decomposes to produce ammonia which is responsible for NO<sub>x</sub> reduction. At a higher temperature, the rate of competing reactions for the direct oxidation of ammonia that forms NO<sub>x</sub> becomes significant. At a lower temperature, the rates of NO<sub>x</sub> reduction reactions become too slow resulting in urea slip (i.e. emissions of unreacted urea).

Optimal implementation of SNCR requires the employment of an injection system that can accomplish thorough reagent/gas mixing within the temperature window while accommodating spatial and production rate temperature variability in the gas stream. The attainment of maximum NO<sub>x</sub> control performance requires that the furnace exhibit a favorable opportunity for the application of this technology relative to the location of the reaction temperature range and steady operation within that temperature window.

**Low NO<sub>x</sub> Burners (LNB)**

Using LNB can reduce formation of NO<sub>x</sub> through careful control of the fuel-air mixture during combustion. Control techniques used in LNBs includes staged air, and staged fuel, as well as other methods that effectively lower the flame temperature.

Experience suggests that significant reduction in NOx emissions can be realized using LNBs. The U.S. EPA reports that LNBs have achieved reduction up to 80%, but actual reduction depends on the type of fuel and varies considerably from one installation to another. Typical reductions range from 40% - 50% but under certain conditions, higher reductions are possible.

**Flue Gas Recirculation (FGR)**

Recirculating a portion of the flue gas to the combustion zone can lower the peak flame temperature and result in reduced thermal NOx production. The flue gas recirculation (FGR) can be highly effective technique for lowering NOx emissions from burners and it's relatively inexpensive to apply. FGR lowers NOx emissions in two ways; the cooler, relatively inert, recirculated flue gases act as heat sink, absorbing heat from the flame and lowering peak flame temperatures and when mixed with the combustion air, recirculated flue gases lower the average oxygen content of the air, starving the NOx-forming reactions for one of the needed ingredients.

**Step 2: Eliminate Technically Infeasible Options:**

Technology	BACT Evaluation
Selective Catalytic Reduction (SCR) Technically Feasible – <b>Yes</b>	Selective Catalytic Reduction (SCR) is technically feasible.
Selective Non-Catalytic Reduction (SNCR) Technically Feasible – <b>No</b>	Riverview will operate at a wide range of load levels, with lower levels potentially unable to provide a temperature profile that maintains the range needed for effective control for sufficient residence time to achieve proper control.  Some ammonia will be emitted.  The combustion units used at Riverview combust a combination of gaseous fuels that are proportionally variable over relatively short time periods and results in short term NOx loading variations. This variability works against the limited temperature flexibility and difficulty of SNCR in adjusting to short term changes maintaining consistent NOx control during operation of these units. For these reasons, the SNCR is technically infeasible.
Low NOx Burner (LNB) Technically Feasible - <b>Yes</b>	LNB/ULNB is technically feasible.
Flue Gas Recirculation (FGR) Technically Feasible – <b>Yes</b>	Flue Gas Recirculation (FGR) is technically feasible.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

Control Option	Expected Control Efficiency
LNB/ULNB	40-85%
SCR	70%-90%
FGR	15-50%

**Step 1: Identify Potential Control Technologies**

For CO, PM/PM10/PM2.5, SO2, VOC and CO2e, the available control technologies are the same as listed under "BACT Analysis Natural gas-fired heaters and boiler" section above.

**Step 2: Eliminate Technically Infeasible Options and**

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness:**

For CO, PM/PM10/PM2.5, SO2, VOC and CO2e, there are no add-on control devices that are considered feasible; therefore no ranking is necessary. See "BACT Analysis Natural gas-fired heaters and boiler" above for evaluations of each pollutant.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Hydrogen Plant - PM/PM10/PM2.5

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	Hydrogen Reformers (EU-7001 and EU-7002)	Combustion of natural gas, good combustion practices and energy efficiency	PM/PM10: 0.0060 lb/MMBtu PM2.5: 0.0048 lb/MMBtu	838.6 (each)
NatGasoline LLC	TX-0656 PSDTX1340, 107764 (5/6/2014)	reformer	Good combustion practices and fuel selection	PM/PM10: 43.72 tpy (equivalent to 0.006 lb/MMBtu) PM2.5: 32.79 tpy (equivalent to 0.0048 lb/MMBtu)	1552
Flint Hills Resources Pine Bend LLC	MN-0093 03700011-101 (1/13/2017) (draft)	No. 4 hydrogen plant reformer-refining equipment (EQUI 471) (natural gas, refinery fuel gas)	clean fuel, GCP	PM10/PM2.5: 0.0075 lb/MMBtu	744.40
Ticona Polymers	TX-0774 PSDTX1438, GHGPSDTX (11/12/2015)	Reformer	Good combustion practices and firing of high hydrogen process gas, and firing of pipeline quality natural gas	PM10/PM2.5: 5.74 tpy (equivalent to 0.0048 lb/MMBtu)	1190
Although the process is the same, this source is in SIC code 2869 and may not establish BACT for the proposed source.					
Sasol Chemicals (USA) LLC	LA-0289 PSD-LA-778 (5/23/2014) (GTL unit)	Furnaces (EQT 964 & 965) (process gas)	gaseous fuel, GCP	PM10/PM2.5: 2.94 lb/hr 10.61 tpy 0.0075 lb/MMBtu	390.10
The GTL project was reportedly cancelled in November 2017, therefore this entry is not considered to represent BACT for the proposed source.					
Air Products and Chemicals, Inc.	LA-0264 PSD-LA-750 (M1) (9/4/2012)	reformer - Hydrogen Plant	Proper equipment designs, good combustion practices, and gaseous fuel	PM/PM10/PM2.5: 11.24 lb/hr 0.0075 lb/MMBtu	1320
Although the process is the same, this source is in SIC code 2813 and may not establish BACT for the proposed source.					
BP Products North America Inc	OH-0329 P0103694 (8/7/2009)	reformer heater	no add on controls were reasonably cost effective	PM10: 3.9 lb/hr 16.94 tpy 7.6 lb/MMBtu AP-42 factor (sic)	519.00

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Rating (MMBtu/hr)
Marathon Petroleum	LA-0211 PSD-LA-719 (12/27/2006)	Hyd. reformer furnace flue gas vent	Proper design, operation, and good engineering practices	PM10: 0.0075 lb/MMBtu	1412.5
Air Products	TX-0526 NA 63, 39693 (8/18/2006)	reformer furnace stack - Hydrogen	SCR	PM10: 16.7 lb/hr 63.0 tpy (0.0075 lb/MMBtu)	1373
Although the process is the same, this source is in SIC code 4931 and may not establish BACT for the proposed source.					
Arizona Clean Fuels Yuma, LLC	AZ-0046 1001205 (4/14/2005)	Hyd. Reformer heater	None	PM10: 0.0075 lb/MMBtu	1435
Source may not have been constructed under this permit, therefore this citation is not considered representative of BACT.					

Hydrogen Plant - SO<sub>2</sub>

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	Hydrogen Reformers (EU-7001 and EU-7002)	Use of low sulfur gas, good combustion practices and energy efficiency	0.005 gr S/scf in fuel gas	838.6 (each)
The source has proposed a limit of 0.005 gr S/scf in fuel gas, this is determined to be BACT.					
Sasol Chemicals (USA) LLC	LA-0289 PSD-LA-778 (5/23/2014) (GTL unit)	Furnaces (EQT 964 & 965) (process gas)	use of gaseous fuel with a sulfur content of no more than 0.005 gr/scf (ann avg)	23.21 lb/hr max (ea) 2.09 tpy annual (ea)	390.1
The GTL project was reportedly cancelled in November 2017, therefore this entry is not considered to represent BACT for the proposed source.					
Diamond Shamrock Refining LP	TX-0580 92929 HAP63 (12/30/2010)	Hydrogen production unit furnace (refinery gas (PSA purge gas) w/ natural gas)		sulfur content of the fuel limited to 5 gr/100 dscf (ann avg)	355.65
BP Products North America Inc	OH-0329 P0103694 (8/7/2009)	reformer heater	none	15.52 lb/hr 38.00 tpy 20 ppmv dry at 0% excess air	519.00
Marathon Petroleum	LA-0211 PSD-LA-719 (12/27/2006)	hydrogen reformer furnace flue gas vent (48-08)	use of low sulfur fuel gas	25 ppmv (as H <sub>2</sub> S)	1412.5
Air Products	TX-0526 NA 63, 39693 (8/18/2006)	reformer furnace stack - Hydrogen	SO <sub>2</sub> limit based on 45 ppmv total sulfur in fuel gas	7.3 lb/hr (28.0 tpy)	1373
Although the process is the same, this source is in SIC code 4931 and may not establish BACT for the proposed source.					
Arizona Clean Fuels Yuma, LLC	AZ-0046 1001205 (4/14/2005)	Hyd. Reformer heater	None	S (as H <sub>2</sub> S) limited to 35 ppmv	1435
Source may not have been constructed under this permit, therefore this citation is not considered representative of BACT.					

Hydrogen Plant - NO<sub>x</sub>

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Rating (MMBtu/hr)
Riverview Energy	Proposed	Hydrogen Reformers (EU-7001 and EU-7002)	SCR with low NO <sub>x</sub> burners	0.0065 lb/MMBtu	838.6 (each)

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Rating (MMBtu/hr)
Air Liquide Large Industries U.S. LP	TX-0738 87575, N116 (2/19/2010)	reformer	SCR	0.0065 lb/MMBtu (annual) 0.015 lb/MMBtu (24-hr) NH3 slip 10 ppmvd@15% O <sub>2</sub>	1041
Although this source is in SIC code 2813, not 2911 like the proposed source, the NOx limitation of 0.0065 lb/MMBtu is the most stringent; therefore it has been determined to be BACT because of the similarity of the processes.					
Citgo Petroleum Corp	LA-0326 PSD-LA-222(M-2) (11/7/2017)	3(XXIII)2 C-reformer B-503, B-504, B-505 furnace (refinery fuel gas/reformer hydrogen)	GCP w/ continuous O2 monitor	83.13 lb/hr 0.095 lb/MMBtu (1-hr block avg)	875.00

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Hydrogen Plant Deaerators (EU-7003 & EU-7004)	None	VOC: 3.20 lb/hr CO: 1.06 lb/hr CO <sub>2</sub> e: 1,080 tons/yr (ea)	838.6 (each)
VOC, CO, and CO <sub>2</sub> e limits proposed by the source as BACT.					
Marathon Petroleum - Garyville Refinery	LA-0211 PSD-LA-719 (12/17/2006)	Hydrogen Plant Deaerator vent	None	VOC and CO: No limits	3125 lb/hr
Hunt Refining	AL-0242 X063 through X072 (5/20/2008)	Hydrogen plant degassifier	None (no controls are considered economically feasible)	None	-

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

- (a) The units shall burn only gaseous fuels.
- (b) PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions from each reformer shall not exceed:

Emission Limitations <sup>1</sup>	
Pollutant	lb/MMBtu
PM	0.006
PM <sub>10</sub> *	0.006
PM <sub>2.5</sub> *	0.0048

Notes:

1. PM shall include only filterable PM. PM<sub>10</sub> and PM<sub>2.5</sub> shall include filterable and condensable.

- (c) Sulfur content of the fuel gas delivered to each reformer shall not exceed 0.005 gr/scf.
- (d) The units shall use selective catalytic reduction (SCR) with low-NO<sub>x</sub> burners for NO<sub>x</sub> control.

- (e) NOx emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu
NOx	0.0065

- (f) VOC emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu <sup>1</sup>
VOC	0.0015

Notes:

1. 1-hr average

- (g) CO emissions from each reformer shall not exceed:

Emission Limitations	
Pollutant	lb/MMBtu
CO	0.020

- (h) The CO<sub>2e</sub> emissions from Block 7000 hydrogen production operations shall not exceed the values shown in the table below per twelve (12) consecutive month period, with compliance determined at the end of each month.

Emission Limitations	
Unit ID	CO <sub>2e</sub> Limit (tons)
EU-7001	987,271
EU-7002	987,271
EU-7003	1,080
EU-7004	1,080

- (h) VOC emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 3.20 b/hr, each.

- (i) CO emissions from the hydrogen plant deaerators (EU-7003 and EU-7004) shall not exceed 1.06 lb/hr, each.

<b>BACT Analysis</b> <b>Wastewater Treatment</b>
---

**Step 1: Identify Potential Control Technologies**

IDEM, OAQ has identified the following control technologies for control of VOC emissions from wastewater treatment processes:

- (a) VOC destruction methods
- (b) VOC removal methods
- (c) Wastewater treatment process design

**Step 2: Eliminate Technically Infeasible Options**

- (a) VOC destruction methods  
 VOC destruction processes, e.g., incineration, are not technically feasible for wastewater streams containing minor amounts of organic compounds. The fuel value of the VOC content is insufficient to support vaporization of the water phase without very substantial use of supplemental fuel. Application of destruction technology to a wastewater stream also requires entirely different unit construction from typical air pollution control devices, i.e., a liquid injection incinerator rather than a flare.
- (b) VOC removal  
 Certain removal processes, such as activated carbon adsorption, are applicable to removal of contaminants from water streams. However, these are generally applied as point-of-use systems for removing trace contaminants from clean streams like drinking water. Oily contaminants and unpredictable suspended solids loading cause plugging in activated carbon systems so adsorption processes are not feasible for wastewater treatment at the proposed source.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

IDEM, OAQ has ranked the control technologies in order of effectiveness as follows:

- (a) Conformance with the requirements of 40 CFR 60, Subpart QQQ; 40 CFR 61, Subpart FF; and 40 CFR 63, Subpart CC; including but not limited to covered oil-water separators, water seal drains, and closed vent systems. (estimated 96% control based on AP-42 Section 5.1)

The applicant proposed a wastewater collection and treatment system compliant with 40 CFR 60, Subpart QQQ which is top BACT. Therefore, a ranking is not required.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Riverview Energy	Proposed	Wastewater treatment	-	VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and MH1 (EU-8003) shall not exceed 20 ppmvd, each	NA
Castleton Commodities International Corpus Christi	TX-0756 116072 & PSDTX1388 (6/19/2015)	Wastewater treatment plant	Overall system to achieve 90% of VOC from treated wastewater. Oil/water separator is enclosed and routed to a carbon adsorption system (CAS). Process drains to be equipped with a water seal. Wastewater sewers will be enclosed. Aerobic digesters will be enclosed and directed to a CAS.	4.56 lb/hr 9.04 tpy 90% overall control	-

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)
Magellan Processing LP	TX-0731 118270 & PSDTX1398 (4/10/2015)	Petroleum refining wastewater and wastewater treatment	Process wastewater shall be immediately directed to a covered system. All lift stations, manholes, junction boxes, conveyances, and any other wastewater facilities shall be covered and all emissions routed to a vapor combustor with a guaranteed DRE of 99% for control.	0.4 tpy	-
Specification of DRE is considered as specific for the emissions control device (i.e., vapor combustor), not as an achievable overall control efficiency for VOC emissions from wastewater collection and treatment processes.					
Valero Refining New Orleans LLC	LA-0213 PSD-LA-619 (M5) (11/17/2009)	Wastewater collection & treatment: refinery	WW (EQT0255): comply with LA refinery MACT WWTU (EQT0359): comply with 40 CFR 61 subpart FF CRUIDS ( <i>sic</i> ) (EQT369): comply with 40 CFR 63 subparts F & G	-	-
Sunoco Inc	OH-0308 04-01447 (2/29/2009)	wastewater streams	-	91.19 tpy	-
This entry is identified as MACT, therefore it is not considered to establish BACT for the proposed source.					
Conoco Phillips	IL-0103 06050052 (8/5/2008)	wastewater treatment plant	Good air pollution control practices	-	-
This entry is identified as LAER, therefore it is not considered to establish BACT for the proposed source.					

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM, OAQ has established the following as VOC BACT for wastewater collection and treatment operations:

- (a) VOC emissions from the wastewater treatment vent (EU-8001), oily water sump (EU-8002), and manhole no. 1 (EU-8003) shall not exceed 20 parts per million by volume (dry) (ppmvd), each.

**BACT Analysis  
 VOC Leaks**

**Step 1: Identify Potential Control Technologies**

IDEM, OAQ has identified the following control technologies for VOC control from fugitive emission sources:

- (a) Leak Detection and Repair Program (LDAR)
- (b) No Control Option

**Step 2: Eliminate Technically Infeasible Options**

- (a) Leak Detection and Repair Program (LDAR)  
 A leak detection and control program (LDAR) is a systematic method of finding and eliminating fugitive emissions from leaking pumps, valves, compressors, pipe fitting, sampling connections, etc. LDAR is a work practice that assists sources identify leaking equipment so that emissions can be reduced through systematic repair or replacement. The key to the effectiveness of fugitive emission control is the regularly scheduled inspections and a defined

repair/replacement schedule. The use of an LDAR program is a technically feasible control option for the fugitive VOC emissions.

(b) No Control Option

It is possible that fugitive emissions from a source are so small that the time and cost required to establish and implement an LDAR program are not cost effective. Fugitive VOC emissions were estimated by the source at 14.39 tons per year. The use of no control is a technically feasible control option for the fugitive VOC emissions.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

IDEM, OAQ has ranked the control technologies in order of effectiveness as follows:

- (a) LDAR (98% control)
- (b) No Control (0% control)

The applicant proposed an LDAR program which is top BACT. Therefore, a ranking is not required.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following table summarizes other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT	Throughput (ton/yr)

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT) and 326 IAC 8-1-6 (New Facilities; General Reduction Requirements), IDEM, OAQ has established the following as VOC BACT for fugitive VOC emissions:

- (a) Fugitive VOC emissions shall be controlled by a Leak Detection and Repair (LDAR) program. The leak detection and repair program specified in 40 CFR 60, Subpart GGGa shall serve as BACT for VOC fugitive emissions.
  - (1) Fugitive VOC emissions from Block 2000 VEBA Combi Cracker operations shall not exceed 151.18 tons per twelve (12) consecutive month period.
  - (2) Fugitive VOC emissions from Block 4000 offsites operations shall not exceed 25.04 tons per twelve (12) consecutive month period.

**Particulate (PM, PM<sub>10</sub> and PM<sub>2.5</sub>) BACT Analysis  
Roads**

**Step 1: Identify Potential Control Technologies**

Emissions of particulate matter (PM), particulate matter with an aerodynamic diameter less than or equal to ten (10) micrometers (PM<sub>10</sub>) and PM<sub>2.5</sub> from fugitive sources are generally controlled with measures to prevent the emissions from occurring. Generally, fugitive PM, PM<sub>10</sub> and PM<sub>2.5</sub> emissions from roadways are controlled through one of the following mechanisms:

- (1) Paving of Roadways
- (2) Wet Suppression or Chemical suppression
- (3) Good Housekeeping (cleanup spilled material)

Add-on particulate control devices such as cyclones, scrubbers, baghouses or ESP's are not possible alternatives because the roadways cannot be enclosed and vented to a point source control device.

**Step 2: Eliminate Technically Infeasible Options**

Wet Suppression or Chemical suppression:

Wet suppression systems use liquid sprays or foam to suppress the formation of airborne dust. The primary control mechanisms are those that prevent emissions through agglomerate formation by combining small dust particles with larger aggregate or with liquid droplets. The key factors that affect the degree of agglomeration and, hence, the performance of the system are the coverage of the material by the liquid and the ability of the liquid to wet small particles. There are two types of wet suppression systems: liquid sprays which use water or water/surfactant mixtures as the wetting agent and systems which supply foams as the wetting agent. Wet suppression systems typically achieve PM control efficiencies of greater than 85%.

Based on the information reviewed for this BACT determination, IDEM, OAQ has determined that the use of a Wet Suppression or Chemical suppression is a technically feasible option for the roads at this source.

Paving Roadways and Good Housekeeping

Paving all haul roads and prompt cleanup of any spilled or eroded materials are effective at minimizing dust emissions from vehicle traffic.

**Step 3: Rank the Remaining Control Technologies by Control Effectiveness**

- (1) Paving haul roads reduces vehicle dust emissions versus unpaved surfaces and is feasible.
- (2) Wet or chemical suppression (frequent use of water or chemical surfactants) can significantly reduce airborne dust emissions from both paved and unpaved roadways.
- (3) Particulate emission from paved roadways can also be minimized with good housekeeping, i.e. cleaning up spills of solid material or dirt eroded onto the road surfaces.

**Step 4: Evaluate the Most Effective Controls and Document the Results**

The following tables summarize other BACT determinations at similar sources or for similar processes that were identified in the EPA's RACT/BACT/LAER Clearinghouse (RBLC):

Paved Roadways and Parking areas

Facility - County, State	RBLC ID / Permit # (Issuance Date)	Process	Control	BACT
Riverview Energy	Proposed	Paved Roads	All roads shall be paved	VE: 0% except for 1 min. in any 1-hr period  Development, maintenance, and implementation of a fugitive dust control plan.
V&M Star	OH-0344 (1/27/2011)	Paved Roads	watering, sweeping, chemical stabilization, or suppressants applied at sufficient frequencies	Paved & Unpaved roads PM: 38.3 tpy PM10: 7.7 tpy VE: 0% except for 1 min. every 60
Sun Coke Energy	OH-0332 (5/20/2010)	Paved Roads	Watering	PM: 1.08 tpy PM10: 0.21 tpy PM2.5: 0.05 tpy fugitive VE: No VE except for any 1 min in any 60 min.

Facility - County, State	RBL ID / Permit # (Issuance Date)	Process	Control	BACT
Note: Source was not constructed; therefore, it has not been demonstrated that this limit can be complied with. Therefore, this was not considered BACT.				
Argos USA	SC-0132 (12/14/2007)	Paved Roads	Best mgmt practices consisting of sweeping and/or water flushing	PM
Entergy Louisiana, LLC	LA-0221 (11/30/2007)	Paved Roads	Newly constructed roads will be paved	PM10: 4.07 lb/hr (17.2 tpy)
Mesabi Nugget	MN-0061 13700318-001 (6/26/2005)	Paved Roads	Fugitive dust control plan	VE: 5% opacity
Martco Limited Partnership	LA-0203 (6/13/2005)	Paved Roads	Limited access	PM10: 2.6 lb/hr
Louisiana Generating, LLC	LA-0223 (1/8/2008)	Paved Roads	Pave all roads	PM10: 1.21 lb/hr 3.54 tpy

**Step 5: Select BACT**

Pursuant to 326 IAC 2-2-3 (PSD BACT), IDEM has established the following BACT:

BACT shall be:

- (a) The Best Available Control Technology (PSD BACT) for PM, PM<sub>10</sub>, and PM<sub>2.5</sub> for the paved roads shall be the development, maintenance, and implementation of a fugitive dust control plan, which shall include but not be limited to vacuum sweeping and water flushing as necessary and the implementation of a speed reduction plan.
- (b) Visible emissions from truck traffic on plant roads shall not exceed one (1) minute in any one (1) hour period.

## **Air Quality Analysis**

### **Riverview Energy Corporation Dale, Indiana (Spencer, County) Tracking and Plant ID: 147-39554-00065**

#### **Proposed Project**

Riverview Energy Corporation (REC) plans to construct a Direct Coal Hydrogenation facility in Spencer County near Dale, Indiana. The facility will convert Indiana Number 5 high sulfur coal into low-sulfur liquid fuel products such as diesel, naphtha, and other saleable products. The site will be located south of Interstate 64 and east of U.S. 231. The Potential to Emit (PTE) is over 100 tons per year (TPY) for nitrous oxides (NO<sub>x</sub>), carbon monoxide (CO), sulfur dioxide (SO<sub>2</sub>), volatile organic compounds (VOCs), and over 25 TPY for particulate matter with an aerodynamic diameter of 10 micrometers and smaller (PM<sub>10</sub>) and particulate matter with an aerodynamic diameter of 2.5 micrometers and smaller (PM<sub>2.5</sub>). In addition, the facility will emit over 25 TPY of Hazardous Air Pollutants (HAPs). The HAP with largest emissions from the proposed facility is Methanol. Kellogg Brown and Root (KBR) were the consultants that submitted the modeling for REC.

#### **Analysis Summary**

Based on the potential emissions after controls, a Prevention of Significant Deterioration (PSD) air quality analysis was triggered for SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, CO, NO<sub>x</sub>, VOCs, and HAPs. The significant impact analysis for 1-hour NO<sub>2</sub>, all averaging times for SO<sub>2</sub>, 24-hour and annual PM<sub>2.5</sub> showed that modeled concentrations exceeded the respective significant impact levels (SILs). A cumulative analysis was therefore required for those pollutants. No violation of the National Ambient Air Quality Standards (NAAQS) was found within the modeling domain for any of the required NAAQS analyses. Pre-construction monitoring is not required since modeled concentrations for the applicable pollutants were below the significant monitoring concentration thresholds. Existing monitoring is available for all pollutants and averaging times. An additional impact analysis was conducted and showed no further impact to vegetation, soils, visibility, endangered species, or economic growth. In addition a secondary ozone and PM<sub>2.5</sub> analysis was performed and no significant impacts were found from this proposed source. Finally, a Hazardous Air Pollutant (HAP) analysis was performed since emissions of one HAP (Methanol) were greater than 10 TPY. Based on the HAPs modeling results, the source will not pose a health concern.

#### **Air Quality Impact Objectives**

The purpose of the air quality impact analysis in the permit application is to accomplish the following objectives; each objective is individually addressed in this document in each section below.

- A. Establish which pollutants require an air quality analysis based on Prevention of Significant Deterioration (PSD) significant emission rates.
- B. Provide analyses of actual stack heights with respect to Good Engineering Practice (GEP), the meteorological data used, a description of the model used in the analysis, and the receptor grid used for the analyses.
- C. Determine the significant impact level, the area impacted by the source's emissions, and background air quality levels.

- D. Demonstrate that the source will not cause or contribute to a violation of the National Ambient Air Quality Standards (NAAQS) or PSD increment if the applicant exceeds significant impact levels.
- E. Perform a qualitative analysis of the source's impact on general growth, soils, vegetation, and visibility in the impact area with emphasis on any Class I areas. The nearest Class I area is Kentucky's Mammoth Cave National Park.
- F. Perform a secondary ozone and PM<sub>2.5</sub> analysis if the applicant is major for NO<sub>2</sub>, VOCs, or SO<sub>2</sub>.
- G. Conduct a Hazardous Air Pollutant (HAP) analysis to determine cancer risk and hazard screening.
- H. Summarize the Air Quality Analysis.

## Section A – Pollutants Analyzed for Air Quality Impact

### Applicability

The PSD requirements, 326 Indiana Administrative Code (IAC) 2-2, apply in attainment and unclassifiable areas and require an air quality impact analysis of each regulated pollutant emitted in significant amounts by a major stationary source or modification. Significant emission levels for each pollutant are defined in 326 IAC 2-2-1 and in the Code of Federal Regulations (CFR) 52.21(b)(23)(i). The proposed site in Spencer County is an attainment area for all applicable NAAQS.

### Proposed Project Emissions

NO<sub>x</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, CO, SO<sub>2</sub>, VOCs, Lead (Pb) and HAPs are the pollutants that will be emitted from REC and are summarized in Table 1. NO<sub>2</sub>, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, SO<sub>2</sub>, VOCs, and HAPs exceed the PSD significant emission rates; and air quality analysis is required for these pollutants.

**TABLE 1**  
**Significant Emission Rates for PSD**

POLLUTANT	SOURCE EMISSION RATE (TPY)	SIGNIFICANT EMISSION RATE (TPY)	PRELIMINARY AQ ANALYSIS REQUIRED
NO <sub>x</sub>	354.08	40	YES
CO	255.12	100	YES
PM <sub>2.5</sub>	62.57	10	YES
PM <sub>10</sub>	71.04	15	YES
SO <sub>2</sub>	123.30	40	YES
VOCs	181.76	40	YES
Pb	0.00117	0.6	NO
HAPs	32.14	25 <sup>1</sup>	YES
H <sub>2</sub> S <sup>2</sup>	7.78	10	NO

<sup>1</sup>10 tpy for a single HAP.

<sup>2</sup>There are no NAAQS for H<sub>2</sub>S; however, there are monitoring concentrations thresholds for pollutants above the de minimis levels.

## **Section B – Good Engineering Practice (GEP), Meteorological Data, Model Used, Receptor Grid**

### **Stack Height Compliance with Good Engineering Practice (GEP)**

#### **Applicability**

Stacks should comply with GEP requirements established in 326 IAC 1-7-4. If stacks are lower than GEP, excessive ambient concentrations due to aerodynamic downwash may occur. Dispersion modeling credit for stacks taller than 65 meters or 213 feet is limited to GEP for the purpose of establishing emission limitations. The GEP stack height takes into account the distance and dimensions of nearby structures, which would affect the downwind wake of the stack. The downwind wake is considered to extend five times the lesser of the structure's height or width. A GEP stack height is determined for each nearby structure by the following formula:

$$H_g = H + 1.5L$$

Where :  $H_g$  is the GEP stack height  
H is the structure's height  
L is the structure's lesser dimension (height or width)

#### **New Stacks**

Since the new stack heights are below GEP stack height, the effect of aerodynamic downwash will be accounted for in the air quality analysis for the project.

#### **Meteorological Data**

The meteorological data used in the American Meteorological Society Environmental Protection Agency Regulatory Model (AERMOD) consisted of 2012 through 2016 surface meteorological data from the Evansville Regional Airport National Weather Service (NWS) Automated Surface Observing System (ASOS) station merged with the upper air data from the Lincoln, Illinois NWS. Additionally, the 1-minute ASOS wind speed and wind direction data were processed with the AERMINUTE preprocessor version 15272. The meteorological data were preprocessed into an AERMOD ready format by the Office of Air Quality (OAQ) using U.S. EPA's AERMET Version 16216, meteorological preprocessor for AERMOD. The meteorological data was processed with the adjusted  $u^*$  values in accordance with Appendix W guidance as a regulatory option.

#### **Model Description**

OAQ used the most recent version of AERMOD (Version 18081 at the time the applicant submitted a modeling analysis) to determine maximum off-property concentrations or impacts for each criteria pollutant. AERMOD is U.S. EPA's preferred near field dispersion model and all regulatory default options were utilized in the U.S. EPA approved model, as listed in the 40 CFR Part 51, Appendix W "Revision to the Guideline on Air Quality Models." The Auer Land Use Classification Scheme was used to determine land use in the area. The area is considered primarily rural; therefore, a rural classification was used.

#### **Receptor Grid**

The receptor grid used by the consultants, KBR, was also used by OAQ. The grid was extended to a distance approximately 10 kilometers from the plant. Receptors were closely spaced at 50 meters

along the plant fence line and out to a 0.5 km away from the plant fence line. A finely spaced grid with a 100 meter spacing extended out to a distance of 1.5 kilometers. A medium density Cartesian grid extended from 1.5 kilometers out to 3 kilometers with receptor spacing of 250 meters. Finally receptors were spaced 500 meters apart from 3 kilometers to 10 kilometers from the facility center.

**Section C - Significant Impact Levels and Background**

An analysis was conducted to determine the modeled impacts of the proposed facility. The highest 1<sup>st</sup> high concentrations for each pollutant and averaging time was determined and are shown below in Table 2. It was found that 1-hour NO<sub>2</sub>, 1-hour, 3-hour, 24-hour and annual SO<sub>2</sub> were above their respective SILs. In addition, 24-hour and annual PM<sub>2.5</sub> were above their respective SILs. All other pollutants and averaging times for NAAQS and PSD analysis were below the SIL. A cumulative NAAQS analysis is required for pollutants and averaging times above their respective SILs. In determining the maximum modeled impacts presented in the SIL table below, care was taken to identify the worst case operating scenario of the facility. This involved modeling scenarios when flaring operations are planned. These flaring scenarios vary in duration from an hour to as long as a week. To ensure that the hourly standards were protected, the highest hourly rate was modeled for each hour over the 5 years of meteorological data in order to match the highest hourly emissions with the worst case meteorological conditions. Appendix A to this document lists results of the worst case scenarios determinations.

The flares were modeled as pseudo-point sources within AERMOD. Effective stack diameters were calculated according to a method used by the Texas Commission on Environmental Quality. In order to calculate the effective stack diameter, the gross heat release from the flare was calculated. The formula to calculate the effective diameter is shown below.

$$D_s = \sqrt{q_n * 10^{-6}}$$

where  $q_n$  is the net heat release in calories per second and calculated as follows:

$$q_n = q * (1 - 0.048 * \sqrt{MW})$$

where  $q$  is the gross heat release from the stack and  $MW$  is the mean molecular weight of the gas going to the flare.

The consultant for the source, KBR, has stated that when the flares are operating, the rest of the facility will be at a diminished operating capacity. IDEM has modeled the facility at or near full capacity for NO<sub>2</sub> and CO. The consultant presented a worst case flaring scenario for SO<sub>2</sub> during which the facility will be at partial capacity. The consultants' worst case SO<sub>2</sub> flaring scenario is reflected in Table 2.

**TABLE 2  
 Significant Impact Levels**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED IMPACTS (µg/m³)	SIGNIFICANT IMPACT LEVEL (µg/m³)	ABOVE SIL ?
NO <sub>2</sub>	1-hour	12.03	7.5	YES
NO <sub>2</sub>	Annual	0.68	1	NO
CO	1-hour	32.53	2000	NO
CO	8-hour	14.40	500	NO
PM <sub>2.5</sub>	Annual	0.32	0.3 <sup>2</sup>	YES

PM <sub>2.5</sub>	24-hour	1.72	1.2	YES
PM <sub>10</sub>	Annual <sup>1</sup>	0.41	1	NO
PM <sub>10</sub>	24-hour	2.18	5	NO
SO <sub>2</sub>	1-hour	36.49	7.8	YES
SO <sub>2</sub>	3-hour	32.10	25	YES
SO <sub>2</sub>	24-hour	10.76	5	YES
SO <sub>2</sub>	Annual	1.18	1	YES

<sup>1</sup>The annual PM<sub>10</sub> NAAQS standard was revoked on October 17, 2006; however, the PSD standard remains in effect.

<sup>2</sup>The PM<sub>2.5</sub> SIL for the annual standard is 0.3 and unchanged in 40 CFR 51.165(b)(2). EPA has recently released guidance on SILS for ozone and fine particulates. A SIL of 0.2 is recommended for the annual standard in EPA's guidance.

## Pre-construction Monitoring Analysis

### Applicability

The PSD rule, 326 IAC 2-2-4, requires an air quality analysis of the new source or the major modification to determine if the pre-construction monitoring threshold is triggered. In most cases, monitoring data taken from a similar geographic location can satisfy this requirement if the pre-construction monitoring threshold has been exceeded. Also, post construction monitoring could be required if the air quality in that area could be adversely impacted by the applicant's emissions. REC did not exceed the de minimis levels for any of the pollutants or averaging times considered for preconstruction monitoring, as shown below in Table 3.

**TABLE 3**  
**Preconstruction Monitoring Analysis**

POLLUTANT	TIME AVERAGING PERIOD	MAXIMUM MODELED IMPACTS (µg/m <sup>3</sup> )	DEMINIMIS LEVEL (µg/m <sup>3</sup> )	ABOVE DE MINIMIS LEVEL
NO <sub>2</sub>	Annual	0.86	14	NO
PM <sub>10</sub>	24-hour	4.18	10	NO
PM <sub>2.5</sub>	24-hour	1.72	4 <sup>1</sup>	N/A
SO <sub>2</sub>	24-hour	5.30	13	NO

<sup>1</sup> On January 22, 2013, the DC Circuit Court of Appeals vacated the 24-hour PM<sub>2.5</sub> SMC (see Sierra Club v. EPA, 705 F.3d 458 (D.C. Cir. 2013)). U.S. EPA promulgated rules on December 9, 2013 changing the PM<sub>2.5</sub> SMC at 40 CFR §§ 51.166(i)(5)(i) and 52.21(i)(5)(i) to 0 µg/m<sup>3</sup>, meaning that there is no preconstruction monitoring exemption available (see 78 FR 73698).

## Background Concentrations

### Applicability

U.S. EPA's "Ambient Monitoring Guidelines for Prevention of Significant Deterioration" (EPA-450/4-87-0007) Section 2.4.1 is cited for approval of the monitoring sites chosen for this area.

### Background Monitors

Representative background concentrations used in the NAAQS analysis are listed in Table 4. The background monitors used for the NAAQS analysis were monitor ID number 18-141-0015, located in South Bend, IN for 1-hour NO<sub>2</sub>, monitor ID number 18-163-0021, located in Evansville, IN, for 1-hour, 3-hour, 24-hour, and annual SO<sub>2</sub> and finally monitor number 18-147-0009 located in Dale, IN, for annual and 24-hour PM<sub>2.5</sub>. The latest 3-year design value (2015-2017) for each of these monitors was used in the modeling analysis. These sites are considered the most representative sites with complete data relative to REC. For NO<sub>2</sub> background values, there are only two monitors within the state that have complete and quality assured data, both of which are in northern Indiana. The monitor in South Bend, Indiana is located in a more rural area than the Gary IITRI monitor, which is located in a more industrialized area. The more rural location of the NO<sub>2</sub> monitor in South Bend is comparable to the proposed location for REC.

**TABLE 4**  
**Background Concentrations**

POLLUTANT	AVERAGING PERIOD	MONITOR ID	MONITOR LOCATION	MONITOR COUNTY	CONCENTRATION ( $\mu\text{g}/\text{m}^3$ )
NO <sub>2</sub>	1-hour	18-141-0015	South Bend	St. Joseph	67.68
SO <sub>2</sub>	1-hour	18-163-0021	Evansville	Vanderburgh	33.0
SO <sub>2</sub>	3-hour	18-163-0021	Evansville	Vanderburgh	22.6
SO <sub>2</sub>	24-hour	18-163-0021	Evansville	Vanderburgh	16.3
SO <sub>2</sub>	Annual	18-163-0021	Evansville	Vanderburgh	3.6

PM <sub>2.5</sub>	Annual	18-147-0009	Dale	Spencer	8.7

### Section D - NAAQS and PSD Analysis

Based on the significant impact analysis, 1-hour NO<sub>2</sub>, all SO<sub>2</sub> averaging times, as well as annual and 24-hour PM<sub>2.5</sub> were above their respective SILs and therefore required a refined NAAQS analysis. A PSD increment analysis was necessary for 3-hour, 24-hour, and annual SO<sub>2</sub> in addition to 24-hour and annual PM<sub>2.5</sub>. U.S. EPA has not established PSD increments for 1-hour NO<sub>2</sub> and SO<sub>2</sub>. Inventory sources included in the NAAQS modeling are listed in Table 5 below. Table 8-2 of Appendix W to 40 CFR Part 51, Guideline for Air Quality Models was utilized in determining appropriate modeled emissions for the inventory sources. Actual operating levels from Continuous Emission Monitoring Systems (CEMS) data was averaged over the most recent two-year period for sources for which this data was available. These sources with available operating level data from CEMS are as follows: ALCOA Power Plant, Indianapolis Power and Light – Petersburg, and Indiana Michigan Power – Rockport. Once the operating levels were established for each of the units located at the separate facilities, the emission limit for each of the units was multiplied by the operating factor in accordance with Table 8-2 of Appendix W to 40 CFR Part 51. Inventories from Kentucky were also compiled and included in the modeling for a conservative analysis.

**TABLE 5**

PM <sub>2.5</sub>	24-hour / annual	Domtar Paper – KY	42

POLLUTANT	TIME AVERAGING PERIOD	INVENTORY SOURCE NAME	DISTANCE FROM PROPOSED SOURCE (km)
PM <sub>2.5</sub>	24-hour / annual	Century Aluminum - KY	32
PM <sub>2.5</sub>	24-hour / annual	Masterbrand Cabinets	10

Table 6 presents the results of the cumulative NAAQS modeling. All pollutants and averaging times were under their respective standards when representative background concentrations were included. For annual and 24-hour PM<sub>2.5</sub>, only the Significant Impact Area (SIA) receptors were included in the cumulative NAAQS modeling. The SIA receptors were those for which REC was found to exceed the SIL. For NO<sub>2</sub>, a Tier I approach was used. This approach is the most conservative approach because it assumes that all modeled NO<sub>x</sub> is converted to NO<sub>2</sub>. No Tier II Ambient Ratio Method II (ARM II) approach was necessary. The PSD increment analysis is shown in Table 7. No pollutant consumed more than 80% of the available PSD increment.

## Section E - Qualitative Additional Impacts Analysis

### Additional Impact Analysis

All PSD permit applicants must prepare an additional impact analysis for each pollutant subject to regulation under the Act. This analysis assesses the impacts on growth, soils and vegetation, endangered species, and visibility caused by any increase in emissions of any regulated pollutant from the source. The REC modeling submittal provided an additional impact analysis prepared by KBR. IDEM reviewed their analysis and provides its review of the analysis below.

### Economic Growth

The purpose of the growth analysis is to quantify project associated growth and estimate the air quality impacts from this growth either quantitatively or qualitatively. It is estimated that 200 jobs will be created as a result of this project and growth impacts related to the NAAQS and PSD increments are expected to be negligible. The proposed facility should not hinder other industrial growth in the area.

### Soils and Vegetation Analysis

Soil types included clay and sandy clay over sandstone and shale. The land surrounding the site is primarily agricultural and the maximum modeled concentrations from REC are well below the threshold limits necessary to have adverse impacts on the surrounding vegetation. Crops in Spencer County and nearby areas consists mainly of corn, soybeans, wheat, and hay. Livestock in Spencer County consists of turkeys, hogs, and cattle and should not be adversely impacted from the facility. Trees in the area are mostly hardwoods and IDEM agrees with KBR's analysis that no adverse impact is expected to the trees from this facility.

### Federal and State Endangered Species Analysis

Federal and state endangered species are listed by the U.S. Fish and Wildlife Service; Division of Endangered Species for Indiana. This species list includes 4 birds, 10 fish, 3 mammals, 11 mussels, 2 reptiles, 3 insects and 6 plants. Of these species, 2 mussels, 1 bird, and 3 mammals are found within Spencer County. These species are found along rivers and lakes and in caves near water bodies and wooded areas. There are no federally endangered plant species found in Spencer County. Modeled impacts from REC are not expected to adversely impact these species.

### Visibility Analysis

A visibility impairment analysis is conducted to demonstrate that emissions from the proposed project do not cause an impairment of visibility. A visibility impairment analysis must address near and long-range Class I area impacts and localized visibility. The Federal Land Managers' Air Quality Related Values Work Group (FLAG) recommends procedures for proposed source locations near (within 50 km) and at large distances (greater than 50 km) from Class I areas. The nearest Class I area to the proposed source is Mammoth Cave National Park (120 km). For long range distances, FLAG recommends applying the Q/D initial screening test to determine whether or not further Class I area visibility analysis is necessary. Q is the total emissions of SO<sub>2</sub>, NO<sub>2</sub>, PM<sub>10</sub>, and H<sub>2</sub>SO<sub>4</sub> annual emissions from the proposed source and D is the total distance in kilometers from the Class I area. If Q/D is 10 or less, the proposed source is considered to have negligible visibility impacts on the Class I area. The results of the Q/D test for REC are shown in Table 8 below. Since Q/D is below 10 for the facility, no negligible visibility impairment is expected from the proposed source on the Class I area.

**TABLE 8**  
**Results of the Q/D Visibility Test on Mammoth Cave**

Class I Area	NO <sub>x</sub> Emissions (tpy)	SO <sub>2</sub> Emissions (tpy)	PM <sub>10</sub> Emissions (tpy)	H <sub>2</sub> SO <sub>4</sub> Emissions (tpy)	Total Emissions (Q, tpy)	Distance (D, km)	Q/D	Q/D ≤ 10
Mammoth Cave	354.08	123.30	71.04	16.99	565.4	120	4.8	YES

The VISCREEN model is designed as a screening model to determine the visual impact parameters from a single source plume on localized visibility. It is used to determine whether or not a plume is visible as an object itself. The visibility impairment analysis considers the impacts that occur within the impact area of the source as defined by the user distances. The user distances are determined by the nearest interstate or airport. For the current source, the nearest interstate would be I-64, 1 kilometer away from the proposed facility location. The background visual range used in this analysis was 25 km as suggested in Figure 9 in U.S. EPA's Workbook for Plume Visual Impact Screening and Analysis.

The NO<sub>x</sub> and PM<sub>10</sub> emission limits were used to run a local visibility Level 1 analysis. VISCREEN was used to determine if the color difference parameter (Delta-E) or the plume (green) contrast limits were exceeded. Delta-E was developed to specify the perceived magnitude of color and brightness changes and is used as the primary basis for determining the perceptibility of plume visual impacts. The plume constant can be defined at any wavelength as the relative difference in the intensity (called spectral radiance) between the viewed object and its background. This is used to determine how the human eye responds differently to different wavelengths of light. Worst case emissions were used for the Riverview facility. The results of the VISCREEN Level 1 analysis are presented in Table 9. The potential emission rates used in this analysis are 64.15 tons/year of particulates and 184.53 tons per year of Nitrous Oxides (NO<sub>x</sub>). None of the critical criteria values for the color contrast and Green contrast were exceeded for the Riverview project.

**TABLE 9**  
**Results from the VISCREEN Level 1 Analysis**

Distance	Background	Theta (degrees)	Azimuth (degrees)	Distance (km)	Alpha (degrees)	Color Contrast – DELTA E		Green Contrast

1 km	TERRAIN	140	1	1	168	2	0.488	0.05	0.020

## Section F – Secondary Analysis for PM<sub>2.5</sub> and Ozone Formation

Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants. Secondary PM<sub>2.5</sub> and ozone (O<sub>3</sub>) are closely related in that they share common sources of emissions and are formed in the atmosphere from chemical reactions with similar precursors. Assessing the formation of secondary pollutants such as O<sub>3</sub> and PM<sub>2.5</sub> is useful for interpreting modeled impacts of precursor pollutants due to changes in emissions from new PSD major sources or PSD major modifications to that area.

In order to address this issue, the U.S. Environmental Protection Agency released updated version of the *Guideline on Air Quality Models* (published as Appendix W to 40 CFR Part 51). A significant modification to Appendix W addresses single-source impacts on ozone and secondary PM<sub>2.5</sub>. Prior to releasing the final version of Appendix W, on December 2<sup>nd</sup>, 2016, U.S. EPA released the draft

*Guidance on the Development of Modeled Emission Rates for Precursors (MERPS) As a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program (MERPS Guidance).* This guidance provides states, local agencies, and tribes with modeled emission rates of hypothetical facilities that emit precursor pollutants to ozone and PM<sub>2.5</sub> that a source could use to determine its contribution to secondary pollution formation. If a future source or modification to a source emits less than a pollutant's MERP based on a representative hypothetical facility, then the new source or modification would not be considered as contributing to an exceedance of a critical air quality threshold for that pollutant, and further air quality analysis is not required. If the source or modification does not pass a Tier 1 demonstration, then a Tier 2 analysis utilizing refined assessment methods including photochemical grid models would be needed.

**MERPS Assessment**

Within the MERPS Guidance, there were three hypothetical facilities modeled in Indiana, located in Dubois, Grant, and Porter Counties. The lowest MERP value for each pollutant was selected for a conservative analysis. Table 10 lists the MERPS values used for this analysis. The significant impact level (SIL) for each pollutant's NAAQS was selected as the critical air quality threshold value for this MERP analysis. The SIL are as follows: 8-hour ozone – 1 part per billion (ppb); 24-hour PM<sub>2.5</sub> – 1.2 micrograms per cubic centimeter (µg/m<sup>3</sup>); and annual PM<sub>2.5</sub> – 0.3 µg/m<sup>3</sup>.

**TABLE 10**  
**Default MERP Values (tpy) for Riverview**

Precursor	8-Hour Ozone	24-hour PM <sub>2.5</sub>	Annual PM <sub>2.5</sub>
NO <sub>x</sub>	234	2308	12500
SO <sub>2</sub>	----	305	4688
VOC	1163	----	----

Riverview Energy Corporation (REC) has submitted an air permit application with the Indiana Department of Environmental Management (IDEM) to construct a direct coal hydrogenation facility in Spencer County, Indiana. REC's proposed emissions were calculated to be 184.5 tons per year of oxides of nitrogen (NO<sub>x</sub>), 181.8 tons per year of Volatile Organic Compounds (VOCs), and 120.6 tons per year of sulfur dioxide (SO<sub>2</sub>).

All of REC's emissions are below the MERP values for Indiana that the U.S. EPA provides in the MERPS Guidance. Therefore, REC is not expected to cause or contribute to a violation of the 8-hour ozone, 24-hour PM<sub>2.5</sub>, or Annual PM<sub>2.5</sub> National Ambient Air Quality Standards (NAAQS) based solely on each precursor pollutant emission rate.

**SIL Assessment**

The MERPS Guidance offers additional details on the analysis when both precursor pollutants are emitted at rates below the MERPS but above the Significant Emission Rate (SER). When this occurs, the cumulative impact of the pollutants must be analyzed and compared to the SIL. The following equations are used for the SIL analysis:

$$\text{For 8-hour ozone: } \frac{EMIS_{NO_x}}{MERP_{NO_x}} + \frac{EMIS_{VOC}}{MERP_{VOC}}$$

$$\text{For PM}_{2.5}: \frac{EMIS_{NO_x}}{MERP_{NO_x}} + \frac{EMIS_{SO_2}}{MERP_{SO_2}}$$

If the sum of these ratios is less than or equal to 1, then the source's impact would be expected to be below the SIL.

REC's results are as follows:

For 8-hour ozone, this sum of ratios is 0.945.

For 24-hour PM<sub>2.5</sub>, this sum of ratios is 0.475.

For Annual PM<sub>2.5</sub>, this sum of ratios is 0.040.

REC's primary PM<sub>2.5</sub> emissions are above the SER threshold of 10 tons per year, so dispersion modeling was conducted for primary PM<sub>2.5</sub>. Therefore, a MERP analysis for the cumulative impacts of REC's primary PM<sub>2.5</sub> and precursor emissions compared to the SIL is necessary. The following equation is used for this analysis:

$$\text{For PM}_{2.5}: \frac{HMC_{PM_{2.5}}}{SIL_{PM_{2.5}}} + \frac{EMIS_{NO_X}}{MERP_{NO_X}} + \frac{EMIS_{SO_2}}{MERP_{SO_2}}$$

where  $HMC_{PM_{2.5}}$  is the highest modeled concentration of PM<sub>2.5</sub>.

If the sum of these ratios is less than 1, then the source will not have an impact above the SIL. REC's maximum modeled PM<sub>2.5</sub> dispersion impacts are  $1.72 \frac{\mu g}{m^3}$  for the 24-hour NAAQS and  $0.32 \frac{\mu g}{m^3}$  for the annual NAAQS.

REC's results are as follows:

For 24-hour PM<sub>2.5</sub>, this sum of ratios is 1.9.

For Annual PM<sub>2.5</sub>, this sum of ratios is 1.1.

Based on the Tier 1 SIL analysis, REC's proposed emissions are not expected to have an impact above the SIL for the 8-hour Ozone NAAQS. However, a Tier 1 cumulative analysis of REC's impact on the 24-hour and Annual PM<sub>2.5</sub> NAAQS is required.

### Cumulative Assessment

IDEM utilizes guidance from the Georgia Department of Natural Resources – Environmental Protection Division on completing the cumulative analysis for the 24-hour PM<sub>2.5</sub> NAAQS. This guidance uses the following equation:

$$Background_{PM_{2.5}} + DV_{PM_{2.5}} + \left[ \left( \frac{EMIS_{SO_2}}{MERP_{SO_2}} + \frac{EMIS_{NO_X}}{MERP_{NO_X}} \right) \times SIL_{PM_{2.5}} \right]$$

where  $DV_{PM_{2.5}}$  is the maximum modeled dispersion impact of either the project source or the project source and inventory sources, depending on the location of the background PM<sub>2.5</sub> monitor in relation to the project source. In this case, IDEM is using the Dale PM<sub>2.5</sub> monitor as the background monitor. This monitor is relatively close to the project source, and would already account for inventory sources. Therefore, for this project  $DV_{PM_{2.5}}$  is the maximum 24-hour and annual modeled impact from Riverview,  $1.72 \frac{\mu g}{m^3}$  and  $0.32 \frac{\mu g}{m^3}$  respectively. The 24-hour background PM<sub>2.5</sub> value is  $19 \frac{\mu g}{m^3}$ , while the annual background value is  $8.7 \frac{\mu g}{m^3}$ . If the result of this equation is less than or equal to the NAAQS, then the project does not cause or contribute to a violation of the NAAQS. Using the values given, the result of this equation for the 24-hour NAAQS is  $21.29 \frac{\mu g}{m^3}$ , which is less than the standard of  $35 \frac{\mu g}{m^3}$ . For the Annual NAAQS, the result of the equation is  $9.03 \frac{\mu g}{m^3}$ , less than the standard of  $12 \frac{\mu g}{m^3}$ . Therefore Riverview's

emissions are not expected to cause or contribute to a violation of the 24-hour or Annual PM<sub>2.5</sub> NAAQS.

## Summary

In summary, based on this Tier 1 MERPS analysis, REC's NO<sub>x</sub>, SO<sub>2</sub>, and VOC emissions are not expected to exceed the SIL for the 8-hour Ozone NAAQS, or cause or contribute to a violation of the 24-hour PM<sub>2.5</sub> NAAQS and the annual PM<sub>2.5</sub> NAAQS.

## Section G – Hazardous Air Pollutant (HAP) Analysis

The Office of Air Quality currently requests data concerning the emission of 189 HAPs listed in the 1990 Clean Air Act Amendments (CAAA) that are either carcinogenic or otherwise considered toxic and may be used by industries in the State of Indiana. These substances are listed as air toxic compounds on the State of Indiana, Department of Environmental Management, Office of Air Quality's construction permit application Form GSD-08.

REC's potential emissions of aggregate HAPs are estimated to be over 30 tons per year. Methanol is approximately 24 tons per year for a single HAP.

The Unit Risk Factor (URF) is the upper-bound excess lifetime cancer risk estimated to result from continuous inhalation exposure to a pollutant over a 70 year lifetime. Multiplying the estimated concentration by the URF will produce a cancer risk estimate. The cancer risk estimate is the conservative probability of developing cancer from exposure to a pollutant or mixture of pollutants over a 70 year lifetime, usually expressed as the number of additional cancer cases in a given number of people, e.g. one in a million. For screening purposes at REC, the cancer estimates for each pollutant are considered to be additive when deriving the cumulative maximum individual cancer risk.

Non-cancer health effects are determined using the Reference Concentration (RfC). The RfC is an estimate of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. Dividing the estimated pollutant concentration by the RfC will determine the pollutant's Hazard Quotient (HQ). All of the HAPs' Hazard Quotients were added together to determine REC's Hazard Index (HI).

This HAP screening analysis uses health protective assumptions that overestimate the actual risk associated with emissions from REC. Estimates 1) assume a 70 year exposure time, 2) assume that all carcinogens cause the same type of cancer, 3) assume that all non-carcinogens have additive health effects, 4) assume maximum permit allowable emissions from the facility, and 5) use conservatively derived dose-response information. The risk analysis cannot accurately predict whether there will be observed health problems around REC; rather it identifies possible avenues of risk. Table 11 lists the Hazardous Air Pollutants associated with Riverview Energy and the HAP analysis.

**TABLE 11**  
**Hazardous Air Pollutant Modeling Results**

Compound	Annual Concentration (µg / m <sup>3</sup> )	Cancer URF (µg / m <sup>3</sup> ) <sup>-1</sup>	Source of URF	Cancer Risk	Non-Cancer Chronic RfC (µg / m <sup>3</sup> )	Source of IDEM RfC	Hazard Quotient
Methanol	1.31				20000	IRIS	6.57E-05
Hexane	0.1503				700	IRIS	2.15E-04
Formaldehyde	0.0008	1.3E-05	IRIS	1.06E-08	9.80	ATSDR	8.34E-05
Toluene	0.1524				5000	IRIS	3.05E-05
Benzene	0.0737	7.8E-06	IRIS	5.75E-07	30	IRIS	2.46E-03
Nickel	2.29E-05	2.4E-04	IRIS	5.49E-09	0.2	ATSDR	1.14E-04
Ammonia	1.8620				100	IRIS	1.86E-02
Hydrogen Sulfide	0.0338				2	IRIS	1.69E-02
Xylenes	0.1910				100	IRIS	1.91E-03

Compound	Annual Concentration ( $\mu\text{g} / \text{m}^3$ )	Cancer URF ( $\mu\text{g} / \text{m}^3$ ) <sup>-1</sup>	Source of URF	Cancer Risk	Non-Cancer Chronic RfC ( $\mu\text{g} / \text{m}^3$ )	Source of IDEM RfC	Hazard Quotient
Phenol	0.0020				200	CAL	1.02E-05
o-Cresol (2- Methylphenol)	0.0041				175	Region 9	2.32E-05
m-, p-Cresols	0.0020				600	CAL	3.39E-06
<b>TOTALS (HAZARD INDEX)</b>				$\Sigma = 0.59\text{E-}07$			$\Sigma = 0.0404$
<b>IDEM STANDARD COMPARISON</b>				$< 1.0\text{E-}06$ BELOW			$< 1$ BELOW

The Hazard Index for the project does not exceed 1. Pollutants with a Hazard Quotient (HQ) greater than 1 are considered to be at concentrations that could represent a health concern. Hazard Quotients above 1 do not represent areas where adverse health effects will be observed but indicate that the potential exists.

The additive cancer risk estimate from all HAPs is 4.6 additional cancer cases in ten million people. This means if an individual was exposed to these HAPs continuously for 70 years, the risk of getting cancer from this exposure would be 4.60 in ten million. The US EPA considers one in ten thousand (1.0E-04) excess cancer risk to be the upper range of acceptability with an ample margin of safety. The probability for the general public to be exposed to these HAPs for 24 hours a day, seven days a week, 52 weeks a year for 70 years is minimal.

## Section H – Summary of Air Quality Analysis

Riverview Energy Corporation applied for a permit to construct a Direct Coal Hydrogenation facility in Spencer County, Indiana. The facility had emissions above the significant emission rates for NO<sub>x</sub>, VOCs, PM<sub>2.5</sub>, PM<sub>10</sub>, CO, SO<sub>2</sub>, and HAPs. The facility had modeled concentrations above the SIL for 1-hour NO<sub>2</sub>, all averaging times for SO<sub>2</sub>, and 24-hour and annual PM<sub>2.5</sub>. Because these pollutants were above the SIL, a refined air quality impact analysis was required. Nearby large emitters were compiled and included in the NAAQS and PSD increment modeling. Several sources in Indiana and Kentucky were included in the NAAQS and PSD Increment modeling. After background concentrations were added to the NAAQS modeling results, the final resulting concentrations were under the NAAQS and PSD increments for all averaging times and pollutants.

An analysis of secondarily formed PM<sub>2.5</sub> and ozone was conducted. It was determined that no significant impact from the facility was found from secondarily formed ozone. Cumulative assessment of 24-hour and annual PM<sub>2.5</sub> showed Riverview would not cause or contribute to a violation of the 24-hour and annual PM<sub>2.5</sub> NAAQS. In addition, an additional impacts analysis on vegetation, soils, visibility, and wildlife in the area was examined and found to show no adverse impacts on the surrounding area are expected. The cumulative cancer risk estimate from all HAPs is well below the excess cancer risk to the upper range of acceptability with an ample margin of safety. No significant impacts are expected from the proposed facility.

		Annual	0.68	2012
NO <sub>2</sub>	Flaring Emergency Fast Depressure Test <sup>1</sup>	1-hour	11.96	2012-2016
		Annual	0.59	2013
PM <sub>2.5</sub>	Normal Operation	24-hour	1.72	2012-2016
		Annual	0.32	2012-2016
PM <sub>10</sub>	Normal Operation	24-hour	2.18	2012-2016
		Annual	0.41	2012

<sup>1</sup>The facility was assumed to be operating at normal (full) capacity. The facility will actually not be operating under normal (full) capacity during the flaring scenario. Emissions in the flaring scenario presented here, therefore, are likely overestimated.

<sup>2</sup>The consultant, KBR, presented IDEM with several worst case scenarios. The rest of the facility will only be operating at partial capacity during these scenarios. The results presented represent the facility at partial capacity.

<sup>3</sup>The annual average result for flaring event reflects running the scenario for all hours of a given year. This is an overestimate as the actual number of hours for these scenarios is much smaller.

## **SENT VIA U.S. MAIL: CONFIRMED DELIVERY AND SIGNATURE REQUESTED**

**TO:** Mr. Gregory Merle  
Riverview Energy Corporation  
15 E. Putnam Avenue, Suite 210  
Greenwich, CT 06830

**DATE:** June 11, 2019

**FROM:** Jenny Acker, Branch Chief  
Permits Branch  
Office of Air Quality

**SUBJECT:** Final Decision  
Title V – New Source Construction  
147-39554-00065

Enclosed is the final decision and supporting materials for the air permit application referenced above. Please note that this packet contains the original, signed, permit documents.

The final decision is being sent to you because our records indicate that you are the contact person for this application. However, if you are not the appropriate person within your company to receive this document, please forward it to the correct person.

A copy of the final decision and supporting materials has also been sent via standard mail to:  
Steven L. Lang, Environmental Consultant, KBR

In addition, the Notice of Decision has been sent to the OAQ Permits Branch Interested Parties List.

If you have technical questions regarding the enclosed documents, please contact the Office of Air Quality, Permits Branch at (317) 233-0178, or toll-free at 1-800-451-6027 (ext. 3-0178), and ask to speak to the permit reviewer who prepared the permit. If you think you have received this document in error, please contact Joanne Smiddie-Brush of my staff at 1-800-451-6027 (ext 3-0185), or via e-mail at [jbrush@idem.IN.gov](mailto:jbrush@idem.IN.gov).

TO: Lincoln Heritage Public Library

From: Jenny Acker, Branch Chief  
Permits Branch  
Office of Air Quality

Subject: **Important Information for Display Regarding a Final Determination**

**Applicant Name: Riverview Energy Corporation**  
**Permit Number: 147-39554-00065**

You previously received information to make available to the public during the public comment period of a draft permit. Enclosed is a copy of the final decision and supporting materials for the same project. Please place the enclosed information along with the information you previously received. To ensure that your patrons have ample opportunity to review the enclosed permit, **we ask that you retain this document for at least 60 days.**

The applicant is responsible for placing a copy of the application in your library. If the permit application is not on file, or if you have any questions concerning this public review process, please contact Joanne Smiddie-Brush, OAQ Permits Administration Section at 1-800-451-6027, extension 3-0185.
